NetScaler 9.3

Contents

NetScaler 9.3

The Citrix NetScaler product line optimizes delivery of applications over the Internet and private networks, combining application-level security, optimization, and traffic management into a single, integrated appliance. You install a NetScaler appliance in your server room and route all connections to your managed servers through it. The NetScaler features that you enable and the policies you set are then applied to incoming and outgoing traffic.

What's New in NetScaler 9.3

The 9.3 release provides new wizards, including a wizard for configuring Citrix Application Firewall™, includes numerous enhancements of a wide variety of features, and delivers some performance enhancements. For a summary of the updates, see the Citrix NetScaler 9.3 Release Notes.

NetScaler Features

Important: We are in the process of transitioning product documentation to Citrix eDocs. This page includes links to product documentation that is located in the Citrix Knowledge Center (http://support.citrix.com/productdocs/). When you click these links, you will leave the site. We recommend that you book mark this site so you can easily return to it.

Can't find what you're looking for? If you're looking for documentation for previously released versions of this product, go to the Citrix Knowledge Center. For a complete list of links to all product documentation in the Knowledge Center, go to http://support.citrix.com/productdocs/.

Readme

A Readme topic describes the bug fixes and known issues for a particular build of the NetScaler software. Readmes are grouped into two categories, one for maintenance releases and the other for enhancement releases. The following topics provide the consolidated list of bugs fixed and known issues of each release:

- Maintenance Releases
- Enhancement Releases

Maintenance Releases

This section provides the readmes for maintenance releases of NetScaler version 9.3.

- Build 54.4
- Build 53.5
- Build 52.3
- Build 51.5
- Build 50.3

Maintenance Releases

This section provides the readmes for maintenance releases of NetScaler version 9.3.

- Build 54.4
- Build 53.5
- Build 52.3
- Build 51.5
- Build 50.3

Build 54.4

Release version: Citrix(R) NetScaler(R), version 9.3 build 54.4

Replaces build: None

Readme version: 1.0

Release date: December, 2011

Language supported: English (US)

This section describes the changes, bug fixes, and known issues in version 9.3 build 54.4 of the Citrix(R) NetScaler(R), Citrix NetScaler SDX, and Citrix Access Gateway(R) software.

Review the following sections:

- Changes and Fixes
- Known Issues and Workarounds

Note:

- Unless stated otherwise, an issue applies to all build types (Classic, nCore, and nCore VPX) of Citrix NetScaler and Citrix Access Gateway.
- A copy of this readme is also available in the Citrix Knowledge Center at http://support.citrix.com/.

Changes and Fixes

AAA-TM Issues

- Issue ID 93854/0257700: When AAA is in use, and a user who has not already authenticated accesses a URL that contains encoded spaces (%20), after authentication AAA replaces the encoded spaces with the plus (+) character before it attempts to access the URL. When it attempts to redirect to the modified URL, the web server returns a 404 error.

Access Gateway Issues

- Issue ID 93631/0257509: Access Gateway supports client interception by using Intranet Applications. You can configure up to 128 intranet applications in Access Gateway. The previous limit was 32 intranet applications.
- Issue ID 91875/0251005: When users log on to Access Gateway, if there is a delay sending the authentication response, authentication and Access Gateway might fail.
- Issue IDs 93657/0257518 and 93716/0257574: When users attempt to log on two times, Access Gateway detects an active session and starts to initiate the transfer logon process. However, Access Gateway fails to remove the original session and transfer logon fails. If users try to transfer logon again, the logon page appears.
- Issue ID 94181/0258005: If UDP packets from the user device arrive at Access Gateway as multiple packets, Access Gateway truncates the UDP packet if all the truncated fragments fit in one packet and then are sent from the appliance.
- Issue ID 0266865: Access Gateway does not update the MAC address cache for XenApp or XenDesktop when the MAC address of the server changes. User connections fail and you must restart Access Gateway.
- Issue ID 0271589: If you upgrade Access Gateway from Version 9.3 build 51.5 to build 53.5, when users log on successfully with the Access Gateway Plug-in on an iPad, an `"Access Gateway unexpected response"` error appears.

AppFlow Issues

- Issue ID 0274236 (nCore and nCore VPX): When the AppFlow feature is enabled, memory more than the allocated size of buffer may be released. This may result in memory

corruption and packet engine failure.

Application Firewall Issues

- Issue ID 0264504: In some circumstances when a large number of Application Firewall sessions are active, the NetScaler watchdog process can stall and abort the packet engine, causing a system restart.
- Issue ID 0269994: After upgrading a NetScaler appliance that has the Application Firewall enabled and configured from version 9.0 of the NetScaler OS to version 9.3, if the deny URL feature is configured and deny URLs are enabled, memory usage increases significantly and continues to increase over time as denied URLs are accessed.
- Issue ID 0271427: When a user attempts to connect to an Application Firewall-protected web site using an Apple IPhone, the connection would fail with an error.

Cloud Bridge Issues

- Issue ID 90206/0249539 (Classic): The IKE process causes a loop and due to which 100 percent CPU usage is observed.

Configuration Utility Issues

- Issue ID 0269486: In an High availability configuration, the configuration utility does not display the configured route monitors on the NetScaler appliances. Also, when a route monitor is configured to monitor a default route , the configuration utility displayes the secondary node's IP address as 0.0.0.0.

Content Switching Issues

- Issue ID 0264772 (nCore and nCore VPX): The NetScaler appliance does not increment the hit counters that are displayed for content switching policy bindings in the output of the "show cs vserver <name>" command, even though it increments the counters for the total number of policy hits in the output of the "show cs policy [<*policyName*>]" command. The issue occurs with URL-based policies when the “caseSensitive” option for the content switching virtual server is set to “OFF.”

DataStream Issues

- Issue ID 90389/0249698 (nCore and nCore VPX): The MSSQL-ECV monitor uses the default MS SQL protocol version, TDS 7.0, even if you set a different MS SQL protocol version for the monitor.

EdgeSight Monitoring Issues

- Issue ID 0266622 (Classic and nCore): Injection of EdgeSight for NetScaler measurement scripts into the response occurs only if the HTTP content-type header is text/html.

Global Server Load Balancing Issues

- Issue ID 92365/0251432: When a GSLB virtual server that is configured with the static proximity method receives requests that alternately match a separate subset of bound GSLB services, the NetScaler appliance fails to serve each request the GSLB service IP addresses, from the respective subset, in round-robin order. For example, if the GSLB virtual server receives a request R1 that matches services S1, S2, and S3 and a request R2 that matches services S4, S5, and S6, in the order R1, R2, R1, R2, the NetScaler appliance fails to serve R1 the IP addresses of S1, S2, and S3 and R2 the IP addresses of S4, S5, and S6, in round-robin order.

Integrated Caching Issues

- Issue ID 93435/0257335: If a request for an object arrives as the object expires (at the time specified by the "**absExpiry**" parameter), the "**pollEveryTime**" parameter for that object is set to YES. Future requests for the object are sent to the origin server.

Load Balancing Issues

- Issue ID 69918//0233211: Unlike in earlier releases, when you use the “sync gslb config” command or its alias, the “sync config” command, the NetScaler appliance displays a warning that the synchronization of GSLB sites can result in loss of configuration on remote sites, and prompts you to confirm that you want to synchronize the sites. The prompt helps prevent unintentional synchronization that might result from accidental use of the command.

NetScaler SDX Appliance Issues

- Issue ID 0261672: You can download the Management Service build and documentation files, SSL keys and certificates, XVA images, NetScaler instance build and documentation files, and licenses to a local computer as a backup. You can also directly download the technical support file to your local computer and then send it to Citrix support. Earlier you had to use FTP to download these files.

- Issue ID 0268115 (nCore): You cannot change an interface on a NetScaler VPX instance if you have not selected any of the management interfaces (0/1 and 0/2) when provisioning the instance.

  Note: Make sure that the NSVLAN is configured correctly. In case of an incorrect configuration, the instance is not reachable.

- Issue ID 0269055: You can now save the settings of all the NetScaler instances provisioned on the SDX appliance before performing a factory reset. You can use the saved information to reprovision the instances after the reset. For more information, see the SDX Administration Guide at http://support.citrix.com/article/CTX129335.

- Issue ID 0267383 (nCore): You cannot remove a configured NSVLAN by using **"Modify NetScaler Instance"** in the management Service VM user interface.

Networking Issues

- Issue ID 0263530 (nCore and nCore VPX): The NetScaler appliance fails when it processes IPv6 UDP packets for which the appliance has not allocated memory for NAT entry.

SNMP Issues

- Issue ID 93916/0257759: For an SNMP query, the NetScaler appliance returns the value of the SNMP objects svcAvgTransactionTime and svcGrpMemberAvgTransactionTime, in picoseconds.

- Issue ID 0260021 (nCore and nCore VPX): NetScaler appliance returns a different value for the SNMP object **'sslSessionsPerSec'** than the value of the corresponding **'SSL sessions (Rate)'** counter displayed on the Monitoring page.

SSL Issues

- Issue ID 92246/0251327 (Classic): In rare cases, on the NetScaler 12000 appliance, if the combination of a NetScaler response and maximum transmission unit (MTU) is such that the data in the last tcp packet is 8 bytes or less, decryption of data using DES/AES ciphers fails.

System Issues

- Issue ID 89581/0249017: The NetScaler appliance fails due to the internal traffic accessing the buffer.
- Issue ID 90580/0249858: Log records are not generated for the "reboot" command.
- Issue ID 0259201: In rare cases, the appliance restarts when the process monitoring daemon does not recognize the short heartbeat messages from clients.
- Issue ID 0263699: The NetScaler appliance does not process invalid requests that are sent after a connection close.
- Issue ID 88149/0247876: The NetScaler appliance is unable to learn the restarting of the httpd process after the process fails. This causes the NetScaler appliance to drop SYN packets intermittently destined to the NSIP, or MIP, or SNIP address on the appliance.
- Issue ID 93475/0257369: After a data structure,used for tracking NAT info was getting freed to memory, a field related to netbridge configuration, was not getting zeroed out and if same data structure was being picked up again for server side coneection, we tried to send data on the bridge which is not configured so packet was not getting out.
- Issue ID 93586/0257469: The NetScaler appliance forwards Keep Alive probes, from the server, to a client even when the client has advertised a zero window. This causes the client to reset the connection.
- Issue ID 93826/0257673: HTTP requests may acknowledge previous responses that causes packet re-ordering. The NetScaler appliance fails when any configured L7 features, for example rewrite policies, processes these packets.
- Issue ID 94442/0258246 and 93593/0257475: When device name length exceeds 256 characters, then the length stored is truncated. However, the NetScaler appliance allocates more memory to store the device name and while releasing the memory, the appliance releases less memory than the extended. This leads to memory leak.

Known Issues and Workarounds

Access Gateway Issues

- Issue ID 92054/0251163: If you enable multi-stream connection policy settings in either XenApp 6.5 for Windows Server 2008 R2 or XenDestop 5.5 and you install the Access Gateway Plug-in by using an MSI package, Access Gateway does not establish multi-stream connections to the resource, although XenApp and XenDesktop launch on the user device in a single stream.

- Issue ID 91832/0250964: If users logon with the Access Gateway Plug-in and then put the user device into hibernation, when the device resumes from a different network, the Access Gateway Plug-in reconnects, but when users log off, the default route might be deleted. Users can restart their device to obtain the network route.

- Issue IDs 80175/0241433 and 82022/0242906: If you enable split tunneling, split DNS, and assign an intranet IP address on Access Gateway, when users log on with the Access Gateway Plug-in using a mobile broadband wireless device that uses the Sierra driver (for example, Telstra Compass or AT&T USBConnect) on a Windows 7 computer, Domain Name Service (DNS) resolution fails and the home page fails to open. You can use one of the following options to resolve the issue:

    1. Disable split tunneling.

    2. Configure Access Gateway so user connections do not receive an intranet IP address.

    3. Configure the wireless device to use an Ethernet connection instead of a mobile broadband connection. For example:

        a. Disable the setting Windows 7 Mobile Broadband in the Telstra Connection Manager Options dialog box.

        b. Install Sierra Wireless Watcher (6.0.2849) if users connect with an AT&T USBConnect 881 network card. This installs an Ethernet adapter instead of the mobile broadband adapter.

        c. Contact the manufacturer for other devices.

- Issue ID 89427/0248893: If users connect with the Access Gateway Plug-in by using an airtel 3G device and the Repeater Plug-in accelerates VPN traffic after the establishing the VPN connection, when users put the user device in standby or hibernate, when users resume the device, the Access Gateway Plug-in fails to reestablish the connection. When users disable acceleration with the Repeater Plug-in, restoration of the VPN connection is successful. Users can then enable acceleration with the Repeater Plug-in.

- Issue ID 89439/0248898: If users connect with the Access Gateway Plug-in and a T-Mobil 3G device and if you enable split tunneling and assign an intranet IP address to users on

Access Gateway, users cannot connect to either intranet or external resources. To allow users to connect to both internal and external resources, disable split tunneling.

- Issue ID 89791/0249202: If users log on with a Windows-based computer that is not part of a domain by using a 3G network adapter and the Access Gateway Plug-in for Windows, requests that use the host name fail. In this instance, use the fully qualified domain name (FQDN) instead of the host name.

- Issue ID 90675/0249937: If users log on with the Access Gateway Plug-in for Windows and then access a CIFS share by using the Run dialog box, when users navigate to a folder in the share and attempt to copy a file to another file share, users receive an error message and the attempt fails.

- Issue ID 84787/0245136: When you issue the command "sh vpn vserver" on Access Gateway, the number of current ICA connections does not appear when Access Gateway is in Basic mode.

- Issue ID 84986/0245297: If users log on with clientless access and attempt to open an external Web site (such as http://www.google.com) from the Email tab in the Access Interface, users might receive the Access Gateway logon page instead of the external Web site.

- Issue ID 88268/0247968: If users attempt to open a large Microsoft Word file from a Distributed File Share (DFS) hosted on Windows Server 2008 64-bit, the Access Gateway fails.

- Issue ID 81494/0242522: If users access a Distributed File Share on a computer running Windows Server 2008 64-bit, a blank folder appears in the directory path.

- Issue ID 83492/0244134: When users log on using clientless access, a JavaScript error might appear when the logon page opens.

- Issue ID 83819/0244412: If you configure a load balancing virtual server and the destination port is 21, when users log on with the Access Gateway Plug-in, logon is successful but data connections do not go through. When you configure a load balancing virtual server, do not use port 21.

- Issue ID 84894/0245227: When users log off from the Access Gateway Plug-in and then clear the cache in Internet Explorer and Firefox, users might receive an error message that says "`Error. Not a privileged user.`" Access Gateway records an HTTP/1.1 403 Access Forbidden error message in the logs.

- Issue ID 84915/0245243: If users attempt to open and edit a Microsoft Office file from Outlook Web Access, users might receive an error and the file takes a long time to open. To allow users to edit files from Outlook Web Access, do the following:

  1. Create a clientless access Outlook Web Access Profile and enable persistent cookies.

  2. Bind the Outlook Web Outlook regular expression to this profile

  3. Bind the profile so that is assumes the highest priority.
- Issue ID 86122/0246165: If you disable transparent interception and set the force time-out setting, when users log on with the Access Gateway Plug-in for Java, when the time-out period expires, a session time-out message appears on the user device, however the session is not terminated on Access Gateway.

- Issue ID 86123/0246166: If users log on with clientless access in the Firefox Web browser, when users click a link for a virtual application, the tab closes and the application does not start. If users right-click the virtual application and attempt to open it in a new window, the Web Interface appears and users receive the warning "`Published resource shortcuts are currently disabled.`" Users can open the virtual application in Internet Explorer.

- Issue ID 86323/0246328: If you configure single sign-on with Windows and configure the user name with special characters, when users log on to Windows 7 Professional, single sign-on fails. Users receive the error message "`Invalid username or password. Please try again.`" This issue does not occur if users log on to Windows XP.

- Issue IDs 86470/0246469 and 86787/0246736: When users log on with the Access Gateway Plug-in for Windows using Internet Explorer 9, a delay may occur in establishing the connection. The Access Interface, or a custom home page, might take a long time to appear when users log on using Internet Explorer 9.

- Issue ID 86471/0246473: When users log on with the Access Gateway Plug-in by using a Web browser, users might see a delay during logon.

- Issue ID 86722/0246679: When users log on with clientless access using Internet Explorer 9 and connect to SharePoint 2007, some images might not appear correctly.

ACL Issues

- Issue ID 0264933: The NetScaler appliance does not display the correct default values for the icmpType and icmpCode parameters of an extended ACL or ACL6.

Application Firewall Issues

- Issue ID 0259458: Attempts to upload a 30 MB or larger file may fail when Cross-Site Scripting (XSS) and SQL Injection checks are enabled.

CloudBridge Issues

- Issue ID 91850/0250982 (nCore and nCore VPX): The NetScaler appliance drops TCP packets when the server has to send a full-size packet, whose DF bit is unset, across the cloud bridge. This happens because of bad checksum.

Command Line Interface Issues

- Issue ID 82908/0243626 (nCore): In certain rare cases, if the NetScaler MPX appliance is subject to conditions of heavy SSL-related traffic, CLI commands fail and report a configuration inconsistency error.

  Workaround: Check for configuration inconsistency by using the "show configstatus" command and reconfigure the appliance under low traffic conditions or during a maintenance period. If this does not resolve the issue, restart the appliance.

DataStream Issues

- Issue ID 83862/0244449 (nCore and nCore VPX): This release does not support IPv6 addresses.

Domain Name System Issues

- Issue ID 93203/0257123 (nCore): A DNS policy that is bound to a GSLB service is not evaluated if the GSLB method is set to dynamic round trip time (RTT).

Load Balancing Issues

- Issue ID 82872/0243593: The setting for maximum requests per connection may be violated during a transaction with the physical server.
- Issue ID 82929/0243645: When using a TCP monitor for a MYSQL service, the MySQL server blocks the MIP for making new connections.
- Issue ID 82996/0243703: The MYSQL monitor shows the service state as UP when no SNIP or MIP is configured.
- Issue ID 86096/0246139: While configuring the WI-EXTENDED monitor, the user will have to provide the value of sitepath in such a way that it does not end with a '/' . For example:

  add monitor wi CITRIX-WI-EXTENDED -sitepath "/Citrix/DesktopWeb" -username aaa -password bbb -dom
- Issue ID 88593/0248222 (nCore): After failover, the '**maxclient**' setting on a service is not honored.
- Issue ID 90271/0249597: Application scripts that parse the servicegroup member name, and use the underscore delimiter (_) to identify fields to be extracted, fail, because the delimiter is now a question mark (?). In NetScaler releases earlier than 9.3, the format is `<service group name>_<IP address>_<port>`. The new format is `<servicegroup name>?<IP address | server name>?<port>`.

- Issue ID 87407/0247289 (nCore and nCore VPX): For an RDP virtual server, the NetScaler appliance automatically maintains persistence through session cookies by using Session Directory, so you need not explicitly configure persistence. Currently, IP address based persistence is not supported, and you cannot disable the implicit session cookie based persistence.

NetScaler SDX Appliance Issues

- Issue ID 265006 (nCore): Tx flow control on the interfaces of a NetScaler VPX instance can cause packets to be dropped instead of transmitted.

  Workaround: Turn off the Tx flow control globally on the interfaces from the management Service VM user interface. On the Configuration tab, in the navigation pane, click System, and then click Interfaces.

- Issue ID 0262505 (nCore): When viewing the built-in or custom reports in the Reporting tab on a NetScaler VPX instance running on the NetScaler SDX 17550/19550/20550/21550 platform, the following message appears: "NO DATA TO CHART".

- Issue ID 86597/0246578 (nCore): Internet Explorer version 9.0 does not load the Configuration tab.

  Workaround: Run Internet Explorer version 9.0 in compatibility mode.

- Issue ID 88515/0248159 (nCore): Client authentication is enabled by default in the Management Service VM. Consequently, HTTPS connections fail when you access the Management Service VM user interface from the Apple Safari browser.

- Issue ID 88556/0248194 (nCore): When provisioning a NetScaler instance, if you have entered invalid NetScaler settings for any of the IP address, Netmask, or Gateway parameters, you cannot modify the values for these parameters.

  Workaround: To correct the parameter values, log on to the NetScaler instance through the Xen Console. You also need to correct the values for this instance in the XenStore. After correcting the values in the both the places, rediscover the NetScaler instances from the Management Service VM user interface without selecting any specific instance, by clicking Rediscovery in the NetScaler Instance pane.

- Issue ID 89148/0248663 (nCore): When you attempt to shut down the SDX appliance from the Management Service VM user interface, the appliance restarts instead of shutting down.

- Issue ID 91605/0250759 (nCore): If the dashboard page on the management service virtual machine is open for more than 4 days, the browser (Internet Explorer 8.0) might report high memory usage.

  Workaround: In the browser, refresh or minimize the page to release the memory.

- Issue ID 0274939: If only a 10/x interface or a 1/x interface is assigned to a NetScaler VPX instance, and the state of that interface is changed from UP to DOWN and then UP again, the instance is not accessible through the NSIP address.

Workaround: Assign a 0/x interface to the VPX instance.

- Issue ID 0275607: In certain cases, if only a 1/x interface is assigned to a NetScaler VPX instance, the instance is unresponsive after it is started.

  Workaround: Assign a 0/x interface to the VPX instance.

NetScaler VPX Appliance Issues

- Issue ID 88057/0247795: If you allocate more than 200MB for caching on a VPX appliance with 2GB RAM or allocate more than 800MB on a VPX appliance with 4GB RAM, memory-intensive features, such as compression and GSLB, stop working.

  Workaround: Reduce the memory allocated for caching.

- Issue ID 94487/0258286: On the Microsoft Hyper-V platform, when there are fragmentation issues on dynamic virtual disks, the NetScaler VPX appliance sends HTTP 5xx responses to requests.

Networking Issues

- Issue ID 0271154 (Classic, nCore, and nCore VPX): The man pages for the commands 'add ns ip','set ns ip','add ns ip6', and 'set ns ip6' displays an incorrect default value for the parameter '**ospfArea**'.

Platform Issues

- Issue ID 0262488 (nCore): On the MPX and SDX 11500/13500/14500/16500/18500/20500 and MPX and SDX 17550/19550/20550/21550 appliances, the network cable does not lock properly into the port and is easy to pull out.

- Issue ID 87419/0247297 (nCore): When you start the remote console from the LOM configuration utility on a NetScaler MPX 11500/13500/14500/16500/18500/20500 or MPX 17550/19550/20550/21550 appliance, remote keyboard redirection does not work.

  Workaround: Reset the LOM firmware. The following error messages might appear on the console during LOM reset, because the LOM module does not respond to the appliance. `ipmi0: KCS error: 01 ipmi0: KCS: Reply address mismatch`

- Issue ID 90018/0249389 (nCore): When you upgrade any MPX appliance, except MPX 15000/17000, restart the appliance, and then apply the default configuration, the 1G interfaces are reset.

- Issue ID 94198/0258025: If a member interface is removed from an LA channel, the LA channel might show negative statistics in the next statistics collection cycle.

Reporting Issues

- Issue ID 85025/0245335 (nCore and nCore VPX): Reporting charts do not support plotting of counters per packet engine.

SSL Issues

- Issue ID 74279/0236509: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.
- Issue ID 81850/0242774 (nCore): You cannot import an external, encrypted FIPS key directly to an MPX 9700/10500/12500/15500 10G FIPS appliance.

  Workaround: First, decrypt the key, and then import it. To decrypt the key, at the shell prompt, type:

  ```
  openssl rsa -in <EncryptedKey.key> > DecryptedKey.out
  ```

- Issue ID 80830/0241961 (nCore): If you attempt to delete an SSL certificate-key pair that is referenced by a certificate revocation list (CRL), the following, incorrect message appears: "`ERROR: Configuration possibly inconsistent. Please check with the 'show configstatus' command or reboot.`" However, the correct message--"`ERROR: Certificate is referenced by a CRL, OCSP responder, virtual server, service, or another certificate`"-- appears upon subsequent attempts to delete the certificate-key pair.
- Issue ID 85393/0245605: A DSA certificate signed with the SHA-2 algorithm is not supported in the client authentication process.

System Issues

- Issue ID 84099/0244639 (nCore): The NetScaler appliance may fail if traffic reaches a load balancing virtual server that uses the token method for load balancing and has connection failover enabled.
- Issue ID 84282/0244774: A global setting of less than 1220 for the maximum segment size (MSS) to use for TCP connections causes an excessive delay in saving the configuration.
- Issue ID 84320/0244792 (nCore and nCore VPX): The NetScaler appliance may fail if a failover happens while high availability (HA) synchronization is in progress.
- Issue ID 94133/0257961: If a server (load balancing virtual server or content switching vserver) is configured with the same IP address, port, and protocol as the server configured in the audit syslog or nslog action, the configured virtual server will be

deleted on upgrading from 9.3_49 or a prior build to a build later than 9.3_49.

Workaround: Do the following:

1. Remove the audit policy and action.
2. Add the deleted virtual server.
3. Add the audit policy and action.
4. Save the configuration.

Web Interface Issues

- Issue ID 89052/0248592 (nCore and nCore VPX): The response from a Web Interface site that is configured in direct mode may have Java errors.

XML Issues

- Issue ID 81650/0242628: The NetScaler import utility validates XML schemas during import, but it may fail to validate certain XHTML files being imported as XMLSchema. These invalid XMLSchema's are rejected if the user tries to use them in profile configuration (XMLValidation binding).
- Issue ID 82058/0242928: The 'unique' element in the XML schema is currently not supported.
- Issue ID 82059/0242929: The 'redefine' element in the XML schema is currently not supported.
- Issue ID 82069/0242939: When the Application Firewall validates XML messages, it does not validate the contents of elements that are defined as type "any" in the applicable XML schema. Specifically, it treats these elements as if the processContent attribute was set to "skip".

  Workaround: Replace the "any" type definitions in the XML schemas with definitions of the actual elements that occur in the XML message. (The "any" type is rarely used.)

XML API Issues

- Issue ID 80170/0241429: The syntax of the "unset servicegroup" command has been changed to allow unsetting the parameters of the service group members. This can cause XML API incompatibility with respect to the "unset servicegroup" command.

Build 53.5

Release version: Citrix(R) NetScaler(R), version 9.3 build 53.5

Replaces build: None

Readme version: 1.0

Release date: November 2011

Language supported: English (US)

This section describes the changes, bug fixes, and known issues in version 9.3, build 53.5 of the Citrix(R) NetScaler(R), Citrix NetScaler SDX, and Citrix Access Gateway(TM) software.

Review the following sections:

- Changes and Fixes
- Known Issues and Workarounds

Note:

- Unless stated otherwise, an issue applies to all build types (Classic, nCore, and nCore VPX) of Citrix NetScaler and Citrix Access Gateway.
- A copy of this readme is also available in the Citrix Knowledge Center at http://support.citrix.com/.

Changes and Fixes

AAA-TM Issues

- Issue IDs 93635/0257512, 0263061, and 0263473: The NetScaler appliance fails in the following scenario:

  1. A user uses invalid credentials to log on to a AAA-TM authentication virtual server, and then sends the virtual server a second request.

  2. The user's browser reuses the TCP connection for the second request.

Access Gateway Issues

- Issue ID 91344/0250516: The multi-stream ICA feature allows you to partition multiple ICA streams in the same session. With multi-stream ICA, you can partition a single TCP connection into multiple streams based on different types of traffic that are typical for session reliability.

- Issue ID 91453/0250615: Occasionally, when users log on with the Access Gateway Plug-in, and a Web browser sends a resources.js request that contains a session cookie (NSC_AAAC), Access Gateway proxies the request to the server and returns an HTTP 404 Not Found error. Unnecessarily, the user receives an NTLM authentication message prompting them to enter credentials.

- Issue ID 92124/0251222: If you configure bookmarks on Access Gateway as a reverse proxy and users do not connect with clientless access, Access Gateway might fail.

- Issue ID 93384/0257288: You can create a session or preauthentication policy to check for REG_MULTI_NZ and REG_BINARY registry types on the user device.

- Issue ID 94534/0258329: When you configure two appliances as a high availability pair, if you create a session policy with a name longer than 31 characters, when users are logged on with the Access Gateway Plug-in,if the primary appliance becomes unavailable, failover to the secondary appliance does not occur and the connection fails.

AppFlow Issues

- Issue IDs 94685/0258921 and 0264518 (nCore and nCore VPX): The NetScaler appliance may crash if you try to delete an AppFlow policy or action while traffic affected by the

policy or action is flowing through the appliance.

Application Firewall Issues

- Issue ID 83695/0244305: On nCore systems with the application firewall enabled, the following counters may show incorrect values:
  - (CLI) Opening client connections
  - (CLI) Established client connections
  - (GUI) Opening connections
  - (GUI) Established connections
  - (GUI) Active Server connections
- Issue ID 92641/0251685 (nCore and nCore VPX): The amount of memory available to the Application Firewall is much lower than the amount of memory available to the NetScaler appliance.
- Issue ID 93940/0257771: When both AAA SSO and the Application Firewall are enabled on the NetScaler appliance, and an advanced Application Firewall profile is bound to global or a bind point, the appliance sends incorrect HTTP POST requests to the web server, breaking web server functionality.

Cache Redirection Issues

- Issue ID 92791/0251815: The NetScaler appliance fails in the following scenario:
  1. A cache redirection virtual server is configured with a listen policy, RNAT is configured, and TCP proxy is enabled for RNAT (by using the "set rnatparam -tcpproxy ENABLED" command).
  2. A client sends the appliance a request meant for the origin server. The request satisfies the RNAT criteria but does not match the listen policy that is configured for the cache redirection virtual server.
  3. Another client sends the appliance a request for the same origin server and, this time, the request matches the listen policy that is configured for the cache redirection virtual server.

Command Line Interface Issues

- Issue ID 92966/0251975: If you are using the Perl package Net::SSH::Perl, the NetScaler appliance may not allow new connections after the limit for maximum number of connections has been reached, even if some users have logged out. Make sure that your

Perl script has the following line: $ssh->login("$user", "$password", 1); instead of: $ssh->login("$user", "$password");

Configuration Utility Issues

- Issue ID 82499/0243259: In NetScaler release 9.3, the PHP version has been upgraded from 5.2.6 to 5.3.8.
- Issue ID 92919/0251932: In the "Select the Template Type" dialog box (AppExpert > Templates > Entity Templates > Add), the option for creating a load balancing virtual server template is not available, and the "SSL Vserver" option is listed more than once.

DataStream Issues

- Issue ID 92394/0251460 (nCore and nCore VPX): If a client cancels an SQL query before the server responds to a query it sent earlier, load balancing fails for subsequent queries sent by the client. The NetScaler appliance forwards all subsequent queries sent by that client to the same database server.

Content Switching Issues

- Issue ID 93339/0257249 (nCore and nCore VPX): A content switching virtual server does not serve a client request in the following scenario:
  - Three or more advanced policies that use the "MATCHES_LOCATION(<location>)" function are bound to the content switching virtual server.
  - The source IP address of the request does not match any location in the location database.

Integrated Caching Issues

- Issue ID 94009/0257849: The NetScaler appliance fails if the maximum response size (maxResSize) of a single object in the integrated cache exceeds 100 MB.
- Issue ID 94708/0258932: The NetScaler appliance does not retransmit data for a 304 Not modified cache hit when RTO (round trip timeout) is hit.

Load Balancing Issues

- Issue ID 92390/0251455: Data transfer might stop after a failover in the following scenario: Stateful connection failover is enabled on the load balancing virtual server that is managing the connection, and the failover was immediately preceded by a burst of traffic.

- Issue ID 87201/0247100 (Classic and nCore): If a load balancing virtual server for TCP services has stateful connection failover enabled, an established connection may be broken if a failover occurs more than once while a large amount of data is being transferred.

NetScaler SDX Appliance Issues

- Issue ID 92664/0251706 (nCore): You can now perform the following actions:

  - Provision a NetScaler VPX instance on a subnet that is different from the subnet of the management service VM. Traffic between the management service VM and the NetScaler VPX instance is routed.
  - Specify that only secure communication is allowed between the management service VM and the NetScaler instances.

  - Specify that the SDX appliance can be accessed only over a secure channel (https instead of http).

  - Apply administrative configuration on a NetScaler instance at a later time if the instance is not reachable from the management service VM.
- Issue ID 0261338 (nCore): If you create a NetScaler IP address from the NetScaler Configuration node in the Configuration tab of the management Service VM user interface, the default IP address created is a subnet IP (SNIP) address and not the mapped IP (MIP) address.

Rewrite Issues

- Issue ID 92586/0251637: Rewrite policies are not applied to HTTP requests that use the HTTP method CONNECT.

- Issue ID 92739/0251770: When an HTTP message body is extremely large (2 GB or more), the replace_all, insert_all, insert_before, and insert_after_all rewrite actions cause the NetScaler to crash.

SNMP Issues

- Issue ID 93003/0252009: A new SNMP OID, sysStatisticsTime (1.3.6.1.4.1.5951.4.1.1.41.17), returns the interval at which various statistical counters are updated.

- Issue ID 93469/0257366: If a content switching classic policy is rebound to the content switching virtual server, an SNMPWALK operation on the csPolicyHits SNMP object returns an error.

SSL Issues

- Issue ID 91408/0250575 (nCore VPX): If OCSP check is enabled on a NetScaler VPX appliance, and the appliance receives the client key exchange and client certificate as part of a single record, the SSL handshake fails.
- Issue IDs 93373/0257280, 0264151, and 0264043 (nCore): If there is a delay between HA health monitoring and SSL card monitoring, HA health monitoring reports that the SSL card is DOWN.

System Issues

- Issue IDs 89829/0249234 and 93515/0257405: The "diff ns config" CLI command erroneously audits a command more than once and displays the error message "Already audited command" in its output. This issue is observed when the command attribute that is treated as the unique ID for the command occurs in multiple records in the NetScaler database. For example, the host name that you specify in the "add dns nsRec" command is treated as the unique ID for the command when a database record is created. If the "add dns nsRec" command is used to assign multiple IP addresses to a host, the host name can occur in multiple records and, consequently, lead to multiple audits of the "add dns nsRec" command when you use "diff ns config."

  Note: As a result of the changes that were made to resolve this issue, the "mx" parameter, which is required in the "add dns mxRec" and "set dns mxRec" commands, is now also required in the "unset dns mxRec" command. The syntax of the "unset dns mxRec" command has changed as follows:

  Before: unset dns mxRec <domain> -TTL

  After: unset dns mxRec <domain> -mx <string> -TTL

- Issue ID 92046/0251155: If a NetScaler appliance is unable to determine the link status of an interface and stores an invalid link-status value in the internal database, the appliance fails.
- Issue ID 94767/0258978: If you use the configuration utility to delete all the configured NTP servers, configurations in one of the startup scripts (rc.netscaler) file are lost.

Known Issues and Workarounds

Access Gateway Issues

- Issue ID 92054/0251163: If you enable multi-stream connection policy settings in either XenApp 6.5 for Windows Server 2008 R2 or XenDestop 5.5 and you install the Access Gateway Plug-in by using an MSI package, Access Gateway does not establish multi-stream connections to the resource, although XenApp and XenDesktop launch on the user device in a single stream.

- Issue ID 91832/0250964: If users logon with the Access Gateway Plug-in and then put the user device into hibernation, when the device resumes from a different network, the Access Gateway Plug-in reconnects, but when users log off, the default route might be deleted. Users can restart their device to obtain the network route.

- Issue IDs 80175/0241433 and 82022/0242906: If you enable split tunneling, split DNS, and assign an intranet IP address on Access Gateway, when users log on with the Access Gateway Plug-in using a mobile broadband wireless device that uses the Sierra driver (for example, Telstra Compass or AT&T USBConnect) on a Windows 7 computer, Domain Name Service (DNS) resolution fails and the home page fails to open. You can use one of the following options to resolve the issue:

    - Disable split tunneling

    - Configure Access Gateway so user connections do not receive an intranet IP address.

    - Configure the wireless device to use an Ethernet connection instead of a mobile broadband connection. For example:

        - Disable the setting Windows 7 Mobile Broadband in the Telstra Connection Manager Options dialog box.

        - Install Sierra Wireless Watcher (6.0.2849) if users connect with an AT&T USBConnect 881 network card. This installs an Ethernet adapter instead of the mobile broadband adapter.

        - Contact the manufacturer for other devices.
- Issue ID 89427/0248893: If users connect with the Access Gateway Plug-in by using an airtel 3G device and the Repeater Plug-in accelerates VPN traffic after the establishing the VPN connection, when users put the user device in standby or hibernate, when users resume the device, the Access Gateway Plug-in fails to reestablish the connection. When users disable acceleration with the Repeater Plug-in, restoration of the VPN connection is successful. Users can then enable acceleration with the Repeater Plug-in.

- Issue ID 89439/0248898: If users connect with the Access Gateway Plug-in and a T-Mobil 3G device and if you enable split tunneling and assign an intranet IP address to users on

Access Gateway, users cannot connect to either intranet or external resources. To allow users to connect to both internal and external resources, disable split tunneling.

- Issue ID 89791/0249202: If users log on with a Windows-based computer that is not part of a domain by using a 3G network adapter and the Access Gateway Plug-in for Windows, requests that use the host name fail. In this instance, use the fully qualified domain name (FQDN) instead of the host name.

- Issue ID 90675/0249937: If users log on with the Access Gateway Plug-in for Windows and then access a CIFS share by using the Run dialog box, when users navigate to a folder in the share and attempt to copy a file to another file share, users receive an error message and the attempt fails.

- Issue ID 84787/0245136: When you issue the command "sh vpn vserver" on Access Gateway, the number of current ICA connections does not appear when Access Gateway is in Basic mode.

- Issue ID 84986/0245297: If users log on with clientless access and attempt to open an external Web site (such as http://www.google.com) from the Email tab in the Access Interface, users might receive the Access Gateway logon page instead of the external Web site.

- Issue ID 88268/0247968: If users attempt to open a large Microsoft Word file from a Distributed File Share (DFS) hosted on Windows Server 2008 64-bit, the Access Gateway fails.

- Issue ID 81494/0242522: If users access a Distributed File Share on a computer running Windows Server 2008 64-bit, a blank folder appears in the directory path.

- Issue ID 83492/0244134: When users log on using clientless access, a JavaScript error might appear when the logon page opens.

- Issue ID 83819/0244412: If you configure a load balancing virtual server and the destination port is 21, when users log on with the Access Gateway Plug-in, logon is successful but data connections do not go through. When you configure a load balancing virtual server, do not use port 21.

- Issue ID 84894/0245227: When users log off from the Access Gateway Plug-in and then clear the cache in Internet Explorer and Firefox, users might receive an error message that says "Error. Not a privileged user." Access Gateway records an HTTP/1.1 403 Access Forbidden error message in the logs.

- Issue ID 84915/0245243: If users attempt to open and edit a Microsoft Office file from Outlook Web Access, users might receive an error and the file takes a long time to open. To allow users to edit files from Outlook Web Access, do the following:

  1. Create a clientless access Outlook Web Access Profile and enable persistent cookies.

  2. Bind the Outlook Web Outlook regular expression to this profile.

  3. Bind the profile so that is assumes the highest priority.
- Issue ID 86122/0246165: If you disable transparent interception and set the force time-out setting, when users log on with the Access Gateway Plug-in for Java, when the time-out period expires, a session time-out message appears on the user device, however the session is not terminated on Access Gateway.

- Issue ID 86123/0246166: If users log on with clientless access in the Firefox Web browser, when users click a link for a virtual application, the tab closes and the application does not start. If users right-click the virtual application and attempt to open it in a new window, the Web Interface appears and users receive the warning "Published resource shortcuts are currently disabled." Users can open the virtual application in Internet Explorer.

- Issue ID 86323/0246328: If you configure single sign-on with Windows and configure the user name with special characters, when users log on to Windows 7 Professional, single sign-on fails. Users receive the error message "Invalid username or password. Please try again." This issue does not occur if users log on to Windows XP.

- Issue IDs 86470/0246469 and 86787/0246736: When users log on with the Access Gateway Plug-in for Windows using Internet Explorer 9, a delay may occur in establishing the connection. The Access Interface, or a custom home page, might take a long time to appear when users log on using Internet Explorer 9.

- Issue ID 86471/0246473: When users log on with the Access Gateway Plug-in by using a Web browser, users might see a delay during logon.

- Issue ID 86722/0246679: When users log on with clientless access using Internet Explorer 9 and connect to SharePoint 2007, some images might not appear correctly.

ACL Issues

- Issue ID 0264933: The NetScaler appliance does not display the correct default values for the icmpType and icmp Code parameters of an extended ACL or ACL6.

Application Firewall Issues

- Issue ID 83089/0243784: The users can look at the default signature rules in configuration utility, but it will be useful to have a comprehensive list of all the rules accessible in documentation or white papers for users to review.

- Issue ID 0259458: Attempts to upload a 30 MB or larger file may fail when Cross-Site Scripting (XSS) and SQL Injection checks are enabled.

CloudBridge Issues

- Issue ID 91850/0250982 (nCore and nCore VPX): The NetScaler appliance drops TCP packets when the server has to send a full-size packet, whose DF bit is unset, across the cloud bridge. This happens because of bad checksum.

Command Line Interface Issues

- Issue ID 82908/0243626 (nCore): In certain rare cases, if the NetScaler MPX appliance is subject to conditions of heavy SSL-related traffic, CLI commands fail and report a configuration inconsistency error.

  Workaround: Check for configuration inconsistency by using the "show configstatus" command and reconfigure the appliance under low traffic conditions or during a maintenance period. If this does not resolve the issue, restart the appliance.

DataStream Issues

- Issue ID 83862/0244449 (nCore and nCore VPX): This release does not support IPv6 addresses.

Domain Name System Issues

- Issue ID 93203/0257123 (nCore): A DNS policy that is bound to a GSLB service is not evaluated if the GSLB method is set to dynamic round trip time (RTT).

Load Balancing Issues

- Issue ID 82872/0243593: The setting for maximum requests per connection may be violated during a transaction with the physical server.
- Issue ID 82929/0243645: When using a TCP monitor for a MYSQL service, the MySQL server blocks the MIP for making new connections.
- Issue ID 82996/0243703: The MYSQL monitor shows the service state as UP when no SNIP or MIP is configured.
- Issue ID 86096/0246139: While configuring the WI-EXTENDED monitor, the user will have to provide the value of sitepath in such a way that it does not end with a '/' . For example: add monitor wi CITRIX-WI-EXTENDED -sitepath "/Citrix/DesktopWeb" -username aaa -password bbb -domain ccc
- Issue ID 87407/0247289 (nCore and nCore VPX): When an RDP service is configured, the NetScaler appliance automatically maintains persistence through session cookies using Session Directory. You need not explicitly configure persistency on NetScaler. In some situations, (where multiple persons use same user-login credentials) session cookie persistence may not be helpful, and IP-based persistence methods are necessary. Future releases will support IP address based persistency. In some other situations, load balancing of the RDP services without persistence may be necessary. That is, each new

connection to an RDP virtual server needs to be load balanced irrespective of a user's disconnected session existing on a terminal server.

- Issue ID 88593/0248222 (nCore): After failover, the "maxclient" setting on a service is not honored.

- Issue ID 90271/0249597: Application scripts that parse the servicegroup member name, and use the underscore delimiter (_) to identify fields to be extracted, fail, because the delimiter is now a question mark (?). In NetScaler releases earlier than 9.3, the format is <service group name>_<IP address>_<port>. The new format is <servicegroup name>?<IP address | server name>?<port>.

NetScaler SDX Appliance Issues

- Issue ID 86597/0246578 (nCore): Internet Explorer version 9.0 does not load the Configuration tab.

  Workaround: Run Internet Explorer version 9.0 in compatibility mode.

- Issue ID 88515/0248159 (nCore): Client authentication is enabled by default in the Management Service VM. Consequently, HTTPS connections fail when you access the Management Service VM user interface from the Apple Safari browser.

- Issue ID 88556/0248194 (nCore): When provisioning a NetScaler instance, if you have entered invalid NetScaler settings for any of the IP address, Netmask, or Gateway parameters, you cannot modify the values for these parameters.

  Workaround: To correct the parameter values, log on to the NetScaler instance through the Xen Console. You also need to correct the values for this instance in the XenStore. After correcting the values in the both the places, rediscover the NetScaler instances from the Management Service VM user interface without selecting any specific instance, by clicking Rediscovery in the NetScaler Instance pane.

- Issue ID 89148/0248663 (nCore): When you attempt to shut down the SDX appliance from the Management Service VM user interface, the appliance restarts instead of shutting down.

- Issue ID 91605/0250759 (nCore): If the dashboard page on the management service virtual machine is open for more than 4 days, the browser (Internet Explorer 8.0) might report high memory usage.

  Workaround: In the browser, refresh or minimize the page to release the memory.

- Issue ID 0262505 (nCore): When viewing the built-in or custom reports in the Reporting tab on a NetScaler VPX instance running on the NetScaler SDX 17550/19550/20550/21550 platform, the following message appears: "NO DATA TO CHART".

- Issue ID 0265006 (nCore): Tx flow control on the interfaces of a NetScaler VPX instance can cause packets to be dropped instead of transmitted.

Workaround: Turn off the Tx flow control globally on the interfaces from the management Service VM user interface. On the Configuration tab, in the navigation pane, click System, and then click Interfaces.

- Issue ID 0268115 (nCore): You cannot change an interface on a NetScaler VPX instance if you have not selected any of the management interfaces (0/1 and 0/2) when provisioning the instance.

  Workaround: First, add an interface to the NetScaler VPX instance. After the instance restarts, remove the interfaces that are not required.

  Note: Make sure that the NSVLAN is configured correctly. In case of an incorrect configuration, the instance is not reachable.

NetScaler VPX Appliance Issues

- Issue ID 88057/0247795: If you allocate more than 200MB for caching on a VPX appliance with 2GB RAM or allocate more than 800MB on a VPX appliance with 4GB RAM, memory-intensive features, such as compression and GSLB, stop working.

  Workaround: Reduce the memory allocated for caching.

Platform Issues

- Issue ID 87419/0247297 (nCore): When you start the remote console from the LOM configuration utility on a NetScaler MPX 11500/13500/14500/16500/18500/20500 or MPX 17550/19550/20550/21550 appliance, remote keyboard redirection does not work.

  Workaround: Reset the LOM firmware. The following error messages might appear on the console during LOM reset, because the LOM module does not respond to the appliance. ipmi0: KCS error: 01 ipmi0: KCS: Reply address mismatch

- Issue ID 90018/0249389 (nCore): When you upgrade any MPX appliance, except MPX 15000/17000, restart the appliance, and then apply the default configuration, the 1G interfaces are reset.

- Issue ID 94198/0258025: If a member interface is removed from an LA channel, the LA channel might show negative statistics in the next statistics collection cycle.

- Issue ID 0262488 (nCore): On the MPX and SDX 11500/13500/14500/16500/18500/20500 and MPX and SDX 17550/19550/20550/21550 appliances, the network cable does not lock properly into the port and is easy to pull out.

Reporting Issues

- Issue ID 85025/0245335 (nCore and nCore VPX): Reporting charts do not support plotting of counters per packet engine

SSL Issues

- Issue ID 74279/0236509: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.
- Issue ID 80830/0241961 (nCore): If you attempt to delete an SSL certificate-key pair that is referenced by a certificate revocation list (CRL), the following, incorrect message appears: "ERROR: Configuration possibly inconsistent. Please check with the 'show configstatus' command or reboot." However, the correct message--"ERROR: Certificate is referenced by a CRL, OCSP responder, virtual server, service, or another certificate"-- appears upon subsequent attempts to delete the certificate-key pair.
- Issue ID 81850/0242774 (nCore): You cannot import an external, encrypted FIPS key directly to an MPX 9700/10500/12500/15500 10G FIPS appliance.

  Workaround: First, decrypt the key, and then import it. To decrypt the key, at the shell prompt, type:

  openssl rsa -in <EncryptedKey.key> > DecryptedKey.out
- Issue ID 85393/0245605: A DSA certificate signed with the SHA-2 algorithm is not supported in the client authentication process.

System Issues

- Issue ID 84099/0244639 (nCore): The NetScaler appliance may fail if traffic reaches a load balancing virtual server that uses the token method for load balancing and has connection failover enabled.
- Issue ID 84282/0244774: A global setting of less than 1220 for the maximum segment size (MSS) to use for TCP connections causes an excessive delay in saving the configuration.
- Issue ID 84320/0244792 (nCore and nCore VPX): The NetScaler appliance may fail if failover happens while high availability (HA) synchronization is in progress.
- Issue ID 94133/0257961: If a server (lb virtual server or cs vserver) is configured with the same IP address, port, and protocol as the server configured in the audit syslog or nslog action, the configured virtual server will be deleted on upgrading from 9.3_47.5 to 9.3_51.5.

  Workaround: Do the following:

  1. Remove the audit policy and action

2. Add the deleted virtual server
3. Add the audit policy and action
4. Save the configuration

Web Interface Issues

- Issue ID 89052/0248592 (nCore and nCore VPX): The response from a Web Interface site that is configured in direct mode may have Java errors.

XML Issues

- Issue ID 81650/0242628: The NetScaler import utility validates XML schemas during import, but it may fail to validate certain XHTML files being imported as XMLSchema. These invalid XMLSchema's are rejected if the user tries to use them in profile configuration (XMLValidation binding).
- Issue ID 82058/0242928: The "unique" element in the XML schema is currently not supported.
- Issue ID 82059/0242929: The "redefine" element in the XML schema is currently not supported.
- Issue ID 82069/0242939: When the Application Firewall validates XML messages, it does not validate the contents of elements that are defined as type "any" in the applicable XML schema. Specifically, it treats these elements as if the processContent attribute was set to "skip".

  Workaround: Replace the "any" type definitions in the XML schemas with definitions of the actual elements that occur in the XML message. (The "any" type is rarely used.)
- Issue ID 83707/0244316: The Import feature for Schema and WSDL files does not support Non-ASCII characters. If an importing WSDL/Schema file contains Non-ASCII characters then it results in a partial import.

  Workaround: Convert XML schema or WSDL files to ASCII before importing them.

XML API Issues

- Issue ID 80170/0241429: The syntax of the "unset servicegroup" command has been changed to allow unsetting the parameters of the service group members. This change can cause XML API incompatibility with respect to the "unset servicegroup" command.

Build 52.3

Release version: Citrix(R) NetScaler(R), version 9.3 build 52.3

Replaces build: None

Release date: October 2011

Language supported: English (US)

Readme version: 2.0

This readme is applicable for version 9.3 build 52.3 of the Citrix(R) NetScaler(R), Citrix NetScaler SDX, and Citrix Access Gateway(TM) software.

Review the following sections:

Note:

- Unless stated otherwise, this readme applies to all build types (Classic, nCore, and nCore VPX) of Citrix NetScaler and Citrix Access Gateway.
- A copy of this readme is also available in the Citrix Knowledge Center at http://support.citrix.com/.

Changes and Fixes

Access Gateway Issues

- Issue ID 86965: When users connect to Access Gateway and you have single sign-on enabled, when users connect to a resource, occasionally Access Gateway returns a 500 Internal Server Error when the resource does not accept a 0 content length during NTLM authentication.
- Issue ID 88409: If 16 users are changing their passwords simultaneously, new users cannot log on.
- Issue ID 91811: If you enable client choices and users can log on with the Access Gateway Plug-in or by using clientless access, when users try to transfer files, an Internal Server Error 29 appears.
- Issue ID 91285: When two Access Gateway appliances are configured as part of a high availability pair and you configure double-source authentication, occasionally if the primary node fails, the secondary node also fails to accept connections and Access Gateway subsequently fails.

Application Firewall Issues

- Issue ID 83366: When the application firewall is configured, the NetScaler appliance may fail because of an issue in delivering the learning messages to the "aslearn" daemon.
- Issue ID 86782: Importing appfw objects such as signatures, htmlerror page, and so on, may fail on first attempt if the import command contains a very long source URL. The command will succeed if executed a second time.
- Issue ID 91899: The Application Firewall fails when a web page with a significantly large number of unique URLs is processed.

Configuration Utility Issues

- Issue 93321: If, when adding a new TCP profile, you specify a value greater than 128 for the "Maximum Burst Limit" field, the appliance adds a minus symbol (-) before the value.

- Issue ID 93358 (Classic and nCore): When you install a CA certificate on a NetScaler FIPS appliance by using the configuration utility, FIPS Key Name is not a required parameter.

Domain Name System Issues

- Issue ID 92383: If a DNS query made by the NetScaler appliance leads to a chain of CNAME responses and one of the intermediate CNAME response expires before the other responses because it has the least time-to-live (TTL) value, the bailiwick check is not handled correctly during subsequent attempts to resolve the same DNS query. Consequently, subsequent attempts fail intermittently. Additionally, when the appliance is functioning as an end resolver, if the length of the domain name in the query is less than 64 characters and the domain name in an intermediate CNAME response is greater than 64 characters, CNAME references are not handled correctly. Consequently, the appliance fails when you run the "flush dns proxyRecords" command.

Global Server Load Balancing Issues

- Issue ID 85912: In a large GSLB configuration, if persistence session exchange is enabled between sites and the configuration of GSLB virtual servers is not symmetric across the participating sites, then the NetScaler appliance may fail.
- Issue ID 87244 (nCore and nCore VPX): A NetScaler appliance running release 9.2 fails under the following sequence of events:

  1. GSLB is configured on the appliance, and it receives a metrics exchange protocol (MEP) connection from another GSLB site that has a lower IP address and is running a NetScaler release earlier than 9.2.
  2. The MEP connection is received by a non-owner core and the state of the MEP connection flaps (goes down and comes back up within an interval of about 10 seconds).
  3. After the MEP connection flaps, the GSLB site running NetScaler 9.2 attempts to share persistence sessions with the GSLB site running the pre-9.2 release.

Integrated Caching Issues

- Issue ID 90335: The "show cache object" CLI command can corrupt NetScaler memory, causing the appliance to fail.

Load Balancing Issues

- Issue ID 91869: The counter that indicates the number of connections made to a load balancing virtual server is not incremented correctly when the load balancing virtual server is bound to a content switching virtual server.

Networking Issues

- Issue ID 87163: If a response packet is dropped during high availability failover, the NetScaler appliance does not block fragmented request packets.
- Issue ID 91703: On failover, the bgp sessions on the secondary NetScaler in a HA-INC pair are reset. This is applicable to cl, nCore and vpx builds.
- Issue ID 91886 (nCore and nCore VPX): If the NetScaler appliance receives a monitoring packet that it sent out for monitoring a service, the appliance may fail to send further monitoring probes for the service.
- Issue ID 92773: The NetScaler appliance fails if a client tries to establish an active FTP session with a server that is reachable through a Link Load Balancing (LLB) route.

NITRO API Issues

- Issue ID 93938: The data type for the "statechangetimeseconds" field for the lbvserver and csvserver classes is not consistent. The lbvserver class uses the integer data type and the csvserver class uses the date data type.

Platform Issues

- Issue ID 92406 (Classic and nCore): On the NetScaler MPX 7500/9500 and MPX 9700/10500/12500/15500 appliances with an Intel 1GB interface, the health monitoring system automatically performs a warm restart if the appliance does not respond to health checks. If the appliance continues to be unresponsive, you have to perform a hard reboot.
- Issue IDs 92435 and 92677 (nCore): In certain rare conditions, access to the BMC device for health check data may fail on the MPX 11500/13500/14500/16500/18500 platform. Consequently, the load on the management CPU significantly escalates and the appliance becomes unresponsive.

Policies Issues

- Issue ID 92982: The NetScaler appliance fails when the rewrite action "replace_all" is applied to a response that is being generated by a content filter action.

Rewrite Issues

- Issue ID 88938: The NetScaler appliance may sometimes fail to rewrite HTTP responses that use chunked encoding.
- Issue ID 92968: If a rewrite policy with the "log" action specified is bound to a TCP virtual server, when the policy matches a connection, the NetScaler appliance fails.

SDX Appliance Issues

- Issue ID 92408: If the Management Service VM is in an idle state, the database connection sometimes times out internally causing continous login failures.

SNMP Issues

- Issue ID 92172: Some types of incorrectly formatted SNMP OID requests may lead to failure of the NetScaler appliance.

System Issues

- Issue ID 91005: Client and server-side connections for RNAT do not log TCP 4 tuple information, connection duration, bytes transferred, and connection duration.
- Issue ID 91561: If you run the shell command showtechsupport to create a collector file, "pciconf -lcv" is also executed. The output of the command appears under <collectorfile>/shell/pciconf-lcv.out.
- Issue ID 91606 (nCore): When a layout file is used with nCore to run PEs on different CPUs, if a PE ID is greater than the ID of the CPU running the PE, the profiler fails.
- Issue ID 91693: If there is no URI-QUERY string after the "?" (example: http://search.citrix.com/search?), the client side weblog report must indicate the NULL value by showing "-". However, nothing is recorded in the weblog report.
- Issue ID 92654: Setting the deprecated "recvbufsize" parameter through the "set ns tcpparam" command throws an "argument deprecated" error in the CLI but still modifies the global tcpprofile nstcp_default_profile.
- Issue IDs 93094 and 93983: If the nsconfigaudit tool cannot allocate the memory required for comparing large configurations, the tool fails.

- Issue ID 94674: If a server (lb virtual server or cs vserver) is configured with the same IP address, port, and protocol as the server configured in the audit syslog or nslog action, the configured virtual server will be deleted on reboot.

Web Interface Issues

- Issue ID 92859 (nCore and nCore VPX): The "Enable access through mobile receiver" option in the Web Interface GUI wizard activates web interface sites for most mobile platforms but is known to work for the following:
  - iPhone Receiver.
  - iPad Receiver.
  - Android Receiver.
  - Blackberry Receiver.
  - Mac Receiver .
  - iPad web browser.
  - Wyse Terminals.

Known Issues and Workarounds

Access Gateway Issues

- Issue ID 92054: If you enable multi-stream connection policy settings in either XenApp 6.5 for Windows Server 2008 R2 or XenDesktop 5.5 and you install the Access Gateway Plug-in by using an MSI package, Access Gateway does not establish multi-stream connections to the resource, although XenApp and XenDesktop launch on the user device in a single stream.

- Issue ID 91832: If users logon with the Access Gateway Plug-in and then put the user device into hibernation, when the device resumes from a different network, the Access Gateway Plug-in reconnects, but when users log off, the default route might be deleted. Users can restart their device to obtain the network route.

- Issue IDs 80175 and 82022: If you enable split tunneling, split DNS, and assign an intranet IP address on Access Gateway, when users log on with the Access Gateway Plug-in using a mobile broadband wireless device that uses the Sierra driver (for example, Telstra Compass or AT&T USBConnect) on a Windows 7 computer, Domain Name Service (DNS) resolution fails and the home page fails to open. You can use one of the following options to resolve the issue:

    1. Disable split tunneling.

    2. Configure Access Gateway so user connections do not receive an intranet IP address.

    3. Configure the wireless device to use an Ethernet connection instead of a mobile broadband connection. For example:

        - Disable the setting Windows 7 Mobile Broadband in the Telstra Connection Manager Options dialog box.

        - Install Sierra Wireless Watcher (6.0.2849) if users connect with an AT&T USBConnect 881 network card. This installs an Ethernet adapter instead of the mobile broadband adapter.

        - Contact the manufacturer for other devices.
- Issue ID 89427: If users connect with the Access Gateway Plug-in by using an airtel 3G device and the Repeater Plug-in accelerates VPN traffic after the establishing the VPN connection, when users put the user device in standby or hibernate, when users resume the device, the Access Gateway Plug-in fails to reestablish the connection. When users disable acceleration with the Repeater Plug-in, restoration of the VPN connection is successful. Users can then enable acceleration with the Repeater Plug-in.

- Issue ID 89439: If users connect with the Access Gateway Plug-in and a T-Mobil 3G device and if you enable split tunneling and assign an intranet IP address to users on Access Gateway, users cannot connect to either intranet or external resources. To allow

users to connect to both internal and external resources, disable split tunneling.

- Issue ID 89791: If users log on with a Windows-based computer that is not part of a domain by using a 3G network adapter and the Access Gateway Plug-in for Windows, requests that use the host name fail. In this instance, use the fully qualified domain name (FQDN) instead of the host name.

- Issue ID 90675: If users log on with the Access Gateway Plug-in for Windows and then access a CIFS share by using the Run dialog box, when users navigate to a folder in the share and attempt to copy a file to another file share, users receive an error message and the attempt fails.

- Issue ID 84787: When you issue the command "sh vpn vserver" on Access Gateway, the number of current ICA connections does not appear when Access Gateway is in Basic mode.

- Issue ID 84986: If users log on with clientless access and attempt to open an external Web site (such as http://www.google.com) from the Email tab in the Access Interface, users might receive the Access Gateway logon page instead of the external Web site.

- Issue ID 88268: If users attempt to open a large Microsoft Word file from a Distributed File Share (DFS) hosted on Windows Server 2008 64-bit, the Access Gateway fails.

- Issue ID 81494: If users access a Distributed File Share on a computer running Windows Server 2008 64-bit, a blank folder appears in the directory path.

- Issue ID 83492: When users log on using clientless access, a JavaScript error might appear when the logon page opens.

- Issue ID 83819: If you configure a load balancing virtual server and the destination port is 21, when users log on with the Access Gateway Plug-in, logon is successful but data connections do not go through. When you configure a load balancing virtual server, do not use port 21.

- Issue ID 84894: When users log off from the Access Gateway Plug-in and then clear the cache in Internet Explorer and Firefox, users might receive an error message that says "Error. Not a privileged user." Access Gateway records an HTTP/1.1 403 Access Forbidden error message in the logs.

- Issue ID 84915: If users attempt to open and edit a Microsoft Office file from Outlook Web Access, users might receive an error and the file takes a long time to open. To allow users to edit files from Outlook Web Access, do the following:

  1. Create a clientless access Outlook Web Access Profile and enable persistent cookies.

  2. Bind the Outlook Web Outlook regular expression to this profile.

  3. Bind the profile so that is assumes the highest priority.
- Issue ID 86122: If you disable transparent interception and set the force time-out setting, when users log on with the Access Gateway Plug-in for Java, when the time-out period expires, a session time-out message appears on the user device, however the session is not terminated on Access Gateway.

- Issue ID 86123: If users log on with clientless access in the Firefox Web browser, when users click a link for a virtual application, the tab closes and the application does not

start. If users right-click the virtual application and attempt to open it in a new window, the Web Interface appears and users receive the warning "Published resource shortcuts are currently disabled." Users can open the virtual application in Internet Explorer.

- Issue ID 86323: If you configure single sign-on with Windows and configure the user name with special characters, when users log on to Windows 7 Professional, single sign-on fails. Users receive the error message "Invalid username or password. Please try again." This issue does not occur if users log on to Windows XP.
- Issue IDs 86470 and 86787: When users log on with the Access Gateway Plug-in for Windows using Internet Explorer 9, a delay may occur in establishing the connection. The Access Interface, or a custom home page, might take a long time to appear when users log on using Internet Explorer 9.
- Issue ID 86471: When users log on with the Access Gateway Plug-in by using a Web browser, users might see a delay during logon.
- Issue ID 86722: When users log on with clientless access using Internet Explorer 9 and connect to SharePoint 2007, some images might not appear correctly.

Application Firewall Issues

- Issue ID 83089: The users can look at the default signature rules in configuration utility, but it will be useful to have a comprehensive list of all the rules accessible in documentation or white papers for users to review.
- Issue ID 0259458: Attempts to upload a 30 MB or larger file may fail when Cross-Site Scripting (XSS) and SQL Injection checks are enabled.

CloudBridge Issues

- Issue ID 91850 (nCore and nCore VPX): The NetScaler appliance drops TCP packets when the server has to send a full-size packet, that has the DF bit unset, across the cloud bridge. This happens because of bad checksum.

Command Line Interface Issues

- Issue ID 82908 (nCore): In certain rare cases, if the NetScaler MPX appliance is subject to conditions of heavy SSL-related traffic, CLI commands fail and report a configuration inconsistency error.

  Workaround: Check for configuration inconsistency by using the "show configstatus" command and reconfigure the appliance under low traffic conditions or during a maintenance period. If this does not resolve the issue, restart the appliance.

DataStream Issues

- Issue ID 83862 (nCore and nCore VPX): In this release, IPv6 addresses are not supported.

Domain Name System Issues

- Issue ID 93203 (nCore): A DNS policy that is bound to a GSLB service is not evaluated if the GSLB method is set to dynamic round trip time (RTT).

Load Balancing Issues

- Issue ID 82872: The setting of maximum requests per connection may be violated when a transaction is going on with the physical server.
- Issue ID 82929: When using a TCP monitor for a MYSQL service, the MySQL server blocks the MIP for making new connections.
- Issue ID 82996: The MYSQL monitor shows the service state as UP when no SNIP or MIP is configured.
- Issue ID 86096: While configuring the WI-EXTENDED monitor, the user will have to provide the value of sitepath in such a way that it does not end with a '/' . For example: add monitor wi CITRIX-WI-EXTENDED -sitepath "/Citrix/DesktopWeb" -username aaa -password bbb -domain ccc
- Issue ID 87201 (Classic and nCore): On a load balancing virtual server for TCP services on which stateful connection failover is enabled, an established connection may be broken if a failover occurs more than once while a large amount of data is being transferred.
- Issue ID 87407 (nCore and nCore VPX): When an RDP service is configured, the NetScaler appliance automatically maintains persistence through session cookies using Session Directory. You need not explicitly configure persistency on NetScaler. In the next releases, IP address based persistency will be supported. In some situations, (where multiple persons use same user-login credentials) session cookie persistence may not be helpful and IP-based persistence methods will be necessary. In some other situations, load balancing of the RDP services without persistence may be necessary. That is, each new connection to an RDP virtual server needs to be load balanced irrespective of a user's disconnected session existing on a terminal server.
- Issue ID 88593 (nCore): After failover, the 'maxclient' setting on a service is not honored.
- Issue ID 90271: The NetScaler appliance internally represents the servicegroup members with unique names. From the NetScaler release 9.3, the internal naming convention

changed because the delimiters used in the servicegroup member name are changed. The earlier format is: <service group name>_<IP address>_<port>. The new format is: <servicegroup name>?<IP address | server name>?<port>. Because of this change, application scripts that parse the servicegroup member name and extract the fields based on the delimiter "underscore" ("_"), will fail because the delimiter is now changed to "question mark" ("?").

NetScaler SDX Appliance Issues

- Issue ID 86597: The "Configuration" tab does not load on Internet Explorer version 9.0.

  Workaround: Run Internet Explorer version 9.0 in compatibility mode.

- Issue ID 88515: Client authentication is enabled by default in the Management Service VM. Consequently, HTTPS connections fail when you access the Management Service VM user interface from the Apple Safari browser.

- Issue ID 88556: While provisioning a NetScaler instance, if you have entered invalid NetScaler settings for any of the IP address, Netmask, or Gateway parameters, you cannot modify the values for these parameters later.

  Workaround: To correct the parameter values, log on to the NetScaler instance through the Xen Console. You also need to correct the values for this instance in the XenStore. After correcting the values in the both the places, rediscover the NetScaler instances from the Management Service VM user interface without selecting any specific instance, by clicking Rediscovery in the NetScaler Instance pane.

- Issue ID 89148: When you attempt to shut down the SDX appliance from the Management Service VM user interface, the appliance restarts instead of shutting down.

Platform Issues

- Issue ID 87419 (nCore): When you launch the remote console from the LOM configuration utility on the MPX 11500/13500/14500/16500/18500 appliance, remote keyboard redirection does not work.

  Workaround: Reset the LOM firmware. Note that the appliance may become unresponsive for approximately 60 seconds when you reset the LOM firmware. Warning: You should reset the LOM firmware only when one of the following conditions applies:

  - The appliance has just been installed.

  - The appliance is the secondary node in a high availability setup.
- Issue ID 90018 (nCore): When you upgrade any MPX appliance, except MPX 15000/17000, restart the appliance, and then apply the default configuration, the 1G interfaces are reset.

Reporting Issues

- Issue ID 85025 (nCore and nCore VPX): Reporting charts do not support plotting of counters per packet engine

SSL Issues

- Issue ID 80830 (nCore): If you attempt to delete an SSL certificate-key pair that is referenced by a certificate revocation list (CRL), the message, "ERROR: Configuration possibly inconsistent. Please check with the 'show configstatus' command or reboot," appears instead of the correct message. However, the correct message, "ERROR: Certificate is referenced by a CRL, OCSP responder, virtual server, service, or another certificate," appears upon subsequent attempts to delete the certificate-key pair.

- Issue ID 81850 (nCore): You cannot import an external, encrypted FIPS key directly to an MPX 9700/10500/12500/15500 10G FIPS appliance.

  Workaround: First, decrypt the key, and then import it. To decrypt the key, at the shell prompt, type: openssl rsa -in <EncryptedKey.key> > DecryptedKey.out

- Issue ID 85393: DSA certificate signed with the SHA-2 algorithm is not supported in the client authentication process.

- Issue ID 74279: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.

System Issues

- Issue ID 84099 (nCore): The NetScaler appliance may fail if traffic reaches a load balancing virtual server that uses the token method for load balancing and has connection failover enabled.

- Issue ID 84282: A global setting of less than 1220 for the maximum segment size (MSS) to use for TCP connections causes an excessive delay in saving the configuration.

- Issue ID 84320 (nCore and nCore VPX): The NetScaler appliance may fail if failover happens while high availability (HA) synchronization is in progress.

- Issue ID 94133: If a server (lb virtual server or cs vserver) is configured with the same IP address, port, and protocol as the server configured in the audit syslog or nslog action, the configured virtual server will be deleted on upgrading from 9.3_47.5 to 9.3_51.5.

  Workaround: Do the following:

  1. Remove the audit policy and action.

  2. Add the deleted virtual server.

3. Add the audit policy and action.

4. Save the configuration.

Web Interface Issues

- Issue ID 89052 (nCore and nCore VPX): The response from a Web Interface site, configured in direct mode, may have Java errors.

XML Issues

- Issue ID 81650: NetScaler import utility already does validation of XML Schema during import. But, it may fail to validate certain XHTML files while being imported as XMLSchema. These invalid XmlSchemas though, will be rejected if the user tries to use them in profile configuration (XMLValidation binding).

- Issue ID 82058: The 'unique' element in the XML schema is currently not supported.

- Issue ID 82059: The 'redefine' element in the XML schema is currently not supported.

- Issue ID 82069: When the Application Firewall validates XML messages, it does not validate the contents of elements that are defined as type "any" in the applicable XML schema. Specifically, it treats these elements as if the processContent attribute was set to "skip".

  Workaround: Replace the "any" type definitions in the XML schemas with definitions of the actual elements that occur in the XML message. (The "any" type is rarely used.)

- Issue ID 83707: Import feature for Schema and WSDL files does not support Non-ASCII characters. If an importing WSDL/Schema file contains Non-ASCII characters then it results in a partial import.

  Workaround: Convert XML schema or WSDL files to ASCII before importing them.

XML API Issues

- Issue ID 80170: The syntax of the "unset servicegroup" command has been changed to allow unsetting the parameters of the service group members. This can cause XML API incompatibility with respect to the "unset servicegroup" command.

Build 51.5

Release version: Citrix(R) NetScaler(R), version 9.3 build 51.5

Replaces build: None

Release date: August 2011

Language supported: English (US)

Readme version: 1.0

This readme is applicable for version 9.3 build 51.5 of the Citrix(R) NetScaler(R), Citrix NetScaler SDX, and Citrix Access Gateway(TM) software.

Review the following sections:

Note:

- Unless stated otherwise, this readme applies to all build types (Classic, nCore, and nCore VPX) of Citrix NetScaler and Citrix Access Gateway.
- A copy of this readme is also available in the Citrix Knowledge Center at http://support.citrix.com/.

Changes and Fixes

AAA Issues

- Issue ID 89587 (Classic and nCore): If you use Internet Explorer with the 'Display a notification for every script error' option enabled, when you access a virtual server on which AAA TM is configured, script error windows are displayed.

Access Gateway Issues

- Issue ID 85276: If Access Gateway does not receive responses from queries sent to servers running the Se Ticket Authority (STA), a new connection is opened for each STA query. When this occurs, Access Gatew fails.
- Issue ID 87967: If you configure LDAP authentication on Access Gateway with nested Group Extraction en when users log on with the Access Gateway Plug-in and the connection routes through a virtual IP addres authentication may fail due to a communication failure between Access Gateway and Active Directory.
- Issue ID 89116: When users log on with the Access Gateway Plug-in on computers running Windows XP an Vista, the Avaya IP Softphone application does not open.
- Issue ID 89641: If you configure group extraction and groups on the authorization server exceed 16 kiloby (KB), when users log on they might receive an HTTP 500 Internal server error message.
- Issue ID 89855: If you create a pre-authentication policy to check for a registry entry and use a large inte value, such as CLIENT.REG('HKEY_LOCAL_MACHINE\\\\SYSTEM\\\\CurrentControlSet\\\\Services\\\\Eventlog_RegCheck02') == 4052471216, user authentication fails.

AppFlow Issues

- Issue ID 91472 (nCore and nCore VPX): The AppFlow feature is re-enabled on a service when you disable it by using the respective Configure Service dialog box.
- Issue ID 92796 (nCore and nCore VPX): NetScaler appliance fails when attempting to export L7 AppFlow records to the collector because of an internal issue.

Application Firewall Issues

- Issue ID 81616: Attempts to upload a 10 MB or larger file may fail when Cross-Site Scripting (XSS) and SQL Injection checks are enabled.
- Issue ID 89103: In some cases with Application Firewall enabled, malformed http requests can cause users to re-login.
- Issue ID 91607: Some internal counters were being incremented incorrectly. This has been fixed.
- Issue ID 91695: The issue is that AppFw does not check for XSS vulnerabilities in HTTP request headers if the attack pattern is percent encoded. Customer is seeing that XSS attack is not detected in the Cookie header in a request because the XSS attack is percent encoded.
- Issue ID 91738: When both AppFw and IC are enabled, for requests that match advanced profiles, if the responses are already cached in IC, then client connection may be reset intermittently.
- Issue ID 92143: Setting "-enableformtagging off" while using the "add appfw profile" command worked fine in 9.2 builds but started to trigger a false ERROR in 9.3 build onwards. As a result, If any add appfw profile command contained "enabledformtagging off", it failed due to this ERROR after upgrade resulting in loss of such profiles.
- Issue ID 92297: The issue is that AppFw runs out of memory when processing HTTP traffic and it is caused by a memory leak in AppFw HTML Form processing code.

CloudBridge Issues

- Issue ID 91805 (nCore and nCore VPX): NetScaler crashes while sending TCP RST to those devices in the cloud, whose connection it manages.

DataStream Issues

- Issue ID 89076 (nCore and nCore VPX): The "Database Users" subnode in the configuration utility that lets you configure your database user name and password on the NetScaler is now moved under the "System" node. Therefore, to add a database user by using the configuration utility, in the navigation pane, expand "System", and then click "Database Users".
- Issue ID 89643 (nCore and nCore VPX): If you have a service for SQL Server 2005 bound to a load balancing virtual server of type MS SQL, you cannot connect to the virtual server by using SQL Management Studio 2008.
- Issue ID 92022 (nCore and nCore VPX): The authentication response from MS SQL Server is not interpreted correctly, thus leading to connection failure.

- Issue ID 92075 (nCore and nCore VPX): The user name in MS SQL Server is not case sensitive, but NetScaler handles it as case sensitive, therefore, causing authentication failure.

High Availability Issues

- Issue ID 90067 (nCore and nCore VPX): If the name of an RTSP load balancing virtual server has more than 31 characters, the NetScaler appliance might fail.
- Issue ID 91790: While the configuration synchronization is in progress, if failover process is triggered and the current secondary appliance becomes the primary appliance, the 'clear config' propagates to the new secondary appliance.

Integrated Caching Issues

- Issue ID 90810: A cache miss occurs when a content-coding value (for example, "gzip" or "compress") in the Accept-Encoding header is accompanied by a quality value (or "qvalue"). Following is an example of an Accept-Encoding header that results in a cache miss:

  Accept-Encoding: gzip;q=1.0

Load Balancing Issues

- Issue ID 90211 (Classic, nCore, and nCore VPX): If USIP is enabled and an HTTP request with CONNECT method comes on an existing connection, connections to LB proxy servers get reset.
- Issue ID 90423: When using the WI EXTENDED MONITOR for monitoring the Web Interface services, in the response to the GET request, if the 'ASP' string is not sent in the first SET cookie, the monitor failed.
- Issue IDs 92081, 92140, and 92215 (nCore): In some rare cases, the NetScaler appliance fails.

NetScaler SDX Appliance Issues

- Issue ID 91335: In certain complex SDX configurations involving LA and HA, one or more 1G interfaces might not begin to receive traffic. A 'reset interface' is then needed to start RX traffic flowing. This is applicable to the e1kvf 1G interfaces only, not the management interfaces.

- Issue ID 91797: Two options, "Force Shut Down" and "Force Reboot" have been added that lets you shut down and restart a NetScaler instance forcefully. You can use these options if normal shut down and/or reboot operations are not working on a particular instance.

Networking Issues

- Issue ID 85290: The NetScaler appliance might fail if you remove an IP address from the appliance that is in the same subnet on which you have configured a SYSLOG or AUDITLOG server.
- Issue ID 85794: NetScaler appliance sends malformed BGP update messages, where Path attributes length value is not properly set, and overwrites withdrawn routes length. This happens because BGP uses circular buffers for sending messages and there was minor error during rewinding of buffer. Therefore, this problem is randomly observed during rewinding.
- Issue ID 91377: Port leak issue during passive FTP. This issue was observed when a client initiated a control connection, requested for a data connection but did not come back for data connection.

Platform Issues

- Issue ID 91829: Perl scripts using SSLeay do not function as expected if they are running on NetScaler release 9.3 build 50.3 and earlier.

Policies Issues

- Issue ID 91579: After the configuration is cleared on a standalone NetScaler appliance, the indexes in the built-in pattern set "ctx_file_extensions" are changed to incorrect values. Consequently, built-in cache policies like "ctx_images" and "ctx_web_css" are evaluated incorrectly. In a high availability setup, the issue also occurs in the secondary appliance after configuration synchronization and in both appliances after a failover.
- Issue ID 91660 (Classic): NetScaler Classic (non-nCore) systems might fail when evaluating the following policy-based entities:
  - An HTTP callout that includes a named expression.
  - A named expression that triggers an HTTP callout.
- Issue ID 92265: If an encrypted cookie value is truncated in an HTTP request, the NetScaler appliance may fail when attempting to decrypt the value. This applies to rewrite actions that use the ENCRYPT() and DECRYPT() functions and to Application Firewall cookie encryption.

Rewrite Issues

- Issue ID 87691: If rewrite is enabled, and if a server sends an amount of data that is more than the specified content length or includes data in the response body for responses that should not have a body (such as a 304 response), in some cases, rewrite does not work.

SSL Issues

- Issue ID 90331 (nCore): On the MPX 9700/10500/12500/15500 10G FIPS appliances in a high availability setup, key management commands such as "add ssl certkey" may fail while accessing the FIPS keys in the FIPS card. This may result in higher CPU utilization and a longer time for the secondary appliance to synchronize commands from the primary appliance.

System Issues

- Issue ID 92367: The value of allocated memory that is displayed for CONN_POOL in the output of the "nsconmsg -d memstats" command is incorrect. This issue is observed when a large amount of memory is allocated to CONN_POOL on NetScaler appliances that have large memory resources.

VPX Issues

- Issue ID 90689 (nCore VPX): The NetScaler VPX virtual appliance installed on the Citrix XenServer fails when it receives a frame with a packet size of more than 1514 bytes.
- Issue ID 92065 (nCore VPX): On a NetScaler VPX appliance, you cannot modify the HAmonitor or the tagall parameter for an interface by using the configuration utility.

Web Interface Issues

- Issue ID 85473 (nCore and nCore VPX): The show techsupport command is updated to collect the WebInterface.conf files from the NetScaler appliance.

Known Issues and Workarounds

Access Gateway Issues

- Issue ID 91832: If users logon with the Access Gateway Plug-in and then put the user device into hibernation, when the device resumes from a different network, the Access Gateway Plug-in reconnects, but when users log off, the default route might be deleted. Users can restart their device to obtain the network route.

- Issue ID 80175 and 82022: If you enable split tunneling, split DNS, and assign an intranet IP address on Access Gateway, when users log on with the Access Gateway Plug-in using a mobile broadband wireless device that uses the Sierra driver (for example, Telstra Compass or AT&T USBConnect) on a Windows 7 computer, Domain Name Service (DNS) resolution fails and the home page fails to open. You can use one of the following options to resolve the issue:

  1. Disable split tunneling

  2. Configure Access Gateway so user connections do not receive an intranet IP address.

  3. Configure the wireless device to use an Ethernet connection instead of a mobile broadband connection. For example:

  - Disable the setting Windows 7 Mobile Broadband in the Telstra Connection Manager Options dialog box.

  - Install Sierra Wireless Watcher (6.0.2849) if users connect with an AT&T USBConnect 881 network card. This installs an Ethernet adapter instead of the mobile broadband adapter.

  - Contact the manufacturer for other devices.
- Issue ID 89427: If users connect with the Access Gateway Plug-in by using an airtel 3G device and the Repeater Plug-in accelerates VPN traffic after the establishing the VPN connection, when users put the user device in standby or hibernate, when users resume the device, the Access Gateway Plug-in fails to reestablish the connection. When users disable acceleration with the Repeater Plug-in, restoration of the VPN connection is successful. Users can then enable acceleration with the Repeater Plug-in.

- Issue ID 89439: If users connect with the Access Gateway Plug-in and a T-Mobil 3G device and if you enable split tunneling and assign an intranet IP address to users on Access Gateway, users cannot connect to either intranet or external resources. To allow users to connect to both internal and external resources, disable split tunneling.

- Issue ID 89791: If users log on with a Windows-based computer that is not part of a domain by using a 3G network adapter and the Access Gateway Plug-in for Windows, requests that use the host name fail. In this instance, use the fully qualified domain name (FQDN) instead of the host name.

- Issue ID 90675: If users log on with the Access Gateway Plug-in for Windows and then access a CIFS share by using the Run dialog box, when users navigate to a folder in the share and attempt to copy a file to another file share, users receive an error message and the attempt fails.

- Issue ID 84787: When you issue the command "sh vpn vserver" on Access Gateway, the number of current ICA connections does not appear when Access Gateway is in Basic mode.

- Issue ID 84986: If users log on with clientless access and attempt to open an external Web site (such as http://www.google.com) from the Email tab in the Access Interface, users might receive the Access Gateway logon page instead of the external Web site.

- Issue ID 88268: If users attempt to open a large Microsoft Word file from a Distributed File Share (DFS) hosted on Windows Server 2008 64-bit, the Access Gateway fails.

- Issue ID 81494: If users access a Distributed File Share on a computer running Windows Server 2008 64-bit, a blank folder appears in the directory path.

- Issue ID 83492: When users log on using clientless access, a JavaScript error might appear when the logon page opens.

- Issue ID 83819: If you configure a load balancing virtual server and the destination port is 21, when users log on with the Access Gateway Plug-in, logon is successful but data connections do not go through. When you configure a load balancing virtual server, do not use port 21.

- Issue ID 84894: When users log off from the Access Gateway Plug-in and then clear the cache in Internet Explorer and Firefox, users might receive an error message that says "Error. Not a privileged user." Access Gateway records an HTTP/1.1 403 Access Forbidden error message in the logs.

- Issue ID 84915: If users attempt to open and edit a Microsoft Office file from Outlook Web Access, users might receive an error and the file takes a long time to open. To allow users to edit files from Outlook Web Access, do the following:

  1. Create a clientless access Outlook Web Access Profile and enable persistent cookies.

  2. Bind the Outlook Web Outlook regular expression to this profile.

  3. Bind the profile so that is assumes the highest priority.

- Issue ID 85861: If you enable ICA Proxy on Access Gateway, when users log on and attempt to open a virtual application, the connection to the Web Interface through Access Gateway times out and closes.

- Issue ID 85906: When users log on with an earlier version of the Access Gateway Plug-in, users do not receive the upgrade prompt and the user device receives a session ID. However, the session is not established and the Web browser trying to load the file services.html and upgrading the plug-in both fail.

- Issue ID 86122: If you disable transparent interception and set the force time-out setting, when users log on with the Access Gateway Plug-in for Java, when the time-out period expires, a session time-out message appears on the user device, however the session is not terminated on Access Gateway.

- Issue ID 86123: If users log on with clientless access in the Firefox Web browser, when users click a link for a virtual application, the tab closes and the application does not start. If users right-click the virtual application and attempt to open it in a new window, the Web Interface appears and users receive the warning "Published resource shortcuts are currently disabled." Users can open the virtual application in Internet Explorer.

- Issue ID 86323: If you configure single sign-on with Windows and configure the user name with special characters, when users log on to Windows 7 Professional, single sign-on fails. Users receive the error message "Invalid username or password. Please try again." This issue does not occur if users log on to Windows XP.

- Issue ID 86470 and 86787: When users log on with the Access Gateway Plug-in for Windows using Internet Explorer 9, a delay may occur in establishing the connection. The Access Interface, or a custom home page, might take a long time to appear when users log on using Internet Explorer 9.

- Issue ID 86471: When users log on with the Access Gateway Plug-in by using a Web browser, users might see a delay during logon.

- Issue ID 86722: When users log on with clientless access using Internet Explorer 9 and connect to SharePoint 2007, some images might not appear correctly.

Application Firewall Issues

- Issue ID 83089: The users can look at the default signature rules in configuration utility, but it will be useful to have a comprehensive list of all the rules accessible in documentation or white papers for users to review.

- Issue ID 86782: Importing appfw objects such as signatures, htmlerror page, and so on, may fail on first attempt if the import command contains a very long source URL. The command will succeed if executed a second time.

- Issue ID 0259458: Attempts to upload a 30 MB or larger file may fail when Cross-Site Scripting (XSS) and SQL Injection checks are enabled.

CloudBridge Issues

- Issue ID 91850 (nCore and nCore VPX): NetScaler drops TCP packets when the server has to send a full-size packet, that has the DF bit unset, across the cloud bridge. This happens due to bad checksum.

Command Line Interface Issues

- Issue ID 82908 (nCore and nCore VPX): In certain rare cases, when the NetScaler appliance is subject to conditions of heavy SSL-related traffic, CLI commands fail and report a configuration inconsistency error.

  Workaround: Check for configuration inconsistency by using the "show configstatus" command and reconfigure the appliance under low traffic conditions or during a maintenance period. If this does not resolve the issue, restart the appliance.

DataStream Issues

- Issue ID 83862 (nCore and nCore VPX): In this release, IPv6 addresses are not supported.

Load Balancing Issues

- Issue ID 82872: The setting of maximum requests per connection may be violated when a transaction is going on with the physical server.
- Issue ID 82929: When using a TCP monitor for a MYSQL service, the MySQL server blocks the MIP for making new connections.
- Issue ID 82996: The MYSQL monitor shows the service state as UP when no SNIP or MIP is configured.
- Issue ID 86096: While configuring the WI-EXTENDED monitor, the user will have to provide the value of sitepath in such a way that it does not end with a '/' .

  For example:

  add monitor wi CITRIX-WI-EXTENDED -sitepath "/Citrix/DesktopWeb" -username aaa

  -password bbb -domain ccc
- Issue ID 87201 (Classic and nCore): On a load balancing virtual server for TCP services on which stateful connection failover is enabled, an established connection may be broken if a failover occurs more than once while a large amount of data is being transferred.
- Issue ID 87407 (nCore and nCore VPX): When an RDP service is configured, the NetScaler appliance automatically maintains persistence through session cookies using Session Directory. You need not explicitly configure persistency on NetScaler. In the next releases, IP address based persistency will be supported.

  In some situations, (where multiple persons use same user-login credentials) session cookie persistence may not be helpful and IP-based persistence methods will be necessary. In some other situations, load balancing of the RDP services without persistence may be necessary. That is, each new connection to an RDP virtual server needs to be load balanced irrespective of a user's disconnected session existing on a terminal server.

- Issue ID 88593 (nCore): After failover, the 'maxclient' setting on a service is not honored.

NetScaler SDX Appliance Issues

- Issue ID 88515: Client authentication is enabled by default in the Management Service VM. Consequently, HTTPS connections fail when you access the Management Service VM user interface from the Apple Safari browser.
- Issue ID 88556: While provisioning a NetScaler instance, if you have entered invalid NetScaler settings for the IP address, Netmask, or Gateway parameters, you cannot modify the values for these parameters later.

  Workaround: To rectify the parameter values, log on to the NetScaler instance through the Xen Console. You also need to rectify the values for this instance in the XenStore.

  After correcting in the both the places, rediscover the NetScaler instances from the Management Service VM user interface without selecting any specific instance by clicking Rediscovery in the NetScaler Instance pane.
- Issue ID 89148: When you attempt to shut down the SDX appliance from the Management Service VM user interface, the appliance restarts instead of shutting down.

Platform Issues Issues

- Issue ID 87419 (nCore): When you launch the remote console from the LOM configuration utility on the MPX 11500/13500/14500/16500/18500 appliance, remote keyboard redirection does not work.

  Workaround: Reset the LOM firmware. Note that the appliance may become unresponsive for approximately 60 seconds when you reset the LOM firmware.

  Warning: You should reset the LOM firmware only when one of the following conditions apply:

  - The appliance has just been installed.
  - The appliance is the secondary node in a high availability setup.
- Issue ID 90018 (nCore): When you upgrade any MPX appliance, except MPX 15000/17000, restart the appliance, and then apply the default configuration, the 1G interfaces are reset.

Reporting Issues

- Issue ID 85025 (nCore and nCore VPX): Reporting charts do not support plotting of counters per packet engine

SSL Issues

- Issue ID 80830 (nCore): When you attempt to delete an SSL certificate key-pair object that is referenced by a Certificate Revocation List (CRL), the message, "ERROR: Configuration possibly inconsistent. Please check with the "show configstatus" command or reboot," is displayed.

  This message is not the intended message. However, on the subsequent attempt to delete the certificate key-pair object, the correct message, "ERROR: Certificate is referenced by a CRL, OCSP responder, virtual server, service, or another certificate," is displayed.

- Issue ID 81850 (nCore): You cannot import an external, encrypted FIPS key directly to an MPX 9700/10500/12500/15500 10G FIPS appliance.

  Workaround: First, decrypt the key, and then import it. To decrypt the key, at the shell prompt, type:

  openssl rsa -in <EncryptedKey.key> > DecryptedKey.out

- Issue ID 85393: DSA certificate signed with SHA-2 algorithm is not supported in the client authentication process.

- Issue ID 74279: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.

System Issues

- Issue ID 84099 (nCore): The NetScaler appliance may fail if traffic reaches a load balancing virtual server on which connection failover is enabled and the load balancing method is the token method.

- Issue ID 84282: If the global setting for the maximum segment size (MSS) to use for TCP connections is less than 1220, the NetScaler appliance causes an excessive delay in saving the configuration.

- Issue ID 84320: The NetScaler appliance may fail if failover happens while high availability (HA) synchronization is in progress.

Web Interface Issues

- Issue ID 89052 (nCore and nCore VPX): The response from a Web Interface site, configured in direct mode, may have Java errors.

XML Issues

- Issue ID 81650: NetScaler import utility already does validation of XML Schema during import. But, it may fail to validate certain XHTML files while being imported as XMLSchema. These invalid XmlSchemas though, will be rejected if the user tries to use them in profile configuration (XMLValidation binding).
- Issue ID 82058: The 'unique' element in the XML schema is currently not supported.
- Issue ID 82059: The 'redefine' element in the XML schema is currently not supported.
- Issue ID 82069: When the Application Firewall validates XML messages, it does not validate the contents of elements that are defined as type "any" in the applicable XML schema. Specifically, it treats these elements as if the processContent attribute was set to "skip".

  Workaround: Replace the "any" type definitions in the XML schemas with definitions of the actual elements that occur in the XML message. (The "any" type is rarely used.)
- Issue ID 83707: Import feature for Schema and WSDL files does not support Non-ASCII characters. If an importing WSDL/Schema file contains Non-ASCII characters then it results in a partial import.Workaround: Convert XML schema or WSDL files to ASCII before importing them.

XML API Issues

- Issue ID 80170: The syntax of the unset servicegroup command has been changed to allow unsetting of the parameters of the service group members. This can cause XML API incompatibility with respect to the unset servicegroup command.

Build 50.3

Release version: Citrix(R) NetScaler(R), version 9.3 build 50.3

Replaces build: None

Date: July 2011

Language supported: English (US)

Readme version: 1.0

This section captures all the changes, bug fixes, and known issues in Citrix NetScaler release 9.3 build 50.3.

Review the following sections:

- Changes and Fixes
- Known Issues and Workarounds

Note:

- Unless stated otherwise, all changes, bug fixes, and known issues in this readme apply to Citrix(R) NetScaler(R) 9.3 Classic, NetScaler 9.3 nCore(TM), and NetScaler VPX(TM) 9.3. For Access Gateway, unless stated otherwise, the known issues, changes, and fixed issues apply to 9.3 Classic and nCore builds.
- The latest version of the readme is available in the Citrix Knowledge Center at http://support.citrix.com/.

Changes and Fixes

Access Gateway Issues

- Issue ID 81781: When users connect to Access Gateway and change an expired password on the challenge response page, users can enter up to 256 characters. If users create a password with more than 31 characters, however, when they log on again, Access Gateway displays a 401 authentication error and logon fails.
- Issue ID 87050: When users log on with Citrix online plug-ins and you configure Access Gateway in a high availability pair, if the primary appliance fails, occasionally the connection fails and users receive an error message stating that the connection to the appliance is interrupted.
- Issue ID 90098: If there is a large amount of network traffic through the Access Gateway VPN tunnel and if users access 40,000 or more resources through the tunnel, access to new resources fail.

Application Firewall Issues

- Issue ID 89103: In some cases with Application Firewall enabled malformed http requests can cause users to re-login.
- Issue ID 89417: Relaxation rules for transformation of SQL special characters do not work in some cases.
- Issue ID 90909: Config sync is triggered every minute instead of exponentially backing off when files are missing in secondary required by the configuration.

Cache Redirection Issues

- Issue ID 91008: If the cache redirection virtual server receives a request without a backslash (/) after the hostname (at the end of a request), the request gets corrupted when it is sent to the destination. When the NetScaler sends the request to the destination, the space is missed between '/' and 'HTTP/1.1'.
- Issue ID 91062: If forward proxy is configured, NetScaler always connects to the physical server using port 443 instead of using the port specified in the client request, and there is a failure in serving the request.

CloudBridge Issues

- Issue ID 89428 (nCore and nCore VPX): This build supports the NAT implementation of RFC 3947 and 3948 for the cloud bridge peers to communicate properly when any of the peer is behind a NAT device. For more information about configuring a cloud bridge, see the "Cloud Bridge" chapter of the Citrix NetScaler Networking Guide at http://support.citrix.com/article/CTX128671.

Configuration Utility Issues

- Issue ID 88379: Now "NetScaler Management Pack for System Center Operation Manager 2007 (SCOM)" can be downloaded from NetScaler GUI Downloads page. The Citrix NetScaler Operation Manager pack provides monitors and rules to monitor the NetScaler systems deployed in your network. The Citrix NetScaler Performance and Resource Optimization (PRO) Management Pack (MP) provides monitors and rules to monitor the health of the virtual servers configured on the managed NetScaler systems and initiate corrective actions using the PRO feature of SCVMM when the virtual servers become unhealthy.

Content Switching Issues

- Issue ID 89906: The NetScaler appliance does not support content switching based on the parameters of a stored procedure call for database protocols.

DataStream Issues

- Issue ID 88227 (nCore): The NetScaler appliance does not support the MySQL server version 5.5.7 or later. The NetScaler fails when you log on to the MySQL load balancing virtual server.
- Issue ID 90228 (nCore and nCore VPX): You can use the following expressions to configure content switching based on remote procedure call (RPC) names or IDs:
  - MSSQL.REQ.RPC.NAME. Returns the name of the procedure that is being called in a remote procedure call (RPC) request. The name is returned as a string.
  - MSSQL.REQ.RPC.IS_PROCID. Returns a Boolean value that indicates whether the remote procedure call (RPC) request contains a process ID or an RPC name. A return value of TRUE indicates that the request contains a process ID and a return value of FALSE indicates that the request contains an RPC name.
  - MSSQL.REQ.RPC.PROCID. Returns the process ID of the remote procedure call (RPC) request as an integer.

- Issue ID 91217: For MySQL virtual servers, the NetScaler appliance does not correctly handle a query of the format 'SET NAMES 'UTF8" with the character set name in quotation marks. This causes the further requests on the same connection to fail.

EdgeSight Monitoring Issues

- Issue ID 90241: When EdgeSight monitoring is enabled on a LB/CS VIP, the user is given options to choose if the responses to the clients from that VIP should be compressed or not. The decision to bind/unbind compression policies to that VIP will be taken accordingly.

Integrated Caching Issues

- Issue ID 89374 (Classic): If all the three following conditions are met, when the NetScaler appliance receives a request for an object and it attempts to re-validate and serve, NetScaler fails:
  - The content group setting "alwaysEvalPolicies" is set to YES.
  - The response cached in this group has status codes greater than 300.
  - The object is in expired state.

Load Balancing Issues

- Issue ID 81582: When an SNIP address is configured as an ADNS service and later the ADNS servers IP address is changed, the ADNS count for the old IP address does not get decremented, and an error occurs when you try to remove the old IP address. Example:

  add ip 1.1.1.1 255.255.255.0 [configured as SNIP]

  add service adns 1.1.1.1 adnS 53 [configuring the same IP as ADNS]

  set server 1.1.1.1 -ipaddress 1.1.1.2 [changing the adns server IP to new IP]

  rm ip 1.1.1.1 [Removing old IP returns error]

- Issue ID 82185 (nCore): In low-traffic-rate scenarios as mentioned below, the least connection load balancing becomes uneven. For example, when a service gets very low traffic rate such as two or three requests per second per service, and the service takes an average of 800 milliseconds to respond with the first byte. To make the load balancing precise and even in low-traffic scenarios, the following option is provided:

  set lb parameter -consolidatedLConn (YES | NO)

By default, the option is set to 'Yes'. If and only if there is uneven least connection load balancing in low-traffic scenarios, you can set the "consolidatedLConn" to 'No' to make the load balancing even.

- Issue ID 82571: When a load balancing virtual server and content switching virtual server are configured on the NetScaler appliance, when a server connection terminates, some counters on the load balancing virtual server such as open established connections (OEs) are not decremented until the connection is flushed. This may lead to other side effects like unnecessary spillover.
- Issue ID 87893: If you set the maxclient value very low, the NetScaler appliance closes connections frequently in spite of reusing them.
- Issue ID 89697 (nCore): If all the Branch Repeater appliances bound to a load balancing virtual server are DOWN, the NetScaler appliance should bypass the Branch Repeater appliances and send traffic directly to the data center.
- Issue ID 90426 (nCore and nCore VPX): The MS-SQL ECV monitor may have errors when the expected response is a result set.
- Issue ID 90917: When you create a load balancing monitor of type MSSQL-ECV, the default expression prefix is now changed from HTTP to MSSQL. When you create a load balancing monitor of type MySQL-ECV, the default expression prefix is now changed from HTTP to MySQL.

NetScaler SDX Appliance Issues

- Issue ID 90966: While modifying nsroot user if password contains special characters such as $, then password is not correctly updated on hypervisor and management vm can not communicate with hypervisor anymore.

Networking Issues

- Issue ID 88583: When OSPF authentication is in use and the packet size is 512, the authentication digest verification on the NetScaler can go wrong resulting in dropped packets.

NITRO API Issues

- Issue ID 90781: In getlbvserver, cookieipport information is missing for servicegroup bindings. In lbvserver response structure, servicegroup member information is missing.

Platform Issues

- Issue ID 88559 (nCore): On the MPX 17500/19500/21500 and MPX 11500/13500/14500/16500/18500 appliances, programming the IP address, default gateway, and netmask from the front panel keypad does not work. Note: You can use the keypad for this purpose only when the appliance has a factory default configuration.
- Issue ID 91248 (nCore): The following table shows the maximum throughput available on the Citrix NetScaler MPX 11500/13500/14500/16500/18500 appliances.

  Model Maximum throughput (in Gbps)

  11500 8

  13500 12

  14500 18

  16500 24

  18500 36

SNMP Issues

- Issue ID 90440: An snmp request from a manager will not get a response from the NetScaler if an rnat rule has been configured on the NetScaler for the manager's subnet with a SNIP as natip and that SNIP has dynamic routing enabled on it.

SSL Issues

- Issue ID 89491: If a policy for client authentication during renegotiation over SSLv3 protocol is configured on the backend server, the NetScaler fails during SSL renegotiation.

System Issues

- Issue ID 88885 (nCore and nCore VPX): During race conditions between user logins and session timeouts on the NetScaler appliance, if a core-to-core message for logout request handling fails, the core that receives the logout message might not clean up the

user session. When a user whose session has not been cleaned up logs on to the appliance again, session duplication occurs on the core and the appliance might fail.

- Issue ID 89527: The NetScaler appliance fails when a large number of HTTP pipeline POST requests with large content lengths are received over the same client-side connection.

- Issue ID 89864: When a server does not receive a window update sent by the NetScaler appliance, download latency is observed.

- Issue ID 89986 (nCore and nCore VPX): If addition of an IP on NetScaler was failing in one of the PE's and succeeding in other PE's, it would lead to config inconsistency across PE's in NetScaler. Now we have added proper recovery mechanism to recover from this failure where if "add ip" command fails on one of PE, we will revert this command across all the successful PE's also.

- Issue ID 90715 (nCore): If the channel is Down/Disable, sh channel command always gives channel downtime as 0h00m00s i.e downtime not increasing. However sh interface gives the correct channel downtime.

Web Interface Issues

- Issue ID 90121 (nCore and nCore VPX): Launching of XenApp application fails on iPad when using Web Interface on NetScaler through Safari with error "Unable to download file". The root cause of this issue is that Safari on iPad does not pass the downloaded ica file to Citrix Receiver correctly since file extension is jsp. In 9.3 build 50.1 onwards, this issue has been fixed by configuring rewrite policy in WI wizard which changes the file extension to .ica while downloading the ICA file.

- Issue ID 90658 (nCore and nCore VPX): If vpn vserver is configured on port other than 443, Single Sign On from Access Gateway to Web Interface fails and Web Interface login remains stuck with blank page at agesso.jsp when logging in to the Web Interface through Access Gateway. Root cause of this issue was incorrect port configuration in AGEWebServiceURL within WebInterface.conf for Web Interface site. Also, DNS record for Access Gateway VIP was not added correctly. This issue is resolved in 9.3 build 50.x onwards.

XML Issues

- Issue ID 68633: You cannot set the total import size limit to less than the currently imported object size.

Known Issues and Workarounds

Access Gateway Issues

- Issue ID 80175 and 82022: If you enable split tunneling, split DNS, and assign an intranet IP address on Access Gateway, when users log on with the Access Gateway Plug-in using a mobile broadband wireless device that uses the Sierra driver (for example, Telstra Compass or AT&T USBConnect) on a Windows 7 computer, Domain Name Service (DNS) resolution fails and the home page fails to open. You can use one of the following options to resolve the issue:

    1. Disable split tunneling.

    2. Configure Access Gateway so user connections do not receive an intranet IP address.

    3. Configure the wireless device to use an Ethernet connection instead of a mobile broadband connection. For example:

        - Disable the setting Windows 7 Mobile Broadband in the Telstra Connection Manager Options dialog box.

        - Install Sierra Wireless Watcher (6.0.2849) if users connect with an AT&T USBConnect 881 network card. This installs an Ethernet adapter instead of the mobile broadband adapter.

        - Contact the manufacturer for other devices.
- Issue ID 89427: If users connect with the Access Gateway Plug-in by using an airtel 3G device and the Repeater Plug-in accelerates VPN traffic after the establishing the VPN connection, when users put the user device in standby or hibernate, when users resume the device, the Access Gateway Plug-in fails to reestablish the connection. When users disable acceleration with the Repeater Plug-in, restoration of the VPN connection is successful. Users can then enable acceleration with the Repeater Plug-in.

- Issue ID 89439: If users connect with the Access Gateway Plug-in and a T-Mobil 3G device and if you enable split tunneling and assign an intranet IP address to users on Access Gateway, users cannot connect to either intranet or external resources. To allow users to connect to both internal and external resources, disable split tunneling.

- Issue ID 89791: If users log on with a Windows-based computer that is not part of a domain by using a 3G network adapter and the Access Gateway Plug-in for Windows, requests that use the host name fail. In this instance, use the fully qualified domain name (FQDN) instead of the host name.

- Issue ID 90675: If users log on with the Access Gateway Plug-in for Windows and then access a CIFS share by using the Run dialog box, when users navigate to a folder in the share and attempt to copy a file to another file share, users receive an error message and the attempt fails.

- Issue ID 84787: When you issue the command "sh vpn vserver" on Access Gateway, the number of current ICA connections does not appear when Access Gateway is in Basic mode.

- Issue ID 84986: If users log on with clientless access and attempt to open an external Web site (such as http://www.google.com) from the Email tab in the Access Interface, users might receive the Access Gateway logon page instead of the external Web site.

- Issue ID 88268: If users attempt to open a large Microsoft Word file from a Distributed File Share (DFS) hosted on Windows Server 2008 64-bit, the Access Gateway fails.

- Issue ID 81494: If users access a Distributed File Share on a computer running Windows Server 2008 64-bit, a blank folder appears in the directory path.

- Issue ID 83492: When users log on using clientless access, a JavaScript error might appear when the logon page opens.

- Issue ID 83819: If you configure a load balancing virtual server and the destination port is 21, when users log on with the Access Gateway Plug-in, logon is successful but data connections do not go through. When you configure a load balancing virtual server, do not use port 21.

- Issue ID 84894: When users log off from the Access Gateway Plug-in and then clear the cache in Internet Explorer and Firefox, users might receive an error message that says "Error. Not a privileged user." Access Gateway records an HTTP/1.1 403 Access Forbidden error message in the logs.

- Issue ID 84915: If users attempt to open and edit a Microsoft Office file from Outlook Web Access, users might receive an error and the file takes a long time to open. To allow users to edit files from Outlook Web Access, do the following:

    1. Create a clientless access Outlook Web Access Profile and enable persistent cookies.

    2. Bind the Outlook Web Outlook regular expression to this profile.

    3. Bind the profile so that is assumes the highest priority.
- Issue ID 85861: If you enable ICA Proxy on Access Gateway, when users log on and attempt to open a virtual application, the connection to the Web Interface through Access Gateway times out and closes.

- Issue ID 85906: When users log on with an earlier version of the Access Gateway Plug-in, users do not receive the upgrade prompt and the user device receives a session ID. However, the session is not established and the Web browser trying to load the file services.html and upgrading the plug-in both fail.

- Issue ID 86022: If you configure the user device to enable users to log on only using the Access Gateway Plug-in and then change the plug-in Web address to an unresolvable address, when users try to log on through the logon dialog box, an authentication error appears. Then, if users try to log on using the plug-in, the logon dialog box does not appear and users cannot change the Web address. Users should exit and then restart the plug-in to subsequently change the Web address.

- Issue ID 86122: If you disable transparent interception and set the force time-out setting, when users log on with the Access Gateway Plug-in for Java, when the time-out period expires, a session time-out message appears on the user device, however the

session is not terminated on Access Gateway.

- Issue ID 86123: If users log on with clientless access in the Firefox Web browser, when users click a link for a virtual application, the tab closes and the application does not start. If users right-click the virtual application and attempt to open it in a new window, the Web Interface appears and users receive the warning "Published resource shortcuts are currently disabled." Users can open the virtual application in Internet Explorer.

- Issue ID 86323: If you configure single sign-on with Windows and configure the user name with special characters, when users log on to Windows 7 Professional, single sign-on fails. Users receive the error message "Invalid username or password. Please try again." This issue does not occur if users log on to Windows XP.

- Issue ID 86470 and 86787: When users log on with the Access Gateway Plug-in for Windows using Internet Explorer 9, a delay may occur in establishing the connection. The Access Interface, or a custom home page, might take a long time to appear when users log on using Internet Explorer 9.

- Issue ID 86471: When users log on with the Access Gateway Plug-in by using a Web browser, users might see a delay during logon.

- Issue ID 86722: When users log on with clientless access using Internet Explorer 9 and connect to SharePoint 2007, some images might not appear correctly.

Application Firewall Issues

- Issue ID 81616: Attempts to upload a 10 MB or larger file may fail when Cross-Site Scripting (XSS) and SQL Injection checks are enabled.

- Issue ID 83089: The users can look at the default signature rules in configuration utility, but it will be useful to have a comprehensive list of all the rules accessible in documentation or white papers for users to review.

- Issue ID 86782: Importing appfw objects such as signatures, htmlerror page, and so on, may fail on first attempt if the import command contains a very long source URL. The command will succeed if executed a second time.

CloudBridge Issues

- Issue ID 91805 (nCore and nCore VPX): NetScaler crashes while sending TCP RST to those devices in the cloud, whose connection it manages.

- Issue ID 91850 (nCore and nCore VPX): NetScaler drops TCP packets when the server has to send a full-size packet, that has the DF bit unset, across the cloud bridge. This happens due to bad checksum.

Command Line Interface Issues

- Issue ID 82908: In certain rare cases, when the NetScaler appliance is subject to conditions of heavy SSL-related traffic, CLI commands fail and report a configuration inconsistency error.

  Workaround: Check for configuration inconsistency by using the "show configstatus" command and reconfigure the appliance under low traffic conditions or during a maintenance period. If this does not resolve the issue, restart the appliance.

DataStream Issues

- Issue ID 83862 (nCore, nCore VPX): In this release, IPv6 addresses are not supported.

Integrated Caching Issues

- Issue ID 81159: When the NetScaler appliance receives a single byte-range request, if the starting position of the range is beyond 9 megabytes, the appliance sends the client a full response with a status code of 200 OK instead of a partial response.

Load Balancing Issues

- Issue ID 82872: The setting of maximum requests per connection may be violated when a transaction is going on with the physical server.
- Issue ID 82929: When using a TCP monitor for MYSQL service, the MySQL server blocks the MIP for making new connections.
- Issue ID 82996: The MYSQL monitor shows the service state as UP when no SNIP or MIP is configured.
- Issue ID 86096: While configuring the WI-EXTENDED monitor, the user will have to provide the value of sitepath in such a way that it does not end with a '/' .

  For example:

  add monitor wi CITRIX-WI-EXTENDED -sitepath "/Citrix/DesktopWeb" -username aaa -password bbb -domain ccc
- Issue ID 87201 (Classic, nCore): On a load balancing virtual server for TCP services on which stateful connection failover is enabled, an established connection may be broken if a failover occurs more than once while a large amount of data is being transferred.

- Issue ID 87407 (nCore and nCore VPX): When an RDP service is configured, the NetScaler appliance automatically maintains persistence through session cookies using Session Directory. You need not explicitly configure persistency on NetScaler. In the next releases, IP address based persistency will be supported. In some situations, (where multiple persons use same user-login credentials) session cookie persistence may not be helpful and IP-based persistence methods will be necessary. In some other situations, load balancing of the RDP services without persistence may be necessary. That is, each new connection to an RDP virtual server needs to be load balanced irrespective of a user's disconnected session existing on a terminal server.

NetScaler SDX Appliance Issues

- Issue ID 88515: Client authentication is enabled by default in the Management Service VM. Consequently, HTTPS connections fail when you access the Management Service VM user interface from the Apple Safari browser.

- Issue ID 88556: While provisioning a NetScaler instance, if you have entered invalid NetScaler settings for the IP address, Netmask, or Gateway parameters, you cannot modify the values for these parameters later.

  Workaround: To rectify the parameter values, log on to the NetScaler instance through the Xen Console. You also need to rectify the values for this instance in the XenStore. After correcting in the both the places, rediscover the NetScaler instances from the Management Service VM user interface without selecting any specific instance by clicking Rediscovery in the NetScaler Instance pane.

- Issue ID 89148: When you attempt to shut down the SDX appliance from the Management Service VM user interface, the appliance restarts instead of shutting down.

- Issue ID 91335: In certain complex SDX configurations involving LA and HA, one or more 1G interfaces might not begin to receive traffic. A "reset interface" is then needed to start RX traffic flowing. This is applicable to the e1kvf 1G interfaces only, not the management interfaces.

Platform Issues

- Issue ID 87419 (nCore): When you launch the remote console from the LOM configuration utility on the MPX 11500/13500/14500/16500/18500 appliance, remote keyboard redirection does not work.

  Workaround: Reset the LOM firmware. Note that the appliance may become unresponsive for approximately 60 seconds when you reset the LOM firmware. Warning: You should reset the LOM firmware only when one of the following conditions apply:

  - The appliance has just been installed.

  - The appliance is the secondary node in a high availability setup.

- Issue ID 90018 (nCore): When you upgrade any MPX appliance, except MPX 15000/17000, to release 9.3 build 50.3, restart the appliance, and then apply the default configuration, the 1G interfaces are reset.

Reporting Issues

- Issue ID 85025 (nCore, nCore VPX): Reporting charts do not support plotting of counters per packet engine.

SSL Issues

- Issue ID 74279: The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.
- Issue ID 80830 (nCore): When you attempt to delete an SSL certificate key-pair object that is referenced by a Certificate Revocation List (CRL), the message, "ERROR: Configuration possibly inconsistent. Please check with the "show configstatus" command or reboot," is displayed. This message is not the intended message. However, on the subsequent attempt to delete the certificate key-pair object, the correct message, "ERROR: Certificate is referenced by a CRL, OCSP responder, virtual server, service, or another certificate," is displayed.
- Issue ID 81850 (nCore): You cannot import an external, encrypted FIPS key directly to an MPX 9700/10500/ 12500/15500 10G FIPS appliance.

  Workaround: First, decrypt the key, and then import it. To decrypt the key, at the shell prompt, type:

  openssl rsa -in <EncryptedKey.key> > DecryptedKey.out

System Issues

- Issue ID 84099 (nCore): The NetScaler appliance may fail if traffic reaches a load balancing virtual server on which connection failover is enabled and the load balancing method is the token method.
- Issue ID 84282: If the global setting for the maximum segment size (mss) to use for TCP connections is less than 1220, the NetScaler appliance causes excessive delay to save the configuration.
- Issue ID 84320 (nCore): The NetScaler appliance may fail if failover happens while high availability (HA) synchronization is in progress.
- Issue ID 88593 (nCore): After failover, the maxclient configuration on a service is not honored.

Web Interface Issues

- Issue ID 89052 (nCore and nCore VPX): The response from a Web Interface site, configured in direct mode, may have Java errors.

XML Issues

- Issue ID 81650: NetScaler import utility already does validation of XML Schema during import. But, it may fail to validate certain XHTML files while being imported as XMLSchema. These invalid XmlSchemas though, will be rejected if the user tries to use them in profile configuration (XMLValidation binding).
- Issue ID 82058: The 'unique' element in the XML schema is currently not supported.
- Issue ID 82059: The 'redefine' element in the XML schema is currently not supported.
- Issue ID 82069: When the Application Firewall validates XML messages, it does not validate the contents of elements that are defined as type "any" in the applicable XML schema. Specifically, it treats these elements as if the processContent attribute was set to "skip".

  Workaround: Replace the "any" type definitions in the XML schemas with definitions of the actual elements that occur in the XML message. (The "any" type is rarely used.)
- Issue ID 83707: Import feature for Schema and WSDL files does not support Non-ASCII characters. If an importing WSDL/Schema file contains Non-ASCII characters then it results in a partial import.

  Workaround: Convert XML schema or WSDL files to ASCII before importing them.

XML API Issues

- Issue ID 80170: The syntax of the unset servicegroup command has been changed to allow unsetting of the parameters of the service group members. This can cause XML API incompatibility with respect to the unset servicegroup command.

Enhancement Releases

This section provides the readmes for enhancement releases of NetScaler version 9.3.

- Build 53.5006.e
- Build 51.5006.e
- Build 50.3002.e

Build 53.5006.e

Release version: Citrix(R) NetScaler(R), version 9.3.e, Build 53.5006.e

Replaces build: None

Readme version: 1.0

Release date: December 2011

Language supported: English (US)

This section describes the enhancements and known issues in version 9.3.e build 53.5006.e of the Citrix(R) NetScaler(R) software. For the list of bug fixes in this release, see the readme for version 9.3 build 53.5, which is available in the Citrix eDocs at http://support.citrix.com/proddocs/topic/ns-readme-map/ns-readme-build-53-5-con.html.

All enhancements, bug fixes, and known issues in this readme apply to Citrix NetScaler 9.3.e nCore™.

Note: A copy of this 9.3.e readme is also available in the Citrix Knowledge Center at http://support.citrix.com/.

Enhancements

Cloud Bridge

- Req ID 0270815: The configuration utility now includes a wizard that helps you to easily configure a cloud bridge between a NetScaler appliance on any network and NetScaler VPX instances on the SOFTLAYER enterprise cloud.

  For more information, see the Cloud Bridge chapter of the Citrix NetScaler Networking Guide, available at http://support.citrix.com/article/CTX130085.

- Req ID 0262566: The following statistical counters have been introduced for IPSEC tunnels:

  - Bytes Received
  - Bytes Sent
  - Packets Received
  - Packets Sent

  For more information, see the man page for the 'stat IPSEC counters' command.

- Req ID 0261540: For an IPSEC tunnel, the NetScaler appliance now performs the standard IKEv2 liveliness check on the peer at a regular interval, which is user configurable. Based on check, the NetScaler appliance displays the status of the tunnel as UP or DOWN.

- Req ID 0258969: By using the configuration utility, you can now configure a cloud bridge between a NetScaler appliance on any network and NetScaler VPX instances on the COTENDO enterprise cloud.

Networking

- Req ID 84792/0245142: Now, in a High Availability (HA) configuration, you can create route monitors in non-INC mode. Route monitors are propagated and get synchronized only in the non-INC mode. Route monitors are useful in a non-INC mode HA configuration where you want the non-reachability of a gateway from a primary node to be one of the conditions for HA failover.

  For more information, see the "Configuring Route Monitors" section in the High Availability chapter of the Citrix NetScaler Networking Guide, available at http://support.citrix.com/article/CTX130085.

- Req ID 0262405: You can now configure the NetScaler appliance to respond or not respond to ARP requests for a Virtual IP (VIP) address on the basis of the state of the virtual servers associated with that VIP.

  For more information, see the "Configuring ARP Response Supression for Virtual IP addresses (VIPs)" section in the IP Addressing chapter of the Citrix NetScaler Networking Guide, available at http://support.citrix.com/article/CTX130085.

- Req ID 94655/0258893: You can now bind a NetScaler owned SNIP address to an interface without using Layer 3 VLANs. Any packets related to the SNIP address will go only through the bound interface.

  For more information, see the "Binding an NetScaler Owned IP address to an Interface" section in the Interface chapter of the Citrix NetScaler Networking Guide, available at http://support.citrix.com/article/CTX130085.

Changes and Fixes

Networking Issues

- Issue IDs 94162/0257992 and 0262493: For a connection from a virtual server to the bound server, the NetScaler appliance uses the SNIP address instead of the net profile IPs configured for the virtual server.

Configuration Utility Issues

- Issue ID 0269486: In a High availability (HA) configuration, the configuration utility does not display the configured route monitors on the NetScaler appliances. Also, when a route monitor is configured to monitor a default route , the configuration utility displays the secondary node's IP address as 0.0.0.0.

System Issues

- Issue ID 93475/0257369: When the NetScaler appliance releases memory for a data structure, which is used for tracking NAT info, an associated field related to net bridge configuration fails to get released. When the server side connection picks the same data structure, the appliance sends data on a bridge, which is not configured. This leads to memory leak.
- Issue ID 94442/0258246 and 93593/0257475: When device name length exceeds 256 characters, then the length stored is truncated. However, the NetScaler appliance allocates more memory to store the device name and while releasing the memory, the appliance releases less memory than the extended. This leads to memory leak.

High Availability Issues

- Issue ID 92866/0251883: In an HA configuration in non-inc mode, on executing the config sync operation, the ‘bind Routemonitor’ command does not get synched to the secondary.
- Issue ID 93068/0252065: In an HA configuration in non-inc mode, on executing the "clear config" command or clearing config as a part of config sync operation, route monitors get modified, but health check is not done and thus node state is not updated properly.

Known Issues and Workarounds

Documentation Issues

- Issue ID 90875/0250110: On a TCP load balancing virtual server, if persistence is defined with the rule '`client.tcp.payload(n)`', and a request is received in multiple parts such that there is a delay between the parts and a FIN is sent from client before the expected number of bytes (n), the NetScaler appliance creates an undesired session with the received number of bytes (which is less than n). This behavior needs to be documented.

Global Server Load Balancing Issues

- Issue ID 93051/0252048: When a load balancing virtual server that is a part of a GSLB configuration is down and receives a client request, the NetScaler appliance makes a GSLB decision and attempts an HTTP redirect or a connection proxy to a GSLB site that is UP and healthy. The appliance fails when making this GSLB decision if source IP persistence is set on both the primary and backup GSLB virtual servers and if the core that receives the request is not the owner of the source IP persistence entry.

Load Balancing Issues

- Issue ID 90395/0249705: If the rule that is used for creating rule based persistence sessions is a compound expression, the "show lb persistentSessions" CLI command displays an internal representation of the persistence parameter instead of the actual persistence parameter.

- Issue ID 91672/0250820: If the token that is used for creating rule based persistence sessions is larger than 100 MB, the "show lb persistentSessions" CLI command does not display the persistence parameter.

- Issue ID 91711/0250846: If the string (or "token") that is used for creating rule based persistence sessions for load balancing virtual servers is larger than 64 KB, the NetScaler appliance fails to create persistence sessions. For example, the appliance fails to create persistence sessions with the rule `CLIENT.TCP.PAYLOAD(70000)` because the token that is used is larger than 64 KB. However, the appliance creates persistence sessions successfully with a rule such as `CLIENT.TCP.PAYLOAD(70000).BEFORE_STR("string2").AFTER_STR("string1")` if the string that is enclosed by "string1" and "string2" is not larger than 64 KB.

Build 51.5006.e

Release version: Citrix(R) NetScaler(R), version 9.3.e, Build 51.5006.e

Replaces build: None

Release date: September 2011

Language supported: English (US)

Readme version: 1.0

Review the following sections:

- Enhancements
- Known Issues and Workarounds

Note:

- All enhancements and known issues in this readme apply to Citrix NetScaler 9.3.e nCore™.
- For the list of bug fixes in this release, see the readme for Citrix NetScaler version 9.3 build 51.5.
- A copy of this 9.3.e readme is also available in the Citrix Knowledge Center at http://support.citrix.com.

Enhancements

Sessionless Field Consistency

With the sessionless Field Consistency Check feature, the application firewall does not store web forms in memory. Instead, it adds a hidden form field named as_ffc_field to each form before forwarding it to the client. When the client submits the form, the application firewall extracts as_ffc_field and compares it to the remaining form to establish field consistency.

By default, sessionless Field Consistency is disabled. The following CLI commands configure sessionless Field Consistency:

add appfw profile <name> -sessionlessFieldConsistency (ON|OFF|postOnly)

set appfw profile <name> -sessionlessFieldConsistency (ON|OFF|postOnly)

Virtual Server - Options of Response to PING

You can now configure the NetScaler not to respond to a ping message if the virtual server is DOWN. This is possible on load balancing, content switching, cache redirection, and VPN virtual servers. By default, the NetScaler responds to a ping message even if one or more virtual servers are DOWN. The option can be set at an IP address level or virtual server level. The option functions as described below:

On an IP address:

Option	Effect
NONE	Always responds
ONE_VSERVER	Responds if at least one virtual server on this IP address is UP
ALL_VSERVER	Responds only if all the virtual servers on this IP address are UP
VSVR_CNTRLD	Responds according to the setting on the virtual servers

On a virtual server:

PASSIVE on all virtual servers	Always responds
ACTIVE on all virtual servers	Responds even if one virtual server is UP
ACTIVE on some and PASSIVE on others	Responds even if one virtual server set to ACTIVE is UP

This option can be set on an IP address only if it is a VIP.

CLI commands:

set ip <IPAddress> -icmpresponse (NONE | ONE_VSERVER | ALL_VSERVERS | VSVR_CNTRLD)

set lb vserver <name> -icmpVsrResponse (PASSIVE | ACTIVE)

You can replace lb with cs, cr or vpn.

GUI:

Create/Configure IP dialog box: The ICMP Response dropdown list

Create/Configure Virtual Server>>Advanced tab: The ICMP VServer Response dropdown list

Denying Nonsecure SSL Renegotiation

SSL and TLS renegotiations are vulnerable to an MITM attack that injects its own content as a prefix to a TLS connection. A new option addresses this vulnerability. If you specify NONSECURE as the value of the denySSLReneg parameter in the "set ssl parameter" command, any nonsecure renegotiations are denied. For more information about this attack, see RFC 5746. For more information about setting this parameter, see "Configuring Advanced SSL Settings" in the "SSL Offload and Acceleration" chapter of the Traffic Management Guide at http://support.citrix.com/article/CTX130084.

Rule Based Persistence Support for Load Balancing Virtual Servers of Type TCP and SSL_TCP

You can now configure a rule to define persistence criteria for load balancing virtual servers of type TCP and SSL_TCP. The persistence criteria can be based on TCP/IP protocol data, Layer 2 data, TCP options, and TCP payloads (even if the protocol that is encapsulated in the TCP payload is not HTTP). In the "add lb vserver" or "set lb vserver" CLI command, set the "persistenceType" parameter to "RULE," and then configure a rule for the rule parameter. You can define rules to configure persistence based on source and destination ports, source and destination IP addresses and IP octets, source and destination MAC addresses, VLAN IDs, payload content, and so on. Following are examples of expressions that you can use to define persistence criteria:

- CLIENT.TCP.PAYLOAD(500).TYPECAST_NVLIST_T('=',';').VALUE("field1"). The value of field1, obtained after casting the first 500 bytes of the TCP payload to a name-value list that consists of name-value pairs in the format <name>=<value>;.
- CLIENT.TCP.SRCPORT. The source port in the client request.
- CLIENT.IP.DST. The destination IP address in the client request.
- CLIENT.IP.SRC.GET4. The fourth octet (rightmost octet) of the source IP address in the client request.

- CLIENT.ETHER.DSTMAC.GET5. The fifth octet of the destination MAC address in the client request.

- CLIENT.VLAN.ID. The ID of the VLAN through which the request arrived.

Following is an example of a command that you can use to configure rule based persistence based on the destination IP address in the client request: add lb vserver mylbvserver SSL_TCP 192.0.2.0 443 -persistenceType RULE -rule CLIENT.IP.DST.

You cannot set the "resRule" parameter for load balancing virtual servers of type TCP and SSL_TCP.

For more information, see the "Load Balancing" chapter of the Citrix NetScaler Traffic Management Guide at http://support.citrix.com/article/CTX130084, which includes a section titled "Configuring Persistence Based on User-Defined Rules." The chapter also has a "Use Cases" section, in which "Configuring Rule Based Persistence Based on a Name-Value Pair in a TCP Byte Stream" describes how to configure rule based persistence for servers that communicate Financial Information eXchange (FIX) protocol data over TCP.

Known Issues and Workarounds

Documentation Issue

- Issue ID 90875: On a TCP load balancing virtual server, if persistence is defined with the rule 'client.tcp.payload(n)', and a request is received in multiple parts such that there is a delay between the parts and a FIN is sent from client before the expected number of bytes (n), the NetScaler appliance creates an undesired session with the received number of bytes (which is less than n). This behavior needs to be documented.

Global Server Load Balancing Issue

- Issue ID 93051: When a load balancing virtual server that is a part of a GSLB configuration is down and receives a client request, the NetScaler appliance makes a GSLB decision and attempts an HTTP redirect or a connection proxy to a GSLB site that is UP and healthy. The appliance fails when making this GSLB decision if source IP persistence is set on both the primary and backup GSLB virtual servers and if the core that receives the request is not the owner of the source IP persistence entry.

Load Balancing Issues

- Issue ID 90395: If the rule that is used for creating rule based persistence sessions is a compound expression, the "show lb persistentSessions" CLI command displays an internal representation of the persistence parameter instead of the actual persistence parameter.

- Issue ID 91672: If the token that is used for creating rule based persistence sessions is larger than 100 MB, the "show lb persistentSessions" CLI command does not display the persistence parameter.

- Issue ID 91711: If the string (or "token") that is used for creating rule based persistence sessions for load balancing virtual servers is larger than 64 KB, the NetScaler appliance fails to create persistence sessions. For example, the appliance fails to create persistence sessions with the rule CLIENT.TCP.PAYLOAD(70000) because the token that is used is larger than 64 KB. However, the appliance creates persistence sessions successfully with a rule such as CLIENT.TCP.PAYLOAD(70000). BEFORE_STR("string2").AFTER_STR("string1") if the string that is enclosed by "string1" and "string2" is not larger than 64 KB.

Build 50.3002.e

Release version: Citrix(R) NetScaler(R), version 9.3.e, Build 50.3002.e

Replaces build: None

Release date: August 2011

Language supported: English (US)

Readme version: 1.0

Review the following sections:

Note:

- All enhancements and known issues in this readme apply to Citrix NetScaler 9.3.e nCore™.
- For the list of bug fixes in this release, see the readme for Citrix NetScaler version 9.3 build 50.3.
- A copy of this 9.3.e readme is also available in the Citrix Knowledge Center at http://support.citrix.com.

Enhancements

Content Switching

When you run the 'show cs vserver' command, you can now view the content switching policies associated with the virtual server in the order of the priority of the policies rather than by the chronological order in which they are bound.

This enhancement can help you know the order in which the content switching polices are applied and therefore, understand how client requests are routed. The configuration utility also shows the content switching policies in the order of their priority.

For more information, see the "Viewing the Properties of Content Switching Virtual Servers" section in the Content Switching chapter of the Citrix NetScaler Traffic Management Guide, available at http://support.citrix.com/article/CTX128670.

Networking

Now you can enable a NetScaler appliance to forward all the ICMP fragments of an ICMP echo request, destined to a network device, and the ICMP fragments of the corresponding echo response.

One of the examples where this enhancement is useful is a scenario including a NetScaler appliance and a Windows 2000 Server.

The Windows 2000 server sends out ICMP request of size 2048 for slow link detection. The NetScaler appliance successfully forwards the ICMP fragments of the ICMP request to the destined network device and the ICMP fragments of the ICMP response from the network device to the Windows 2000 server.

Surge Protection

If you want to flush the surge queue of a service, service group, or a load balancing or content switching virtual server, now you do not need to disable the NetScaler entity. With this enhancement, you can manage the traffic in surge conditions without affecting the existing traffic.

Options are added to the command line interface and configuration utility to flush a surge queue. Flushing a surge queue does not affect the existing connections. Only the requests present in the surge queue get deleted. For those requests, the client has to make a fresh request.

When you flush the surge queue of a virtual server, the surge queues of all the services and service groups bound to it are flushed. When you flush the surge queue of a service group, surge queues of all its members are flushed. You can flush the surge queue of one or more members of a service group without flushing the surge queues of all its members. You can flush the surge queue of a specific service.

In the configuration utility, when you select an entity the 'Flush Surge Queue' option is available in the action pane. In the command line interface 'flush ns surgeQ' option is added with necessary options.

For more information, see the "Flushing the Surge Queue" section in the Load Balancing chapter of the Citrix NetScaler Traffic Management Guide, available at http://support.citrix.com/article/CTX128670.

Known Issues and Workarounds

High Availability Issues

- Issue ID 92866: In HA non-inc mode, on executing the config sync operation, the 'bind routemonitor' command is not getting synched to secondary.
- Issue ID 93068: In HA non-inc mode, on executing the 'clear config' command or clearing config as a part of config sync operation, routemonitors get modified, but health check is not done and thus node state is not updated properly.

Release Notes

These topics describe enhancements in NetScaler® 9.3 Classic, NetScaler® 9.3 nCore™, and NetScaler® 9.3 nCore™ VPX™ releases. The nCore NetScaler uses multiple CPU cores for packet handling, which greatly improves the performance of many NetScaler features.

Note: From this release, NetScaler® Classic VPX™ will not be available.

You can determine your NetScaler build type by looking at the build information in the upper-right corner of the NetScaler browser window, or by issuing the show version command at the command line. The file extension indicates the build type. In a browser, an nCore NetScaler has a .nc extension and a Classic NetScaler has a .cl extension. On the command line, the tar file name for an nCore NetScaler contains _nc and a Classic NetScaler contains _cl.

Note: Unless stated otherwise, the enhancements, known issues, and limitations apply to Citrix® NetScaler® 9.3 Classic, NetScaler 9.3 nCore™, and NetScaler® 9.3 nCore™ VPX™.

The NetScaler documentation (PDF format) for Citrix NetScaler release 9.3 is available on the **Documentation** tab of your NetScaler appliance. Most of the documents require Adobe Reader, available at http://adobe.com/.

To view the documentation for a given feature

1. Log on to the NetScaler appliance from a Web browser.
2. Click the **Documentation** tab.
3. To view a short description of each document, hover your cursor over the title. To open a document, click its title.

NetScaler 9.3 Enhancements

The following enhancements are available in this release.

Note: Unless stated otherwise, the enhancements apply to Citrix® NetScaler® 9.3 Classic, NetScaler 9.3 nCore™, and NetScaler® 9.3 nCore™ VPX™.

AAA

The following AAA feature enhancements are available in this release.

Kerberos Support for AAA

The NetScaler appliance can now authenticate a client/user by Kerberos or NTLM through Simple and Protected GSSAPI Negotiation Mechanism (SPNEGO) protocol. To configure this, define and bind a NEGOTIATE authentication policy. For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

AAA and Microsoft SharePoint

You can now successfully download or edit documents from Microsoft SharePoint sites after authenticating through AAA.

Access Gateway

The following Access Gateway enhancement is available in this release.

Idle Time-Out

If users log on with the Access Gateway Plug-in for Java and you configure an idle time-out on Access Gateway, the session does not end if the plug-in does not detect mouse or keyboard activity within the specified time limit.

Advanced Policies

The following policy enhancements are available in this release.

Virtual Server-Based Expressions

A new expression prefix, `SYS.VSERVER("<vserver-name>")`, enables you to identify a virtual server. You can use the `THROUGHPUT`, `CONNECTIONS`, `STATE`, `HEALTH`, `RESPTIME`, and `SURGECOUNT` functions with this prefix to retrieve information related to the specified virtual server. For more information about these functions, see the "Virtual Server Based Expressions" section in the "Default Syntax Expressions: Working with Dates, Times, and Numbers" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Named Expressions

You can now use the name of a default syntax expression as the prefix to a function. The named expression can be either a simple expression or a compound expression. The function must be one that can operate on the type of data that is returned by the named expression.

Example 1: Simple Advanced Expression

The following named expression, which identifies a text string, can be used as a prefix to the `AFTER_STR("<string>")` expression function, which works with text data:

```
HTTP.REQ.BODY(1000)
```

If the name of the expression is `top1000bytes`, you can use `top1000bytes.AFTER_STR("username")` instead of `HTTP.REQ.BODY(1000).AFTER_STR("username")`.

Example 2: Compound Advanced Expression

The name of the following compound named expression, which identifies a number, can be used in a comparison:

```
HTTP.REQ.HEADER("Header1").LENGTH + HTTP.REQ.HEADER("Header2").LENGTH
```

If the name of the compound expression is `headerlimit`, this enhancement allows you to use `headerlimit.GT(30)` instead of `(HTTP.REQ.HEADER("Header1").LENGTH + HTTP.REQ.HEADER("Header2").LENGTH) > 30`.

Additionally, you can use a named expression (either by itself or as a prefix to a function) to create the text expression for the replacement target in rewrite.

Support for Unsigned Long and Double Data Types

In NetScaler 9.3, simple expressions can return both double and unsigned long data types, thus allowing compound expressions that use arithmetic operators and logical operators to evaluate or return values of these data types. Additionally, you can use double and unsigned long values in policy expressions. For information about the functions that can work with the double and unsigned long data types, see the "Functions for Data Types in the Policy Infrastructure" section in the "Configuring Default Syntax Expressions: Getting Started" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Modifying (Corrupting) HTTP Headers

A new rewrite action, CORRUPT_HTTP_HEADER, replaces the name of the given HTTP header with a corrupted name so that it will not be recognized by the receiver.

Pattern Set Name Length

The name of a pattern set can now contain up to 127 characters.

Encryption and Decryption of Payloads

You can now configure the NetScaler appliance to encrypt and decrypt text and XML data in requests and responses. To encrypt and decrypt text, you use the ENCRYPT and DECRYPT functions, respectively. To encrypt and decrypt XML payloads, you use the XML_ENCRYPT() and XML_DECRYPT() functions, respectively. For more information about encrypting text, see the "Encrypting and Decrypting Text" section in the "Default Syntax Expressions: Evaluating Text" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673. For more information about encrypting XML payloads, see the "Encrypting and Decrypting XML Payloads" section in the "Default Syntax Expressions: Parsing HTTP, TCP, and UDP Data" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Policy-Based Logging for Responder Policies

You can now log audit messages in a defined format when the rule in a responder policy evaluates to TRUE. To do this, you must configure an audit message action and associate it with a responder policy. The format of audit messages can be defined only with advanced expressions in an audit message. Audit message actions can be used to log messages at various log levels, either only in SYSLOG format or in both SYSLOG and newnslog formats. You can also define the SYSLOG messages to be logged. To log such SYSLOG messages, you must select **User Configurable Log Messages** (**System** > **Auditing** > **Change Global Auditing Settings**) in the NetScaler configuration utility or set the "UserDefinedLogging" SYSLOG parameter to YES in the NetScaler command line.

For example, you can configure a log action that defines the format of the log message and then associate the log action with a responder policy that can be bound globally or that can be bound to a load balancing or a content switching virtual server, as demonstrated in the following commands:

```
 Done
> set syslogparams -userDefinedAuditlog yes
 Done
> add audit messageaction log_vserver_resptime_act INFORMATIONAL "\"NS Response Time to Servers:\" + sys
 Done
> add responder action redirect_url_2_act redirect "\"http://redirect_url.com\""
 Done
```

```
> add responder policy  redirect_policy_url_1  "http.req.url.eq(\"url_1.com\")" redirect_url_2_act RESET -log
 Done
> bind responder global redirect_policy_url_1 200 END -type REQ_DEFAULT
 Done
>
```

Support for the UTF-8 Character Set

The NetScaler policy infrastructure now supports the UTF-8 character set. For more information, see the “Specifying the Character Set in Expressions” section in the chapter, “Configuring Advanced Expressions: Getting Started,” in the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Matching Text by Using a String Map

You can now use string maps to perform pattern matching in all NetScaler features that use the default policy syntax. A string map is a NetScaler entity that consists of key-value pairs. The keys and values are strings in either ASCII or UTF-8 format. String comparison uses two new functions, `MAP_STRING(<string_map_name>)` and `IS_STRINGMAP_KEY(<string_map_name>)`.

A policy configuration that uses string maps performs better than one that does string matching through policy expressions, and you need fewer policies to perform string matching with a large number of key-value pairs. String maps are also intuitive, simple to configure, and result in a smaller configuration.

For more information about string maps, see the "String Maps" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Rules for Names in Identifiers Used in Policies

The names of identifiers in the named expression, HTTP callout, pattern set, and rate limiting features must begin with an ASCII alphabet or an underscore (_). The remaining characters can be ASCII alphanumeric characters or underscores (_).

The names of these identifiers must not begin with the following reserved words:

- The words `ALT`, `TRUE`, and `FALSE` and the one-character identifiers `Q` and `S`.
- Words that indicate special syntax, which are `RE` (for regular expressions) and `XP` (for XPath expressions).
- Expression prefixes, which currently are the following:
  - CLIENT
  - EXTEND
  - HTTP

- SERVER
- SYS
- TARGET
- TEXT
- URL
- MYSQL

Additionally, the names of these identifiers cannot be the same as the names of enumeration constants used in the policy infrastructure. For example, the name of an identifier cannot be `IGNORECASE`, `YEAR`, or `LATIN2_CZECH_CS` (a MySQL character set).

Note: The NetScaler appliance performs a case-insensitive comparison of identifiers with these words and enumeration constants. For example, names of the identifiers cannot begin with `TRUE`, `True`, or `true`.

Stripping Characters From a String

You can use the `STRIP_CHARS(<string>)` operator to remove specific characters from the text that is returned by an advanced expression prefix. You can then use a text method on the resulting string. For example, you can compare the resulting string with the strings in a pattern set. You can also use the `STRIP_START_CHARS(<string>)` and `STRIP_END_CHARS(<string>)` functions to strip characters from the beginning and end of input strings, respectively. For more information about stripping characters from an input string, see the "Stripping Specific Characters from a String" section in the "Default Syntax Expressions: Evaluating Text" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Tool for Converting Classic Expressions to the Newer Default Expression Syntax

You can convert a classic expression to the default expression syntax by using the `nspepi` conversion tool. You can also use the tool to convert all the classic expressions in the NetScaler configuration to the default syntax (with the exception of NetScaler entities that currently support only classic expressions). For more information about converting classic expressions and NetScaler configuration files to the default syntax, see "Converting Classic Expressions to the Newer Default Expression Syntax" section in the "Introduction to Policies and Expressions" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Identifying a Response That is Associated with an HTTP Redirect

You can use the IS_REDIRECT function to determine whether a response is associated with a redirect. For information about the IS_REDIRECT function, see the "Expressions for HTTP Status Codes and Numeric HTTP Payload Data Other Than Dates" section in the "Default Syntax Expressions: Parsing HTTP, TCP, and UDP Data" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Expressions for Generating the Day of the Week, as Strings, in Short and Long Formats

Two functions, WEEKDAY_STRING_SHORT and WEEKDAY_STRING, have been introduced for generating the day of the week as a string, in short and long formats, respectively. The strings that are returned are always in English. The prefix used with these functions must return the day of the week in integer format and the acceptable range for the value returned by the prefix is 0–6. Therefore, you can use any prefix that returns an integer in the acceptable range. An UNDEF condition is raised if the returned value is not in this range or if memory allocation fails.

Following are the descriptions of the functions:

Function	Description
<prefix>.WEEKDAY_STRING_SHORT	Returns the day of the week in short format. The short form is always 3 characters long with the first character in upper case and the remaining characters in lower case. For example, SYS.TIME.WEEKDAY.WEEKDAY_STRING_SHORT returns Sun if the value returned by the WEEKDAY function is 0 and Sat if the value returned by the prefix is 6.
<prefix>.WEEKDAY_STRING	Returns the day of the week in long format. The first character in the long form is always in upper case and the remaining characters are in lower case. For example, SYS.TIME.WEEKDAY.WEEKDAY_STRING returns Sunday if the value returned by the WEEKDAY function is 0 and Saturday if the value returned by the prefix is 6.

Enhancements to Expressions That Process Binary Strings

The default policy infrastructure has had some changes and improvements regarding handling of binary strings. These are particularly useful for handling protocols that have binary values in them.

The two parameters of the GET_SIGNED16, GET_UNSIGNED16, and GET_SIGNED32 functions have been changed:

- The first parameter is now an offset, instead of an index into a list of identically sized items. This change enables the functions to handle items that are not aligned on the boundaries required by indexes.
  - For 16-bit values: instead of using `N`, use `2*N` for an aligned value.
  - For 32-bit values: instead of using `N`, use `4*N` for an aligned value.
- The second parameter now takes a mnemonic value instead of the nonintuitive `0` or `1`. The values are `LITTLE_ENDIAN` and `BIG_ENDIAN`.
  - What used to be `0` is now `LITTLE_ENDIAN`.
  - What used to be `1` is now `BIG_ENDIAN`.
- Expressions using these functions will need to be changed.

Example:

HTTP.REQ.BODY(100).GET_SIGNED16(7, BIG_ENDIAN)

Additionally, the following new functions have been introduced. The functions that produce binary strings, numbered 2 through 9 in the following list, are particularly useful in TCP rewrite, as replacement strings for binary data.

1. `<text>.GET_UNSIGNED32(n, endianness)`

   This function returns the 32-bit unsigned binary integer at offset `n`. If the offset would make part or all of the value outside of the current text, an `UNDEF` is raised. In the above expression:

   - `n` is the number of bytes from the current position to the first byte of the binary integer.
   - The “endianness” can be either `LITTLE_ENDIAN` or `BIG_ENDIAN`.
   - The value returned is an unsigned long number. This is different from the other `GET` functions for binary strings, which return a number.

   Example:

   HTTP.REQ.BODY(100).GET_UNSIGNED32(30, LITTLE_ENDIAN)

2. `<number>.SIGNED8_STRING`

   This function produces an 8-bit signed binary string representing the number. If the value is out of range an `UNDEF` is raised. The value returned is of type text.

   Example:

   HTTP.REQ.BODY(100).GET_SIGNED8(16).SUB(3).SIGNED8_STRING

3. `<number>.UNSIGNED8_STRING`

   This function produces an 8-bit unsigned binary string representing the number. If the value is out of range, an `UNDEF` is raised. The value returned is of type text.

Example:

HTTP.REQ.BODY(100).GET_UNSIGNED8(31).ADD(3).UNSIGNED8_STRING

4. `<number>.SIGNED16_STRING(endianness)`

   This function produces a 16-bit signed binary string representing the number. If the value is out of range, an `UNDEF` is raised. The "endianness" can be either `LITTLE_ENDIAN` or `BIG_ENDIAN`. The value returned is of type text.

   Example:

   HTTP.REQ.BODY(100).SKIP(12).GET_SIGNED16(0, BIG_ENDIAN).SUB(4).SIGNED16_STRING(BIG_ENDIAN)

5. `<number>.UNSIGNED16_STRING(endianness)`

   This function produces a 16-bit unsigned binary string representing the number. If the value is out of range, an `UNDEF` is raised. The "endianness" can be either `LITTLE_ENDIAN` or `BIG_ENDIAN`. The value returned is of type text.

   Example:

   HTTP.REQ.BODY(100).GET_UNSIGNED16(47, LITTLE_ENDIAN).ADD(7).UNSIGNED16_STRING(LITTLE_ENDIAN

6. `<number>.SIGNED32_STRING(endianness)`

   This function produces a 32-bit signed binary string representing the number. The "endianness" can be either `LITTLE_ENDIAN` or `BIG_ENDIAN`. The value returned is of type text.

   Example:

   HTTP.REQ.BODY(100).AFTER_STR("delim").GET_SIGNED32(0, BIG_ENDIAN).SUB(1).SIGNED32_STRING(BIG_

7. `<unsigned_long_number>.UNSIGNED8_STRING`

   This function produces an 8-bit unsigned binary string representing the number. If the value is out of range, an `UNDEF` is raised. The value returned is of type text.

   Example:

   HTTP.REQ.BODY(100).GET_UNSIGNED8(24).TYPECAST_UNSIGNED_LONG_AT.ADD(12).UNSIGNED8_STRING

8. `<unsigned_long_number>.UNSIGNED16_STRING(endianness)`

   This function produces a 16-bit unsigned binary string representing the number. If the value is out of range, an `UNDEF` is raised. The "endianness" can be either `LITTLE_ENDIAN` or `BIG_ENDIAN`. The value returned is of type text.

   Example:

HTTP.REQ.BODY(100).GET_UNSIGNED16(23, LITTLE_ENDIAN).TYPECAST_UNSIGNED_LONG_AT.ADD(10).UN

9. `<unsigned_long_number>.UNSIGNED32_STRING(endianness)`

   This function produces a 32-bit unsigned binary string representing the number. If the value is out of range, an `UNDEF` is raised. The “endianness” can be either `LITTLE_ENDIAN` or `BIG_ENDIAN`. The value returned is of type text.

   Example:

   HTTP.REQ.BODY(100).AFTER_STR("delim2").GET_UNSIGNED32(0, BIG_ENDIAN).ADD(2).UNSIGNED32_STRIN

Rewriting TCP Payloads

You can now treat the payload of a TCP packet as a raw stream of bytes and perform rewrite actions on the payload regardless of the protocol that the TCP connection is transmitting. You can evaluate TCP traffic that is associated with only those services that are of type `TCP` and `SSL_TCP`. You can configure policies that use the `CLIENT.TCP.PAYLOAD(<integer>)` expression prefix and the `SERVER.TCP.PAYLOAD(<integer>)` expression prefix to evaluate TCP and SSL_TCP traffic received from clients and servers, respectively. With these prefixes, you can use all types of existing string manipulation functions to identify the strings that you want to rewrite. To bring the policies into effect, you bind the TCP rewrite policies to load balancing virtual servers and content switching virtual servers of type `TCP` and `SSL_TCP`. You can also bind them to the following new bind points:

- OTHERTCP_REQ_DEFAULT
- OTHERTCP_REQ_OVERRIDE
- OTHERTCP_RES_DEFAULT
- OTHERTCP_RES_OVERRIDE

Note: The term "OTHERTCP" is used in the context of the NetScaler appliance to refer to all TCP or SSL_TCP requests and responses that you want to treat as a raw stream of bytes regardless of the protocol that the TCP packets encapsulate.

The order of evaluation of policies bound to these policy banks is the same as that for policies that evaluate HTTP traffic: TCP rewrite policies are evaluated from the most specific bind point to the most general bind point. That is, policies at the override bind points are evaluated first, followed by those at the virtual server bind points, and finally, those at the default bind points.

Note: A TCP rewrite policy does not evaluate connections that are active at the time at which it is bound to a bind point, but it evaluates the TCP connections that are initiated after binding is performed.

The following rewrite actions are supported in TCP rewrite policies.

- INSERT_AFTER
- INSERT_BEFORE

- REPLACE
- DELETE
- INSERT_AFTER_ALL
- INSERT_BEFORE_ALL
- REPLACE_ALL
- DELETE_ALL
- DROP
- RESET

Even though you cannot rewrite data other than that in TCP payloads, you can use all the expressions that are available for evaluating TCP traffic and information associated with lower network layers such as that in IP packets and Ethernet frames. Based on the information retrieved, you can perform an appropriate rewrite action, selected from the preceding list, on the TCP payload.

Additionally, the following two transform types (values for the `transform` parameter in the `add rewrite policyLabel` CLI command) have been introduced for rewrite policy labels:

- OTHERTCP_REQ
- OTHERTCP_RES

When you create a rewrite policy label, you specify `OTHERTCP_REQ` as the transform type to specify that the policies that are bound to the policy label are request-based policies. You can specify `OTHERTCP_RES` as the transform type to specify that the policies that are bound to the policy label are response-based policies.

Following are some limitations of the TCP rewrite feature:

- Named expressions and HTTP callouts are not supported in TCP rewrite policies.
- If the payload length received is less than the expected payload length, the NetScaler waits for the remaining bytes. Eventually, the request times out.

Example:

The following rewrite action `c_ip` identifies the first 150 bytes of the TCP payload and then inserts the string `CLIENT_IP` and the IP address of the client before the string `\r\n\r\n`.

add rewrite action c_ip INSERT_BEFORE "CLIENT.TCP.PAYLOAD(150).BEFORE_STR(\"\r\n\r\n\")" "\"CLIENT_IP\"

AppExpert

The following AppExpert enhancements are available in this release.

Deployment Files for AppExpert Applications

In earlier NetScaler releases, when you exported an AppExpert application, only a template file was created, in GZIP format. The template file contained only application-configuration information. You had to specify deployment-specific information, such as public endpoints and backend servers, in the **AppExpert Template Wizard** when importing the template file. With release 9.3, when you export an AppExpert application, a deployment file is created along with the application template file. Both files are created in XML format. The template file contains configuration-specific information and the deployment file contains deployment-specific information. In the **AppExpert Template Wizard**, you can specify use of the deployment file when you import the template file, or you can manually specify all the deployment information. If you specify the deployment file, the NetScaler appliance uses the deployment information in the deployment file. For more information, see the chapter, "AppExpert Applications and Templates," in the *Citrix NetScaler AppExpert Guide* at http://support.citrix.com/article/CTX128682.

Roll Back Support for AppExpert Application Import

In this release, if an error occurs during the import of an AppExpert application, the configuration changes that were made during the import process are automatically rolled back.

Creating Application Templates from Content Switching Virtual Servers

In earlier releases, you could export a content switching virtual server configuration to an application template only from the **Content Switching Visualizer**. Additionally, the template file was in GZIP format and included only configuration information. No deployment information was exported. In this release, you can export a content switching virtual server either from the **Content Switching Visualizer** or from the **Content Switching Virtual Servers** pane. A deployment file is created along with the template file. Both files are in XML format. For more information about exporting a content switching virtual server, template files, and deployment files, see the "Creating and Managing Template Files" chapter of the *Citrix NetScaler AppExpert Guide* at http://support.citrix.com/article/CTX128682.

Application Firewall

The following Application Firewall enhancements are available in this release.

Document Type Definitions (DTD) Support for XML Security Checks

Support has been added for document type definitions (DTDs) in the **Application Firewall Imports** pane, **XML Schema** tab. You can upload DTDs to the Application Firewall and they will be used for the relevant XML security checks.

Audit Server Configuration for Application Firewall

Support has been added to the NetScaler GUI for configuring the Application Firewall logs, in the **Auditing Policies** pane. In this pane, you can configure auditing to any server by adding that server in the **Servers** tab, and then adding an Audit policy that refers to that server. The process is the same as for AAA.

Learning Visualizer for Deployed Application Firewall Rules

The Application Firewall learning visualizer is now available for learned rules that you have already deployed, as well as rules that are pending review. For more information about how to use the learning visualizer, see the "Learning" section in the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

SNMP Traps for Application Firewall Security Checks

SNMP traps have been added for each of the Application Firewall security checks. You configure the traps in the NetScaler configuration utility, under **System** > **SNMP** > **Traps**. For more information, see the *Citrix NetScaler SNMP OID Reference Guide* at http://support.citrix.com/article/CTX128676.

Application Firewall Custom Variables for HTML/XML Error Objects

You can now use five new variables to write troubleshooting information into an Application Firewall HTML or XML error object. These variables are:

- **${NS_TRANSACTION_ID}.** The transaction ID that the Application Firewall assigned to this transaction.
- **${NS_APPFW_SESSION_ID}.** The Application Firewall session ID.
- **${NS_APPFW_VIOLATION_CATEGORY}.** The specific Application Firewall security check or rule that was violated.
- **${NS_APPFW_VIOLATION_LOG}.** The detailed error message associated with the violation.

- **${COOKIE("<CookieName>")}.** The contents of the specified cookie. For `<CookieName>`, substitute the name of the specific cookie that you want to display on the error page. If you have multiple cookies whose contents you want to display for troubleshooting, you can use multiple instances of this customization variable, each with the appropriate cookie name.

To use these variables, you embed them in the HTML or XML of the error page object as if they were any ordinary text string. For more information, see the "Imports" chapter in the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

Cookie Encryption, Cookie Proxying, and Adding Flags to Cookies

The Application Firewall now supports encryption and proxying of cookies, and can be configured to add flags to cookies. For information about configuring this feature, see the "The Cookie Consistency Check" section in the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

Limiting the Number of Files Uploaded to a Web Site

By default, there is no limit on the number of files that can be uploaded to your protected Web site by using an HTML Web form or properly structured XML request. You can now limit the number of file uploads allowed on your protected Web sites. At the NetScaler command prompt, type:

set appfw profile -fileUploadMaxNum <integer>

For `<integer>`, substitute a number between 0 and 65535. If you set this value to 0, that disables all file uploads. If you set it to 65535, that allows unlimited uploads rather than stopping at 65535.

In the configuration utility, in the **Configure Application Firewall Profile** dialog box, **Settings** tab, you select the **Max File Uploads** check box, and enter a number in text box.

New Signatures Feature

All Application Firewall signatures, SQL injection and cross-site scripting patterns are now combined into a single XML-based signatures object file. You can download this file to your local computer and edit it in a text editor to add to or modify the lists of SQL injection keywords and special strings, SQL injection transformations, and cross-site scripting allowed and denied tags, attributes, and patterns. For more information, see the "Signatures" chapter in the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

Configuration Wizard Added to Application Firewall

The Application Firewall configuration wizard is now available to assist users in performing initial configuration of a new Application Firewall. You access the wizard on the main **Application Firewall** pane, in the details area, under **Getting Started**, by clicking **Application Firewall Wizard**.

Excluding XML Elements and Attributes from Security Checks

You can now exempt elements and attributes from the XML SQL Injection and Cross-Site scripting checks. To exempt an element from either check at the NetScaler command line, you issue one of the following commands:

bind appfw profile <name> -XMLSQLInjection <string> [-isRegex (REGEX | NOTREGEX)] [-location <location>

bind appfw profile <name> -XMLXSS <string> [-isRegex (REGEX | NOTREGEX)] [-location <location>]

For <name>, you substitute the name of the profile. For <string>, you substitute a literal string or a Posix-complaint regular expression that describes the element or elements to exempt. If you typed a regular expression, you must include " -isRegex REGEX". If you typed a string, this parameter is optional. For <location>, you type the location where this element is found in the XML document.

Inverse Regular Expressions

You can now easily create an inverse regular expression in the Application Firewall when you are adding a relaxation or rule to supported security checks. You do this by putting an exclamation point (!) at the beginning of the expression. You can use this new regular expression notation in Start URL, Form Field Consistency, Cookie Consistency, HTML SQL Injection, Cross-Site Request Forgery, or HTML Cross-Site Scripting check relaxations, or in Deny URL or Field Format check rules.

Note: You cannot use a solitary exclamation point to create an inverse expression. There must be a valid regular expression that follows the exclamation point, or it is treated as a text element and not as a logical inverse.

Adding XQuery Injection Patterns to XPath

The XPATH Injection settings can be used to detect XQuery violations, by adding the XQUERY injection pattern(s) that you want to block, and setting the injection type to XQUERY. In the configuration utility, you do this as follows:

1. In the navigation pane, expand **Application Firewall**, and select **Signatures**.
2. In the details pane, select the default Xpath Injection file, and then click **Add**.

3. In the **Add Signatures Object** dialog box, **Name** field, type a name for your new custom Xpath Injection file. You can also type a comment in the **Comment** field that describes the purpose of this custom file.

4. In the lower left-hand corner of the **Add Signatures Object** dialog box, click **Manage SQL/XSS patterns**.

5. In the **Manage SQL/XSS patterns** dialog box, **Filtered Results** window, select **Patterns**, and then in the button row beneath the **Filtered Results** window, click **Add**.

6. In the **Create Signatures Folder** dialog box, **Attributes** area, **delimiter** drop-down list, choose **Any**.

7. In the **type** text box, type **XQUERY**, and then click **OK**.

8. If your new folder is not selected, select it, and then click **Add**.

9. In the **Create Signatures Folder** dialog box, choose **keyword**, and then click **OK**.

10. Repeat steps 8 and 9, but choose **Special String** this time.

11. Add your XQUERY keywords and special strings by clicking the **Add** button beneath the details window below the **Filtered Results** window, filling out the **Create Signature Item** dialog box, and then clicking **OK**.

Web-Based GUI Editor for Imported Files

A GUI-based editor has been added for editing imported files in the **Application Firewall Import** pane. Users can now select a previously imported file, and then click **Open**, to open that file in a Web-based text editor, where they can make changes to the file. This allows minor modifications to be made without having to export the file to the local system for editing.

XML SOAP Array Rule Added to XDOS Check

The XML SOAP Array rule has been added to the XML denial-of-security (XDoS) check. This check protects SOAP processors on your XML server from attacks launched through SOAP Arrays that exceed either individual or total limits on size and dimensions. The check verifies the following attributes of SOAP arrays in requests:

- **XMLMaxSOAPArraySize.** Checks for SOAP arrays that exceed the configured maximum total SOAP Array size across the request.

  XMLMaxSOAPArrayRank. Checks for SOAP arrays that exceed the configured maximum individual SOAP Array dimensions, or rank.

You configure the XML SOAP Array rule under **Application Firewall** --> **Profiles**, by selecting a profile, and then clicking **Open**. In **the Configure Application Firewall Profiles** dialog box, you select **XML Denial of Service**, and then click **Open**. In the **Modify XML Denial of Service Check** dialog box, you select **Soap Array Check**, and enable or disable the check by using the appropriate buttons. For more information, see the *Citrix Application Firewall*

Guide at http://support.citrix.com/article/CTX128677, XML Security Checks chapter, XML Denial of Service Check section.

Application Firewall/XML Signature Updates

Users can update the signatures and patterns on their Application Firewall by importing an updated signatures object file under the same name as an existing signatures object. Signatures updates support the following:

- By default, when updating a signatures object file, the Application Firewall will display the local or network location from which a signatures object file was originally imported. The user can choose a different location, or accept the default.
- Signatures each have an identification number. By default, when updating, any signature in the update file that uses the same signature identification number as an existing signature replaces the existing signature. This means that any modifications that the user made to existing signatures by editing the existing file will be overwritten unless the user also modifies the identification number to a number that is not already in use. Any existing signatures that have unique IDs are preserved. Any signatures in the update file that have unique IDs are added to the signatures object file.
- Any configuration that the user performed in the configuration utility is preserved during an update.
- All in-memory profile configurations that use information in the signatures object are updated immediately, without restarting the NetScaler VPX process, the NetScaler appliance, or the Application Firewall appliance.
- The complete update process requires less than a minute.

For instructions on updating signatures, see the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677, Signatures chapter.

Importing Cenzic Scan Results as XML File

You can now import results from a Cenzic scan as a signatures object. To do so, you must save the results as an XSLT file, and then import them as a signatures object. During the import process, you select the “Convert External Format” check box and then converting the XSLT file during import. To import a Cenzic results file, and then browse to and select the XSLT file. The results are imported as a signatures object.

Compression

The following compression feature enhancements are available in this release.

Policy Manager for Compression

The NetScaler configuration utility now includes a policy manager for the HTTP Compression feature. By using the Compression Policy Manager, you can configure compression policies and/or bind them to various request-time and response-time bind points from a single dialog box.

To configure compression policy bindings by using the Compression Policy Manager

1. Click **HTTP Compression**, and then, in the details pane, click **Compression policy manager**.

2. In the **Compression Policy Manager** dialog box, click **Request** or **Response**, depending on whether you want the policy you are binding to be evaluated at request time or at response time.

   Click the name of the bind point to which you want to bind the policy. An example of a bind point is **Override Global**.

   The policies that have already been bound to the bind point appear in the dialog box.

4. To insert a policy, click **Insert Policy**, and then, in the drop-down list that appears in the **Policy Name** column, do one of the following:

   - Click **New Policy** to open the **Create Compression Policy** dialog box. In this dialog box, you can create a compression policy. After you create the policy in this dialog box, click **Create** to bind the policy to the bind point.

   - Click the name of an existing policy to bind it to the bind point.

5. To unbind a policy, click the name of the policy, and then click **Unbind Policy**.

6. To regenerate priorities, click **Regenerate Priorities**. The priority values are modified to begin at 100, with increments of 10, without affecting the order of evaluation.

7. To modify a policy that is already bound, click the name of the policy, and then click **Modify Policy**. If the policy is a built-in policy, the **View Compression Policy** dialog box displays the details of the policy. If the policy is a user-defined policy, the **Configure Compression Policy** dialog box appears and you can modify the policy.

8. After you have configured policies and policy bindings for the bind point, click **Apply Changes**.

9. Click **Close**.

Configuration Utility

The following configuration utility enhancements are available in this release.

EdgeSight Monitoring

The HTML Injection feature in NetScaler has been renamed to EdgeSight® Monitoring in the NetScaler Configuration Utility. You can now configure EdgeSight Monitoring for both load balancing and content switching virtual servers and configure the EdgeSight services. You can register the NetScaler appliance to an EdgeSight server and also access the EdgeSight server from the NetScaler.

Note: If you had configured the EdgeSight Monitoring feature on the NetScaler appliance before upgrading to release 9.3, you must configure the feature again on the virtual servers.

IP Address Type Identification in VLAN Configuration Dialog Boxes

A new column, Type, has been added to the table in the IPs section of the Create VLAN and Configure VLAN dialog boxes. This column displays the IP address type (such as mapped IP, virtual IP, and subnet IP) for each IP address in the IP Addresses column.

Default Policy Format for NetScaler Features

Starting with NetScaler release 9.3, the newer advanced policy syntax is referred to as the "default syntax." Additionally, the policy configuration dialog boxes for NetScaler features that support both the older classic policy syntax and the default syntax no longer include the Classic Syntax and Advanced Syntax option buttons. By default, the policy configuration dialog boxes accept policy expressions that use the default syntax. The option buttons have been replaced by a hyperlink that enables you to switch between the classic syntax and the default syntax.

Viewing SYSLOG Event IDs

You can now view the unique identification number of every NetScaler SYSLOG event in the Syslog Viewer dialog box.

IP Address Range Support

Now, as an alternative to creating IP addresses one at a time, you can specify a consecutive range of IP addresses.

Customized System User Prompt

You can also customize the NetScaler command-line prompt for a user. Prompts can be defined in a user’s configuration, in a user-group configuration, and in the global configuration. The prompt displayed for a given user is determined by the following order of precedence:

1. Display the prompt as defined in the user's configuration.
2. Display the prompt as defined in the group configuration for the user’s group.
3. Display the prompt as defined in the system global configuration.

UTF-8 Support in Regular Expression Editors

The regular expression editor in the configuration utility now supports the UTF-8 character set and parses and displays details of regular expressions that consist of UTF-8 characters.

Documentation

The following documentation enhancements are available in this release.

NetScaler Documentation on eDocs

The 9.3 documentation suite is now available on Citrix® eDocs, the documentation portal. PDF versions of the guides will continue to be available on http://support.citrix.com and Configuration Utility (the NetScaler® graphical user interface). The salient features of the NetScaler® documentation library on eDocs are as follows:

1. **Intuitive organization.** Information is presented in a flatter and more intuitive manner. Each main node represents a release, and the subnodes represent specific features or tasks. In addition, the first few nodes cover basic configuration tasks to help new users adopt the product quickly.
2. **Global search.** Users can now search across releases and features. Users can also create their own search scopes.
3. **PDF on-the-fly.** Users can custom-create their own PDF documents by selecting information from specific nodes in eDocs.

Enhanced Context-Sensitive Online Help

The context-sensitive online help has been enhanced to display links to blogs, videos, articles, and documentation pertaining to the dialog box or pane from which the online help is invoked. This is made possible by an intelligent content aggregator that fetches results from key Citrix sites such as Knowledge Center, Citrix TV, and eDocs. The new help system is compatible with most popular Web browsers, such as Internet Explorer, Chrome, Safari, and Firefox.

Hardware

The following hardware enhancement is available in this release.

Support for 1G SFP Hot Swap

This release introduces support for SFP hot swap on the Intel 1G (e1k) driver for both fiber and copper SFPs, on the following NetScaler hardware platforms:

- MPX 7500/9500
- MPX 9700/10500/12500/15500
- MPX 9700/10500/12500/15500 10G and 10G FIPS

High Availability

The following high availability enhancements are available in this release.

Synchronizing Configuration Files in High Availability Setup

In a high availability (HA) setup, the `sync HA files` command now supports the following two new synchronization modes:

`sync misc`. Synchronizes all licenses and the configuration (rc.conf) file.

`Sync_all_plus_misc`. Synchronizes all files, including licenses and rc.conf file.

Enhanced Force Failover Warning Message

In a high availability configuration, the warning message for the force failover command now also includes the information the warning is based on.

HTML Injection (EdgeSight Monitoring)

The following HTML Injection enhancement is available in this release.

Details of Virtual Server and Service

When you enable HTML injection, you can view the name, IP address, and port number of the virtual server that load balanced the request and of the physical service that sent the response to the request.

Integrated Cache

The following integrated cache enhancements are available in this release.

Integrated Cache Support for Single Byte-Range Requests

The integrated cache can now serve partial content in response to single byte-range requests.

Built-in Content Group, Pattern Set, and Policies for the Integrated Cache

Release 9.3 includes a built-in integrated caching configuration that you can use for caching content. The configuration consists of a content group called ctx_cg_poc, a pattern set called ctx_file_extensions, and a set of integrated cache policies. In the content group ctx_cg_poc, only objects that are 500 KB or smaller are cached. The content is cached for 86000 seconds, and the memory limit for the content group is 512 MB. The pattern set is an indexed array of common file extensions for file-type matching. For more information about the built-in configuration, see the "Built-in Content Group, Pattern Set, and Policies for the Integrated Cache" section in the "Integrated Caching" chapter of the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

Monitoring Utility

The following monitoring utility enhancement is available in this release.

Viewing Dashboard Functionalities on the Monitoring Utility

You can now view the dashboard functionalities in HTML on the Monitoring interface. You can no longer view the Java Dashboard on nCore version.

The HTML Dashboard feature provides the following new functionalities:

- **Comparative charts**:
  - The two comparative charts on the left side of the **Monitoring** page help in monitoring a built-in set of counters for all the global and entity-based system statistics.
  - The charts are auto-updated and depict the variation of two or more counters over time. You can view the related historical data by clicking the **Reporting** link.
  - Maximizing the charts opens the charts in a new window. You can also add or delete counters from this view.
  - In addition to the built-in comparative charts, you can also load, save, or delete custom charts.
- **Graphical view**:
  - You can view the performance statistics data graphically by clicking **Graphical View**.

- You can hide or unhide the counter plot by clicking the legend name.
- By default, the graphical view for multiple-entity stat commands is displayed for the entity that has the maximum value for a predefined counter. You can, however, choose a different entity by clicking **Counters** and view it graphically.
- You can add or remove counters and other entities by clicking **Counters** on the bottom right corner of the page.
- Multiple counters for multiple entities with a maximum of 16 data series can be plotted.
- The graph also displays historical data for a maximum period of five minutes.

- **Virtual server view**: You can view the statistics of multiple load balancing virtual servers in consecutive rows, which have fixed headers, with all the statistic attributes lined up in columns. This view is also applicable to other entities, such as GSLB virtual servers, services, and interfaces.

Gaps between Java Dashboard and HTML Dashboard: The following features which were supported on Java Dashboard are currently not supported on HTML Dashboard:

- Viewing the per-core usage and per-interface throughput charts, which can be obtained by clicking the **CPU Usage** and **InUse Memory** meters
- Customizing the chart type
- Viewing charts for bound entities
- Viewing the graphs displayed in the graphical view in an independent window
- Changing the units for the counters on the Y axis from Rate to Total and the other way round

Domain Name System (DNS)

The following Domain Name System enhancements are available in this release.

DNS Security Extensions on the NetScaler

You can configure DNS Security Extensions (DNSSEC) on the Citrix® NetScaler® appliance. You can configure DNSSEC for zones for which the NetScaler appliance is authoritative. You can configure the NetScaler appliance as a DNS proxy server for signed zones hosted on a farm of backend name servers. If the NetScaler appliance is authoritative for a subset of the records belonging to a zone for which the appliance is configured as a DNS proxy server, you can include the subset of records in the DNSSEC implementation. For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Controlling the Number of Pipeline Requests on an Individual Client Connection

You can now control the number of pipelined DNS requests on a single client connection, which is identified by the <clientip:port>-<vserverip:port> tuple.

NetScaler VPX

The following NetScaler VPX enhancements are available in this release.

3 Gbps Throughput on the NetScaler Virtual Appliance (nCore VPX only)

The Citrix NetScaler VPX virtual appliance now supports a throughput of 3 gigabits per second (Gbps), which requires a 3 Gbps license on the virtual appliance.

VMTools Support (nCore VPX only)

VMTools provides the ability to perform graceful shutdown and reset of the virtual appliances by using the vSphere/vCenter clients. VMTools now reports the version of VMTools running, and also the state of each virtual appliance, to the ESX server. You can also use VMTools to directly enter the IP address, gateway, and subnet mask of each virtual appliance without starting the virtual appliance.

VLAN Tagging (nCore VPX only)

The NetScaler virtual appliance hosted on VMware ESX or ESXi platform now supports VLAN tagging.

Networking

The following networking enhancements are available in this release.

RNAT NAT IP Range

When creating a RNAT entry using the NetScaler command line, you can now specify a range of IP addresses for the **natip** parameter. RNAT entries are created with all the NetScaler-owned IP addresses, except the NSIP, that fall within the range specified.

PBR with Multiple Next Hops

Instead of sending the selected packets to a next hop router, you can now configure the PBR to send them to a link load balancing (LLB) virtual server to which you have bound multiple next hops. So if one of the next hop fails, all the packets that matched against a PBR are routed to other bound next hops as determined by the LB method configured on the LLB virtual server.

Round Robin Method for Selecting Source IPs for IP Tunnels

Now you can set an IP tunnel global parameter that enables the NetScaler appliance to use a different source IP address for each new session through a particular IP tunnel, as determined by round robin selection of one of the SNIP addresses. This setting is ignored if a common global source IP address has been specified for all the IP tunnels. This setting does not apply to a tunnel for which a source IP address has been specified.

Simple ACL6

Now you can quickly create ACLs, called simple ACL6s that filter IPv6 packets on the basis of their source IP address and, optionally, their destination port and/or their protocol. Any packet that has the characteristics specified in the ACL is dropped.

Inbound Network Address Translation (INAT)

The following Inbound Network Address Translation (INAT) configurations are now supported:

- **IPv4-IPv6 Mapping:** A public IPv4 address on the NetScaler appliance listens to connection requests on behalf of a private IPv6 server. The NetScaler appliance creates an IPv6 request packet with the IP address of the IPv6 server as the destination IP address.
- **IPv6-IPv4 Mapping:** A public IPv6 address on the NetScaler appliance listens to connection requests on behalf of a private IPv4 server. The NetScaler appliance creates an IPv4 request packet with the IP address of the IPv4 server as the destination IP address.
- **IPv6-IPv6 Mapping:** A public IPv6 address on the NetScaler appliance listens to connection requests on behalf of a private IPv6 server. The NetScaler appliance translates the packet's public destination IP address to the destination IP address of the server and forwards the packet to the server at that address.

Prefix-Based IPv6-IPv4 Translation

Now the NetScaler appliance can translate packets sent from private IPv6 servers into IPv4 packets, using an IPv6 prefix configured in the NetScaler appliance. This prefix has a length of 96 bits (128-32=96). The IPv6 servers embed the destination IP address of the IPv4 servers or hosts in the last 32 bits of the destination IP address field of the IPv6 packets. The first 96 bits of the destination IP address field are set as the IPv6 NAT prefix.

The NetScaler appliance compares the first 96 bits of the destination IP address of all the incoming IPv6 packets to the configured prefix. If there is a match, the NetScaler appliance generates an IPv4 packet and sets the destination IP address as the last 32 bits of the destination IP address of the matched IPv6 packet.

IPv6 packets addressed to this prefix have to be routed to the NetScaler so that the IPv6-IPv4 translation is done by the NetScaler.

Pinging Link Local Address from Any VLAN

An option that lets you specify a VLAN ID has been introduced in the `Ping6` command for pinging a link local address from the VLAN.

Host Name-Based SNMP Managers

While adding an SNMP manager, you can now specify an associated host name of the SNMP manager instead of its IP address. To do so, you need to add a DNS name server that resolves the host name of the SNMP manager to its IP address. You can add up to a maximum of five host name-based SNMP managers in addition to hundred IP address-based managers.

Time-out for Dynamic ARP Entries

You can now globally set an aging time (time-out value) for dynamically learned ARP entries. The new value applies only to ARP entries that are dynamically learned after the new value is set. Previously existing ARP entries expire after the previously configured aging time. You can specify an ARP time-out value from 1 through 1200 seconds.

Alias Name for a VLAN

An option for adding alias names for VLANs has been introduced, with a view to enhancing readability. However, you cannot perform VLAN operations by specifying alias names instead of VLAN IDs.

Option for Tagging or Untagging the NSVLAN

An option for tagging or untagging the NSVLAN (the VLAN to which NSIP address is bound) has been introduced. By default, the NSVLAN is tagged.

New vtysh Commands

The following vtysh commands have been introduced:

- **`show ns ha sync-status`:** Displays ZebOS config sync status.
- **`ns ha sync`:** Synchronizes ZebOS routing configuration between the primary and secondary nodes in a high availability configuration.

NITRO API

The following NITRO API enhancements are available in this release.

NITRO API Support for AppExpert Applications

NITRO API support has been added for exporting and importing of AppExpert applications.

Exporting an AppExpert application. When you export an AppExpert application, the following two XML files are automatically created:

- **Application template file**. Contains the AppExpert application's configuration information, such as application units, rules, and configured policies. The template file is stored in the /nsconfig/nstemplates/applications directory on the NetScaler appliance.
- **Deployment file**. Contains deployment-specific information of the AppExpert application, such as public endpoints, services, and configured variables. By default, the deployment file is stored in the /nsconfig/nstemplates/applications/deployment_files/ directory on the NetScaler appliance.

Importing an AppExpert application. You can import an AppExpert application template file, or a template file and its corresponding deployment file, to a NetScaler appliance. If you import both files, all of the application's configuration information is imported from the template file and all deployment-specific information is imported from the deployment file. Alternatively, if you import just the template file, you can set parameters to configure your own deployment settings (such as public endpoints (VIPs), services, and variable values).

NITRO API Support for Entity Templates

You can now import and export entity templates for a load balancing virtual server through the NITRO API version of the NetScaler appliance. The templates are saved as XML files.

Secure Sockets Layer (SSL)

The following Secure Sockets Layer enhancements are available in this release.

SHA-2 Signature Algorithm Support

The NetScaler appliance now supports client certificate authentication for certificates signed with the SHA-2 signature algorithm.

Small Records Processing

You can now insert the PUSH flag into decrypted, encrypted, or all records. If the PUSH flag is set to a value other than 0, the buffered records are forwarded to the server on the basis of the value of the PUSH flag.

The SSL engine has been enhanced to better handle small records received from a client or a server. This change optimizes the handling of multiple small SSL records in one TCP packet. Together with the option to set the PUSH flag after encryption or decryption as described above, the new feature helps prevent the generation of small packets on the server or the client.

Server Name Indication

If Server Name Indication (SNI) is enabled on the virtual server, all client requests in which the client initiates the handshake for one domain and sends an HTTP request for another domain are now dropped by the NetScaler appliance.

Support for IPv6 Addresses in Online Certificate Status Protocol

The NetScaler appliance now supports IPv6 addresses in Online Certificate Status protocol (OCSP) for certificate management.

Inserting Complete Client Certificate in Online Certificate Status Protocol

The NetScaler appliance now inserts the complete client certificate in its query for certificate status to the OCSP responder.

Advanced Encryption Standard New Instructions

Advanced Encryption Standard (AES) New Instructions (AES-NI) is now supported on the NetScaler VPX virtual appliance. AES-NI is supported on systems with Intel Westmere processors. On appliances with this processor, SSL bulk encryption performance for AES cipher will be significantly enhanced.

PUSH Flag-Based Encryption Trigger Mechanism

The encryption trigger mechanism that is based on the PUSH TCP flag now enables you to do the following:

- Merge consecutive packets in which the PUSH flag is set into a single SSL record or ignore the PUSH flag on packets.
- Perform timer-based encryption, in which the time-out value is set globally using the `set ssl parameter -pushEncTriggerTimeout <positive_integer>` command.

The options that are available for the PUSH encryption trigger enhancements are:

- **Always.** Any PUSH packet triggers encryption
- **Ignore.** Ignore PUSH packet for triggering encryption
- **Merge.** For consecutive sequence of PUSH packets, last PUSH packet triggers encryption
- **Timer.** PUSH packet triggering encryption delayed by timer period defined in '`set ssl parameter`'

The default value is "Always."

Importing an External Key as a FIPS Key (nCore MPX FIPS appliance only)

You can now import an external key as a FIPS key on the MPX 9700/10500/12500/15500 10G FIPS appliances. The key should be in PEM format and not be encrypted. When importing an external key on the MPX appliances, you do not need a wrap key, nor do you have to convert the key to PKCS8 format.

SSL Enhancements in the NetScaler Configuration Utility

Configuring the NetScaler for SSL Offloading has been made simpler with the following enhancements to the SSL landing page in the NetScaler configuration utility:

- Direct links to create a server certificate, root CA certificate, intermediate CA certificate, and client certificate.
- Access to the OpenSSL interface from the configuration utility.

In addition:

- When you remove a certificate-key pair, you are prompted to remove the certificate file from the appliance.
- To avoid errors in linking certificates, when you select a certificate and click Link, only certificates that can be linked to the selected certificate are listed.

Warm Restart Option On 10G FIPS Appliances (nCore only)

Warm restart is now supported on MPX 9700/10500/12500/15500 10G FIPS appliances.

System

The following system enhancements are available in this release.

Enhanced Application Visibility Using AppFlow (nCore and nCore VPX only)

The Citrix® NetScaler® appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits this information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called flow records, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.

To limit the types of flows to monitor, by sampling and filtering the application traffic, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

Rate Limiting Notification (nCore and nCore VPX only)

You can now configure a threshold to trigger an alarm to send SNMP traps when the throughput rate (in Mbps) reaches the specified threshold. You must configure the threshold to a value lesser than the maximum throughput of the NetScaler appliance. The maximum throughput is based on the license installed on the NetScaler appliance. The platform sends the platformRateLimitThresholdHigh trap when the throughput rate exceeds the high threshold. When the throughput rate returns to the normal limit, the platformRateLimitThresholdNormal trap is sent.

You can use the following command to set the snmp alarm and specify the maximum and the normal threshold limits:

set snmp alarm PF-RL-RATE-THRESHOLD [**-thresholdValue** <positive_integer> [**-normalValue** <positive_integer>]] [**-time** <secs>] [**-state** (**ENABLED** | **DISABLED**)] [**-severity** <severity>] [**-logging** (**ENABLED** | **DISABLED**)]

Optimizing the TCP Maximum Segment Size for a Virtual Server Configuration

In earlier releases, when a client connects to a virtual server on the NetScaler appliance, the appliance responds with either the default Maximum Segment Size (MSS) value of 1460 or the MSS advertised by the client. Now, you can specify the MSS that the appliance advertises to a client when the client initiates a connection to a virtual server on the appliance. You can configure the MSS for the virtual servers configured on the appliance in two ways:

- You can set the MSS for each virtual server to a value of your choice in a TCP profile.
- You can set the learnVsvrMSS global TCP parameter to ENABLED to enable MSS learning for all the virtual servers configured on the appliance.

For more information about optimizing the TCP maximum segment size for a virtual server configuration, see the "Advanced Configurations" chapter of the *Citrix NetScaler Administration Guide* at http://support.citrix.com/article/CTX128667.

Specifying a TCP Buffer Size Globally and for Virtual Servers and Services

Now, you can set the TCP buffer size both globally and for individual virtual servers and services through TCP profiles. The value that you set is the minimum value that is advertised by the NetScaler appliance and reserved when clients initiate a connection that is associated with an endpoint application function such as compression or SSL. If the TCP buffer size is set both at the global level and at the entity level (virtual server or service level), the buffer size that is specified for the virtual server takes precedence over the global value. For more information about specifying a TCP buffer size globally and for virtual servers and services, see the "Advanced Configurations" chapter of the *Citrix NetScaler Administration Guide* at http://support.citrix.com/article/CTX128667.

Memory Consumption Statistics for NetScaler Features

You can run the following command at the command prompt to view the NetScaler memory currently allocated for a particular feature, the percentage of memory allocated for the feature, and the total number of allocation failures for the feature:

```
stat ns memory
```

Statistics for Overall System Memory Consumption

You can view statistics for overall system memory consumption by running the following command at the NetScaler command prompt:

```
Stat system memory
```

The output of the command includes information about total available system memory, memory allocated in megabytes, percentage of memory allocated, in-use memory in megabytes, percentage of memory in use, and shared memory.

Filtering a NetScaler Trace to Capture Information About an Interface or a VLAN ID

You can now run a trace on the NetScaler appliance and filter packets associated with a given interface or VLAN ID. Only the packets that are filtered are captured in the trace files. To filter the trace for a given interface or VLAN ID, you must include the filter option in the nstrace command. The option takes a simple or compound expression. The expression must specify the interface or VLAN ID for which the trace must be filtered.

To capture the trace for a given interface on the appliance, at the NetScaler command prompt, type the following command:

nstrace -filter <expression>

The following example captures the trace at interface 1/1 by using a simple expression:

```
nstrace -filter "intf == 1/1"
```

The following example captures the trace at interface 1/1 and further filters the trace for packets associated with TCP destination port 80:

```
nstrace -filter "intf == 1/1 && destport == 80"
```

To capture the trace for a given VLAN ID, at the NetScaler command prompt, type the following command:

nstrace -filter "vlan <operator> <vlanid>**"**

The operator in the expression for filtering the trace on the basis of a VLAN ID can be equal to (==), not equal to (!=), less than (<), greater than (>), less than or equal to (<=), or greater than or equal to (>=).

The following example captures the trace for a VLAN with ID equal to 1:

```
nstrace -filter "vlan == 1"
```

Time Stamp of the Last Configuration Change

The “show nsconfig” command now displays the time stamp of the most recent change in the running configuration on the NetScaler.

View System Date in the NetScaler Command Line

The show ns config now displays the system date and time. The date and time of the NetScaler appliance is the date and time of the location in which the NetScaler is located. To change the system date and time, you must use the shell interface to the underlying FreeBSD OS.

Omitting Device-Specific Information in Output

An option `ignoredevspecific` has been introduced in the `diff ns config` command for not displaying device-specific information (such as IP address and host name) in the output.

Web Interface on NetScaler (nCore and nCore VPX only)

The Web Interface on NetScaler is based on Java Server Pages (JSP) technology and provides access to Citrix® XenApp™ and Citrix® XenDesktop® applications. Users access resources through a standard Web browser or by using the Citrix XenApp plug-in.

The Web Interface runs as a service on port 8080 on the NetScaler appliance. To create Web Interface sites, Java is executed on Apache Tomcat Web server version 6.0.26 on the NetScaler appliance. The Web Interface sites provide user access to the XenApp and XenDesktop resources, which include applications, content, and desktops.

For information about the Web Interface feature, see the "Advanced Configuration" chapter of the *Citrix NetScaler Administration Guide* at http://support.citrix.com/article/CTX128667.

Traffic Management

The following traffic management enhancements are available in this release.

Load Balancing of Branch Repeaters for WAN Optimization (nCore and nCore VPX only)

Now, to provide high-scale WAN optimization, the branch repeaters deployed at data centers can be load balanced through NetScaler appliances. The bandwidth and number of concurrent sessions can be improved significantly.

DataStream™ (nCore and nCore VPX only)

The DataStream feature of NetScaler provides an intelligent mechanism for request switching at the database layer by distributing requests based on the SQL query being sent.

When deployed in front of database servers, a NetScaler ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and on the basis of database names, usernames, character sets, and packet size.

You can either configure load balancing to switch requests based on load balancing algorithms or elaborate the switching criteria by configuring content switching to make a decision based on SQL query parameters, such as user name and database name, command parameters. You can further configure monitors to track the state of database servers.

The advanced policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process the requests. The advanced expressions evaluate traffic associated with MySQL database servers. You can use request-based expressions (expressions that begin with `MYSQL.CLIENT` and `MYSQL.REQ`) in advanced policies to make request switching decisions at the content switching virtual server bind point and response-based expressions (expressions that begin with `MYSQL.RES`) to evaluate server responses to user-configured health monitors. For more information about these expressions, see the "Evaluating Connections to Database Servers" chapter in the *Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Note: DataStream is supported only for MySQL databases. For information about the DataStream feature, see the "DataStream" chapter in the *Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

XenApp and XenDesktop Load Balancing Wizard Enhancements

Now, through the wizards for load balancing Citrix XenApp and Citrix XenDesktop, you can do the following:

- Choose to use the HTTP protocol for the backend communication even when the protocol for front-end communication is SSL.
- Specify any port number or use the port number specified on the virtual server.
- By default, the wizard selects the site path for the latest version of WI 5.x. You can select any path or specify a path of your choice.

No-Monitor Option for Services and Service Groups

If you do not want the NetScaler appliance to monitor a service or service group, you can disable monitoring by using the `healthMonitor` option for that service or service group. When the healthMonitor option is set to `NO`, the NetScaler appliance does not monitor the health of the service, and the service is always shown as `UP`.

Hash-Based Load Balancing Method

The hash-based load balancing algorithms have been enhanced to support pseudo-group persistency across multiple virtual servers. This pseudo-group persistency can be achieved by specifying a hash ID, which will be used for calculating the hash.

Support for Remote Desktop Protocol Load Balancing (nCore and nCore VPX only)

Starting this release, the NetScaler appliance supports Remote Desktop Protocol load balancing with session persistency. If the user reconnects with the session cookie, the NetScaler appliance connects the client to the server to which it was previously connected.

Policy-Based Routing Domains (nCore and nCore VPX only)

Now, enabling the L2Conn parameter for a load balancing virtual server allows multiple TCP and non-TCP connections with the same 4-tuple (<source IP>:<source port>::<destination IP>:< destination port>) to co-exist on the NetScaler appliance. The appliance uses both the 4-tuple and the Layer 2 parameters to identify TCP and non-TCP connections. The L2Conn parameters are the MAC address, VLAN ID, and channel ID, which are the Layer 2 parameters.

You can enable the L2Conn option in the following scenario:

1. Multiple VLANs are configured on the NetScaler appliance, and a firewall has been set up for each VLAN.

2. You want the traffic originating from the servers in one VLAN and bound for a virtual server in another VLAN to pass through the firewalls configured for both VLANs.

Note: In NetScaler 9.3 Classic, the l2Conn parameter, which specifies that Layer 2 connection parameters must also be used to uniquely identify a connection, is not supported for load balancing virtual servers even though it is listed in the CLI command synopses for load balancing virtual servers. The parameter is supported only for cache redirection virtual servers. In NetScaler 9.3 nCore, the parameter is supported for both load balancing virtual servers and cache redirection virtual servers. Therefore, when an nCore NetScaler appliance on which the l2Conn parameter is set for one or more load balancing virtual servers is downgraded to a Classic build or to an nCore build that does not support the l2Conn parameter, the load balancing configurations that use the l2Conn parameters are lost.

Graceful Shutdown of Backend Services

When you disable a service, if you cannot estimate the approximate amount of time it takes for all the connections of the service to complete their transactions, you can choose to shut down the service gracefully. In case of a graceful shutdown, the service is moved out of the service state only after all the clients connected to that service have either completed their transactions or are closed.

Additional Statistics for Load Balancing Virtual Servers

Now, in the statistics of virtual servers, you can see at the same time the number of hits per second for all the virtual servers configured on the NetScaler.

Persistence Time-out Option

The default time-out value for any persistence other than the cookie persistence is two minutes. If the time-out value is set to less than two minutes, the following error message appears:

ERROR: "Timeout value out of range; enter a value between 2 minutes and 1440 minutes"

Virtual Servers Bound to a Service Group

A new command show servicegroupbindings <serviceGroupName> displays the load balancing virtual servers that are bound to a service group.

Domain-Name-Based Service Groups

You can now bind domain-name-based service (DBS) members to a service group, in addition to IP-address-based members. If you bind the member on the basis of its domain name, you need not reconfigure the member on the NetScaler whenever the IP address of the member changes. The NetScaler automatically detects such changes.

N-tier Cache Redirection

You can deploy NetScaler appliances in two tiers (layers), with the appliances in the upper tier load balancing those in the lower tier, and the appliances in the lower tier load balancing the cache servers. The two-tier cache redirection helps in handling huge amounts (several Gbps) of traffic.

Sessionless Load Balancing in IP Mode

You can do sessionless load balancing in the IP-based forwarding mode as well as in the MAC-based forwarding mode. For sessionless load balancing in the IP mode, you need not configure the IP address of the virtual server on the physical servers.

Customization of the HTTPONLY Flag (Classic only)

You can now customize the addition of the “httponly” flag in persistence cookies. At the NetScaler command line, type:

set lb parameter [**-httpOnlyCookieFlag** (ENABLED|DISABLED)]

The flag is enabled by default.

Enhancement of XenDesktop Monitors

The XD-DDC monitor for the Dynamic Desktop Controller (DDC) servers of Citrix® XenDesktop™ includes more intelligent health checks. The DDC monitor can validate the login credentials.

The new CITRIX-WEB-INTERFACE monitor for the Web Interface component monitors a dynamic page in the specified site path. The dynamic page helps to check for critical failures in resource availability.

You can use the CITRIX-WI-EXTENDED monitor to verify the validity of the login credentials, correct configuration of the monitor (for example, the site path), and the connection with the IIS server.

Link Load Balancing

You can now configure multiple link load balancing (LLB) routes by specifying the same virtual server name as the gateway.

Rule-Based Persistence for ANY Type Virtual Servers

You can configure the load balancing virtual servers that have the service type as "ANY" with rule-based persistence. This can be used for load balancing the Branch Repeater appliances for WAN optimization and for any other physical servers.

NetScaler 9.3 Enhancements

The following enhancements are available in this release.

Note: Unless stated otherwise, the enhancements apply to Citrix® NetScaler® 9.3 Classic, NetScaler 9.3 nCore™, and NetScaler® 9.3 nCore™ VPX™.

AAA

The following AAA feature enhancements are available in this release.

Kerberos Support for AAA

The NetScaler appliance can now authenticate a client/user by Kerberos or NTLM through Simple and Protected GSSAPI Negotiation Mechanism (SPNEGO) protocol. To configure this, define and bind a NEGOTIATE authentication policy. For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

AAA and Microsoft SharePoint

You can now successfully download or edit documents from Microsoft SharePoint sites after authenticating through AAA.

Access Gateway

The following Access Gateway enhancement is available in this release.

Idle Time-Out

If users log on with the Access Gateway Plug-in for Java and you configure an idle time-out on Access Gateway, the session does not end if the plug-in does not detect mouse or keyboard activity within the specified time limit.

Advanced Policies

The following policy enhancements are available in this release.

Virtual Server-Based Expressions

A new expression prefix, `SYS.VSERVER("<vserver-name>")`, enables you to identify a virtual server. You can use the `THROUGHPUT`, `CONNECTIONS`, `STATE`, `HEALTH`, `RESPTIME`, and `SURGECOUNT` functions with this prefix to retrieve information related to the specified virtual server. For more information about these functions, see the "Virtual Server Based Expressions" section in the "Default Syntax Expressions: Working with Dates, Times, and Numbers" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Named Expressions

You can now use the name of a default syntax expression as the prefix to a function. The named expression can be either a simple expression or a compound expression. The function must be one that can operate on the type of data that is returned by the named expression.

Example 1: Simple Advanced Expression

The following named expression, which identifies a text string, can be used as a prefix to the `AFTER_STR("<string>")` expression function, which works with text data:

```
HTTP.REQ.BODY(1000)
```

If the name of the expression is `top1000bytes`, you can use `top1000bytes.AFTER_STR("username")` instead of `HTTP.REQ.BODY(1000).AFTER_STR("username")`.

Example 2: Compound Advanced Expression

The name of the following compound named expression, which identifies a number, can be used in a comparison:

```
HTTP.REQ.HEADER("Header1").LENGTH + HTTP.REQ.HEADER("Header2").LENGTH
```

If the name of the compound expression is `headerlimit`, this enhancement allows you to use `headerlimit.GT(30)` instead of `(HTTP.REQ.HEADER("Header1").LENGTH + HTTP.REQ.HEADER("Header2").LENGTH) > 30`.

Additionally, you can use a named expression (either by itself or as a prefix to a function) to create the text expression for the replacement target in rewrite.

Support for Unsigned Long and Double Data Types

In NetScaler 9.3, simple expressions can return both double and unsigned long data types, thus allowing compound expressions that use arithmetic operators and logical operators to evaluate or return values of these data types. Additionally, you can use double and unsigned long values in policy expressions. For information about the functions that can work with the double and unsigned long data types, see the "Functions for Data Types in the Policy Infrastructure" section in the "Configuring Default Syntax Expressions: Getting Started" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Modifying (Corrupting) HTTP Headers

A new rewrite action, CORRUPT_HTTP_HEADER, replaces the name of the given HTTP header with a corrupted name so that it will not be recognized by the receiver.

Pattern Set Name Length

The name of a pattern set can now contain up to 127 characters.

Encryption and Decryption of Payloads

You can now configure the NetScaler appliance to encrypt and decrypt text and XML data in requests and responses. To encrypt and decrypt text, you use the ENCRYPT and DECRYPT functions, respectively. To encrypt and decrypt XML payloads, you use the XML_ENCRYPT() and XML_DECRYPT() functions, respectively. For more information about encrypting text, see the "Encrypting and Decrypting Text" section in the "Default Syntax Expressions: Evaluating Text" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673. For more information about encrypting XML payloads, see the "Encrypting and Decrypting XML Payloads" section in the "Default Syntax Expressions: Parsing HTTP, TCP, and UDP Data" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Policy-Based Logging for Responder Policies

You can now log audit messages in a defined format when the rule in a responder policy evaluates to TRUE. To do this, you must configure an audit message action and associate it with a responder policy. The format of audit messages can be defined only with advanced expressions in an audit message. Audit message actions can be used to log messages at various log levels, either only in SYSLOG format or in both SYSLOG and newnslog formats. You can also define the SYSLOG messages to be logged. To log such SYSLOG messages, you must select **User Configurable Log Messages** (**System** > **Auditing** > **Change Global Auditing Settings**) in the NetScaler configuration utility or set the "UserDefinedLogging" SYSLOG parameter to YES in the NetScaler command line.

For example, you can configure a log action that defines the format of the log message and then associate the log action with a responder policy that can be bound globally or that can be bound to a load balancing or a content switching virtual server, as demonstrated in the following commands:

```
 Done
> set syslogparams -userDefinedAuditlog yes
 Done
> add audit messageaction log_vserver_resptime_act INFORMATIONAL "\"NS Response Time to Servers:\" + sys
 Done
> add responder action redirect_url_2_act redirect "\"http://redirect_url.com\""
 Done
```

```
> add responder policy  redirect_policy_url_1  "http.req.url.eq(\"url_1.com\")" redirect_url_2_act RESET -log
 Done
> bind responder global redirect_policy_url_1 200 END -type REQ_DEFAULT
 Done
>
```

Support for the UTF-8 Character Set

The NetScaler policy infrastructure now supports the UTF-8 character set. For more information, see the “Specifying the Character Set in Expressions” section in the chapter, “Configuring Advanced Expressions: Getting Started,” in the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Matching Text by Using a String Map

You can now use string maps to perform pattern matching in all NetScaler features that use the default policy syntax. A string map is a NetScaler entity that consists of key-value pairs. The keys and values are strings in either ASCII or UTF-8 format. String comparison uses two new functions, `MAP_STRING(<string_map_name>)` and `IS_STRINGMAP_KEY(<string_map_name>)`.

A policy configuration that uses string maps performs better than one that does string matching through policy expressions, and you need fewer policies to perform string matching with a large number of key-value pairs. String maps are also intuitive, simple to configure, and result in a smaller configuration.

For more information about string maps, see the "String Maps" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Rules for Names in Identifiers Used in Policies

The names of identifiers in the named expression, HTTP callout, pattern set, and rate limiting features must begin with an ASCII alphabet or an underscore (_). The remaining characters can be ASCII alphanumeric characters or underscores (_).

The names of these identifiers must not begin with the following reserved words:

- The words `ALT`, `TRUE`, and `FALSE` and the one-character identifiers `Q` and `S`.
- Words that indicate special syntax, which are `RE` (for regular expressions) and `XP` (for XPath expressions).
- Expression prefixes, which currently are the following:
  - CLIENT
  - EXTEND
  - HTTP

- SERVER
- SYS
- TARGET
- TEXT
- URL
- MYSQL

Additionally, the names of these identifiers cannot be the same as the names of enumeration constants used in the policy infrastructure. For example, the name of an identifier cannot be `IGNORECASE`, `YEAR`, or `LATIN2_CZECH_CS` (a MySQL character set).

Note: The NetScaler appliance performs a case-insensitive comparison of identifiers with these words and enumeration constants. For example, names of the identifiers cannot begin with `TRUE`, `True`, or `true`.

Stripping Characters From a String

You can use the `STRIP_CHARS(<string>)` operator to remove specific characters from the text that is returned by an advanced expression prefix. You can then use a text method on the resulting string. For example, you can compare the resulting string with the strings in a pattern set. You can also use the `STRIP_START_CHARS(<string>)` and `STRIP_END_CHARS(<string>)` functions to strip characters from the beginning and end of input strings, respectively. For more information about stripping characters from an input string, see the "Stripping Specific Characters from a String" section in the "Default Syntax Expressions: Evaluating Text" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Tool for Converting Classic Expressions to the Newer Default Expression Syntax

You can convert a classic expression to the default expression syntax by using the `nspepi` conversion tool. You can also use the tool to convert all the classic expressions in the NetScaler configuration to the default syntax (with the exception of NetScaler entities that currently support only classic expressions). For more information about converting classic expressions and NetScaler configuration files to the default syntax, see "Converting Classic Expressions to the Newer Default Expression Syntax" section in the "Introduction to Policies and Expressions" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Identifying a Response That is Associated with an HTTP Redirect

You can use the IS_REDIRECT function to determine whether a response is associated with a redirect. For information about the IS_REDIRECT function, see the "Expressions for HTTP Status Codes and Numeric HTTP Payload Data Other Than Dates" section in the "Default Syntax Expressions: Parsing HTTP, TCP, and UDP Data" chapter of the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Expressions for Generating the Day of the Week, as Strings, in Short and Long Formats

Two functions, WEEKDAY_STRING_SHORT and WEEKDAY_STRING, have been introduced for generating the day of the week as a string, in short and long formats, respectively. The strings that are returned are always in English. The prefix used with these functions must return the day of the week in integer format and the acceptable range for the value returned by the prefix is 0–6. Therefore, you can use any prefix that returns an integer in the acceptable range. An UNDEF condition is raised if the returned value is not in this range or if memory allocation fails.

Following are the descriptions of the functions:

Function	Description
<prefix>.WEEKDAY_STRING_SHORT	Returns the day of the week in short format. The short form is always 3 characters long with the first character in upper case and the remaining characters in lower case. For example, SYS.TIME.WEEKDAY.WEEKDAY_STRING_SHORT returns Sun if the value returned by the WEEKDAY function is 0 and Sat if the value returned by the prefix is 6.
<prefix>.WEEKDAY_STRING	Returns the day of the week in long format. The first character in the long form is always in upper case and the remaining characters are in lower case. For example, SYS.TIME.WEEKDAY.WEEKDAY_STRING returns Sunday if the value returned by the WEEKDAY function is 0 and Saturday if the value returned by the prefix is 6.

Enhancements to Expressions That Process Binary Strings

The default policy infrastructure has had some changes and improvements regarding handling of binary strings. These are particularly useful for handling protocols that have binary values in them.

The two parameters of the GET_SIGNED16, GET_UNSIGNED16, and GET_SIGNED32 functions have been changed:

- The first parameter is now an offset, instead of an index into a list of identically sized items. This change enables the functions to handle items that are not aligned on the boundaries required by indexes.
  - For 16-bit values: instead of using `N`, use `2*N` for an aligned value.
  - For 32-bit values: instead of using `N`, use `4*N` for an aligned value.
- The second parameter now takes a mnemonic value instead of the nonintuitive `0` or `1`. The values are `LITTLE_ENDIAN` and `BIG_ENDIAN`.
  - What used to be `0` is now `LITTLE_ENDIAN`.
  - What used to be `1` is now `BIG_ENDIAN`.
- Expressions using these functions will need to be changed.

Example:

HTTP.REQ.BODY(100).GET_SIGNED16(7, BIG_ENDIAN)

Additionally, the following new functions have been introduced. The functions that produce binary strings, numbered 2 through 9 in the following list, are particularly useful in TCP rewrite, as replacement strings for binary data.

1. `<text>.GET_UNSIGNED32(n, endianness)`

   This function returns the 32-bit unsigned binary integer at offset `n`. If the offset would make part or all of the value outside of the current text, an `UNDEF` is raised. In the above expression:

   - `n` is the number of bytes from the current position to the first byte of the binary integer.
   - The “endianness” can be either `LITTLE_ENDIAN` or `BIG_ENDIAN`.
   - The value returned is an unsigned long number. This is different from the other `GET` functions for binary strings, which return a number.

   Example:

   HTTP.REQ.BODY(100).GET_UNSIGNED32(30, LITTLE_ENDIAN)

2. `<number>.SIGNED8_STRING`

   This function produces an 8-bit signed binary string representing the number. If the value is out of range an `UNDEF` is raised. The value returned is of type text.

   Example:

   HTTP.REQ.BODY(100).GET_SIGNED8(16).SUB(3).SIGNED8_STRING

3. `<number>.UNSIGNED8_STRING`

   This function produces an 8-bit unsigned binary string representing the number. If the value is out of range, an `UNDEF` is raised. The value returned is of type text.

Example:

HTTP.REQ.BODY(100).GET_UNSIGNED8(31).ADD(3).UNSIGNED8_STRING

4. `<number>.SIGNED16_STRING(endianness)`

   This function produces a 16-bit signed binary string representing the number. If the value is out of range, an `UNDEF` is raised. The "endianness" can be either `LITTLE_ENDIAN` or `BIG_ENDIAN`. The value returned is of type text.

   Example:

   HTTP.REQ.BODY(100).SKIP(12).GET_SIGNED16(0, BIG_ENDIAN).SUB(4).SIGNED16_STRING(BIG_ENDIAN)

5. `<number>.UNSIGNED16_STRING(endianness)`

   This function produces a 16-bit unsigned binary string representing the number. If the value is out of range, an `UNDEF` is raised. The "endianness" can be either `LITTLE_ENDIAN` or `BIG_ENDIAN`. The value returned is of type text.

   Example:

   HTTP.REQ.BODY(100).GET_UNSIGNED16(47, LITTLE_ENDIAN).ADD(7).UNSIGNED16_STRING(LITTLE_ENDIAN

6. `<number>.SIGNED32_STRING(endianness)`

   This function produces a 32-bit signed binary string representing the number. The "endianness" can be either `LITTLE_ENDIAN` or `BIG_ENDIAN`. The value returned is of type text.

   Example:

   HTTP.REQ.BODY(100).AFTER_STR("delim").GET_SIGNED32(0, BIG_ENDIAN).SUB(1).SIGNED32_STRING(BIG_

7. `<unsigned_long_number>.UNSIGNED8_STRING`

   This function produces an 8-bit unsigned binary string representing the number. If the value is out of range, an `UNDEF` is raised. The value returned is of type text.

   Example:

   HTTP.REQ.BODY(100).GET_UNSIGNED8(24).TYPECAST_UNSIGNED_LONG_AT.ADD(12).UNSIGNED8_STRING

8. `<unsigned_long_number>.UNSIGNED16_STRING(endianness)`

   This function produces a 16-bit unsigned binary string representing the number. If the value is out of range, an `UNDEF` is raised. The "endianness" can be either `LITTLE_ENDIAN` or `BIG_ENDIAN`. The value returned is of type text.

   Example:

HTTP.REQ.BODY(100).GET_UNSIGNED16(23, LITTLE_ENDIAN).TYPECAST_UNSIGNED_LONG_AT.ADD(10).UN

9. `<unsigned_long_number>.UNSIGNED32_STRING(endianness)`

   This function produces a 32-bit unsigned binary string representing the number. If the value is out of range, an `UNDEF` is raised. The “endianness” can be either `LITTLE_ENDIAN` or `BIG_ENDIAN`. The value returned is of type text.

   Example:

   HTTP.REQ.BODY(100).AFTER_STR("delim2").GET_UNSIGNED32(0, BIG_ENDIAN).ADD(2).UNSIGNED32_STRIN

Rewriting TCP Payloads

You can now treat the payload of a TCP packet as a raw stream of bytes and perform rewrite actions on the payload regardless of the protocol that the TCP connection is transmitting. You can evaluate TCP traffic that is associated with only those services that are of type `TCP` and `SSL_TCP`. You can configure policies that use the `CLIENT.TCP.PAYLOAD(<integer>)` expression prefix and the `SERVER.TCP.PAYLOAD(<integer>)` expression prefix to evaluate TCP and SSL_TCP traffic received from clients and servers, respectively. With these prefixes, you can use all types of existing string manipulation functions to identify the strings that you want to rewrite. To bring the policies into effect, you bind the TCP rewrite policies to load balancing virtual servers and content switching virtual servers of type `TCP` and `SSL_TCP`. You can also bind them to the following new bind points:

- OTHERTCP_REQ_DEFAULT
- OTHERTCP_REQ_OVERRIDE
- OTHERTCP_RES_DEFAULT
- OTHERTCP_RES_OVERRIDE

Note: The term "OTHERTCP" is used in the context of the NetScaler appliance to refer to all TCP or SSL_TCP requests and responses that you want to treat as a raw stream of bytes regardless of the protocol that the TCP packets encapsulate.

The order of evaluation of policies bound to these policy banks is the same as that for policies that evaluate HTTP traffic: TCP rewrite policies are evaluated from the most specific bind point to the most general bind point. That is, policies at the override bind points are evaluated first, followed by those at the virtual server bind points, and finally, those at the default bind points.

Note: A TCP rewrite policy does not evaluate connections that are active at the time at which it is bound to a bind point, but it evaluates the TCP connections that are initiated after binding is performed.

The following rewrite actions are supported in TCP rewrite policies.

- INSERT_AFTER
- INSERT_BEFORE

- REPLACE
- DELETE
- INSERT_AFTER_ALL
- INSERT_BEFORE_ALL
- REPLACE_ALL
- DELETE_ALL
- DROP
- RESET

Even though you cannot rewrite data other than that in TCP payloads, you can use all the expressions that are available for evaluating TCP traffic and information associated with lower network layers such as that in IP packets and Ethernet frames. Based on the information retrieved, you can perform an appropriate rewrite action, selected from the preceding list, on the TCP payload.

Additionally, the following two transform types (values for the `transform` parameter in the `add rewrite policyLabel` CLI command) have been introduced for rewrite policy labels:

- OTHERTCP_REQ
- OTHERTCP_RES

When you create a rewrite policy label, you specify `OTHERTCP_REQ` as the transform type to specify that the policies that are bound to the policy label are request-based policies. You can specify `OTHERTCP_RES` as the transform type to specify that the policies that are bound to the policy label are response-based policies.

Following are some limitations of the TCP rewrite feature:

- Named expressions and HTTP callouts are not supported in TCP rewrite policies.
- If the payload length received is less than the expected payload length, the NetScaler waits for the remaining bytes. Eventually, the request times out.

Example:

The following rewrite action `c_ip` identifies the first 150 bytes of the TCP payload and then inserts the string `CLIENT_IP` and the IP address of the client before the string `\r\n\r\n`.

add rewrite action c_ip INSERT_BEFORE "CLIENT.TCP.PAYLOAD(150).BEFORE_STR(\"\r\n\r\n\")" "\"CLIENT_IP\"

AppExpert

The following AppExpert enhancements are available in this release.

Deployment Files for AppExpert Applications

In earlier NetScaler releases, when you exported an AppExpert application, only a template file was created, in GZIP format. The template file contained only application-configuration information. You had to specify deployment-specific information, such as public endpoints and backend servers, in the **AppExpert Template Wizard** when importing the template file. With release 9.3, when you export an AppExpert application, a deployment file is created along with the application template file. Both files are created in XML format. The template file contains configuration-specific information and the deployment file contains deployment-specific information. In the **AppExpert Template Wizard**, you can specify use of the deployment file when you import the template file, or you can manually specify all the deployment information. If you specify the deployment file, the NetScaler appliance uses the deployment information in the deployment file. For more information, see the chapter, "AppExpert Applications and Templates," in the *Citrix NetScaler AppExpert Guide* at http://support.citrix.com/article/CTX128682.

Roll Back Support for AppExpert Application Import

In this release, if an error occurs during the import of an AppExpert application, the configuration changes that were made during the import process are automatically rolled back.

Creating Application Templates from Content Switching Virtual Servers

In earlier releases, you could export a content switching virtual server configuration to an application template only from the **Content Switching Visualizer**. Additionally, the template file was in GZIP format and included only configuration information. No deployment information was exported. In this release, you can export a content switching virtual server either from the **Content Switching Visualizer** or from the **Content Switching Virtual Servers** pane. A deployment file is created along with the template file. Both files are in XML format. For more information about exporting a content switching virtual server, template files, and deployment files, see the "Creating and Managing Template Files" chapter of the *Citrix NetScaler AppExpert Guide* at http://support.citrix.com/article/CTX128682.

Application Firewall

The following Application Firewall enhancements are available in this release.

Document Type Definitions (DTD) Support for XML Security Checks

Support has been added for document type definitions (DTDs) in the **Application Firewall Imports** pane, **XML Schema** tab. You can upload DTDs to the Application Firewall and they will be used for the relevant XML security checks.

Audit Server Configuration for Application Firewall

Support has been added to the NetScaler GUI for configuring the Application Firewall logs, in the **Auditing Policies** pane. In this pane, you can configure auditing to any server by adding that server in the **Servers** tab, and then adding an Audit policy that refers to that server. The process is the same as for AAA.

Learning Visualizer for Deployed Application Firewall Rules

The Application Firewall learning visualizer is now available for learned rules that you have already deployed, as well as rules that are pending review. For more information about how to use the learning visualizer, see the "Learning" section in the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

SNMP Traps for Application Firewall Security Checks

SNMP traps have been added for each of the Application Firewall security checks. You configure the traps in the NetScaler configuration utility, under **System** > **SNMP** > **Traps**. For more information, see the *Citrix NetScaler SNMP OID Reference Guide* at http://support.citrix.com/article/CTX128676.

Application Firewall Custom Variables for HTML/XML Error Objects

You can now use five new variables to write troubleshooting information into an Application Firewall HTML or XML error object. These variables are:

- **${NS_TRANSACTION_ID}.** The transaction ID that the Application Firewall assigned to this transaction.
- **${NS_APPFW_SESSION_ID}.** The Application Firewall session ID.
- **${NS_APPFW_VIOLATION_CATEGORY}.** The specific Application Firewall security check or rule that was violated.
- **${NS_APPFW_VIOLATION_LOG}.** The detailed error message associated with the violation.

- **${COOKIE("<CookieName>")}.** The contents of the specified cookie. For <CookieName>, substitute the name of the specific cookie that you want to display on the error page. If you have multiple cookies whose contents you want to display for troubleshooting, you can use multiple instances of this customization variable, each with the appropriate cookie name.

To use these variables, you embed them in the HTML or XML of the error page object as if they were any ordinary text string. For more information, see the "Imports" chapter in the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

Cookie Encryption, Cookie Proxying, and Adding Flags to Cookies

The Application Firewall now supports encryption and proxying of cookies, and can be configured to add flags to cookies. For information about configuring this feature, see the "The Cookie Consistency Check" section in the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

Limiting the Number of Files Uploaded to a Web Site

By default, there is no limit on the number of files that can be uploaded to your protected Web site by using an HTML Web form or properly structured XML request. You can now limit the number of file uploads allowed on your protected Web sites. At the NetScaler command prompt, type:

set appfw profile -fileUploadMaxNum <integer>

For <integer>, substitute a number between 0 and 65535. If you set this value to 0, that disables all file uploads. If you set it to 65535, that allows unlimited uploads rather than stopping at 65535.

In the configuration utility, in the **Configure Application Firewall Profile** dialog box, **Settings** tab, you select the **Max File Uploads** check box, and enter a number in text box.

New Signatures Feature

All Application Firewall signatures, SQL injection and cross-site scripting patterns are now combined into a single XML-based signatures object file. You can download this file to your local computer and edit it in a text editor to add to or modify the lists of SQL injection keywords and special strings, SQL injection transformations, and cross-site scripting allowed and denied tags, attributes, and patterns. For more information, see the "Signatures" chapter in the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

Configuration Wizard Added to Application Firewall

The Application Firewall configuration wizard is now available to assist users in performing initial configuration of a new Application Firewall. You access the wizard on the main **Application Firewall** pane, in the details area, under **Getting Started**, by clicking **Application Firewall Wizard**.

Excluding XML Elements and Attributes from Security Checks

You can now exempt elements and attributes from the XML SQL Injection and Cross-Site scripting checks. To exempt an element from either check at the NetScaler command line, you issue one of the following commands:

bind appfw profile <name> -XMLSQLInjection <string> [-isRegex (REGEX | NOTREGEX)] [-location <location>

bind appfw profile <name> -XMLXSS <string> [-isRegex (REGEX | NOTREGEX)] [-location <location>]

For <name>, you substitute the name of the profile. For <string>, you substitute a literal string or a Posix-complaint regular expression that describes the element or elements to exempt. If you typed a regular expression, you must include " -isRegex REGEX". If you typed a string, this parameter is optional. For <location>, you type the location where this element is found in the XML document.

Inverse Regular Expressions

You can now easily create an inverse regular expression in the Application Firewall when you are adding a relaxation or rule to supported security checks. You do this by putting an exclamation point (!) at the beginning of the expression. You can use this new regular expression notation in Start URL, Form Field Consistency, Cookie Consistency, HTML SQL Injection, Cross-Site Request Forgery, or HTML Cross-Site Scripting check relaxations, or in Deny URL or Field Format check rules.

Note: You cannot use a solitary exclamation point to create an inverse expression. There must be a valid regular expression that follows the exclamation point, or it is treated as a text element and not as a logical inverse.

Adding XQuery Injection Patterns to XPath

The XPATH Injection settings can be used to detect XQuery violations, by adding the XQUERY injection pattern(s) that you want to block, and setting the injection type to XQUERY. In the configuration utility, you do this as follows:

1. In the navigation pane, expand **Application Firewall**, and select **Signatures**.
2. In the details pane, select the default Xpath Injection file, and then click **Add**.

3. In the **Add Signatures Object** dialog box, **Name** field, type a name for your new custom Xpath Injection file. You can also type a comment in the **Comment** field that describes the purpose of this custom file.

4. In the lower left-hand corner of the **Add Signatures Object** dialog box, click **Manage SQL/XSS patterns**.

5. In the **Manage SQL/XSS patterns** dialog box, **Filtered Results** window, select **Patterns**, and then in the button row beneath the **Filtered Results** window, click **Add**.

6. In the **Create Signatures Folder** dialog box, **Attributes** area, **delimiter** drop-down list, choose **Any**.

7. In the **type** text box, type **XQUERY**, and then click **OK**.

8. If your new folder is not selected, select it, and then click **Add**.

9. In the **Create Signatures Folder** dialog box, choose **keyword**, and then click **OK**.

10. Repeat steps 8 and 9, but choose **Special String** this time.

11. Add your XQUERY keywords and special strings by clicking the **Add** button beneath the details window below the **Filtered Results** window, filling out the **Create Signature Item** dialog box, and then clicking **OK**.

Web-Based GUI Editor for Imported Files

A GUI-based editor has been added for editing imported files in the **Application Firewall Import** pane. Users can now select a previously imported file, and then click **Open**, to open that file in a Web-based text editor, where they can make changes to the file. This allows minor modifications to be made without having to export the file to the local system for editing.

XML SOAP Array Rule Added to XDOS Check

The XML SOAP Array rule has been added to the XML denial-of-security (XDoS) check. This check protects SOAP processors on your XML server from attacks launched through SOAP Arrays that exceed either individual or total limits on size and dimensions. The check verifies the following attributes of SOAP arrays in requests:

- **XMLMaxSOAPArraySize.** Checks for SOAP arrays that exceed the configured maximum total SOAP Array size across the request.

  XMLMaxSOAPArrayRank. Checks for SOAP arrays that exceed the configured maximum individual SOAP Array dimensions, or rank.

You configure the XML SOAP Array rule under **Application Firewall** --> **Profiles**, by selecting a profile, and then clicking **Open**. In **the Configure Application Firewall Profiles** dialog box, you select **XML Denial of Service**, and then click **Open**. In the **Modify XML Denial of Service Check** dialog box, you select **Soap Array Check**, and enable or disable the check by using the appropriate buttons. For more information, see the *Citrix Application Firewall*

Guide at http://support.citrix.com/article/CTX128677, XML Security Checks chapter, XML Denial of Service Check section.

Application Firewall/XML Signature Updates

Users can update the signatures and patterns on their Application Firewall by importing an updated signatures object file under the same name as an existing signatures object. Signatures updates support the following:

- By default, when updating a signatures object file, the Application Firewall will display the local or network location from which a signatures object file was originally imported. The user can choose a different location, or accept the default.
- Signatures each have an identification number. By default, when updating, any signature in the update file that uses the same signature identification number as an existing signature replaces the existing signature. This means that any modifications that the user made to existing signatures by editing the existing file will be overwritten unless the user also modifies the identification number to a number that is not already in use. Any existing signatures that have unique IDs are preserved. Any signatures in the update file that have unique IDs are added to the signatures object file.
- Any configuration that the user performed in the configuration utility is preserved during an update.
- All in-memory profile configurations that use information in the signatures object are updated immediately, without restarting the NetScaler VPX process, the NetScaler appliance, or the Application Firewall appliance.
- The complete update process requires less than a minute.

For instructions on updating signatures, see the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677, Signatures chapter.

Importing Cenzic Scan Results as XML File

You can now import results from a Cenzic scan as a signatures object. To do so, you must save the results as an XSLT file, and then import them as a signatures object. During the import process, you select the “Convert External Format” check box and then converting the XSLT file during import. To import a Cenzic results file, and then browse to and select the XSLT file. The results are imported as a signatures object.

Compression

The following compression feature enhancements are available in this release.

Policy Manager for Compression

The NetScaler configuration utility now includes a policy manager for the HTTP Compression feature. By using the Compression Policy Manager, you can configure compression policies and/or bind them to various request-time and response-time bind points from a single dialog box.

To configure compression policy bindings by using the Compression Policy Manager

1. Click **HTTP Compression**, and then, in the details pane, click **Compression policy manager**.

2. In the **Compression Policy Manager** dialog box, click **Request** or **Response**, depending on whether you want the policy you are binding to be evaluated at request time or at response time.

   Click the name of the bind point to which you want to bind the policy. An example of a bind point is **Override Global**.

   The policies that have already been bound to the bind point appear in the dialog box.

4. To insert a policy, click **Insert Policy**, and then, in the drop-down list that appears in the **Policy Name** column, do one of the following:

   - Click **New Policy** to open the **Create Compression Policy** dialog box. In this dialog box, you can create a compression policy. After you create the policy in this dialog box, click **Create** to bind the policy to the bind point.

   - Click the name of an existing policy to bind it to the bind point.

5. To unbind a policy, click the name of the policy, and then click **Unbind Policy**.

6. To regenerate priorities, click **Regenerate Priorities**. The priority values are modified to begin at 100, with increments of 10, without affecting the order of evaluation.

7. To modify a policy that is already bound, click the name of the policy, and then click **Modify Policy**. If the policy is a built-in policy, the **View Compression Policy** dialog box displays the details of the policy. If the policy is a user-defined policy, the **Configure Compression Policy** dialog box appears and you can modify the policy.

8. After you have configured policies and policy bindings for the bind point, click **Apply Changes**.

9. Click **Close**.

Configuration Utility

The following configuration utility enhancements are available in this release.

EdgeSight Monitoring

The HTML Injection feature in NetScaler has been renamed to EdgeSight® Monitoring in the NetScaler Configuration Utility. You can now configure EdgeSight Monitoring for both load balancing and content switching virtual servers and configure the EdgeSight services. You can register the NetScaler appliance to an EdgeSight server and also access the EdgeSight server from the NetScaler.

Note: If you had configured the EdgeSight Monitoring feature on the NetScaler appliance before upgrading to release 9.3, you must configure the feature again on the virtual servers.

IP Address Type Identification in VLAN Configuration Dialog Boxes

A new column, Type, has been added to the table in the IPs section of the Create VLAN and Configure VLAN dialog boxes. This column displays the IP address type (such as mapped IP, virtual IP, and subnet IP) for each IP address in the IP Addresses column.

Default Policy Format for NetScaler Features

Starting with NetScaler release 9.3, the newer advanced policy syntax is referred to as the "default syntax." Additionally, the policy configuration dialog boxes for NetScaler features that support both the older classic policy syntax and the default syntax no longer include the Classic Syntax and Advanced Syntax option buttons. By default, the policy configuration dialog boxes accept policy expressions that use the default syntax. The option buttons have been replaced by a hyperlink that enables you to switch between the classic syntax and the default syntax.

Viewing SYSLOG Event IDs

You can now view the unique identification number of every NetScaler SYSLOG event in the Syslog Viewer dialog box.

IP Address Range Support

Now, as an alternative to creating IP addresses one at a time, you can specify a consecutive range of IP addresses.

Customized System User Prompt

You can also customize the NetScaler command-line prompt for a user. Prompts can be defined in a user’s configuration, in a user-group configuration, and in the global configuration. The prompt displayed for a given user is determined by the following order of precedence:

1. Display the prompt as defined in the user's configuration.
2. Display the prompt as defined in the group configuration for the user’s group.
3. Display the prompt as defined in the system global configuration.

UTF-8 Support in Regular Expression Editors

The regular expression editor in the configuration utility now supports the UTF-8 character set and parses and displays details of regular expressions that consist of UTF-8 characters.

Documentation

The following documentation enhancements are available in this release.

NetScaler Documentation on eDocs

The 9.3 documentation suite is now available on Citrix® eDocs, the documentation portal. PDF versions of the guides will continue to be available on http://support.citrix.com and Configuration Utility (the NetScaler® graphical user interface). The salient features of the NetScaler® documentation library on eDocs are as follows:

1. **Intuitive organization.** Information is presented in a flatter and more intuitive manner. Each main node represents a release, and the subnodes represent specific features or tasks. In addition, the first few nodes cover basic configuration tasks to help new users adopt the product quickly.
2. **Global search.** Users can now search across releases and features. Users can also create their own search scopes.
3. **PDF on-the-fly.** Users can custom-create their own PDF documents by selecting information from specific nodes in eDocs.

Enhanced Context-Sensitive Online Help

The context-sensitive online help has been enhanced to display links to blogs, videos, articles, and documentation pertaining to the dialog box or pane from which the online help is invoked. This is made possible by an intelligent content aggregator that fetches results from key Citrix sites such as Knowledge Center, Citrix TV, and eDocs. The new help system is compatible with most popular Web browsers, such as Internet Explorer, Chrome, Safari, and Firefox.

Hardware

The following hardware enhancement is available in this release.

Support for 1G SFP Hot Swap

This release introduces support for SFP hot swap on the Intel 1G (e1k) driver for both fiber and copper SFPs, on the following NetScaler hardware platforms:

- MPX 7500/9500
- MPX 9700/10500/12500/15500
- MPX 9700/10500/12500/15500 10G and 10G FIPS

High Availability

The following high availability enhancements are available in this release.

Synchronizing Configuration Files in High Availability Setup

In a high availability (HA) setup, the `sync HA files` command now supports the following two new synchronization modes:

`sync misc`. Synchronizes all licenses and the configuration (rc.conf) file.

`Sync_all_plus_misc`. Synchronizes all files, including licenses and rc.conf file.

Enhanced Force Failover Warning Message

In a high availability configuration, the warning message for the force failover command now also includes the information the warning is based on.

HTML Injection (EdgeSight Monitoring)

The following HTML Injection enhancement is available in this release.

Details of Virtual Server and Service

When you enable HTML injection, you can view the name, IP address, and port number of the virtual server that load balanced the request and of the physical service that sent the response to the request.

Integrated Cache

The following integrated cache enhancements are available in this release.

Integrated Cache Support for Single Byte-Range Requests

The integrated cache can now serve partial content in response to single byte-range requests.

Built-in Content Group, Pattern Set, and Policies for the Integrated Cache

Release 9.3 includes a built-in integrated caching configuration that you can use for caching content. The configuration consists of a content group called ctx_cg_poc, a pattern set called ctx_file_extensions, and a set of integrated cache policies. In the content group ctx_cg_poc, only objects that are 500 KB or smaller are cached. The content is cached for 86000 seconds, and the memory limit for the content group is 512 MB. The pattern set is an indexed array of common file extensions for file-type matching. For more information about the built-in configuration, see the "Built-in Content Group, Pattern Set, and Policies for the Integrated Cache" section in the "Integrated Caching" chapter of the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

Monitoring Utility

The following monitoring utility enhancement is available in this release.

Viewing Dashboard Functionalities on the Monitoring Utility

You can now view the dashboard functionalities in HTML on the Monitoring interface. You can no longer view the Java Dashboard on nCore version.

The HTML Dashboard feature provides the following new functionalities:

- **Comparative charts**:
  - The two comparative charts on the left side of the **Monitoring** page help in monitoring a built-in set of counters for all the global and entity-based system statistics.
  - The charts are auto-updated and depict the variation of two or more counters over time. You can view the related historical data by clicking the **Reporting** link.
  - Maximizing the charts opens the charts in a new window. You can also add or delete counters from this view.
  - In addition to the built-in comparative charts, you can also load, save, or delete custom charts.
- **Graphical view**:
  - You can view the performance statistics data graphically by clicking **Graphical View**.

- You can hide or unhide the counter plot by clicking the legend name.
- By default, the graphical view for multiple-entity stat commands is displayed for the entity that has the maximum value for a predefined counter. You can, however, choose a different entity by clicking **Counters** and view it graphically.
- You can add or remove counters and other entities by clicking **Counters** on the bottom right corner of the page.
- Multiple counters for multiple entities with a maximum of 16 data series can be plotted.
- The graph also displays historical data for a maximum period of five minutes.

- **Virtual server view**: You can view the statistics of multiple load balancing virtual servers in consecutive rows, which have fixed headers, with all the statistic attributes lined up in columns. This view is also applicable to other entities, such as GSLB virtual servers, services, and interfaces.

Gaps between Java Dashboard and HTML Dashboard: The following features which were supported on Java Dashboard are currently not supported on HTML Dashboard:

- Viewing the per-core usage and per-interface throughput charts, which can be obtained by clicking the **CPU Usage** and **InUse Memory** meters
- Customizing the chart type
- Viewing charts for bound entities
- Viewing the graphs displayed in the graphical view in an independent window
- Changing the units for the counters on the Y axis from Rate to Total and the other way round

Domain Name System (DNS)

The following Domain Name System enhancements are available in this release.

DNS Security Extensions on the NetScaler

You can configure DNS Security Extensions (DNSSEC) on the Citrix® NetScaler® appliance. You can configure DNSSEC for zones for which the NetScaler appliance is authoritative. You can configure the NetScaler appliance as a DNS proxy server for signed zones hosted on a farm of backend name servers. If the NetScaler appliance is authoritative for a subset of the records belonging to a zone for which the appliance is configured as a DNS proxy server, you can include the subset of records in the DNSSEC implementation. For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Controlling the Number of Pipeline Requests on an Individual Client Connection

You can now control the number of pipelined DNS requests on a single client connection, which is identified by the <clientip:port>-<vserverip:port> tuple.

NetScaler VPX

The following NetScaler VPX enhancements are available in this release.

3 Gbps Throughput on the NetScaler Virtual Appliance (nCore VPX only)

The Citrix NetScaler VPX virtual appliance now supports a throughput of 3 gigabits per second (Gbps), which requires a 3 Gbps license on the virtual appliance.

VMTools Support (nCore VPX only)

VMTools provides the ability to perform graceful shutdown and reset of the virtual appliances by using the vSphere/vCenter clients. VMTools now reports the version of VMTools running, and also the state of each virtual appliance, to the ESX server. You can also use VMTools to directly enter the IP address, gateway, and subnet mask of each virtual appliance without starting the virtual appliance.

VLAN Tagging (nCore VPX only)

The NetScaler virtual appliance hosted on VMware ESX or ESXi platform now supports VLAN tagging.

Networking

The following networking enhancements are available in this release.

RNAT NAT IP Range

When creating a RNAT entry using the NetScaler command line, you can now specify a range of IP addresses for the **natip** parameter. RNAT entries are created with all the NetScaler-owned IP addresses, except the NSIP, that fall within the range specified.

PBR with Multiple Next Hops

Instead of sending the selected packets to a next hop router, you can now configure the PBR to send them to a link load balancing (LLB) virtual server to which you have bound multiple next hops. So if one of the next hop fails, all the packets that matched against a PBR are routed to other bound next hops as determined by the LB method configured on the LLB virtual server.

Round Robin Method for Selecting Source IPs for IP Tunnels

Now you can set an IP tunnel global parameter that enables the NetScaler appliance to use a different source IP address for each new session through a particular IP tunnel, as determined by round robin selection of one of the SNIP addresses. This setting is ignored if a common global source IP address has been specified for all the IP tunnels. This setting does not apply to a tunnel for which a source IP address has been specified.

Simple ACL6

Now you can quickly create ACLs, called simple ACL6s that filter IPv6 packets on the basis of their source IP address and, optionally, their destination port and/or their protocol. Any packet that has the characteristics specified in the ACL is dropped.

Inbound Network Address Translation (INAT)

The following Inbound Network Address Translation (INAT) configurations are now supported:

- **IPv4-IPv6 Mapping:** A public IPv4 address on the NetScaler appliance listens to connection requests on behalf of a private IPv6 server. The NetScaler appliance creates an IPv6 request packet with the IP address of the IPv6 server as the destination IP address.
- **IPv6-IPv4 Mapping:** A public IPv6 address on the NetScaler appliance listens to connection requests on behalf of a private IPv4 server. The NetScaler appliance creates an IPv4 request packet with the IP address of the IPv4 server as the destination IP address.
- **IPv6-IPv6 Mapping:** A public IPv6 address on the NetScaler appliance listens to connection requests on behalf of a private IPv6 server. The NetScaler appliance translates the packet's public destination IP address to the destination IP address of the server and forwards the packet to the server at that address.

Prefix-Based IPv6-IPv4 Translation

Now the NetScaler appliance can translate packets sent from private IPv6 servers into IPv4 packets, using an IPv6 prefix configured in the NetScaler appliance. This prefix has a length of 96 bits (128-32=96). The IPv6 servers embed the destination IP address of the IPv4 servers or hosts in the last 32 bits of the destination IP address field of the IPv6 packets. The first 96 bits of the destination IP address field are set as the IPv6 NAT prefix.

The NetScaler appliance compares the first 96 bits of the destination IP address of all the incoming IPv6 packets to the configured prefix. If there is a match, the NetScaler appliance generates an IPv4 packet and sets the destination IP address as the last 32 bits of the destination IP address of the matched IPv6 packet.

IPv6 packets addressed to this prefix have to be routed to the NetScaler so that the IPv6-IPv4 translation is done by the NetScaler.

Pinging Link Local Address from Any VLAN

An option that lets you specify a VLAN ID has been introduced in the `Ping6` command for pinging a link local address from the VLAN.

Host Name-Based SNMP Managers

While adding an SNMP manager, you can now specify an associated host name of the SNMP manager instead of its IP address. To do so, you need to add a DNS name server that resolves the host name of the SNMP manager to its IP address. You can add up to a maximum of five host name-based SNMP managers in addition to hundred IP address-based managers.

Time-out for Dynamic ARP Entries

You can now globally set an aging time (time-out value) for dynamically learned ARP entries. The new value applies only to ARP entries that are dynamically learned after the new value is set. Previously existing ARP entries expire after the previously configured aging time. You can specify an ARP time-out value from 1 through 1200 seconds.

Alias Name for a VLAN

An option for adding alias names for VLANs has been introduced, with a view to enhancing readability. However, you cannot perform VLAN operations by specifying alias names instead of VLAN IDs.

Option for Tagging or Untagging the NSVLAN

An option for tagging or untagging the NSVLAN (the VLAN to which NSIP address is bound) has been introduced. By default, the NSVLAN is tagged.

New vtysh Commands

The following vtysh commands have been introduced:

- **`show ns ha sync-status`:** Displays ZebOS config sync status.
- **`ns ha sync`:** Synchronizes ZebOS routing configuration between the primary and secondary nodes in a high availability configuration.

NITRO API

The following NITRO API enhancements are available in this release.

NITRO API Support for AppExpert Applications

NITRO API support has been added for exporting and importing of AppExpert applications.

Exporting an AppExpert application. When you export an AppExpert application, the following two XML files are automatically created:

- **Application template file**. Contains the AppExpert application's configuration information, such as application units, rules, and configured policies. The template file is stored in the /nsconfig/nstemplates/applications directory on the NetScaler appliance.
- **Deployment file**. Contains deployment-specific information of the AppExpert application, such as public endpoints, services, and configured variables. By default, the deployment file is stored in the /nsconfig/nstemplates/applications/deployment_files/ directory on the NetScaler appliance.

Importing an AppExpert application. You can import an AppExpert application template file, or a template file and its corresponding deployment file, to a NetScaler appliance. If you import both files, all of the application's configuration information is imported from the template file and all deployment-specific information is imported from the deployment file. Alternatively, if you import just the template file, you can set parameters to configure your own deployment settings (such as public endpoints (VIPs), services, and variable values).

NITRO API Support for Entity Templates

You can now import and export entity templates for a load balancing virtual server through the NITRO API version of the NetScaler appliance. The templates are saved as XML files.

Secure Sockets Layer (SSL)

The following Secure Sockets Layer enhancements are available in this release.

SHA-2 Signature Algorithm Support

The NetScaler appliance now supports client certificate authentication for certificates signed with the SHA-2 signature algorithm.

Small Records Processing

You can now insert the PUSH flag into decrypted, encrypted, or all records. If the PUSH flag is set to a value other than 0, the buffered records are forwarded to the server on the basis of the value of the PUSH flag.

The SSL engine has been enhanced to better handle small records received from a client or a server. This change optimizes the handling of multiple small SSL records in one TCP packet. Together with the option to set the PUSH flag after encryption or decryption as described above, the new feature helps prevent the generation of small packets on the server or the client.

Server Name Indication

If Server Name Indication (SNI) is enabled on the virtual server, all client requests in which the client initiates the handshake for one domain and sends an HTTP request for another domain are now dropped by the NetScaler appliance.

Support for IPv6 Addresses in Online Certificate Status Protocol

The NetScaler appliance now supports IPv6 addresses in Online Certificate Status protocol (OCSP) for certificate management.

Inserting Complete Client Certificate in Online Certificate Status Protocol

The NetScaler appliance now inserts the complete client certificate in its query for certificate status to the OCSP responder.

Advanced Encryption Standard New Instructions

Advanced Encryption Standard (AES) New Instructions (AES-NI) is now supported on the NetScaler VPX virtual appliance. AES-NI is supported on systems with Intel Westmere processors. On appliances with this processor, SSL bulk encryption performance for AES cipher will be significantly enhanced.

PUSH Flag-Based Encryption Trigger Mechanism

The encryption trigger mechanism that is based on the PUSH TCP flag now enables you to do the following:

- Merge consecutive packets in which the PUSH flag is set into a single SSL record or ignore the PUSH flag on packets.
- Perform timer-based encryption, in which the time-out value is set globally using the `set ssl parameter -pushEncTriggerTimeout <positive_integer>` command.

The options that are available for the PUSH encryption trigger enhancements are:

- **Always.** Any PUSH packet triggers encryption
- **Ignore.** Ignore PUSH packet for triggering encryption
- **Merge.** For consecutive sequence of PUSH packets, last PUSH packet triggers encryption
- **Timer.** PUSH packet triggering encryption delayed by timer period defined in '`set ssl parameter`'

The default value is "Always."

Importing an External Key as a FIPS Key (nCore MPX FIPS appliance only)

You can now import an external key as a FIPS key on the MPX 9700/10500/12500/15500 10G FIPS appliances. The key should be in PEM format and not be encrypted. When importing an external key on the MPX appliances, you do not need a wrap key, nor do you have to convert the key to PKCS8 format.

SSL Enhancements in the NetScaler Configuration Utility

Configuring the NetScaler for SSL Offloading has been made simpler with the following enhancements to the SSL landing page in the NetScaler configuration utility:

- Direct links to create a server certificate, root CA certificate, intermediate CA certificate, and client certificate.
- Access to the OpenSSL interface from the configuration utility.

In addition:

- When you remove a certificate-key pair, you are prompted to remove the certificate file from the appliance.
- To avoid errors in linking certificates, when you select a certificate and click Link, only certificates that can be linked to the selected certificate are listed.

Warm Restart Option On 10G FIPS Appliances (nCore only)

Warm restart is now supported on MPX 9700/10500/12500/15500 10G FIPS appliances.

System

The following system enhancements are available in this release.

Enhanced Application Visibility Using AppFlow (nCore and nCore VPX only)

The Citrix® NetScaler® appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits this information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called flow records, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.

To limit the types of flows to monitor, by sampling and filtering the application traffic, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

Rate Limiting Notification (nCore and nCore VPX only)

You can now configure a threshold to trigger an alarm to send SNMP traps when the throughput rate (in Mbps) reaches the specified threshold. You must configure the threshold to a value lesser than the maximum throughput of the NetScaler appliance. The maximum throughput is based on the license installed on the NetScaler appliance. The platform sends the platformRateLimitThresholdHigh trap when the throughput rate exceeds the high threshold. When the throughput rate returns to the normal limit, the platformRateLimitThresholdNormal trap is sent.

You can use the following command to set the snmp alarm and specify the maximum and the normal threshold limits:

set snmp alarm PF-RL-RATE-THRESHOLD [**-thresholdValue** <positive_integer> [**-normalValue** <positive_integer>]] [**-time** <secs>] [**-state** (**ENABLED** | **DISABLED**)] [**-severity** <severity>] [**-logging** (**ENABLED** | **DISABLED**)]

Optimizing the TCP Maximum Segment Size for a Virtual Server Configuration

In earlier releases, when a client connects to a virtual server on the NetScaler appliance, the appliance responds with either the default Maximum Segment Size (MSS) value of 1460 or the MSS advertised by the client. Now, you can specify the MSS that the appliance advertises to a client when the client initiates a connection to a virtual server on the appliance. You can configure the MSS for the virtual servers configured on the appliance in two ways:

- You can set the MSS for each virtual server to a value of your choice in a TCP profile.
- You can set the learnVsvrMSS global TCP parameter to ENABLED to enable MSS learning for all the virtual servers configured on the appliance.

For more information about optimizing the TCP maximum segment size for a virtual server configuration, see the "Advanced Configurations" chapter of the *Citrix NetScaler Administration Guide* at http://support.citrix.com/article/CTX128667.

Specifying a TCP Buffer Size Globally and for Virtual Servers and Services

Now, you can set the TCP buffer size both globally and for individual virtual servers and services through TCP profiles. The value that you set is the minimum value that is advertised by the NetScaler appliance and reserved when clients initiate a connection that is associated with an endpoint application function such as compression or SSL. If the TCP buffer size is set both at the global level and at the entity level (virtual server or service level), the buffer size that is specified for the virtual server takes precedence over the global value. For more information about specifying a TCP buffer size globally and for virtual servers and services, see the "Advanced Configurations" chapter of the *Citrix NetScaler Administration Guide* at http://support.citrix.com/article/CTX128667.

Memory Consumption Statistics for NetScaler Features

You can run the following command at the command prompt to view the NetScaler memory currently allocated for a particular feature, the percentage of memory allocated for the feature, and the total number of allocation failures for the feature:

```
stat ns memory
```

Statistics for Overall System Memory Consumption

You can view statistics for overall system memory consumption by running the following command at the NetScaler command prompt:

```
Stat system memory
```

The output of the command includes information about total available system memory, memory allocated in megabytes, percentage of memory allocated, in-use memory in megabytes, percentage of memory in use, and shared memory.

Filtering a NetScaler Trace to Capture Information About an Interface or a VLAN ID

You can now run a trace on the NetScaler appliance and filter packets associated with a given interface or VLAN ID. Only the packets that are filtered are captured in the trace files. To filter the trace for a given interface or VLAN ID, you must include the filter option in the nstrace command. The option takes a simple or compound expression. The expression must specify the interface or VLAN ID for which the trace must be filtered.

To capture the trace for a given interface on the appliance, at the NetScaler command prompt, type the following command:

nstrace -filter <expression>

The following example captures the trace at interface 1/1 by using a simple expression:

```
nstrace -filter "intf == 1/1"
```

The following example captures the trace at interface 1/1 and further filters the trace for packets associated with TCP destination port 80:

```
nstrace -filter "intf == 1/1 && destport == 80"
```

To capture the trace for a given VLAN ID, at the NetScaler command prompt, type the following command:

nstrace -filter "vlan <operator> <vlanid>**"**

The operator in the expression for filtering the trace on the basis of a VLAN ID can be equal to (==), not equal to (!=), less than (<), greater than (>), less than or equal to (<=), or greater than or equal to (>=).

The following example captures the trace for a VLAN with ID equal to 1:

```
nstrace -filter "vlan == 1"
```

Time Stamp of the Last Configuration Change

The “show nsconfig” command now displays the time stamp of the most recent change in the running configuration on the NetScaler.

View System Date in the NetScaler Command Line

The show ns config now displays the system date and time. The date and time of the NetScaler appliance is the date and time of the location in which the NetScaler is located. To change the system date and time, you must use the shell interface to the underlying FreeBSD OS.

Omitting Device-Specific Information in Output

An option `ignoredevspecific` has been introduced in the `diff ns config` command for not displaying device-specific information (such as IP address and host name) in the output.

Web Interface on NetScaler (nCore and nCore VPX only)

The Web Interface on NetScaler is based on Java Server Pages (JSP) technology and provides access to Citrix® XenApp™ and Citrix® XenDesktop® applications. Users access resources through a standard Web browser or by using the Citrix XenApp plug-in.

The Web Interface runs as a service on port 8080 on the NetScaler appliance. To create Web Interface sites, Java is executed on Apache Tomcat Web server version 6.0.26 on the NetScaler appliance. The Web Interface sites provide user access to the XenApp and XenDesktop resources, which include applications, content, and desktops.

For information about the Web Interface feature, see the "Advanced Configuration" chapter of the *Citrix NetScaler Administration Guide* at http://support.citrix.com/article/CTX128667.

Traffic Management

The following traffic management enhancements are available in this release.

Load Balancing of Branch Repeaters for WAN Optimization (nCore and nCore VPX only)

Now, to provide high-scale WAN optimization, the branch repeaters deployed at data centers can be load balanced through NetScaler appliances. The bandwidth and number of concurrent sessions can be improved significantly.

DataStream™ (nCore and nCore VPX only)

The DataStream feature of NetScaler provides an intelligent mechanism for request switching at the database layer by distributing requests based on the SQL query being sent.

When deployed in front of database servers, a NetScaler ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and on the basis of database names, usernames, character sets, and packet size.

You can either configure load balancing to switch requests based on load balancing algorithms or elaborate the switching criteria by configuring content switching to make a decision based on SQL query parameters, such as user name and database name, command parameters. You can further configure monitors to track the state of database servers.

The advanced policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process the requests. The advanced expressions evaluate traffic associated with MySQL database servers. You can use request-based expressions (expressions that begin with `MYSQL.CLIENT` and `MYSQL.REQ`) in advanced policies to make request switching decisions at the content switching virtual server bind point and response-based expressions (expressions that begin with `MYSQL.RES`) to evaluate server responses to user-configured health monitors. For more information about these expressions, see the "Evaluating Connections to Database Servers" chapter in the *Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Note: DataStream is supported only for MySQL databases. For information about the DataStream feature, see the "DataStream" chapter in the *Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

XenApp and XenDesktop Load Balancing Wizard Enhancements

Now, through the wizards for load balancing Citrix XenApp and Citrix XenDesktop, you can do the following:

- Choose to use the HTTP protocol for the backend communication even when the protocol for front-end communication is SSL.
- Specify any port number or use the port number specified on the virtual server.
- By default, the wizard selects the site path for the latest version of WI 5.x. You can select any path or specify a path of your choice.

No-Monitor Option for Services and Service Groups

If you do not want the NetScaler appliance to monitor a service or service group, you can disable monitoring by using the `healthMonitor` option for that service or service group. When the healthMonitor option is set to `NO`, the NetScaler appliance does not monitor the health of the service, and the service is always shown as `UP`.

Hash-Based Load Balancing Method

The hash-based load balancing algorithms have been enhanced to support pseudo-group persistency across multiple virtual servers. This pseudo-group persistency can be achieved by specifying a hash ID, which will be used for calculating the hash.

Support for Remote Desktop Protocol Load Balancing (nCore and nCore VPX only)

Starting this release, the NetScaler appliance supports Remote Desktop Protocol load balancing with session persistency. If the user reconnects with the session cookie, the NetScaler appliance connects the client to the server to which it was previously connected.

Policy-Based Routing Domains (nCore and nCore VPX only)

Now, enabling the L2Conn parameter for a load balancing virtual server allows multiple TCP and non-TCP connections with the same 4-tuple (<source IP>:<source port>::<destination IP>:< destination port>) to co-exist on the NetScaler appliance. The appliance uses both the 4-tuple and the Layer 2 parameters to identify TCP and non-TCP connections. The L2Conn parameters are the MAC address, VLAN ID, and channel ID, which are the Layer 2 parameters.

You can enable the L2Conn option in the following scenario:

1. Multiple VLANs are configured on the NetScaler appliance, and a firewall has been set up for each VLAN.

2. You want the traffic originating from the servers in one VLAN and bound for a virtual server in another VLAN to pass through the firewalls configured for both VLANs.

Note: In NetScaler 9.3 Classic, the l2Conn parameter, which specifies that Layer 2 connection parameters must also be used to uniquely identify a connection, is not supported for load balancing virtual servers even though it is listed in the CLI command synopses for load balancing virtual servers. The parameter is supported only for cache redirection virtual servers. In NetScaler 9.3 nCore, the parameter is supported for both load balancing virtual servers and cache redirection virtual servers. Therefore, when an nCore NetScaler appliance on which the l2Conn parameter is set for one or more load balancing virtual servers is downgraded to a Classic build or to an nCore build that does not support the l2Conn parameter, the load balancing configurations that use the l2Conn parameters are lost.

Graceful Shutdown of Backend Services

When you disable a service, if you cannot estimate the approximate amount of time it takes for all the connections of the service to complete their transactions, you can choose to shut down the service gracefully. In case of a graceful shutdown, the service is moved out of the service state only after all the clients connected to that service have either completed their transactions or are closed.

Additional Statistics for Load Balancing Virtual Servers

Now, in the statistics of virtual servers, you can see at the same time the number of hits per second for all the virtual servers configured on the NetScaler.

Persistence Time-out Option

The default time-out value for any persistence other than the cookie persistence is two minutes. If the time-out value is set to less than two minutes, the following error message appears:

ERROR: "Timeout value out of range; enter a value between 2 minutes and 1440 minutes"

Virtual Servers Bound to a Service Group

A new command show servicegroupbindings <serviceGroupName> displays the load balancing virtual servers that are bound to a service group.

Domain-Name-Based Service Groups

You can now bind domain-name-based service (DBS) members to a service group, in addition to IP-address-based members. If you bind the member on the basis of its domain name, you need not reconfigure the member on the NetScaler whenever the IP address of the member changes. The NetScaler automatically detects such changes.

N-tier Cache Redirection

You can deploy NetScaler appliances in two tiers (layers), with the appliances in the upper tier load balancing those in the lower tier, and the appliances in the lower tier load balancing the cache servers. The two-tier cache redirection helps in handling huge amounts (several Gbps) of traffic.

Sessionless Load Balancing in IP Mode

You can do sessionless load balancing in the IP-based forwarding mode as well as in the MAC-based forwarding mode. For sessionless load balancing in the IP mode, you need not configure the IP address of the virtual server on the physical servers.

Customization of the HTTPONLY Flag (Classic only)

You can now customize the addition of the “httponly” flag in persistence cookies. At the NetScaler command line, type:

set lb parameter [**-httpOnlyCookieFlag** (ENABLED|DISABLED)]

The flag is enabled by default.

Enhancement of XenDesktop Monitors

The XD-DDC monitor for the Dynamic Desktop Controller (DDC) servers of Citrix® XenDesktop™ includes more intelligent health checks. The DDC monitor can validate the login credentials.

The new CITRIX-WEB-INTERFACE monitor for the Web Interface component monitors a dynamic page in the specified site path. The dynamic page helps to check for critical failures in resource availability.

You can use the CITRIX-WI-EXTENDED monitor to verify the validity of the login credentials, correct configuration of the monitor (for example, the site path), and the connection with the IIS server.

Link Load Balancing

You can now configure multiple link load balancing (LLB) routes by specifying the same virtual server name as the gateway.

Rule-Based Persistence for ANY Type Virtual Servers

You can configure the load balancing virtual servers that have the service type as "ANY" with rule-based persistence. This can be used for load balancing the Branch Repeater appliances for WAN optimization and for any other physical servers.

NetScaler 9.3 Known Issues and Workarounds

The following known issues have been identified in this release.

Note: Unless stated otherwise, the known issues apply to Citrix® NetScaler® 9.3 Classic, NetScaler 9.3 nCore™, and NetScaler® 9.3 nCore™ VPX™. Workarounds are included where applicable.

Access Gateway Issues

Issue ID 81494

If users access a Distributed File Share on a computer running Windows Server 2008 64-bit, a blank folder appears in the directory path.

Issue ID 83492

When users log on using clientless access, a JavaScript error might appear when the logon page opens.

Issue ID 83819

If you configure a load balancing virtual server and the destination port is 21, when users log on with the Access Gateway Plug-in, logon is successful but data connections do not go through. When you configure a load balancing virtual server, do not use port 21.

Issue ID 84894

When users log off from the Access Gateway Plug-in and then clear the cache in Internet Explorer and Firefox, users might receive an error message that says "Error. Not a privileged user." Access Gateway records an HTTP/1.1 403 Access Forbidden error message in the logs.

Issue ID 84915

If users attempt to open and edit a Microsoft Office file from Outlook Web Access, users might receive an error and the file takes a long time to open. To allow users to edit files from Outlook Web Access, do the following:

1. Create a clientless access Outlook Web Access Profile and enable persistent cookies.
2. Bind the Outlook Web regular expression to this profile.
3. Bind the profile so that is assumes the highest priority.

Issue ID 85861

If you enable **ICA Proxy** on Access Gateway, when users log on and attempt to open a virtual application, the connection times out and terminates.

Issue ID 85906

When users log on with an earlier version of the Access Gateway Plug-in, users do not receive the upgrade prompt and the user device receives a session ID. However, the session is not established and the Web browser trying to load the file services.html and upgrading the plug-in both fail.

Issue ID 86022

If you configure the user device to enable users to log on only using the Access Gateway Plug-in and then change the plug-in Web address to an unresolvable address, when users try to log on through the logon dialog box, an authentication error appears. Then, if users try to log on using the plug-in, the logon dialog box does not appear and users cannot change the Web address. Users should exit and then restart the plug-in to subsequently change the Web address.

Issue ID 86122

If you disable transparent interception and set the force time-out setting, when users log on with the Access Gateway Plug-in for Java, when the time-out period expires, a session time-out message appears on the user device, however the session is not terminated on Access Gateway.

Issue ID 86123

If users log on with clientless access in the Firefox Web browser, when users click a link for a virtual application, the tab closes and the application does not start. If users right-click the virtual application and attempt to open it in a new window, the Web Interface appears and users receive the warning "Published resource shortcuts are currently disabled." Users can open the virtual application in Internet Explorer.

Issue ID 86323

If you configure single sign-on with Windows and configure the user name with special characters, when users log on to Windows 7 Professional, single sign-on fails. Users receive the error message "Invalid username or password. Please try again." This issue does not occur if users log on to Windows XP.

Issue ID 86470 and 86787

When users log on with the Access Gateway Plug-in for Windows using Internet Explorer 9, a delay may occur in establishing the connection. The Access Interface, or a custom home page, might take a long time to appear when users log on using Internet Explorer 9.

Issue ID 86471

When users log on with the Access Gateway Plug-in by using a Web browser, users might see a delay during logon.

Issue ID 86722

When users log on with clientless access using Internet Explorer 9 and connect to SharePoint 2007, some images might not appear correctly.

Application Firewall Issues

Issue ID 77089

In certain cases, transformation does not work correctly for allowed/denied XSS patterns defined in custom settings file.

Issue ID 81616

Attempts to upload a 10 MB or larger file may fail when Cross-Site Scripting (XSS) and SQL Injection checks are enabled.

Issue ID 83088

Sig Rule 16218 blocks any request with Content-length Header and should only be enabled by the user after careful consideration since it will block all POST requests.

Issue ID 83089

The users can look at the default signature rules in GUI, but it will be useful to have a comprehensive list of all the rules accessible in documentation or white papers for users to review.

Issue ID 81650

Certain XML schemas may be imported successfully, but when the user attempts to bind that XML schema to an Application Firewall profile, the binding fails.

Workaround: Avoid using XML schemas that contain DOCTYPE definitions with references to a DTD.

Issue ID 83707

The Application Firewall does not import XML schema or WSDL files that contain non-ASCII characters correctly. Attempting to import such files results in a partial import.

Workaround: Convert XML schema or WSDL files to ASCII before importing them.

Issue ID 83754

The Application Firewall may fail to detect a signature violation in a request that contains trailing spaces after the PCRE match expression sent in an HTTP header.

Issue ID 86782

Importing Application Firewall objects, such as signatures and HTML error pages may fail on the first attempt if the import command contains a very long source URL. The command will succeed when executed for the second time.

Issue ID 82058

The "unique" element in the XML schema is currently not supported.

Issue ID 82059

The "redefine" element in the XML schema is currently not supported.

Issue ID 82069

When the Application Firewall validates XML messages, it does not validate the contents of elements that are defined as type "any" in the applicable XML schema. Specifically, it treats these elements as if the processContent attribute was set to "skip".

Workaround: Replace the "any" type definitions in the XML schemas with definitions of the actual elements that occur in the XML message. (The "any" type is rarely used.)

Command-Line Interface Issues

Issue ID 77865

In certain rare cases, connection to the NetScaler over Secure FTP (SFTP) by using superuser (administrator) credentials other than nsroot fails.

Configuration Utility Issues

Issue ID 87595

When upgrading the NetScaler appliance from 9.2 e release to 9.3 release using the **Upgrade wizard** in the configuration utility, if you keep the wizard idle for 5 minutes then the **Yes** and **No** radio buttons will disappear.

Issue ID 86201

If you use Internet Explorer 9 to log on to the NetScaler configuration utility, the following page is displayed: res://ieframe.dll/acr_error.htm.

The page displays the following message: "A problem with this Web page caused Internet Explorer to close and reopen the tab."

Workaround: Enable Compatibility View in the browser and then log on to the NetScaler configuration utility.

DataStream Issues

Issue ID 82084

On receiving the MySQL nit_db command from the client, the virtual server of type MySQL links the client connection permanently with a server-side connection and no further requests on that client connection are multiplexed.

Issue ID 82872

If the connection to the database server is a transaction or if special queries are sent to the database server, the maximum request per connection setting is overridden and all the queries are sent using the same connection.

Integrated Cache Issues

Issue ID 81159

When the NetScaler appliance receives a single byte-range request, if the starting position of the range is beyond 9 megabytes, the appliance sends the client a full response with a status code of `200 OK` instead of a partial response.

Load Balancing Issues

Issue ID 80170

The syntax of the `unset servicegroup` command has been changed to allow unsetting of the parameters of the service group members. This can cause XML API incompatibility with respect to the `unset servicegroup` command.

Issue ID 82929

If a TCP monitor is configured for a MySQL service, attempts by the NetScaler appliance to establish a connection with the MySQL server are treated as failed logon attempts. After some time, the MySQL server blocks the NetScaler mapped IP address (MIP) from making new MySQL connections and returns the following error message: "MYSQL Server Greeting Error 1129 Host <hostname> is blocked because of many connection errors; unblock with 'mysqladmin flush-hosts'"

Workaround: Bind a MYSQL_ECV monitor to the MySQL service.

Issue ID 82996

The MySQL monitor shows the state of the service as UP even if a mapped IP address (MIP) or subnet IP address (SNIP) is not configured on the NetScaler.

Issue ID 83862 (nCore and nCore VPX only)

In this release, IPv6 addresses are not supported in the DataStream feature.

Issue ID 83924 (nCore and nCore VPX only)

When the MySQL server responds with an error to a syntactically or semantically incorrect SET command that is sent by the client, the NetScaler appliance resets the

client connection.

Issue ID 86096

When you configure the WI-EXTENDED monitor, when specifying the site path, do not enter a slash (/) at the end of the path as the software internally adds a slash at the end of the path. For example, note the following command:

add monitor wi CITRIX-WI-EXTENDED -**sitepath** "/Citrix/DesktopWeb" **-username** aaa **-password** bbb **-domain** ccc

Issue ID 87407 (nCore and nCore VPX only)

When an RDP service is configured, the NetScaler appliance automatically maintains persistence through session cookies using Session Directory. You need not explicitly configure persistency on NetScaler. In the next releases IP address based persistency will be supported.

In some situations, (where multiple persons use same user-login credentials) session cookie persistence may not be helpful and IP-based persistence methods will be necessary. In some other situations, load balancing of the RDP services without persistence may be necessary. That is, each new connection to an RDP virtual server needs to be load balanced irrespective of a user's disconnected session existing on a terminal server.

Issue ID 87201 (Classic only)

On a load balancing virtual server for TCP services on which stateful connection failover is enabled, an established connection may be broken if a failover occurs more than once while a large amount of data is being transferred.

Issue ID 87242 (Classic only)

On a load balancing virtual server for FTP services on which connection failover is enabled and USIP mode is enabled for the service, if a failover occurs and the client sends a new FTP command before the CM connections are re-established, the established FTP control connection breaks.

NITRO API Issues

Issue ID 83274

When you use the NITRO API to run the `unset` commands for a service or service group, the NetScaler log file (ns.log) shows two `unset` commands and one associated `set` command instead of one `unset` command and one associated `set` command.

Reporting Issues

Issue ID 85025

The Reporting tool chart does not properly plot counters per packet engine.

SSL Issues

Issue ID 74279

The cipher TLS1-EXP1024-DES-CBC-SHA is not supported by the NetScaler appliance.

Issue ID 81825

If you import an external key as a FIPS key, you cannot create a certificate signing request with this key.

Issue ID 82908

In certain rare cases, when the NetScaler appliance is subject to conditions of heavy SSL-related traffic, CLI commands fail and report a configuration inconsistency error.

Workaround: Check for configuration inconsistency by using the "show configstatus" command and reconfigure the appliance under low traffic conditions or during a maintenance period. If this does not resolve the issue, restart the appliance.

Issue ID 80830 (nCore only)

When you attempt to delete an SSL certificate key-pair object that is referenced by a Certificate Revocation List (CRL), the message, " ERROR: Configuration possibly inconsistent. Please check with the "show configstatus" command or reboot," is displayed. This message is not the intended message. However, on the subsequent attempt to delete the certificate key-pair object, the correct message, " ERROR: Certificate is referenced by a CRL, OCSP responder, virtual server, service, or another certificate," is displayed.

MPX 9700/10500/12500/15500 10G FIPS Appliances Issues

Issue ID 81850 (nCore only)

You cannot import an external, encrypted FIPS key directly to an MPX 9700/10500/12500/15500 10G FIPS appliance.

Workaround: First, decrypt the key, and then import it. To decrypt the key, at the shell prompt, type:

openssl rsa -in <EncryptedKey.key> > **DecryptedKey.out**

Issue ID 85522 (nCore only)

Signed OCSP requests fail if the requests are encrypted by using an imported external FIPS key. This is a known bug in the crypto card's firmware, which returns "0" for the modulus of an imported external FIPS key.

System Issues

Issue ID 84282

If the global setting for the maximum segment size (mss) to use for TCP connections is less than 1220, the NetScaler appliance causes excessive delay to save the configuration.

Issue ID 65259

As a result of the Apache2 upgrade, customers need to remove any `/nsconfig/httpd.conf` file they have used to customize their httpd runtime environment. The older `httpd.conf` files are not forward-compatible with Apache2.

NetScaler VPX Issues

Issue ID 87605

For an instance of NetScaler VPX running on VMware ESX server, you need to enable promiscuous mode on the corresponding virtual switch (vswitch) port to configure the following on VPX:

- Virtual MAC address (VMAC)
- Link Aggregation (LA)
- LA with Link Aggregation Control Protocol (LACP)

Issue ID 87858

You can use the 9.3 xva images for XenServer to create a new VPX instance on XenServer version 5.6 and 5.6 FP1. You can also upgrade an existing VPX instance running on XenServer version 5.0 or version 5.5 to release 9.3. However, on appliances running XenServer version 5.0 or version 5.5, you cannot create a new VPX instance from the 9.3 xva image.

Getting Started with Citrix NetScaler

Intended for system and network administrators who install and configure complex networking equipment, this section of the library describes initial set-up and basic configuration of the NetScaler, including the following topics.

Understanding the NetScaler	What a NetScaler is and where it fits in a network, with descriptions of entities used in typical configurations and the order in which data is processed by the various features.
Introduction to the NetScaler Product Line	Brief introduction to the software and hardware platforms. Also covers the feature groups.
Installing the NetScaler Hardware	Tasks for unpacking and installing the hardware, including rack mounting, connecting transceivers, connecting the console cable, connecting to a power source, and connecting to a network.
Accessing a NetScaler	Descriptions of the CLI and GUI access mechanisms that you can use to configure and monitor a NetScaler.
Configuring a NetScaler for the First Time	Procedures for configuring a NetScaler for the first time.
Understanding Common Network Topologies	Describes the four common deployment topologies: Two-Arm Multiple Subnet, Two-Arm Transparent, One-Arm Single Subnet, and One-Arm Multiple Subnet. Includes topology diagrams, sample values, and references.
Configuring System Management Settings	Procedures for configuring basic system management settings, such as VLANs, SNMP, and DNS.
Load Balancing Traffic	Basic introduction to the load balancing feature. Includes procedures for configuring a basic load balancing setup to deliver a Web application, and procedures for configuring persistence, URL redirection, and backup vservers.
Accelerating Load Balanced Traffic by Using Compression	Basic introduction to the compression feature. Includes procedures for configuring a NetScaler to compress application traffic.

Securing Load Balanced Traffic by Using SSL	Basic introduction to the SSL offload feature. Includes procedures for configuring a NetScaler to secure application traffic by using SSL.
Features at a Glance	Brief description of all the features, with links to documentation for the features.

Understanding the NetScaler

The Citrix® NetScaler® product is an application switch that performs application-specific traffic analysis to intelligently distribute, optimize, and secure Layer 4-Layer 7 (L4-L7) network traffic for web applications. For example, a NetScaler makes load balancing decisions on individual HTTP requests rather than on the basis of long-lived TCP connections, so that the failure or slowdown of a server is managed much more quickly and with less disruption to clients. The NetScaler feature set can be broadly categorized as consisting of switching features, security and protection features, and server-farm optimization features.

Understanding the NetScaler

The Citrix® NetScaler® product is an application switch that performs application-specific traffic analysis to intelligently distribute, optimize, and secure Layer 4-Layer 7 (L4-L7) network traffic for web applications. For example, a NetScaler makes load balancing decisions on individual HTTP requests rather than on the basis of long-lived TCP connections, so that the failure or slowdown of a server is managed much more quickly and with less disruption to clients. The NetScaler feature set can be broadly categorized as consisting of switching features, security and protection features, and server-farm optimization features.

Switching Features

When deployed in front of application servers, a NetScaler ensures optimal distribution of traffic by the way in which it directs client requests. Administrators can segment application traffic according to information in the body of an HTTP or TCP request, and on the basis of L4-L7 header information such as URL, application data type, or cookie. Numerous load balancing algorithms and extensive server health checks improve application availability by ensuring that client requests are directed to the appropriate servers.

Security and Protection Features

NetScaler security and protection features protect web applications from application-layer attacks. A NetScaler allows legitimate client requests and can block malicious requests. It provides built-in defenses against denial-of-service (DoS) attacks and supports features that protect applications against legitimate surges in application traffic that would otherwise overwhelm the servers. An available built-in firewall protects web applications from application-layer attacks, including buffer overflow exploits, SQL injection attempts, cross-site scripting attacks, and more. In addition, the firewall provides identity theft protection by securing confidential corporate information and sensitive customer data.

Optimization Features

Optimization features offload resource-intensive operations such as Secure Sockets Layer (SSL) processing, data compression, client keep-alive, TCP buffering, and the caching of static and dynamic content from servers. This improves the performance of the servers in the server farm and therefore speeds up applications. A NetScaler supports several transparent TCP optimizations, which mitigate problems caused by high latency and congested network links, accelerating the delivery of applications while requiring no configuration changes to clients or servers.

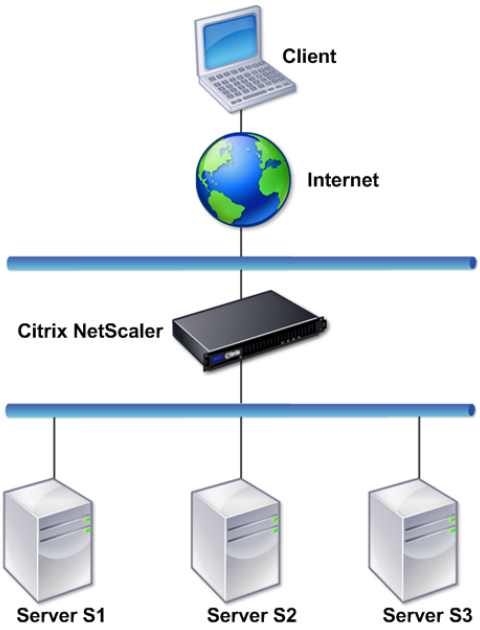
Where Does a NetScaler Fit in the Network?

A NetScaler resides between the clients and the servers, so that client requests and server responses pass through it. In a typical installation, virtual servers (vservers) configured on the NetScaler provide connection points that clients use to access the applications behind the NetScaler. In this case, the NetScaler owns public IP addresses that are associated with its vservers, while the real servers are isolated in a private network. It is also possible to operate the NetScaler in a transparent mode as an L2 bridge or L3 router, or even to combine aspects of these and other modes.

Physical Deployment Modes

A NetScaler logically residing between clients and servers can be deployed in either of two physical modes: inline and one-arm. In inline mode, multiple network interfaces are connected to different Ethernet segments, and the NetScaler is placed between the clients and the servers. The NetScaler has a separate network interface to each client network and a separate network interface to each server network. The NetScaler and the servers can exist on different subnets in this configuration. It is possible for the servers to be in a public network and the clients to directly access the servers through the NetScaler, with the NetScaler transparently applying the L4-L7 features. Usually, vservers (described later) are configured to provide an abstraction of the real servers. The following figure shows a typical inline deployment.

Figure 1. Inline Deployment



In one-arm mode, only one network interface of the NetScaler is connected to an Ethernet segment. The NetScaler in this case does not isolate the client and server sides of the network, but provides access to applications through configured vservers. One-arm mode can simplify network changes needed for NetScaler installation in some environments.

For examples of inline (two-arm) and one-arm deployment, see Understanding Common Network Topologies.

Citrix NetScaler as an L2 Device

A NetScaler functioning as an L2 device is said to operate in L2 mode. In L2 mode, the NetScaler forwards packets between network interfaces when all of the following conditions are met:

- The packets are destined to another device's media access control (MAC) address.
- The destination MAC address is on a different network interface.
- The network interface is a member of the same virtual LAN (VLAN).

By default, all network interfaces are members of a pre-defined VLAN, VLAN 1. Address Resolution Protocol (ARP) requests and responses are forwarded to all network interfaces that are members of the same VLAN. To avoid bridging loops, L2 mode must be disabled if another L2 device is working in parallel with the NetScaler.

For information about how the L2 and L3 modes interact, see Configuring Modes of Packet Forwarding.

For information about configuring L2 mode, see Enabling and Disabling Layer 2 Mode.

Citrix NetScaler as a Packet Forwarding Device

A NetScaler can function as a packet forwarding device, and this mode of operation is called L3 mode. With L3 mode enabled, the NetScaler forwards any received unicast packets that are destined for an IP address that it does not have internally configured, if there is a route to the destination. A NetScaler can also route packets between VLANs.

In both modes of operation, L2 and L3, a NetScaler generally drops packets that are in:

- Multicast frames
- Unknown protocol frames destined for a NetScaler's MAC address (non-IP and non-ARP)
- Spanning Tree protocol (unless BridgeBPDUs is ON)

For information about how the L2 and L3 modes interact, see Configuring Modes of Packet Forwarding.

For information about configuring the L3 mode, see Enabling and Disabling Layer 3 Mode.

How a NetScaler Communicates with Clients and Servers

A NetScaler is usually deployed in front of a server farm and functions as a transparent TCP proxy between clients and servers, without requiring any client-side configuration. This basic mode of operation is called Request Switching technology and is the core of NetScaler functionality. Request Switching enables a NetScaler to multiplex and offload the TCP connections, maintain persistent connections, and manage traffic at the request (application layer) level. This is possible because the NetScaler can separate the HTTP request from the TCP connection on which the request is delivered.

Depending on the configuration, a NetScaler may process the traffic before forwarding the request to a server. For example, if the client attempts to access a secure application on the server, the NetScaler might perform the necessary SSL processing before sending traffic to the server.

To facilitate efficient and secure access to server resources, a NetScaler uses a set of IP addresses collectively known as NetScaler-owned IP addresses. To manage your network traffic, you assign NetScaler-owned IP addresses to virtual entities that become the building blocks of your configuration. For example, to configure load balancing, you create virtual servers (vservers) to receive client requests and distribute them to services, which are entities representing the applications on your servers.

Understanding NetScaler-Owned IP Addresses

To function as a proxy, a NetScaler uses a variety of IP addresses. The key NetScaler-owned IP addresses are:

NetScaler IP address (NSIP)

The NSIP is the IP address for management and general system access to the NetScaler itself, and for HA communication.

Mapped IP address (MIP)

A MIP is used for server-side connections. It is not the IP address of the NetScaler. In most cases, when the NetScaler receives a packet, it replaces the source IP address with a MIP before sending the packet to the server. With the servers abstracted from the clients, the NetScaler manages connections more efficiently.

Virtual server IP address (VIP)

A VIP is the IP address associated with a vserver. It is the public IP address to which clients connect. A NetScaler managing a wide range of traffic may have many VIPs configured.

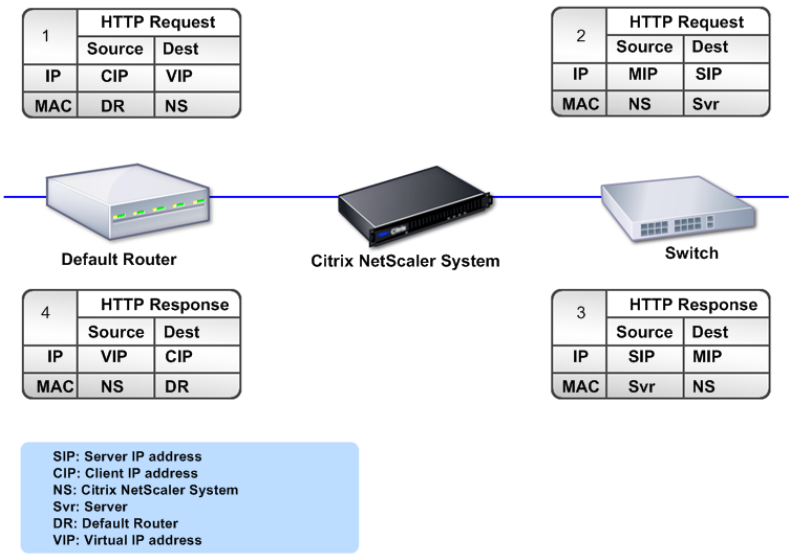
Subnet IP address (SNIP)

When the NetScaler is attached to multiple subnets, SNIPs can be configured for use as MIPs providing access to those subnets. SNIPs may be bound to specific VLANs and interfaces.

How Traffic Flows Are Managed

Because a NetScaler functions as a TCP proxy, it translates IP addresses before sending packets to a server. When you configure a vserver, clients connect to a VIP on the NetScaler instead of directly connecting to a server. Based on the settings on the vserver, the NetScaler selects an appropriate server and sends the client's request to that server. By default, the NetScaler uses a MIP or SNIP to establish connections with the server, as shown in the following figure.

Figure 1. Vserver-Based Connections



Note: You can use SNIP instead of MIP in the preceding figure.

In the absence of a vserver, when a NetScaler receives a request, it transparently forwards the request to the server. This is called the transparent mode of operation. When operating in transparent mode, a NetScaler translates the source IP addresses of incoming client requests to the MIP or SNIP but does not change the destination IP address. For this mode to work, L2 or L3 mode needs to be configured appropriately.

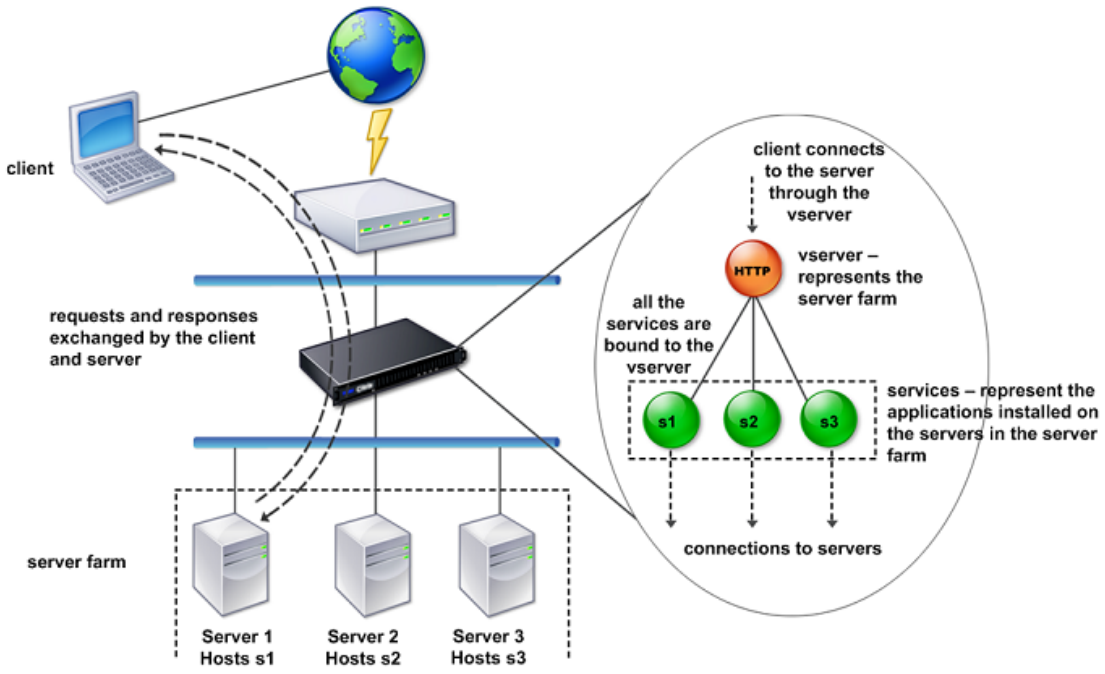
For cases in which the servers need the actual client IP address, the NetScaler can be configured to modify the HTTP header by inserting the client IP address as an additional field, or configured to use the client IP address instead of the MIP or SNIP for connections to the servers.

Traffic Management Building Blocks

The configuration of a NetScaler is typically built up with a series of virtual entities that serve as building blocks for traffic management. The building block approach helps separate traffic flows. Virtual entities are abstractions, typically representing IP addresses, ports, and protocol handlers for processing traffic. Clients access applications and resources through these virtual entities. The most commonly used entities are vservers and services. Vservers represent groups of servers in a server farm or remote network, and services represent specific applications on each server.

Most features and traffic settings are enabled through virtual entities. For example, you can configure a NetScaler to compress all server responses to a client that is connected to the server farm through a particular vserver. To configure the NetScaler for a particular environment, you need to identify the appropriate features and then choose the right mix of virtual entities to deliver them. Most features are delivered through a cascade of virtual entities that are bound to each other. In this case, the virtual entities are like blocks being assembled into the final structure of a delivered application. You can add, remove, modify, bind, enable, and disable the virtual entities to configure the features. The following figure shows the concepts covered in this section.

Figure 1. How Traffic Management Building Blocks Work

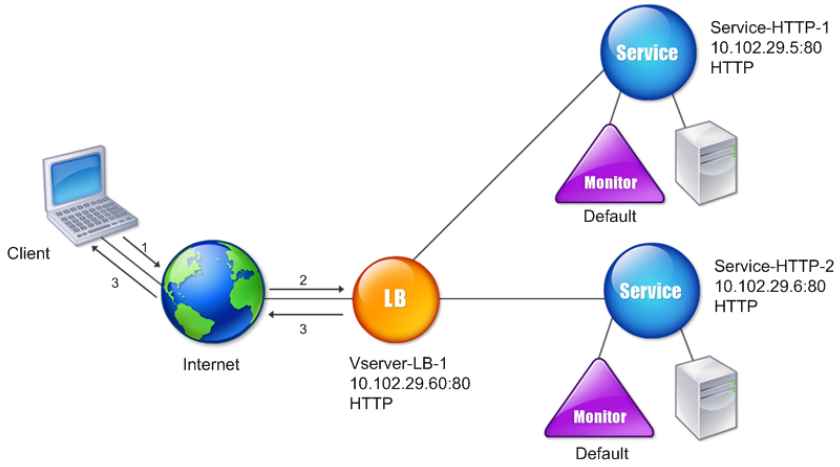


A Simple Load Balancing Configuration

In the example shown in the following figure, the NetScaler is configured to function as a load balancer. For this configuration, you need to configure virtual entities specific to load balancing and bind them in a specific order. As a load balancer, a NetScaler distributes client requests across several servers and thus optimizes the utilization of resources.

The basic building blocks of a typical load balancing configuration are services and load balancing vservers. The services represent the applications on the servers. The vservers abstract the servers by providing a single IP address to which the clients connect. To ensure that client requests are sent to a server, you need to bind each service to a vserver. That is, you must create services for every server and bind the services to a vserver. Clients use the VIP to connect to a NetScaler. When the NetScaler receives client requests on the VIP, it sends them to a server determined by the load balancing algorithm. Load balancing uses a virtual entity called a monitor to track whether a specific configured service (server plus application) is available to receive requests.

Figure 1. Load Balancing Virtual Server, Services, and Monitors



In addition to configuring the load balancing algorithm, you can configure several parameters that affect the behavior and performance of the load balancing configuration. For example, you can configure the vserver to maintain persistence based on source IP address. The NetScaler then directs all requests from any specific IP address to the same server.

Understanding Virtual Servers

A vserver is a named NetScaler entity that external clients can use to access applications hosted on the servers. It is represented by an alphanumeric name, virtual IP address (VIP), port, and protocol. The name of the vserver is only of local significance and is designed to make the vserver easier to identify. When a client attempts to access applications on a server, it sends a request to the VIP instead of the IP address of the physical server. When the NetScaler receives a request on the VIP, it terminates the connection at the vserver and uses its own connection with the server on behalf of the client. The port and protocol settings of the vserver determine the applications that the vserver represents. For example, a web server can be represented by a vserver and a service whose port and protocol are set to 80 and HTTP, respectively. Multiple vservers can use the same VIP but different protocols and ports.

Vservers are points for delivering features. Most features, like compression, caching, and SSL offload, are normally enabled on a vserver. When the NetScaler receives a request on a VIP, it chooses the appropriate vserver by the port on which the request was received and its protocol. The NetScaler then processes the request as appropriate for the features configured on the vserver.

In most cases, vservers work in tandem with services. You can bind multiple services to a vserver. These services represent the applications running on physical servers in a server farm. After the NetScaler processes requests received on a VIP, it forwards them to the servers as determined by the load balancing algorithm configured on the vserver. The following figure shows these concepts.

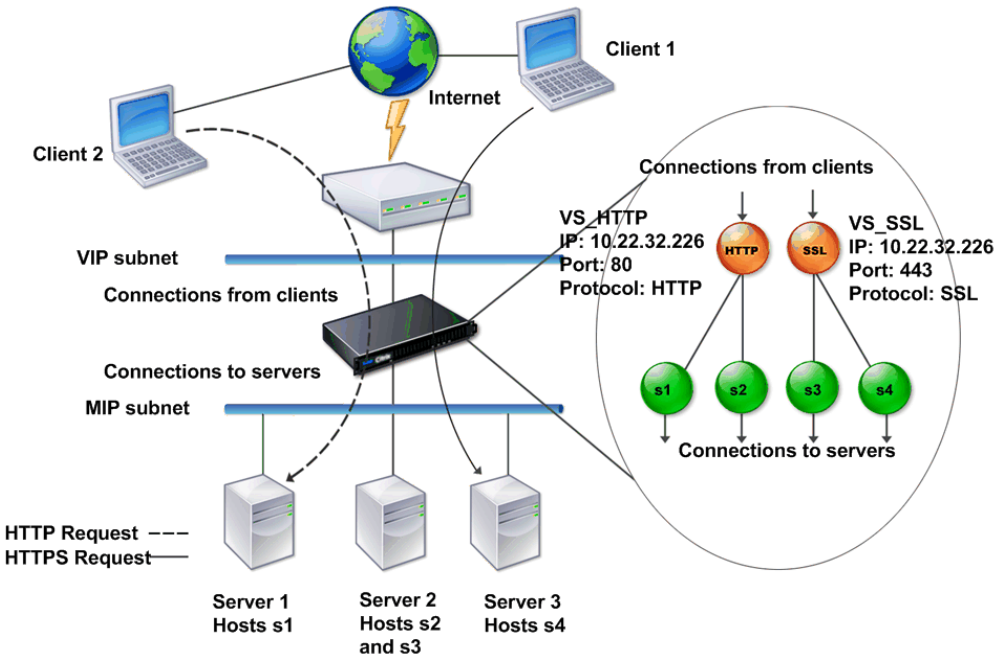


Figure 1. Multiple Virtual Servers on a Single VIP

The preceding figure shows a configuration consisting of two vservers with a common VIP but different ports and protocols. Each of these vservers has two services bound to it. The services s1 and s2 are bound to VS_HTTP and represent the HTTP applications on Server 1 and Server 2. The services s3 and s4 are bound to VS_SSL and represent the SSL applications on Server 2 and Server 3 (Server 2 provides both HTTP and SSL applications). When the NetScaler receives an HTTP request on the VIP, it processes the request based on the settings of VS_HTTP and sends it to either Server 1 or Server 2. Similarly, when the NetScaler receives an HTTPS request on the VIP, it processes it based on the settings of VS_SSL and it sends it to either Server 2 or Server 3.

Vservers are not always represented by specific IP address, port numbers, or protocols. They can be represented by wildcards, in which case they are known as wildcard vservers. For example, when you configure a vserver with a wildcard instead of a VIP, but with a specific port number, the NetScaler intercepts and processes all traffic conforming to that protocol and destined for the predefined port. For vservers with wildcards instead of VIPs and port numbers, the NetScaler intercepts and processes all traffic conforming to the protocol.

Vservers can be grouped into the following categories:

Load balancing virtual server

Receives and redirects requests to an appropriate server. Choice of the appropriate server is based on which of the various load balancing methods the user configures.

Cache redirection virtual server

Redirects client requests for dynamic content to origin servers and static content to cache servers. Cache redirection vservers often work in conjunction with load balancing vservers.

Content switching virtual server

Directs traffic to a server on the basis of the content that the client has requested. For example, you can create a content switching vserver that directs all client requests for images to a server that serves images only. Content switching vservers often work in conjunction with load balancing vservers.

Virtual private network (VPN) virtual server

Decrypts tunneled traffic and sends it to intranet applications.

SSL virtual server

Receives and decrypts SSL traffic, and then redirects to an appropriate server. Choosing the appropriate server is similar to choosing a load balancing virtual server.

Understanding Services

Services represent applications on a server. While services are normally combined with vservers, in the absence of a vserver, a service can still manage application-specific traffic. For example, you can create an HTTP service on a NetScaler to represent a web server application. When the client attempts to access a web site hosted on the web server, the NetScaler intercepts the HTTP requests and creates a transparent connection with the web server.

In service-only mode, a NetScaler functions as a proxy. It terminates client connections, uses a SNIP or MIP to establish a connection to the server, and translates incoming client requests to the SNIP or MIP. Although the clients send requests directly to the IP address of the server, the server sees them as coming from the SNIP or MIP. The NetScaler translates the IP addresses, port numbers, and sequence numbers.

A service is also a point for applying features. Consider the example of SSL acceleration. To use this feature, you must create an SSL service and bind an SSL certificate to the service. When the NetScaler receives an HTTPS request, it decrypts the traffic and sends it, in clear text, to the server. Only a limited set of features can be configured in the service-only case.

Services use entities called monitors to track the health of applications. Every service has a default monitor, which is based on the service type, bound to it. As specified by the settings configured on the monitor, the NetScaler sends probes to the application at regular intervals to determine its state. If the probes fail, the NetScaler marks the service as down. In such cases, the NetScaler responds to client requests with an appropriate error message or re-routes the request as determined by the configured load balancing policies.

Understanding Policies and Expressions

A policy defines specific details of traffic filtering and management on a NetScaler. It consists of two parts: the expression and the action. The expression defines the types of requests that the policy matches. The action tells the NetScaler what to do when a request matches the expression. As an example, the expression might be to match a specific URL pattern to a type of security attack, with the action being to drop or reset the connection. Each policy has a priority, and the priorities determine the order in which the policies are evaluated.

When a NetScaler receives traffic, the appropriate policy list determines how to process the traffic. Each policy on the list contains one or more expressions, which together define the criteria that a connection must meet to match the policy.

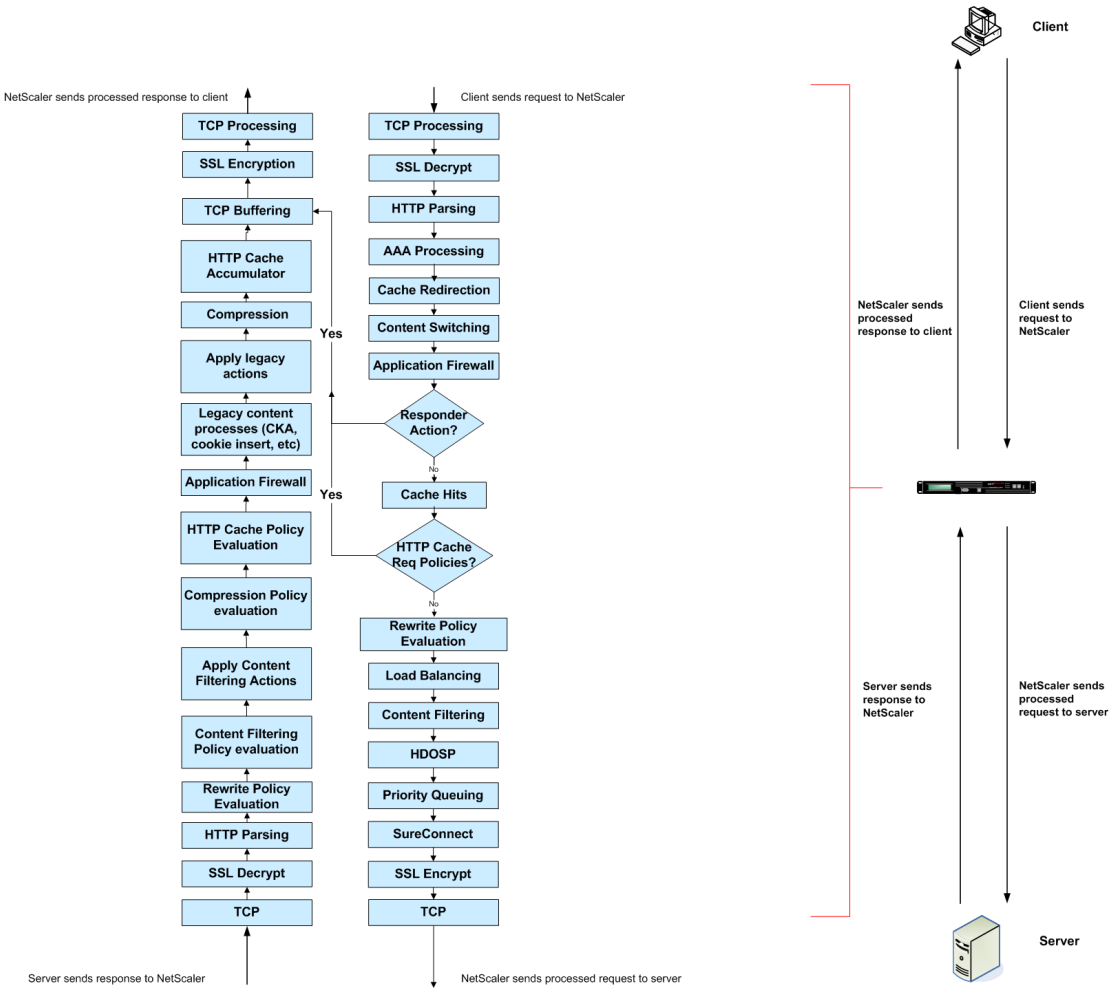
For all policy types except Rewrite policies, a NetScaler implements only the first policy that a request matches, not any additional policies that it might also match. For Rewrite policies, the NetScaler evaluates the policies in order and, in the case of multiple matches, performs the associated actions in that order. Policy priority is important for getting the results you want.

Processing Order of Features

Depending on requirements, you can choose to configure multiple features. For example, you might choose to configure both compression and SSL offload. As a result, an outgoing packet might be compressed and then encrypted before being sent to the client.

The following figure shows the L7 packet flow in the NetScaler.

Figure 1. L7 Packet Flow Diagram



The following figure shows the DataStream packet flow in the NetScaler. DataStream is supported only for MySQL databases. For information about the DataStream feature, see DataStream.

Introduction to the Citrix NetScaler Product Line

The Citrix® NetScaler® product line optimizes delivery of applications over the Internet and private networks, combining application-level security, optimization, and traffic management into a single, integrated appliance. You install a NetScaler appliance in your server room and route all connections to your managed servers through it. The NetScaler features that you enable and the policies you set are then applied to incoming and outgoing traffic.

A NetScaler can be integrated into any network as a complement to existing load balancers, servers, caches,and firewalls. It requires no additional client or server side software, and can be configured using the NetScaler web-based GUI and CLI configuration utilities.

NetScaler appliances are available in a variety of hardware platforms that have a range of specifications, including multicore processors.

The NetScaler operating system is the base operating system for all NetScaler hardware platforms. The NetScaler operating system is available in three editions: Standard, Enterprise, and Platinum.

Citrix NetScaler Hardware Platforms

NetScaler hardware is available in a variety of platforms that have a range of hardware specifications, including multicore processors. All hardware platforms support some combination of Fast Ethernet, Gigabit Ethernet, and 10 Gigabit Ethernet interfaces.

The following platforms are available for NetScaler 9.3.

- Citrix NetScaler 7000
- Citrix NetScaler 9010/9010 FIPS
- Citrix NetScaler 10010
- Citrix NetScaler 12000/12000 10G
- Citrix NetScaler MPX™ 5500
- Citrix NetScaler MPX 7500/9500
- Citrix NetScaler MPX 9700/10500/12500/15500
- Citrix NetScaler MPX 15000
- Citrix NetScaler MPX 17000
- Citrix NetScaler MPX 17500/19500/21500

For more information about the hardware platform specifications, see Introduction to the Hardware Platforms.

The following tables list different editions of the NetScaler and the hardware platforms on which they are available.

Table 1. Product Editions and Standard Hardware Platforms

Hardware	7000	9010	10010	12000
Platinum Edition	Yes	Yes	Yes	Yes
Enterprise Edition	Yes	Yes	Yes	Yes
Standard Edition	Yes	Yes	No	No

Table 2. Product Editions and MPX Hardware Platforms

Hardware	MPX 5500	MPX 7500/9500	MPX 15000	MPX 17000	MPX 9700/10500/12500/15500	MPX 17500/19500/21500

Platinum Edition	Yes	Yes	Yes	Yes	Yes	Yes
Enterprise Edition	Yes	Yes	Yes	Yes	Yes	Yes
Standard Edition	Yes	Yes	Yes	Yes	Yes	Yes

Citrix NetScaler Editions

The NetScaler operating system is available in Standard, Enterprise, and Platinum editions. The Enterprise and Standard editions have limited features available. Feature licenses are required for all editions.

For instructions on how to obtain and install licenses, see NetScaler Licenses.

The Citrix NetScaler editions are described as follows:

Citrix NetScaler, Standard Edition. Provides small and medium enterprises with comprehensive Layer 4- Layer 7 (L4-L7) traffic management, enabling increased web application availability.

Citrix NetScaler, Enterprise Edition. Provides web application acceleration and advanced L4-L7 traffic management, enabling enterprises to increase web application performance and availability and reduce datacenter costs.

- *Citrix NetScaler, Platinum Edition*. Provides a web application delivery solution that reduces data center costs and accelerates application performance, with end-to-end visibility of application performance, and provides advanced application security.

The following table summarizes the features supported by each edition in the Citrix NetScaler product line:

Table 1. Citrix NetScaler Application Delivery Product Line Features

Key Features	Platinum Edition	Enterprise Edition	Standard Edition
Application availability			
Layer 4 load balancing	Yes	Yes	Yes
Layer 7 content switching	Yes	Yes	Yes
AppExpert rate controls	Yes	Yes	Yes
IPv6 support	Yes	Yes	Yes
Global server load balancing (GSLB)	Yes	Yes	Optional
Dynamic routing protocols	Yes	Yes	No
Surge protection	Yes	Yes	No
Priority queuing	Yes	Yes	No
Application acceleration			
Client and server TCP optimizations	Yes	Yes	Yes
Citrix® AppCompress™ for HTTP	Yes	Yes	Optional
Citrix® AppCache™	Yes	Optional	No
Citrix® Branch Repeater™ client	Yes	No	No

Application security			
Layer 4 DoS defenses	Yes	Yes	Yes
Layer 7 content filtering	Yes	Yes	Yes
HTTP/URL Rewrite	Yes	Yes	Yes
Citrix® Access Gateway™, EE SSL VPN	Yes	Yes	Yes
Layer 7 DoS Defenses	Yes	Yes	No
AAA security	Yes	Yes	No
Application Firewall with XML security	Yes	Optional	No
Simple manageability			
AppExpert visual policy builder	Yes	Yes	Yes
AppExpert service callouts	Yes	Yes	Yes
AppExpert templates	Yes	Yes	Yes
Role-based administration	Yes	Yes	Yes
Configuration wizards	Yes	Yes	Yes
Citrix® Command Center	Yes	Yes	No
Citrix® EdgeSight™ for NetScaler	Yes	Optional	No
Web 2.0 optimization			
Rich Internet application support	Yes	Yes	Yes
Advanced server offload	Yes	Yes	No
Lower total cost of ownership (TCO)			
TCP buffering	Yes	Yes	Yes
TCP multiplexing	Yes	Yes	Yes
SSL offload and acceleration	Yes	Yes	Yes
Cache redirection	Yes	Yes	No
Citrix® EasyCall™	Yes	No	No

Note: While we have taken care to ensure absolute accuracy when compiling this information, it might change. For the latest information, see Citrix Support at http://www.citrix.com.

Installing the NetScaler Hardware

Before installing a NetScaler® appliance, review the pre-installation checklist. A NetScaler is typically mounted in a rack, and all models ship with rack-rail hardware. All models except the 7000 support small form factor pluggable SFP, XFP, or SFP+ transceivers. After mounting the appliance and installing the transceivers, connect the NetScaler to your network. Use a console cable to connect the NetScaler to a personal computer so that you can perform an initial configuration. After connecting everything else, connect the NetScaler to a power source.

Reviewing the Pre-installation Checklist

The hardware accessories for your particular appliance, such as cables, adapters, and rail kit, will vary depending on the hardware platform you ordered. Unpack the box that contains your new appliance on a sturdy table with plenty of space and inspect the contents.

Use the following list to verify that you received everything that should have been included in the box.

- One NetScaler
- 1 Ethernet cable
- 1 RJ-45-to-RS-232 serial cable
- 1 RJ-45-to-DB-9 adapter
- The following list specifies the number of power cables included for each appliance model:
  - MPX 5500, MPX 7500/MPX 9500, and 7000: 1 power cable
  - 9010, 10010, 12000, MPX 9700/10500/12500/15500, MPX15000, MPX 17000 and MPX 17500/19500/21500: 2 power cables

  Note: Make sure that a power outlet is available for each cable.
- 1 mounting rail kit with all the models.

In addition to the items included in the box with your new appliance, you will need the following items to complete the installation and initial configuration process.

- Additional Ethernet cables for each additional Ethernet port that you will connect to your network.
- One available Ethernet port on your network switch or hub for each Ethernet port you want to connect to your network.
- A desktop or laptop/notebook computer to serve as a management workstation.

Rack Mounting the Appliance

Most appliances can be installed in standard server racks. The appliances ship with a set of rails, which you must install before you mount the appliance. The only tool you will need to install an appliance is a Phillips screwdriver.

Caution: If you are installing the appliance as the only unit in the rack, mount it at the bottom. If the rack contains other units, make sure that the heaviest unit is at the bottom. If the rack has stabilizing devices available, install them before mounting the appliance.

The 7000, MPX 5500, MPX 7500/9500 appliances each require one rack unit. The 9010, 10010, 12000, MPX 9700/10500/12500/15500, MPX 15000, MPX 17000, MPX 11500/13500/14500/16500/18500, and MPX 17500/19500/21500 appliances each require two rack units. Each of these units ships with a mounting rail kit that contains two rail assemblies, one for the left side and the other for the right side of the appliance, and screws to attach the rails. An assembly consists of an inner rail and a rack rail.

To mount the appliance, you must first install the rails and then install the appliance in the rack.

Perform the following tasks to mount the appliance:

- Remove the inner rails from the rail assembly.
- Attach the inner rails to the appliance.
- Install the rack rails on the rack.
- Install the appliance in the rack.

To remove the inner rails from the rail assembly

1. Place the rail assembly on a flat surface.
2. Slide out the inner rail toward the front of the assembly.
3. Depress the locking tabs until the inner rail comes all the way out of the rail assembly, as shown in the following figure.

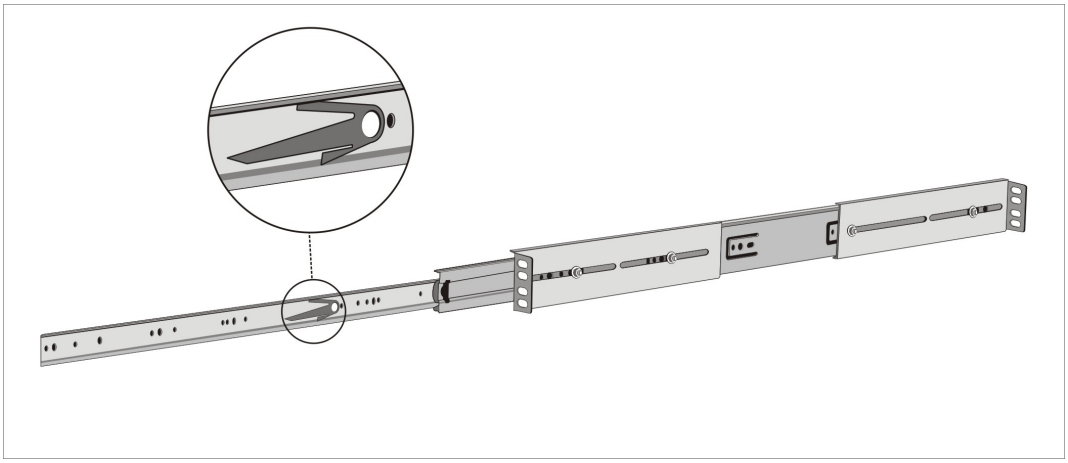

Figure 1. Removing inner rails

4. Repeat steps 1 through 3 to remove the second inner rail.

To attach the inner rails to the appliance

1. Position the right inner rail behind the ear bracket on the right side of the appliance.
2. Align the holes on the rail with the corresponding holes on the side of the appliance.
3. Attach the rail to the appliance with screws, as shown in the following figure.

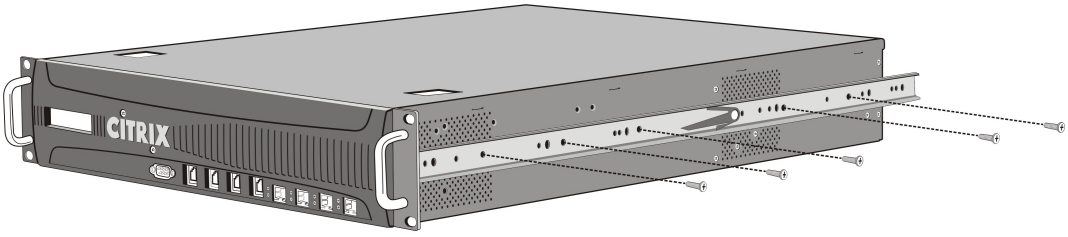

Figure 2. Attaching inner rails

4. Repeat steps 1 through 3 to install the left inner rail on the left side of the appliance.

To install the rack rails

1. Position the rack rails at the desired location in the rack, keeping the sliding rail guide facing inward.
2. Snap the tool-less rails to the rack.

   Note: Make sure that both rack rails are at same height and that the rail guides are facing inward.

To install the appliance in the rack

1. Align the inner rails, attached to the appliance, with the rack rails.
2. Slide the appliance into the rack rails, keeping the pressure even on both sides.
3. Verify that the appliance is locked in place by pulling it all the way out from the rack.

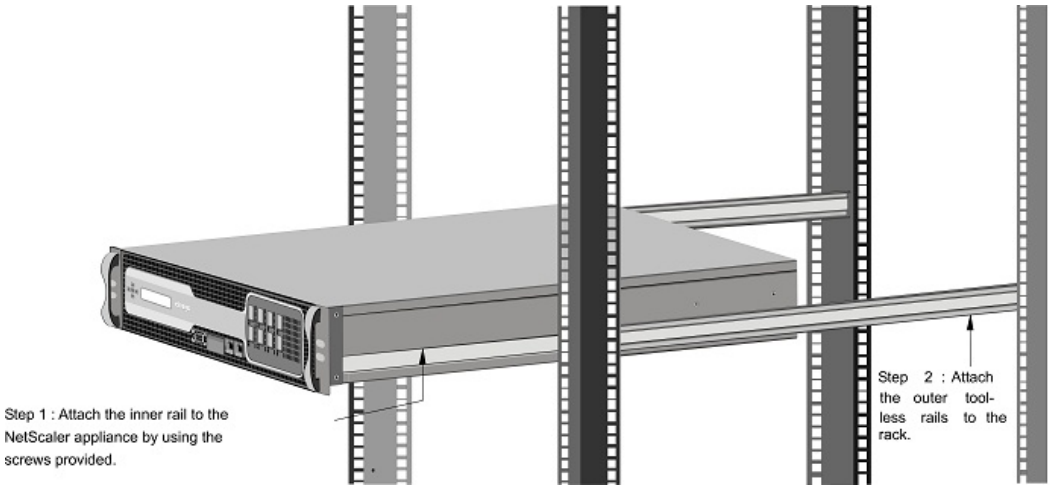

Figure 3. Rack Mounting the Appliance

Installing and Removing SFP Transceivers

Note: This section applies to the 9010, 10010, 12000, and MPX 9700/10500/12500/15500 appliances.

A Small Form Factor Pluggable (SFP) is a compact transceiver that can operate at speeds of up to 1 gigabit per second and is available in both copper and fiber types. Inserting an SFP copper transceiver converts the SFP port to a 1000BASE-T port. Inserting an SFP fiber transceiver converts the SFP port to a 1000BASE-X port. Auto-negotiation is enabled by default on the SFP port into which you insert your SFP transceiver. As soon as a link between the port and the network is established, the speed and mode are matched on both ends of the cable.

Note: SFP transceivers are hot-swappable on the 9010, 10010, 12000 appliances. However, SFP transceivers are **not hot-swappable** on the MPX 9700/10500/12500/15500 appliances. You must shutdown the MPX appliance before removing or inserting a transceiver into an SFP port on the MPX appliance.

Caution: Only SFP transceivers provided by Citrix Systems are supported on NetScaler appliances. Attempting to install third-party SFP transceivers on your NetScaler appliance voids the warranty.

Insert SFP transceivers into the SFP ports on the front panel of the appliance. Frequent installation and removal of transceivers shortens their life span. Follow the removal procedure carefully to avoid damaging the SFP transceiver or the appliance.

Caution: Do not install the transceivers with the cables attached. Doing so can damage the cable, the connector, or the optical interface of the transceiver.

To install an SFP transceiver

1. Remove the SFP transceiver carefully from its box. DANGERDo not look directly into fiberoptic transceivers or cables. They emit laser beams that can damage your eyes.

2. Align the SFP transceiver to the front of the SFP transceiver port on the front panel of the appliance, as shown in the following figure.

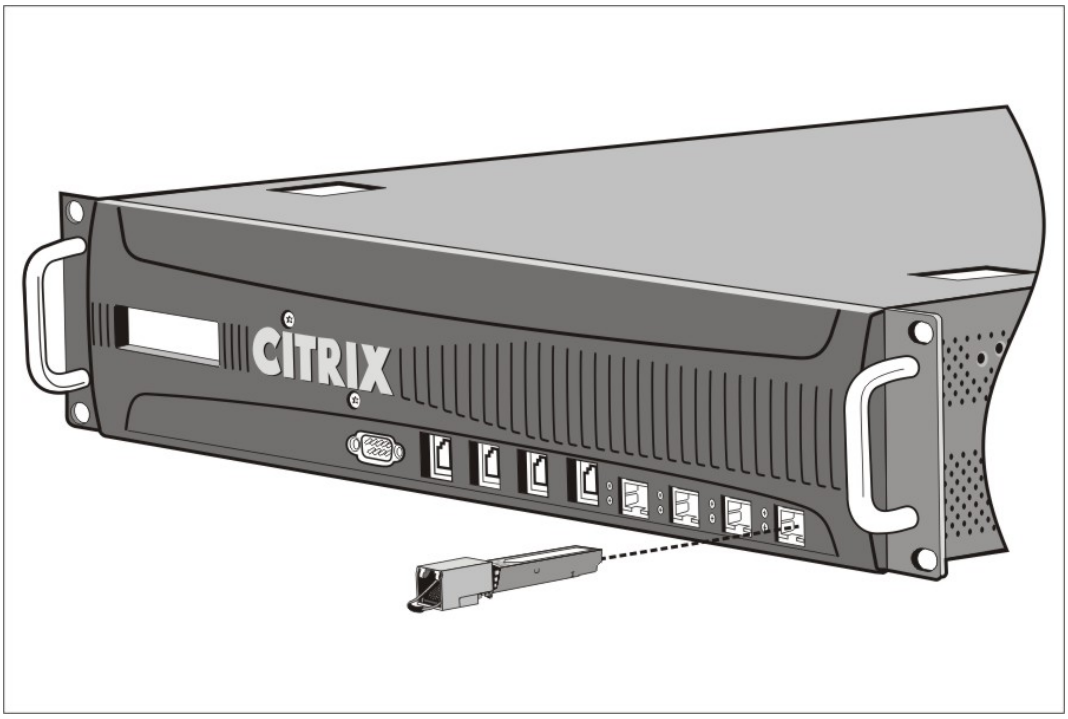

Figure 1. Installing an SFP transceiver

3. Hold the SFP transceiver between your thumb and index finger and insert it into the SFP transceiver port, pressing it in until you hear the transceiver snap into place.

4. Lock the transceiver.

5. Verify that the LED is green and blinks twice, which indicates that the transceiver is functioning correctly.

6. If you are using a fiber SFP transceiver, remove the dust caps attached to the transceiver and the cable only when you are ready to insert the cable.

To remove an SFP transceiver

1. Disconnect the cable from the SFP transceiver. If you are using a fiberoptic cable, replace the dust cap on the cable before putting it away. DANGERDo not look directly into fiberoptic transceivers or cables. They emit laser beams that can damage your eyes.

2. Unlock the SFP transceiver.

3. Hold the SFP transceiver between your thumb and index finger and slowly pull it out of the port.

4. If you are removing a fiber SFP transceiver, replace the dust cap before putting it away.

5. Put the SFP transceiver into its original box or another appropriate container.

Installing and Removing XFP and SFP+ Transceivers

Note: This section applies to the 12000 10G, MPX 9700/10500/12500/15500, MPX 15000, MPX 17000, and MPX 17500/19500/21500 appliances.

A 10-Gigabit Small Form Factor Pluggable (XFP or SFP+) is a compact optical transceiver that can operate at speeds of up to 10 gigabits per second. The 12000 10G, MPX 15000, and MPX 17000 appliances use XFP transceivers and the MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500, and MPX 17500/19500/21500 appliances use SFP+ transceivers. Auto-negotiation is enabled by default on the XFP/SFP+ ports into which you insert your XFP/SFP+ transceiver. As soon as a link between the port and the network is established, the mode is matched on both ends of the cable and for SFP+ transceivers, the speed is also autonegotiated.

Note: XFP and SFP+ transceivers are **not hot-swappable** on the NetScaler appliances. You must restart a NetScaler appliance after you insert a 10 GE XFP or SFP+ transceiver.

Caution: Only XFP/SFP+ transceivers provided by Citrix Systems are supported on NetScaler appliances. Attempting to install third-party XFP/SFP+ transceivers on your NetScaler appliance voids the warranty.

Insert the XFP/SFP+ transceivers into the XFP/SFP+ ports on the front panel of the appliance. Frequent installation and removal of transceivers shortens their life span. Follow the removal procedure carefully to avoid damaging the transceiver or the appliance.

Caution: Do not install the transceivers with the cables attached. Doing so can damage the cable, the connector, or the optical interface of the transceiver.

To install an XFP/SFP+ transceiver

1. Remove the XFP/SFP+ transceiver carefully from its box. DANGERDo not look directly into fiberoptic transceivers and cables. They emit laser beams that can damage your eyes.

2. Align the XFP/SFP+ transceiver to the front of the XFP/SFP+ transceiver port on the front panel of the appliance.

3. Hold the XFP/SFP+ transceiver between your thumb and index finger and insert it into the XFP/SFP+ transceiver port, pressing it in until you hear the transceiver snap into place.

4. Move the locking hinge to the DOWN position as shown in the following figure.

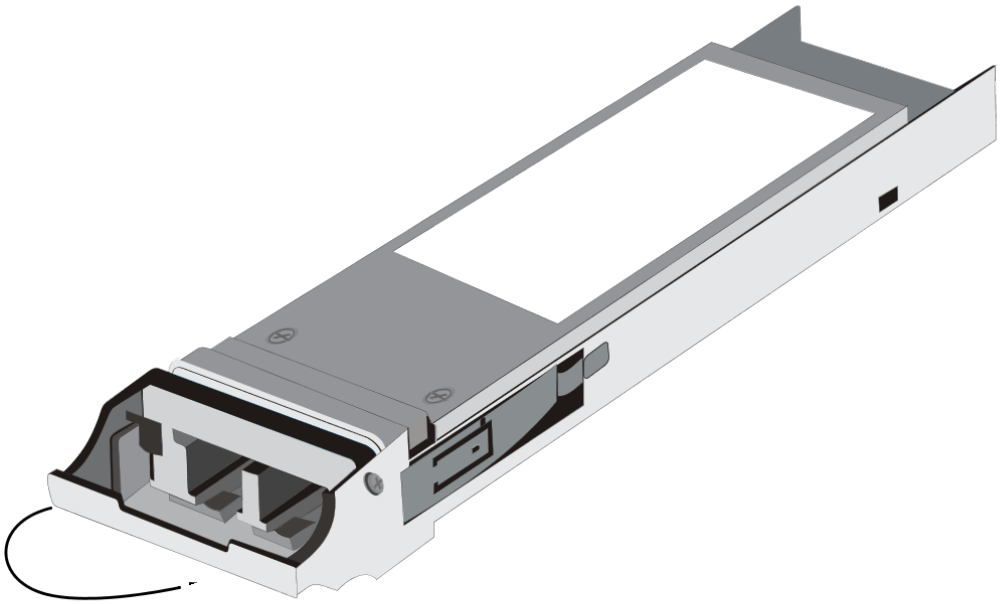

Figure 1. Locking an XFP transceiver

5. Verify that the LED is green and blinks twice, which indicates that the transceiver is functioning correctly.

6. Remove the dust caps attached to the transceiver and cable only when you are ready to insert the cable.

To remove an XFP/SFP+ transceiver

1. Disconnect the cable from the XFP/SFP+ transceiver. Replace the dust cap on the cable before putting it away. DANGERDo not look directly into fiberoptic transceivers or cables. They emit laser beams that can damage your eyes.

2. Unlock the XFP/SFP+ transceiver by moving the locking hinge to the UP position.

3. Hold the XFP/SFP+ transceiver between your thumb and index finger and slowly pull it out of the port.

4. Replace the dust cap on the transceiver before putting it away.

5. Put the XFP/SFP+ transceiver into its original box or another appropriate container.

Connecting the Cables

When the appliance is securely mounted on the rack, you are ready to connect the cables. Ethernet cables and the optional console cable are connected first. Connect the power cable last.

DANGERRemove all jewelry and other metal objects that might come in contact with power sources or wires before installing or repairing the appliance. When you touch both a live power source or wire and ground, any metal objects can heat up rapidly, and may cause burns, set clothing on fire, or fuse the metal object to an exposed terminal.

Connecting the Ethernet Cables

Ethernet cables connect your appliance to the network. The type of cable you need depends on the type of port used to connect to the network. Use a category 5e or category 6 Ethernet cable with a standard RJ-45 connector on a 10/100/1000BASE-T port or 1-gigabit SFP copper transceiver. Use a fiber optic cable with an LC duplex connector with an SFP fiber transceiver, SFP+, or XFP transceiver. The type of connector at the other end of the fiber optic cable depends on the port of the device that you are connecting to.

To connect an Ethernet cable to a 10/100/1000BASE-T port or 1-gigabit SFP copper transceiver

1. Insert the RJ-45 connector on one end of your Ethernet cable into an appropriate port on the front panel of the appliance as shown in the following figure.

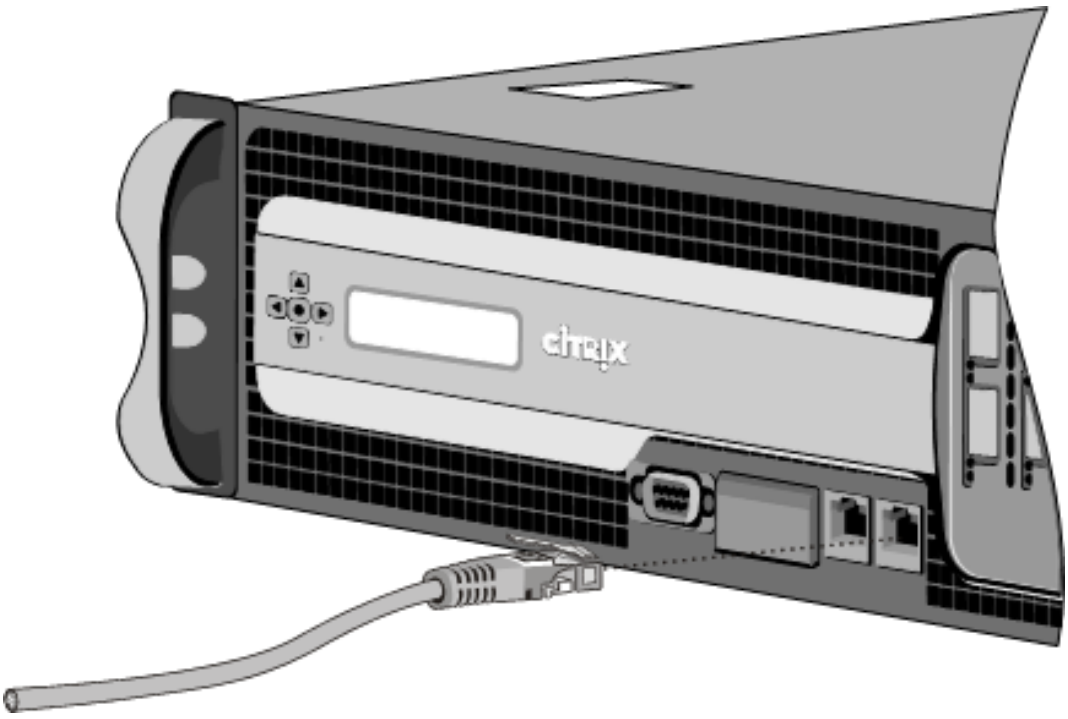

Figure 1. Inserting an Ethernet cable

2. Insert the RJ-45 connector on the other end into the target device, such as a router or switch.

3. Verify that the LED glows amber when the connection is established.

To connect the Ethernet cable to an SFP fiber, SFP+, or XFP transceiver

1. Remove the dust caps from the transceiver and cable.

2. Insert the LC connector on one end of the fiber optic cable into the appropriate port on the front panel of the appliance.

3. Insert the connector on the other end into the target device, such as a router or switch.

4. Verify that the LED glows amber when the connection is established.

Connecting the Console Cable

You can use the console cable to connect your appliance to a computer or terminal from which you can configure the appliance. Alternatively, you can use a computer connected to the network. Before connecting the console cable, configure the computer or terminal to support VT100 terminal emulation, 9600 baud, 8 data bits, 1 stop bit, parity, and flow control set to NONE. Then connect one end of the console cable to the RS232 serial port on the appliance and the other end to the computer or terminal.

To connect the console cable to a computer or terminal

1. Insert the DB-9 connector at the end of the cable into the console port that is located on the front panel of the appliance as shown in the following figure.

   Figure 2. Inserting a console cable

   Note: To use a cable with an RJ-45 converter, insert the optional converter provided into the console port and attach the cable to it.

2. Insert the RJ-45 connector at the other end of the cable into the serial port of the computer or terminal.

Connecting the Power Cable

An MPX 5500, MPX 7500/9500, and 7000 appliance has one power cable. All the other appliances come with two power cables, but they can also operate if only one power cable is connected. A separate ground cable is not required, because the three-prong plug provides grounding.

To connect the appliance to the power source

1. Connect one end of the power cable to the power outlet on the back panel of the appliance, next to the power supply, as shown in the following figure.

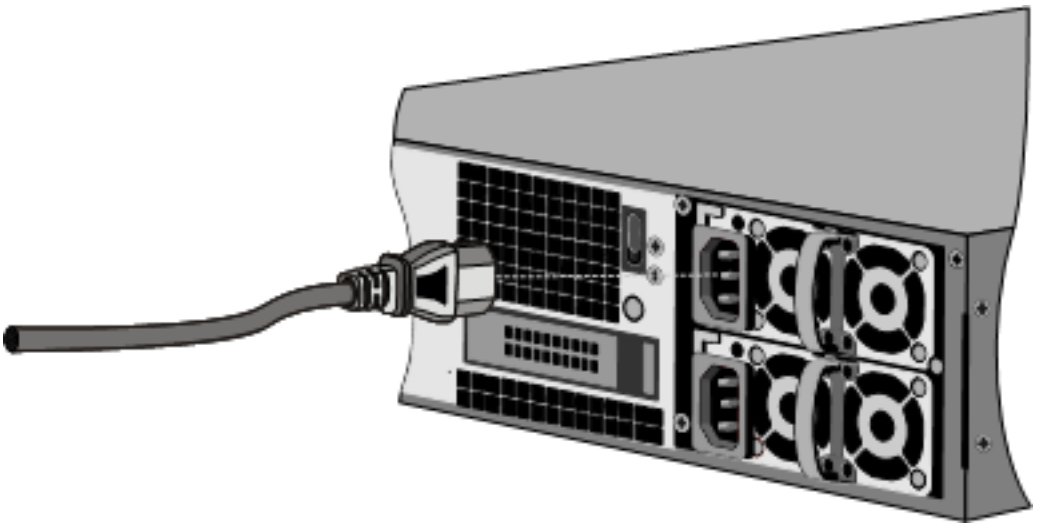

Figure 3. Inserting a power cable

2. Connect the other end of the power cable to a standard 110V/220V power outlet.

3. If a second power supply is provided, repeat steps 1 and 2 to connect the second power supply.

Note: The 9010, 10010, 12000, MPX 9700/10500/12500/15500, and MPX 17500/19500/21500 appliances emit a high-pitched alert if one power supply fails or if you connect only one power cable to the appliance. To silence the alarm, you can press the small red button located on the back panel of the appliance.

Accessing a Citrix NetScaler

A NetScaler® appliance has both a command line interface (CLI) and a graphical user interface (GUI). The GUI includes a configuration utility for configuring the appliance and a statistical utility, called Dashboard. For initial access, all NetScaler appliances ship with the default NetScaler IP address (NSIP) of 192.168.100.1 and default subnet mask of 255.255.0.0. You can assign a new NSIP and an associated subnet mask during initial configuration.

If you encounter an IP address conflict when deploying multiple NetScaler units, check for the following possible causes:

- Did you select an NSIP that is an IP address already assigned to another device on your network?
- Did you assign the same NSIP to multiple NetScaler appliances?
- The NSIP is reachable on all physical ports. The ports on a NetScaler are host ports, not switch ports.

The following table summarizes the available access methods.

Table 1. Methods for Accessing a NetScaler

Access Method	Port	Default IP Address Required? (Y/N)
CLI	Console	N
CLI and GUI	Ethernet	Y

Using the Command Line Interface

You can access the CLI either locally, by connecting a workstation to the console port, or remotely, by connecting through secure shell (SSH) from any workstation on the same network.

For more information about the features of the CLI, including SSH, see the *Citrix NetScaler Command Reference Guide* at http://support.citrix.com/article/CTX128678.

Logging on to the Command Line Interface through the Console Port

The NetScaler has a console port for connecting to a computer workstation. To log on to the NetScaler, you need a serial crossover cable and a workstation with a terminal emulation program.

To log on to the CLI through the console port

1. Connect the console port to a serial port on the workstation, as described in Connecting the Console Cable .
2. On the workstation, start HyperTerminal or any other terminal emulation program. If the logon prompt does not appear, you may need to press ENTER one or more times to display it.
3. Log on as `nsroot`. For initial configuration, use `nsroot` as the administrative password. For subsequent access, use the password assigned during initial configuration. The command prompt (>) appears on the workstation monitor.

Logging on to the Command Line Interface by using SSH

The SSH protocol is the preferred remote access method for accessing a NetScaler remotely from any workstation on the same network. You can use either SSH version 1 (SSH1) or SSH version 2 (SSH2.)

If you do not have a working SSH client, you can download and install any of the following SSH client programs:

- PuTTY

Open Source software supported on multiple platforms. Available at:

http://www.chiark.greenend.org.uk/~sgtatham/putty/

- Vandyke Software SecureCRT

  Commercial software supported on the Windows platform. Available at:

  http://www.vandyke.com/products/securecrt/

These programs have been tested by the Citrix NetScaler team, which has verified that they work correctly with a NetScaler. Other programs may also work correctly, but have not been tested.

To verify that the SSH client is installed properly, use it to connect to any device on your network that accepts SSH connections.

To log on to a NetScaler by using an SSH client

1. On your workstation, start the SSH client.
2. For initial configuration, use the default NetScaler IP address (NSIP), which is 192.168.100.1. For subsequent access, use the NSIP that was assigned during initial configuration. Select either SSH1 or SSH2 as the protocol.
3. Log on as `nsroot`. For initial configuration, use `nsroot` as the administrative password. For subsequent access, use the password assigned during initial configuration. For example:

```
login as: nsroot
Using keyboard-interactive authentication.
Password:
Last login: Tue Jun 16 10:37:28 2009 from 10.102.29.9

 Done
>
```

Using the Graphical User Interface

The graphical user interface includes a configuration utility and a statistical utility, called Dashboard, either of which you access through a workstation connected to an Ethernet port on the NetScaler. If your computer does not have a supported Java plug-in installed, the utillity prompts you to download and install the plug-in the first time you log on. If automatic installation fails, you can install the plug-in separately before you attempt to log on to the configuration utility or Dashboard.

The system requirements for the workstation running the GUI are as follows:

- For Windows-based workstations, a Pentium® 166 MHz or faster processor with at least 48 MB of RAM is recommended for applets running in a browser using a Java plug-in product. You should have 40 MB free disk space before installing the plug-in.
- For Linux-based workstations, a Pentium platform running Linux kernel v2.2.12 or above, and glibc version 2.12-11 or later. A minimum of 32 MB RAM is required, and 48 MB RAM is recommended. The workstation should support 16-bit color mode, KDE and KWM window managers used in conjunction, with displays set to local hosts.
- For Solaris-based workstations, a Sun running either Solaris 2.6, Solaris 7, or Solaris 8, and the Java 2 Runtime Environment, Standard Edition, version 1.6 or later.

Your workstation must have a supported web browser and version 1.6 or above of the Java® applet plug-in installed to access the configuration utility and Dashboard.

The following browsers are supported.

On the Windows 7 operating system:

- Internet Explorer 8
- Google Chrome 4.1

On the Windows XP Home and Windows XP Professional operating systems:

- Internet Explorer 6, 7, 8
- Netscape 7.0
- Google Chrome 4.1

On the Red Hat Linux 5.0 and 6.0 operating systems:

- Mozilla Firefox 1.0, 2.0, 3.0

Using the Configuration Utility

Once you log on to the configuration utility, you can configure the NetScaler through a graphical interface that includes context-sensitive help.

If your computer does not have a supported Java plug-in installed, the first time you log on to the NetScaler, the configuration utility will prompt you to download and install the plug-in.

Note: Prior to installing the Java 2 Runtime Environment, ensure that you have installed the full set of required operating system patches needed for the current Java release.

To log on to the configuration utility

1. Open your web browser and enter the NetScaler IP (NSIP) as an HTTP address. If you have not yet set up the initial configuration, enter the default NSIP (`http://192.168.100.1`). The **Citrix Logon** page appears.

   Note: If you have two NetScaler appliances in a high availability setup, make sure that you do not access the GUI by entering the IP address of the secondary NetScaler. If you do so and use the GUI to configure the secondary NetScaler, your configuration changes will not be applied to the primary NetScaler.

2. In the **User Name** text box, type `nsroot`.

3. In the **Password** text box, type the administrative password you assigned to the nsroot account during initial configuration.

4. In the **Start in** list, click **Configuration**, and then click **Login**. The **Configuration Utility** page appears.

   Note: If your workstation does not already have a supported version of the Java runtime plug-in installed, the NetScaler prompts you to download the Java Plug-in. After the download is complete, the configuration utility page appears.

   If you need to access the online help, select Help from the Help menu at the top right corner.

Using the Statistical Utility

Dashboard, the statistical utility, is a browser-based application that displays charts and tables on which you can monitor the performance of a NetScaler.

To log on to Dashboard

1. Open your web browser and enter the NSIP as an HTTP address (http://<NSIP>). The **Citrix Logon** page appears.

2. In the **User Name** text box, type `nsroot`.

3. In the **Password** text box, type the administrative password you assigned to the nsroot account during initial configuration.

4. In the **Start in** list, click **Dashboard**, and then click **Login**.

   Note: If your workstation does not already have a supported version of the Java runtime plug-in installed, the NetScaler prompts you to download the Java Plug-in. After the download is complete, Dashboard is displayed. If automatic installation of the Java plug-in fails, you can install the plug-in separately before you attempt to log on to Dashboard.

Installing the Java Runtime Plug-in

If automatic installation of the Java plug-in fails, you can install the plug-in separately before you attempt to log on to the configuration utility or Dashboard.

Note: Before installing the Java 2 Runtime Environment, make sure that you have installed the full set of required operating system patches needed for the current Java release.

To install the Java runtime plug-in on your workstation

1. In your web browser, enter the NSIP and port number of your NetScaler: `http://<NSIP>:80` The Java plug-in icon appears.

2. Click the Java plug-in icon and follow the screen prompts to copy the plug-in installer to your workstation hard disk. The Java plug-in setup icon (for example, **j2re-1.6.0**) appears on your computer at the location you specified.

3. Double-click the plug-in setup icon, and follow the screen prompts to install the plug-in.

4. Return to your web browser and click the Java plug-in icon a second time to display the GUI logon screen.

Configuring a NetScaler for the First Time

Your new NetScaler is preconfigured with a default IP address (the NSIP) and associated subnet mask for management access. The default NSIP is 192.168.100.1 and the subnet mask (netmask) is 255.255.0.0. You can change these values to fit the addressing scheme for your network. For your initial configuration, you must also specify at least one SNIP or MIP. Before saving your new configuration, you should change the administrator password.

If you are setting up two NetScaler appliances as a high availability pair, you configure one as primary and the other as secondary.

Using the LCD Keypad

Note: The following section is applicable to MPX 5500, MPX 7500/9500, MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500, and MPX 17500/19500/21500 appliances only.

When you first install the appliance, you can configure the initial settings by using the LCD keypad on the front panel of the appliance. The keypad interacts with the LCD display module, which is also on the front panel of these appliances.

Note: You can use the LCD keypad for initial configuration on a new appliance with the default configuration. The configuration file (ns.conf) should contain the following command and default values.

set ns config -**IPAddress** 192.168.100.1 **-netmask** 255.255.0.0

The functions of the different keys are explained in the following table.

Table 1. LCD Key Functions

Key	Function
<	Moves the cursor one digit to the left.
>	Moves the cursor one digit to the right.
^	Increments the digit under the cursor.
v	Decrements the digit under the cursor.
.	Processes the information, or terminates the configuration, if none of the values are changed. This key is also known as the ENTER key.

You are prompted to enter the subnet mask, NetScaler IP address (NSIP), and gateway in that order respectively. The subnet mask is associated with both the NSIP and default gateway IP address. The NSIP is the IPv4 address of the NetScaler appliance. The default gateway is the IPv4 address for the router, which will handle external IP traffic that the NetScaler cannot otherwise route. The NSIP and the default gateway should be on the same subnet.

If you enter a valid value for the subnet mask, such as 255.255.255.224, you are prompted to enter the IP address. Similarly, if you enter a valid value for the IP address, you are prompted to enter the gateway address. If the value you entered is invalid, the following error message appears for three seconds, where xxx.xxx.xxx.xxx is the IP address you entered, followed by a request to re-enter the value.

Invalid addr!
xxx.xxx.xxx.xxx

If you press the ENTER (.) key without changing any of the digits, the software interprets this as a user exit request.The following message will be displayed for three seconds.

Exiting menu...
xxx.xxx.xxx.xxx

If all the values entered are valid, when you press the ENTER key, the following message appears.

Values accepted,
Rebooting...

The subnet mask, NSIP, and gateway values are saved in the configuration file.

Configuring a NetScaler by Using the Command Line Interface

When you first install the appliance, you can configure the inital settings by using the serial console. Connect a serial cable to the port on the appliance and the other end to a computer, as described in Connecting the Console Cable . For remote access to the command-line interface (CLI), see Logging on to the Command Line Interface by using SSH. At the CLI, you can setup or change the NSIP, subnet or mapped IP address, advanced network settings, and time zone.

To configure a NetScaler by using the command line interface

1. Connect a workstation to the NetScaler.
2. Run the vt100 terminal emulation program of your choice on your workstation or notebook computer to connect to the appliance.
   - For Microsoft Windows, you can use Hyperterminal, which is installed with all current versions of Windows.
   - For Apple Macintosh OSX, you can use the GUI-based Terminal program or the shell-based telnet client.

     Note: OSX is based on the FreeBSD UNIX platform. Most standard UNIX shell programs are available from the OSX command line.
   - For UNIX-based workstations, you can use the shell-based telnet client or any supported terminal emulation program.
3. Press ENTER. The terminal screen displays the Logon prompt.

   Note: You might have to press ENTER two or three times, depending on which terminal program you are using.
4. Log on to the appliance by using the administrator credentials.

   Note: Your sales representative or Citrix Customer Service can provide the administrator credentials.
5. At the NetScaler command prompt, you can type `config ns` and follow the prompts to complete the initial configuration. Alternatively, type the commands shown in the following steps.

   Note: To prevent an attacker from breaching your ability to send packets to the appliance, choose a non-routable IP address on your organization's LAN as your appliance IP address.
6. `set ns config` **`-ipaddress`** `<IPAddress>` **`-netmask`** `<Netmask>`
7. `add ns ip <IPAddress> <Netmask>` **`-type`** `<Type>`

8. `add route <Network> <Netmask> <Gateway>`
9. `set system user nsroot <Password>`
10. `save ns config`
11. `reboot`

Example

set ns config - ipaddress 10.102.29.60 - netmask 255.255.255.0
add ns ip 10.102.29.61 255.255.255.0 -type snip
add route 0.0.0.0 0.0.0.0 10.102.29.1
set system user nsroot administrator
save ns config
reboot

Configuring a NetScaler by Using the Configuration Utility

The configuration utility is accessed from a web browser.To configure the NetScaler using the Setup Wizard in the configuration utility, you need an administrative workstation or laptop configured on the same network as the appliance. You also need Java RunTime Environment (JRE) version 1.6 or later. You can use the Setup Wizard to configure the following initial settings:

- System IP address and subnet mask
- Subnet or Mapped IP address and subnet mask
- Host name
- Default gateway
- Time zone
- Licenses
- Administrator password

Important: Before running the Setup Wizard, you should download your licenses from the Citrix web site and put them in a location on your workstation or laptop hard drive or another device where you can access them from your web browser during configuration.

To configure initial settings by using the Setup Wizard

1. In a web browser, type `http:// 192.168.100.1`.

   Note: The operating system is preconfigured with a default IP address and associated netmask. The default IP address is 192.168.100.1 and the default netmask is 255.255.0.0.

2. In **User Name** and **Password**, type the administrator credentials. You can obtain the initial user name and password from your sales representative or from Citrix Customer Service.

3. In **Start in**, select **Configuration**, and then click **Login**.

4. In the **Setup Wizard**, click **Next**, and then follow the instructions in the wizard.

   Note: To prevent an attacker from breaching your ability to send packets to the appliance, choose a non-routable IP address on your organization's LAN as your appliance IP address.

Configuring a NetScaler by Using the XML API

You can use an external Application Programming Interface (API) to configure the NetScaler. The API allows you to create custom client applications to configure and monitor the state of the NetScaler. It is based on Simple Object Access Protocol (SOAP) over HTTP. You can download the API documentation from the Downloads page of the configuration utility.

Configuring a High Availability Pair for the First Time

You can deploy two NetScaler appliances in a high availability configuration, where one unit actively accepts connections and manages servers while the secondary unit monitors the first. The NetScaler that is actively accepting connections and managing the servers is called a primary unit and the other one is called a secondary unit in a high availability configuration. If there is a failure in the primary unit, the secondary unit becomes the primary and begins actively accepting connections.

Each NetScaler in a high availability pair monitors the other by sending periodic messages, called heartbeat messages or health checks, to determine the health or state of the peer node. If a health check for a primary unit fails, the secondary unit retries the connection for a specific time period. (For more information about high availability, see the *Citrix NetScaler Networking Guide* at http://support.citrix.com/article/CTX128671.) If a retry does not succeed by the end of the specified time period, the secondary unit takes over for the primary unit in a process called failover. The following figure shows two high availability configurations, one in one-arm mode and the other in two-arm mode.

Figure 1. High availability in one-arm mode

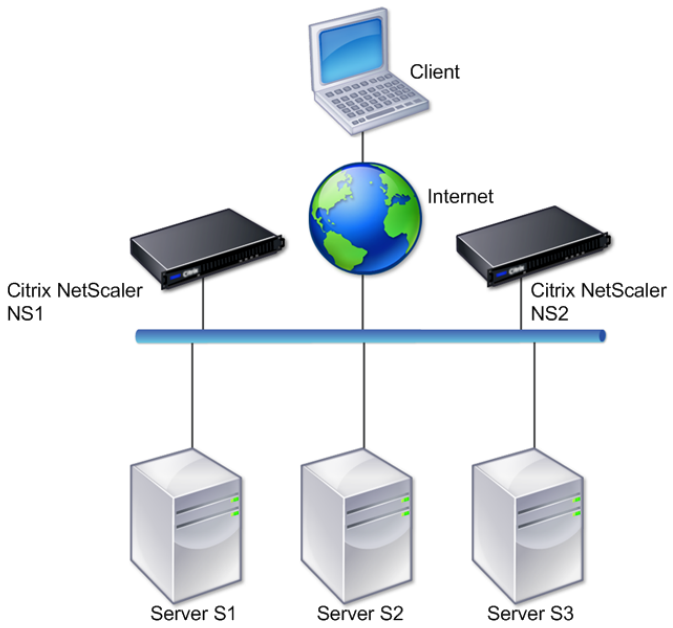

Figure 2. High availability in two-arm mode

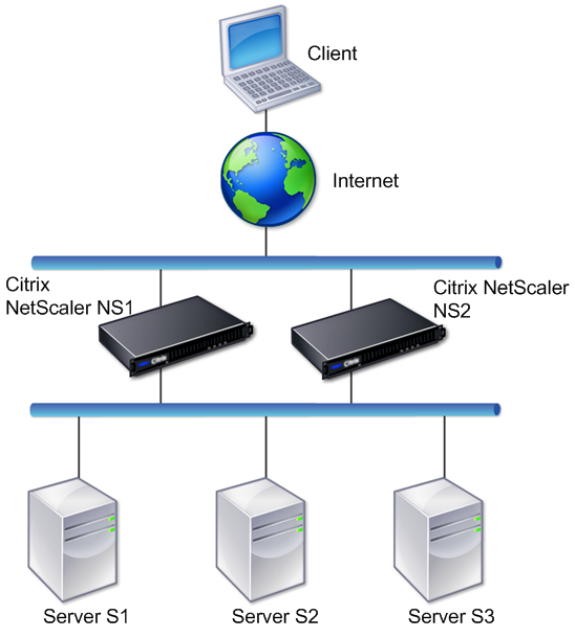


In one-arm configuration, both NS1 and NS2 and servers S1, S2, and S3 are connected to the switch.

In two-arm configuration, both NS1 and NS2 are connected to two switches. The servers S1, S2, and S3 are connected to the second switch. The traffic between client and the servers passes through either NS1 or NS2.

To set up a high availability environment, configure one NetScaler as primary and another as secondary. Perform the following tasks on each of the NetScalers:

- Add a node.
- Disable high availability monitoring for unused interfaces.

Adding a Node

A node is a logical representation of a peer NetScaler. It identifies the peer unit by ID and NSIP. A NetScaler uses these parameters to communicate with the peer and track its state. When you add a node, the primary and secondary units exchange heartbeat messages asynchronously. The node ID is an integer that must not be greater than 64.

To add a node by using the NetScaler command line

At the NetScaler command prompt, type the following commands to add a node and verify that the node has been added:

- `add HA node <id> <IPAddress>`
- `show HA node <id>`

  Example

  ```
  add HA node 0 10.102.29.170
   Done
  > show HA node 0
  1)      Node ID:      0
          IP:   10.102.29.200 (NS200)
          Node State: UP
          Master State: Primary
          SSL Card Status: UP
          Hello Interval: 200 msecs
          Dead Interval: 3 secs
          Node in this Master State for: 1:0:41:50 (days:hrs:min:sec)
  ```

To add a node by using the configuration utility

1. In the navigation pane, expand **System** and click **High Availability**. The **High Availability** page appears.
2. On the **High Availability** page, select the **Nodes** tab.
3. Click **Add**. The **High Availability Setup** dialog box appears.
4. In the **High Availability Setup** dialog box, in the **Remote Node IP Address** text box, type an IP Address (for example, `10.102.29.170`).
5. Ensure that the **Configure remote system to participate in High Availability setup** check box is selected. By default, this check box is selected.
6. Select the **Turn off HA monitor on interfaces/channels that are down** check box to disable the HA monitor on interfaces that are down. By default, this check box is selected.
7. Verify that the node you added appears in the list of nodes under the **Nodes** tab.

Disabling High Availability Monitoring for Unused Interfaces

The high availability monitor is a virtual entity that monitors an interface. You must disable the monitor for interfaces that are not connected or being used for traffic. When the monitor is enabled on an interface whose status is DOWN, the state of the node becomes NOT UP. In a high availability configuration, a primary node entering a NOT UP state might cause a high availability failover. An interface is marked DOWN under the following conditions:

- The interface is not connected
- The interface is not working properly
- The cable connecting the interface is not working properly

To disable the high availability monitor for an unused interface by using the command line

At the NetScaler command prompt, type the following commands to disable the high availability monitor for an unused interface and verify that it is disabled:

- `set interface <id> -haMonitor OFF`
- `show interface <id>`

Example

```
> set interface 1/8 -haMonitor OFF
 Done
> show interface 1/8
        Interface 1/8 (Gig Ethernet 10/100/1000 MBits) #2
        flags=0x4000 <ENABLED, DOWN, down, autoneg, 802.1q>
        MTU=1514, native vlan=1, MAC=00:d0:68:15:fd:3d, downtime 238h55m44s
        Requested: media AUTO, speed AUTO, duplex AUTO, fctl OFF,
                throughput 0

        RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
        TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
        NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0) Muted(0)
        Bandwidth thresholds are not set.
```

When the high availability monitor is disabled for an unused interface, the output of the show interface command for that interface does not include "HAMON."

To disable the high availability monitor for unused interfaces by using the configuration utility

1. In the navigation pane, expand **Network** and click **Interfaces**. The **Interfaces** page appears.
2. Select the interface for which the monitor must be disabled.
3. Click **Open**. The **Modify Interface** dialog box appears.
4. In **HA Monitoring**, select the **OFF** option.
5. Click **OK**.
6. Verify that, when the interface is selected, "HA Monitoring: OFF" appears in the details at the bottom of the page.

Understanding Common Network Topologies

As described in Physical Deployment Modes, you can deploy the Citrix® NetScaler® appliance either inline between the clients and servers or in one-arm mode. Inline mode uses a two-arm topology, which is the most common type of deployment.

Setting Up Common Two-Arm Topologies

In a two-arm topology, one network interface is connected to the client network and another network interface is connected to the server network, ensuring that all traffic flows through the NetScaler. This topology might require you to reconnect your hardware and also might result in a momentary downtime. The basic variations of two-arm topology are multiple subnets, typically with the NetScaler on a public subnet and the servers on a private subnet, and transparent mode, with both the NetScaler and the servers on the public network.

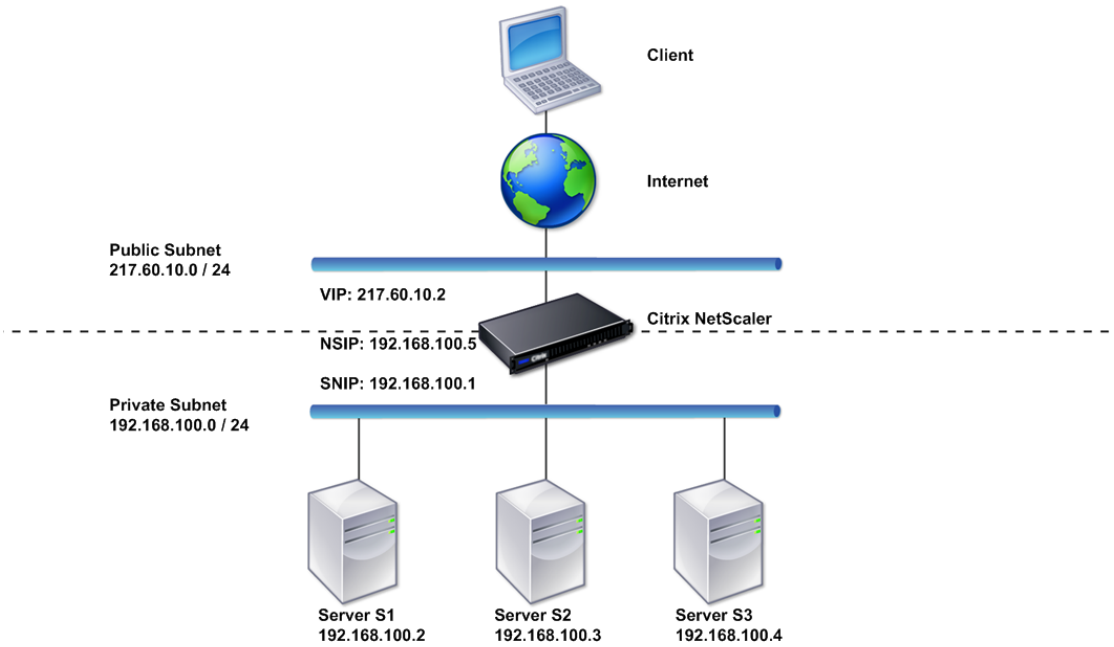
Setting Up a Simple Two-Arm Multiple Subnet Topology

One of the most commonly used topologies has the NetScaler inline between the clients and the servers, with a vserver configured to handle the client requests. This configuration is used when the clients and servers reside on different subnets. In most cases, the clients and servers reside on public and private subnets, respectively.

For example, consider a NetScaler deployed in two-arm mode for managing servers S1, S2, and S3, with a vserver of type HTTP configured on the NetScaler, and with HTTP services running on the servers. The servers are on a private subnet and a SNIP is configured on the NetScaler to communicate with the servers. The Use SNIP (USNIP) option must be enabled on the NetScaler so that it uses the SNIP instead of the MIP.

As shown in the following figure, the VIP and a SNIP are on public subnet 217.60.10.0, and the NSIP, the servers, and another SNIP are on private subnet 192.168.100.0/24.

Figure 1. Topology Diagram for Two-Arm Mode, Multiple Subnets



Task overview: To deploy a NetScaler in two-arm mode with multiple subnets

1. Configure the NSIP and default gateway, as described in Configuring a NetScaler by Using the Command Line Interface.

2. Configure the SNIP, as described in the Configuring Subnet IP Addresses (SNIPs).

3. Enable the USNIP option, as described in the To enable or disable USNIP mode by using the NetScaler command line.

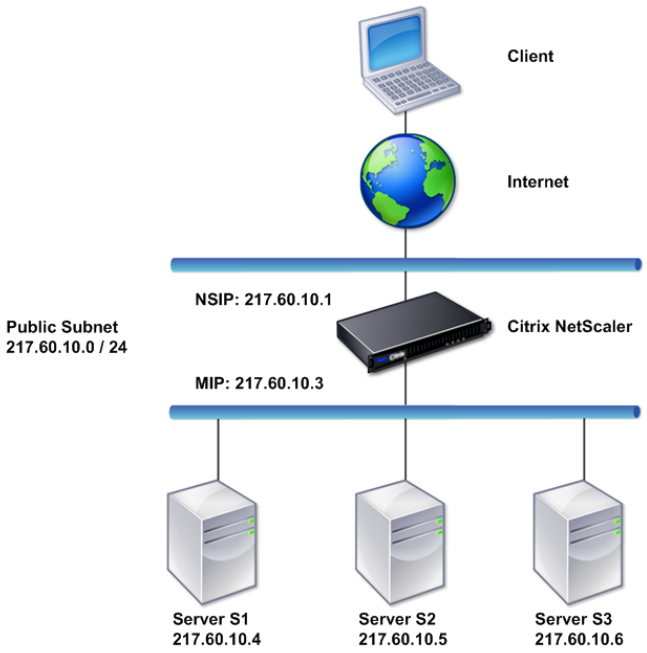
4. Configure the vserver and the services, as described in the Creating a Virtual Server and Configuring Services.

5. Connect one of the network interfaces to a private subnet and the other interface to a public subnet.

Setting Up a Simple Two-Arm Transparent Topology

Use transparent mode if the clients need to access the servers directly, with no intervening vserver. The server IP addresses must be public because the clients need to be able to access them. In the example shown in the following figure, a NetScaler is placed between the client and the server, so the traffic must pass through the NetScaler. You must enable L2 mode for bridging the packets. The NSIP and MIP are on the same public subnet, 217.60.10.0/24.

Figure 1. Topology Diagram for Two-Arm, Transparent Mode



Task overview: To deploy a NetScaler in two-arm, transparent mode

1. Configure the NSIP, MIP, and default gateway, as described in Configuring a NetScaler by Using the Command Line Interface.
2. Enable L2 mode, as described in the Enabling and Disabling Layer 2 Mode.
3. Configure the default gateway of the managed servers as the MIP.
4. Connect the network interfaces to the appropriate ports on the switch.

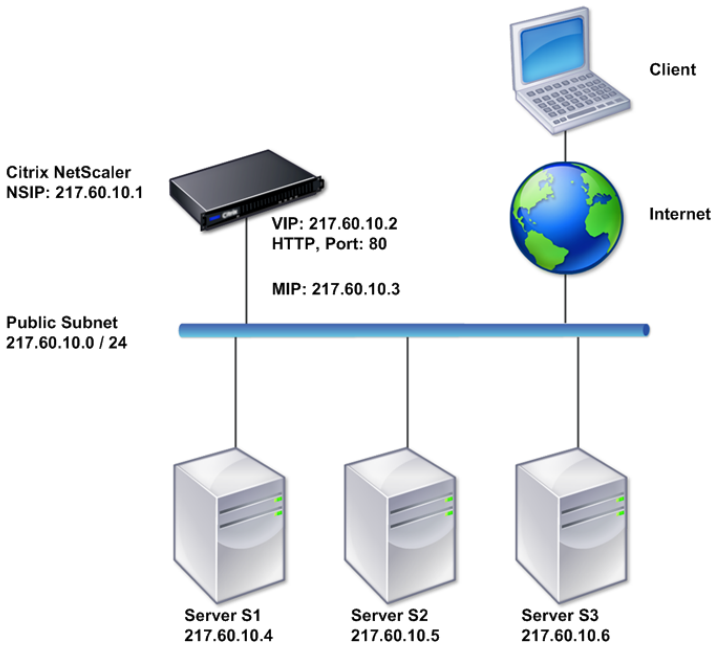
Setting Up Common One-Arm Topologies

The two basic variations of one-arm topology are with a single subnet and with multiple subnets.

Setting Up a Simple One-Arm Single Subnet Topology

You can use a one-arm topology with a single subnet when the clients and servers reside on the same subnet. For example, consider a NetScaler deployed in one-arm mode for managing servers S1, S2, and S3. A vserver of type HTTP is configured on a NetScaler, and HTTP services are running on the servers. As shown in the following figure, the NetScaler IP address (NSIP), the Mapped IP address (MIP), and the server IP addresses are on the same public subnet, 217.60.10.0/24.

Figure 1. Topology Diagram for One-Arm Mode, Single Subnet



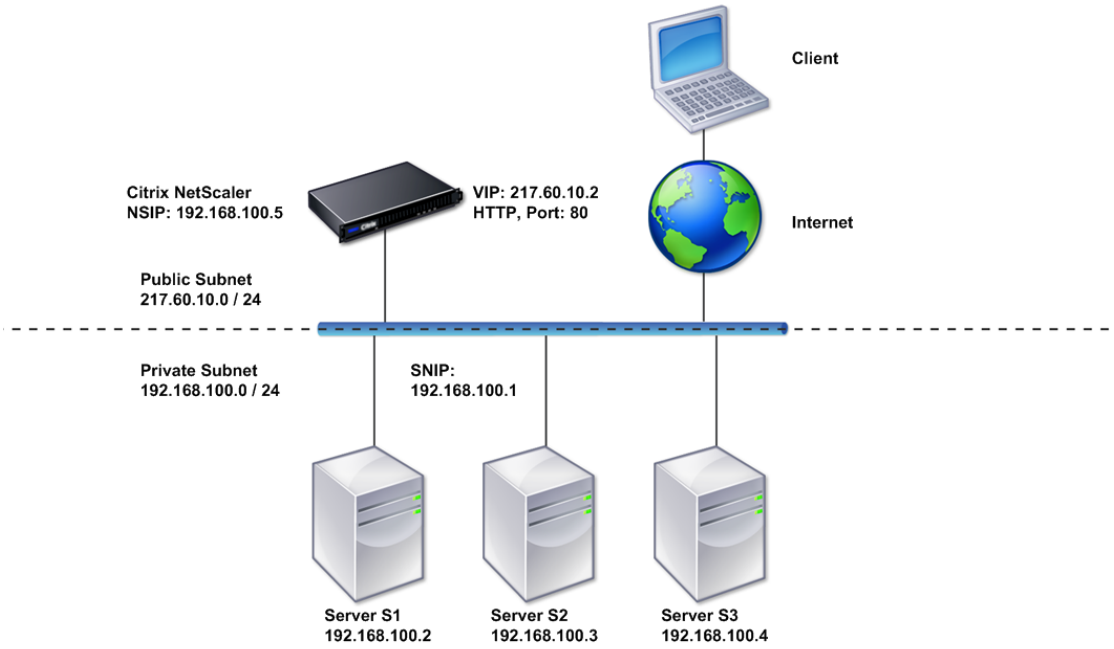
Task overview: To deploy a NetScaler in one-arm modewith a single subnet

1. Configure the NSIP, MIP, and the default gateway, as described in Configuring a NetScaler by Using the Command Line Interface.
2. Configure the vserver and the services, as described in Creating a Virtual Server and Configuring Services.
3. Connect one of the network interfaces to the switch.

Setting Up a Simple One-Arm Multiple Subnet Topology

You can use a one-arm topology with multiple subnets when the clients and servers reside on the different subnets. For example, consider a NetScaler deployed in one-arm mode for managing servers S1, S2, and S3, with the servers connected to switch SW1 on the network. A vserver of type HTTP is configured on the NetScaler, and HTTP services are running on the servers. These three servers are on the private subnet, so a subnet IP address (SNIP) is configured to communicate with them. The Use Subnet IP address (USNIP) option must be enabled so that the NetScaler uses the SNIP instead of a MIP. As shown in the following figure, the virtual IP address (VIP) is on public subnet 217.60.10.0/24; the NSIP, SNIP, and the server IP addresses are on private subnet 192.168.100.0/24.

Figure 1. Topology Diagram for One-Arm Mode, Multiple Subnets



Task overview: To deploy a NetScaler in one-arm mode with multiple subnets

1. Configure the NSIP and the default gateway, as described in Configuring a NetScaler by Using the Command Line Interface.

2. Configure the SNIP and enable the USNIP option, as described in the Configuring Subnet IP Addresses (SNIPs).

3. Configure the vserver and the services, as described in Creating a Virtual Server and Configuring Services.

4. Connect one of the network interfaces to the switch.

Configuring System Management Settings

Once your initial configuration is in place, you can configure settings to define the behavior of the Citrix® NetScaler® appliance and facilitate connection management. You have a number of options for handling HTTP requests and responses. Routing, bridging, and MAC based forwarding modes are available for handling packets not addressed to the NetScaler. You can define the characteristics of your network interfaces and can aggregate the interfaces. To prevent timing problems, you can synchronize the NetScaler clock with a Network Time Protocol (NTP) server. The NetScaler can operate in various DNS modes, including as an authoritative domain name server (ADNS). You can set up SNMP for system management and customize syslog logging of system events. Before deployment, verify that your configuration is complete and correct.

Configuring System Settings

Configuration of system settings includes basic tasks such as configuring HTTP ports to enable connection keep-alive and server offload, setting the maximum number of connections for each server, and setting the maximum number of requests per connection. You can enable client IP address insertion for situations in which a proxy IP address is not suitable, and you can change the HTTP cookie version.

You can also configure a NetScaler to open FTP connections on a controlled range of ports instead of ephemeral ports for data connections. This improves security, because opening all ports on the firewall is insecure. You can set the range anywhere from 1,024 to 64,000.

Before deployment, go through the verification checklists to verify your configuration. To configure HTTP parameters and the FTP port range, use the NetScaler configuration utility.

You can modify the types of HTTP parameters described in the following table.

Table 1. HTTP Parameters

Parameter Type	Specifies
HTTP Port Information	The Web server HTTP ports used by your managed servers. If you specify the ports, the NetScaler can perform request switching for any client request that has a destination port matching a specified port. **Note:** If an incoming client request is not destined for a service or a virtual server that is specifically configured on the NetScaler, the destination port in the request must match one of the globally configured HTTP ports. This allows the NetScaler to perform connection keep-alive and server off-load.

Limits	The maximum number of connections to each managed server, and the maximum number of requests sent over each connection. For example, if set **Max Connections** to 500, and the NetScaler is managing three servers, it can open a maximum of 500 connections to each of the three servers. By default, the NetScaler can create an unlimited number of connections to any of the servers it manages. To specify an unlimited number of requests per connection, set **Max Requests** to 0. **Note:** If you are using the Apache HTTP server, you must set **Max Connections** equal to the value of the MaxClients parameter in the Apache httpd.conf file. Setting this parameter is optional for other web servers.
Client IP Insertion	Enable/disable insertion of the client's IP address into the HTTP request header. You can specify a name for the header field in the adjacent text box. When a Web server managed by a NetScaler receives a mapped IP address or a subnet IP address, the server identifies it as the client's IP address. Some applications need the client's IP address for logging purposes or to dynamically determine the content to be served by the web server. You can enable insertion of the actual client IP address into the HTTP header request sent from the client to one, some, or all servers managed by the NetScaler. You can then access the inserted address through a minor modification to the server (using an Apache module, ISAPI interface, or NSAPI interface).
Cookie Version	The HTTP cookie version to use when COOKIEINSERT persistence is configured on a virtual server. The default, version 0, is the most common type on the Internet. Alternatively, you can specify version 1.
Requests/Responses	Options for handling certain types of requests, and enable/disable logging of HTTP error responses.
Server Header Insertion	Insert a server header in NetScaler-generated HTTP responses.

To configure HTTP parameters by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change HTTP parameters**.
3. In the **Configure HTTP parameters** dialog box, specify values for some or all of the parameters that appear under the headings listed in the table above.
4. Click **OK**.

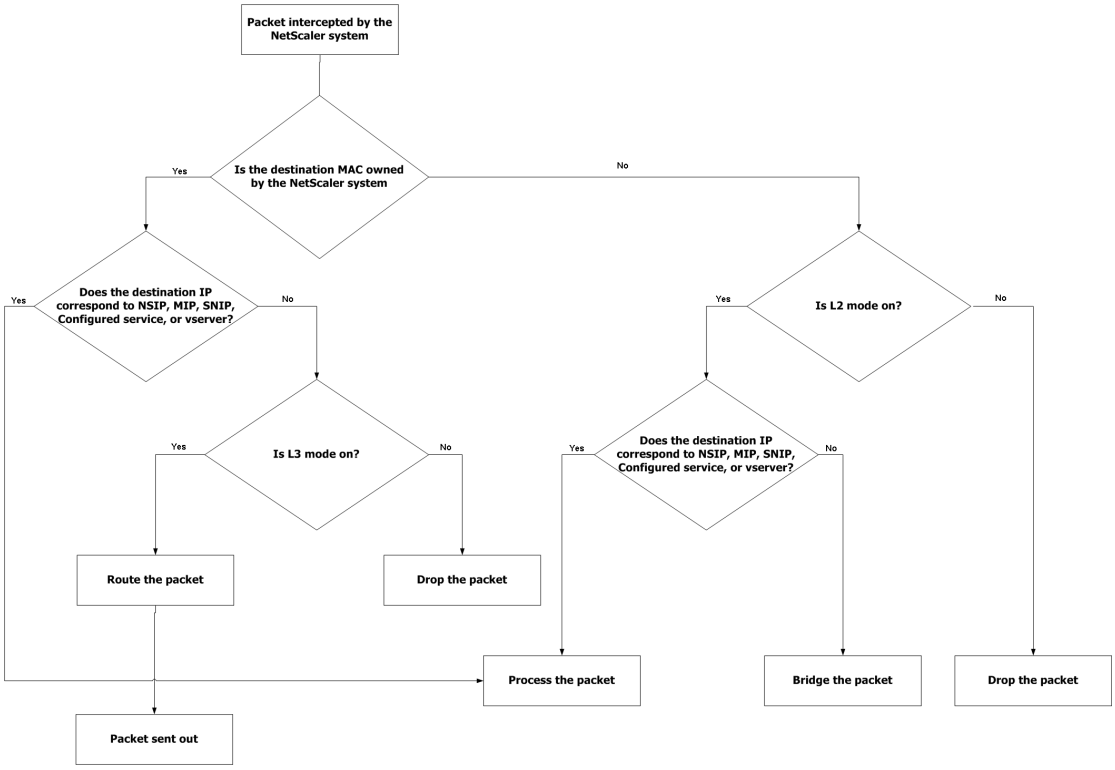
To set the FTP port range by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change global system settings**.
3. Under **FTP Port Range**, in the **Start Port** and **End Port** text boxes, type the lowest and highest port numbers, respectively, for the range you want to specify (for example, 5000 and 6000).
4. Click **OK**.

Configuring Modes of Packet Forwarding

The NetScaler can either route or bridge packets that are not destined for an IP address owned by the NetScaler (that is, the IP address is not the NSIP, a MIP, a SNIP, a configured service, or a configured vserver). By default, L3 mode (routing) is enabled and L2 mode (bridging) is disabled, but you can change the configuration. The following flow chart shows how the NetScaler evaluates packets and either processes, routes, bridges, or drops them.

Figure 1. Interaction between Layer 2 and Layer 3 Modes



A NetScaler can use the following modes to forward the packets it receives:

- Layer 2 (L2) Mode
- Layer 3 (L3) Mode
- MAC-Based Forwarding Mode

Enabling and Disabling Layer 2 Mode

Layer 2 mode controls the Layer 2 forwarding (bridging) function. You can use this mode to configure a NetScaler to behave as a Layer 2 device and bridge the packets that are not destined for it. When this mode is enabled, packets are not forwarded to any of the MAC addresses, because the packets can arrive on any interface of the NetScaler and each interface has its own MAC address.

With Layer 2 mode disabled (which is the default), a NetScaler drops packets that are not destined for one of its MAC address. If another Layer 2 device is installed in parallel with a NetScaler, Layer 2 mode must be disabled to prevent bridging (Layer 2) loops. You can use the configuration utility or the command line to enable Layer 2 mode.

Note: The NetScaler does not support spanning tree protocol. To avoid loops, if you enable L2 mode, do not connect two interfaces on the NetScaler to the same broadcast domain.

To enable or disable Layer 2 mode by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable/disable Layer 2 mode and verify that it has been enabled/disabled:

- `enable ns mode <Mode>`
- `disable ns mode <Mode>`
- `show ns mode`

Examples

```
> enable ns mode l2
 Done
> show ns mode

      Mode                  Acronym          Status
      -------               -------          ------
 1)    Fast Ramp               FR              ON
 2)    Layer 2 mode             L2              ON
 .
 .
 .
 Done
>

> disable ns mode l2
```

```
 Done
> show ns mode

      Mode                  Acronym          Status
      -------               -------          ------
1)    Fast Ramp               FR               ON
2)    Layer 2 mode            L2               OFF
.
.
.
 Done
>
```

To enable or disable Layer 2 mode by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change modes**.
3. In the **Configure Modes** dialog box, to enable Layer 2 mode, select the **Layer 2 Mode** check box. To disable Layer 2 mode, clear the check box.
4. Click **OK**. The **Enable/Disable Mode(s)?** message appears in the details pane.
5. Click **Yes**.

Enabling and Disabling Layer 3 Mode

Layer 3 mode controls the Layer 3 forwarding function. You can use this mode to configure a NetScaler to look at its routing table and forward packets that are not destined for it. With Layer 3 mode enabled (which is the default), a NetScaler performs route table lookups and forwards all packets that are not destined for any NetScaler-owned IP address. If you disable Layer 3 mode, the NetScaler drops these packets.

To enable or disable Layer 3 mode by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable/disable Layer 3 mode and verify that it has been enabled/disabled:

- `enable ns mode <Mode>`
- `disable ns mode <Mode>`
- `show ns mode`

Examples

```
> enable ns mode l3
 Done
> show ns mode

      Mode                    Acronym          Status
      -------                 -------          ------
 1)   Fast Ramp                 FR               ON
 2)   Layer 2 mode               L2               OFF
 .
 .
 .
 9)   Layer 3 mode (ip forwarding)   L3               ON
 .
 .
 .
 Done
>

> disable ns mode l3
 Done
> show ns mode

      Mode                    Acronym          Status
      -------                 -------          ------
```

```
1)   Fast Ramp                  FR              ON
2)   Layer 2 mode                L2              OFF
.
.
.
9)   Layer 3 mode (ip forwarding)  L3              OFF
.
.
.
Done
>
```

To enable or disable Layer 3 mode by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change modes**.
3. In the **Configure Modes** dialog box, to enable Layer 3 mode, select the **Layer 3 Mode (IP Forwarding)** check box. To disable Layer 3 mode, clear the check box.
4. Click **OK**. The **Enable/Disable Mode(s)?** message appears in the details pane.
5. Click **Yes**.

Enabling and Disabling MAC-Based Forwarding Mode

You can use MAC-based forwarding to process traffic more efficiently and avoid multiple-route or ARP lookups when forwarding packets, because the NetScaler remembers the MAC address of the source. To avoid multiple lookups, the NetScaler caches the source MAC address of every connection for which it performs an ARP lookup, and it returns the data to the same MAC address.

MAC-based forwarding is useful when you use VPN devices because the NetScaler ensures that all traffic flowing through a particular VPN passes through the same VPN device.

The following figure shows the process of MAC-based forwarding.

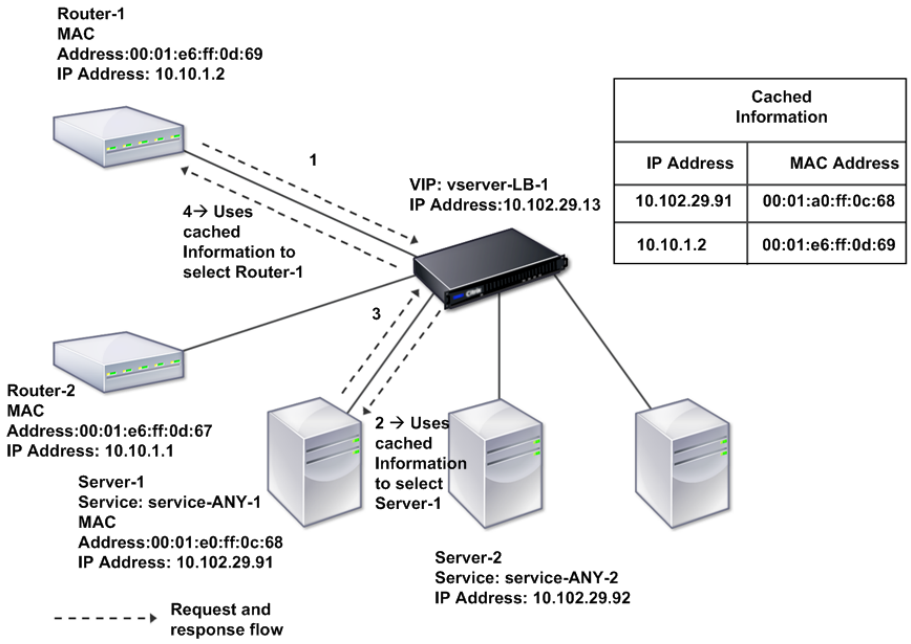


Figure 1. MAC-Based Forwarding Process

When MAC-based forwarding is enabled, a NetScaler caches the MAC address of:

- The source (a transmitting device such as router, firewall, or VPN device) of the inbound connection.
- The server that responds to the requests.

When a server responds through a NetScaler, the NetScaler sets the destination MAC address of the response packet to the cached address, ensuring that the traffic flows in a symmetric manner, and then forwards the response to the client. The process bypasses the route table lookup and ARP lookup functions. However, when a NetScaler initiates a connection, it uses the route and ARP tables for the lookup function. To enable MAC-based forwarding, use the configuration utility or the command line.

Some deployments require the incoming and outgoing paths to flow through different routers. In these situations, MAC-based forwarding breaks the topology design. For a global server load balancing (GSLB) site that requires the incoming and outgoing paths to flow through different routers, you must disable MAC-based forwarding and use the NetScaler unit's default router as the outgoing router.

With MAC-based forwarding disabled and Layer 2 or Layer 3 connectivity enabled, a route table can specify separate routers for outgoing and incoming connections. To disable MAC-based forwarding, use the configuration utility or the command line.

To enable or disable MAC-based forwarding by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable/disable MAC-based forwarding mode and verify that it has been enabled/disabled:

- `enable ns mode <Mode>`
- `disable ns mode <Mode>`
- `show ns mode`

Example

```
> enable ns mode mbf
 Done
> show ns mode

      Mode                  Acronym          Status
      -------               -------          ------
 1)   Fast Ramp               FR               ON
 2)   Layer 2 mode             L2               OFF
 .
 .
 .
 6)   MAC-based forwarding      MBF              ON
 .
 .
 .
 Done
>

> disable ns mode mbf
 Done
```

```
> show ns mode

      Mode                    Acronym          Status
      -------                 -------          ------
 1)   Fast Ramp                 FR               ON
 2)   Layer 2 mode               L2               OFF
 .
 .
 .
 6)   MAC-based forwarding       MBF              OFF
 .
 .
 .
 Done
>
```

To enable or disable MAC-based forwarding by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features** group, click **Change modes**.
3. In the **Configure Modes** dialog box, to enable MAC-based forwarding mode, select the **MAC Based Forwarding** check box. To disable MAC-based forwarding mode, clear the check box.
4. Click **OK**. The **Enable/Disable Mode(s)?** message appears in the details pane.
5. Click **Yes**.

Configuring Clock Synchronization

You can configure your NetScaler to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network. NTP uses User Datagram Protocol (UDP) port 123 as its transport layer. You have to add NTP servers in the NTP configuration file so that the NetScaler periodically gets updates from these servers.

If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site at http://www.ntp.org/.

To configure clock synchronization on your NetScaler

1. Log on to the NetScaler command line and enter the `shell` command.

2. At the shell prompt, copy the ntp.conf file from the /etc directory to the /nsconfig directory. If the file already exists in the /nsconfig directory, make sure that you remove the following entries from the ntp.conf file:

   ```
   restrict localhost

   restrict 127.0.0.2
   ```

   These entries are required only if you want to run the device as a time server. However, this feature is not supported on the NetScaler.

3. Edit /nsconfig/ntp.conf by typing the IP address for the desired NTP server under the file's server and restrict entries.

4. Create a file named rc.netscaler in the /nsconfig directory, if the file does not already exist in the directory.

5. Edit /nsconfig/rc.netscaler by adding the following entry: `/usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &`

   This entry starts the ntpd service, checks the ntp.conf file, and logs messages in the /var/log directory.

   Note: If the time difference between the NetScaler and the time server is more than 1000 sec, the ntpd service terminates with a message to the NetScaler log. To avoid this, you need to start ntpd with the **-g** option,which forcibly syncs the time. Add the following entry in /nsconfig/rc.netscaler:

   ```
   /usr/sbin/ntpd -g -c /nsconfig/ntp.conf -l /var/log/ntpd.log &
   ```

   If you do not want to forcibly sync the time when there is a large difference, you can set the date manually and then start ntpd again. You can check the time difference between the NetScaler and the time server by executing the following command in the shell:

   ntpdate -q <IP address or domain name of the NTP server>

6. Reboot the NetScaler to enable clock synchronization.

   Note: If you want to start time synchronization before you restart the NetScaler, you can enter the

   /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ ntpd.log &

   command (which you added to the rc.netscaler file in step 5) at the shell prompt.

Configuring DNS

You can configure a NetScaler to function as an Authoritative Domain Name Server (ADNS), DNS proxy server, End Resolver, or Forwarder. You can add DNS resource records such as SRV Records, AAAA Records, A Records, MX Records, NS Records, CNAME Records, PTR Records, and SOA Records. Also, the NetScaler can balance the load on external DNS servers.

A common practice is to configure a NetScaler as a forwarder. For this configuration, you need to add external name servers. After you have added the external servers, you should verify that your configuration is correct.

For other configurations, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

You can add, remove, enable, and disable external name servers. You can create a name server by specifying its IP address, or you can configure an existing vserver as the name server.

When adding name servers, you can specify IP addresses or virtual IP addresses (VIPs). If you use IP addresses, the NetScaler load balances requests to the configured name servers in a round robin manner. If you use VIPs, you can specify any load balancing method. For information about using a VIP, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To add a name server by using the NetScaler command line

At the NetScaler command prompt, type the following commands to add a name server and verify the configuration:

- `add dns nameServer <IP>`
- `show dns nameServer <IP>`

  Example

```
> add dns nameServer 10.102.29.10
 Done
> show dns nameServer 10.102.29.10
1)      10.102.29.10  -  State: DOWN
 Done
>
```

To add a name server by using the configuration utility

1. In the navigation pane, expand **DNS**, and then click **Name Servers**.
2. In the details pane, click **Add**.
3. In the **Create Name Server** dialog box, select **IP Address**.
4. In the **IP Address** text box, type the IP address of the name server (for example, `10.102.29.10`). If you are adding an external name server, clear the **Local** check box.
5. Click **Create**, and then click **Close**.
6. Verify that the name server you added appears in the **Name Servers** pane.

Configuring SNMP

The Simple Network Management Protocol (SNMP) network management application, running on a external computer, queries the SNMP agent on the NetScaler. The agent searches the management information base (MIB) for data requested by the network management application and sends the data to the application.

SNMP monitoring uses traps messages and alarms. SNMP traps messages are asynchronous events that the agent generates to signal abnormal conditions, which are indicated by alarms. For example, if you want to be informed when CPU utilization is above 90 percent, you can set up an alarm for that condition. The following figure shows a network with a NetScaler that has SNMP enabled and configured.

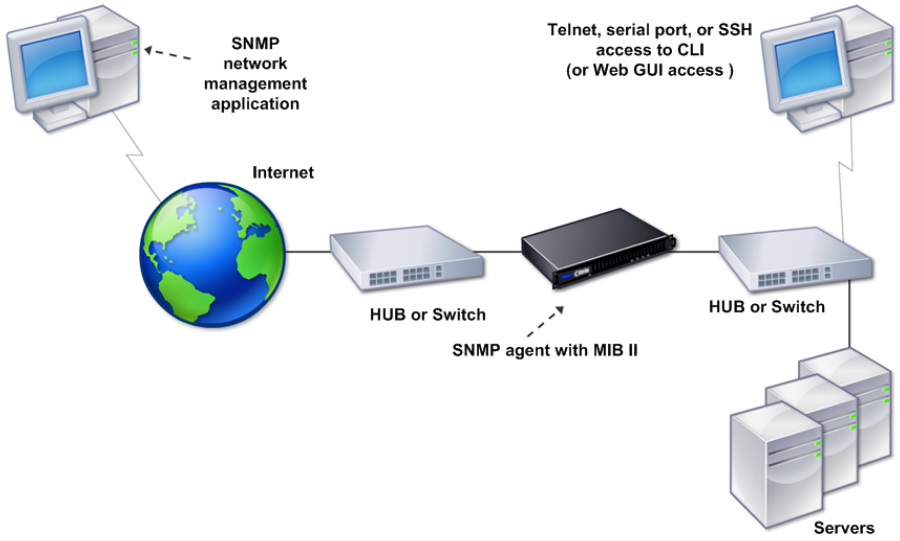

Figure 1. SNMP on the NetScaler

The SNMP agent on a NetScaler supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3). Because it operates in bilingual mode, the agent can handle SNMPv2 queries, such as Get-Bulk, and SNMPv1 queries. The SNMP agent also sends traps compliant with SNMPv2 and supports SNMPv2 data types, such as counter64. SNMPv1 managers (programs on other servers that request SNMP information from the NetScaler) use the NS-MIB-smiv1.mib file when processing SNMP queries. SNMPv2 managers use the NS-MIB-smiv2.mib file.

The NetScaler supports the following enterprise-specific MIBs:

A subset of standard MIB-2 groups

Provides MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.

A system enterprise MIB

Provides system-specific configuration and statistics.

To configure SNMP, you specify which managers can query the SNMP agent, add SNMP trap listeners that will receive the SNMP trap messages, and configure SNMP Alarms.

Adding SNMP Managers

You can configure a workstation running a management application that complies with SNMP version 1, 2, or 3 to access a NetScaler. Such a workstation is called an SNMP manager. If you do not specify an SNMP manager on the NetScaler, the NetScaler accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the NetScaler accepts and responds to SNMP queries from only those specific IP addresses. When specifying the IP address of an SNMP manager, you can use the netmask parameter to grant access from entire subnets. You can add a maximum of 100 SNMP managers or networks.

To add an SNMP manager by using the NetScaler command line

At the NetScaler command prompt, type the following commands to add an SNMP manager and verify the configuration:

- `add snmp manager <IPAddress> ... [-netmask <netmask>]`
- `show snmp manager <IPAddress>`

  Example

```
> add snmp manager 10.102.29.5 -netmask 255.255.255.255
 Done
> show snmp manager 10.102.29.5
1)     10.102.29.5       255.255.255.255
 Done
>
```

To add an SNMP manager by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Managers**.
2. In the details pane, click **Add**.
3. In the **Add SNMP Manager** dialog box, in the **IP Address** text box, type the IP address of the workstation running the management application (for example, `10.102.29.5`).
4. Click **Create**, and then click **Close**.
5. Verify that the SNMP manager you added appears in the **Details** section at the bottom of the pane.

Adding SNMP Traps Listeners

After configuring the alarms, you need to specify the trap listener to which the NetScaler will send the trap messages. Apart from specifying parameters like IP address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

To add an SNMP trap listener by using the NetScaler command line

At the NetScaler command prompt, type the following command to add an SNMP trap and verify that it has been added:

- `add snmp trap specific <IP>`
- `show snmp trap`

Example

```
> add snmp trap specific 10.102.29.3
 Done
> show snmp trap
Type       DestinationIP    DestinationPort  Version    SourceIP       Min-Severity   Community
----      -------------   ---------------  -------    --------      ------------  ---------
generic    10.102.29.9     162           V2       NetScaler IP    N/A          public
generic    10.102.29.5     162           V2       NetScaler IP    N/A          public
generic    10.102.120.101   162           V2       NetScaler IP    N/A          public
.
.
.
specific   10.102.29.3     162           V2       NetScaler IP    -           public
 Done
>
```

To add an SNMP trap listener by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Traps**.
2. In the details pane, click **Add**.
3. In the **Add SNMP Trap Destination** dialog box, in the **Destination IP Address** text box, type the IP address (for example, `10.102.29.3`).
4. Click **Create** and then click **Close**.
5. Verify that the SNMP trap you added appears in the **Details** section at the bottom of the pane.

Configuring SNMP Alarms

You configure alarms so that the NetScaler generates a trap message when an event corresponding to one of the alarms occurs. Configuring an alarm consists of enabling the alarm and setting the severity level at which a trap is generated. There are five severity levels: Critical, Major, Minor, Warning, and Informational. A trap is sent only when the severity of the alarm matches the severity specified for the trap.

Some alarms are enabled by default. If you disable an SNMP alarm, the NetScaler will not generate trap messages when corresponding events occur. For example, if you disable the Login-Failure SNMP alarm, the NetScaler will not generate a trap message when a login failure occurs.

To enable or disable an alarm by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable or disable an alarm and verify that it has been enabled or disabled:

- `set snmp alarm <trapName> [-state ENABLED | DISABLED ]`
- `show snmp alarm <trapName>`

Example

```
> set snmp alarm LOGIN-FAILURE -state ENABLED
 Done
> show snmp alarm LOGIN-FAILURE
   Alarm                  Alarm Threshold    Normal Threshold  Time  State     Severity     Logging
   -----                  ---------------    ----------------  ----  --------  ------------ --------
 1) LOGIN-FAILURE              N/A              N/A             N/A   ENABLED   -            ENABLED
 Done
>
```

To set the severity of the alarm by using the NetScaler command line

At the NetScaler command prompt, type the following commands to set the severity of the alarm and verify that the severity has been set correctly:

- `set snmp alarm <trapName> [-severity <severity>]`
- `show snmp alarm <trapName>`

Example

```
> set snmp alarm LOGIN-FAILURE -severity Major
 Done
> show snmp alarm LOGIN-FAILURE
   Alarm                    Alarm Threshold    Normal Threshold  Time  State     Severity     Logging
   -----                   ---------------   ----------------  ----  --------  ------------ --------
 1) LOGIN-FAILURE               N/A              N/A             N/A   ENABLED    Major       ENABLED
 Done
>
```

To configure alarms by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Alarms**.
2. In the details pane, select an alarm (for example, **LOGIN-FAILURE**), and then click **Open**.
3. In the **Configure SNMP Alarm** dialog box, to enable the alarm, select the **Enable** check box. To disable the alarm, clear the **Enable** check box.
4. In the **Severity** drop-down list, select a severity option (for example, **Major**).
5. Click **OK**, and then click **Close**.
6. Verify that the parameters for the SNMP alarm you configured are correctly configured by viewing the **Details** section at the bottom of the pane.

Configuring Syslog

You can customize logging of NetScaler and Access Gateway Enterprise Edition access events for the needs of your site. You can direct these logs either to files on the NetScaler or to external log servers. The NetScaler uses the Audit Server Logging feature for logging the states and status information collected by different modules in the kernel and by user-level daemons.

Syslog is used to monitor a NetScaler and to log connections, statistics, and so on. You can customize the two logging functions for system events messaging and syslog. The NetScaler internal event message generator passes log entries to the syslog server. The syslog server accepts these log entries and logs them. For more information about the Audit Server Logging feature, see the *Citrix NetScaler Administration Guide* at http://support.citrix.com/article/CTX128667.

Verifying the Configuration

After you finish configuring your system, complete the following checklists to verify your configuration.

Configuration Checklist

- The build running is:
- There are no incompatibility issues. (Incompatibility issues are documented in the build's release notes.)
- The port settings (speed, duplex, flow control, monitoring) are the same as the switch's port.
- Enough mapped IP addresses have been configured to support all server-side connections during peak times.
    - The number of configured mapped IP addresses is: ____
    - The expected number of simultaneous server connections is:

      [ ] 62,000 [ ] 124,000 [ ] Other____

Topology Configuration Checklist

The routes have been used to resolve servers on other subnets.

The routes entered are:

_____

- If the NetScaler is in a public-private topology, reverse NAT has been configured.
- The failover (high availability) settings configured on the NetScaler resolve in a one arm or two-arm configuration. All unused network interfaces have been disabled:

  _____
  _____
- If the NetScaler is placed behind an external load balancer, then the load balancing policy on the external load balancer is not "least connection."

  The load balancing policy configured on the external load balancer is:

  _____
- If the NetScaler is placed in front of a firewall, the session time-out on the firewall is set to a value greater than or equal to 300 seconds.

  The value configured for the session time-out is: _____

Server Configuration Checklist

- "Keep-alive" has been enabled on all the servers.

  The value configured for the keep-alive time-out is: _____

- The default gateway has been set to the correct value. (The default gateway should either be a NetScaler or upstream router.) The default gateway is: _____

- The server port settings (speed, duplex, flow control, monitoring) are the same as the switch port settings.

- If the Microsoft® Internet Information Server is used, buffering is enabled on the server.

- If an Apache Server is used, the MaxConn (maximum number of connections) parameter is configured on the server and on the NetScaler.

  The MaxConn (maximum number of connections) value that has been set is: _____

- If a NetScape® Enterprise Server™ is used, the maximum requests per connection parameter is set on the NetScaler.

  The maximum requests per connection value that has been set is: _____

Software Features Configuration Checklist

- Does the Layer 2 mode feature need to be disabled? (Disable if another Layer 2 device is working in para

  Reason for enabling or disabling: _____

- Does the MAC-based forwarding feature need to be disabled? (If the MAC address used by return traffic is

  Reason for enabling or disabling: _____

- Does host-based reuse need to be disabled? (Is there virtual hosting on the servers?)

  Reason for enabling or disabling: _____

- Do the default settings of the surge protection feature need to be changed?

  Reason for changing or not changing: _____

Access Checklist

- The system IPs can be pinged from the client-side network.

- The system IPs can be pinged from the server-side network.
- The managed server(s) can be pinged through the NetScaler.
- Internet hosts can be pinged from the managed servers.
- The managed server(s) can be accessed through the browser.
- The Internet can be accessed from managed server(s) using the browser.
- The system can be accessed using SSH.
- Admin access to all managed server(s) is working.

Note: When you are using the ping utility, ensure that the pinged server has ICMP ECHO enabled, or your ping will not succeed.

Firewall Checklist

The following firewall requirements have been met:

- UDP 161 (SNMP)
- UDP 162 (SNMP trap)
- TCP/UDP 3010 (GUI)
- HTTP 80 (GUI)
- TCP 22 (SSH)

Load Balancing Traffic on a NetScaler

The load balancing feature distributes client requests across multiple servers to optimize resource utilization. In a real-world scenario with a limited number of servers providing service to a large number of clients, a server can become overloaded and degrade the performance of the server farm. A Citrix® NetScaler® appliance uses load balancing criteria to prevent bottlenecks by forwarding each client request to the server best suited to handle the request when it arrives.

To configure load balancing, you define a virtual server (vserver) to proxy multiple servers in a server farm and balance the load among them.

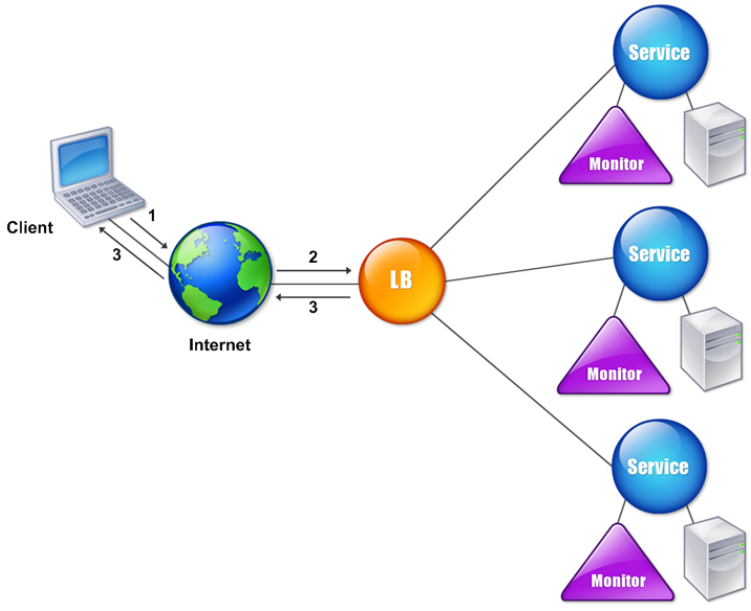
How Load Balancing Works

When a client initiates a connection to the server, a vserver terminates the client connection and initiates a new connection with the selected server, or reuses an existing connection with the server, to perform load balancing. The load balancing feature provides traffic management from Layer 4 (TCP and UDP) through Layer 7 (FTP, HTTP, and HTTPS).

The NetScaler uses a number of algorithms, called load balancing methods, to determine how to distribute the load among the servers. The default load balancing method is the Least Connections method.

A typical load balancing deployment consists of the entities described in the following figure.

Figure 1. Load Balancing Architecture



The entities function as follows:

- **Vserver**. An entity that is represented by an IP address, a port, and a protocol. The vserver IP address (VIP) is usually a public IP address. The client sends connection requests to this IP address. The vserver represents a bank of servers.

- **Service**. A logical representation of a server or an application running on a server. Identifies the server's IP address, a port, and a protocol. The services are bound to the vservers.

- **Server object**. An entity that is represented by an IP address. The server object is created when you create a service. The IP address of the service is taken as the name of the server object. You can also create a server object and then create services by using the server object.

- **Monitor**. An entity that tracks the health of the services. The NetScaler periodically probes the servers using the monitor bound to each service. If a server does not respond within a specified response timeout, and the specified number of probes fails, the service is marked DOWN. The NetScaler then performs load balancing among the remaining services.

Configuring Load Balancing

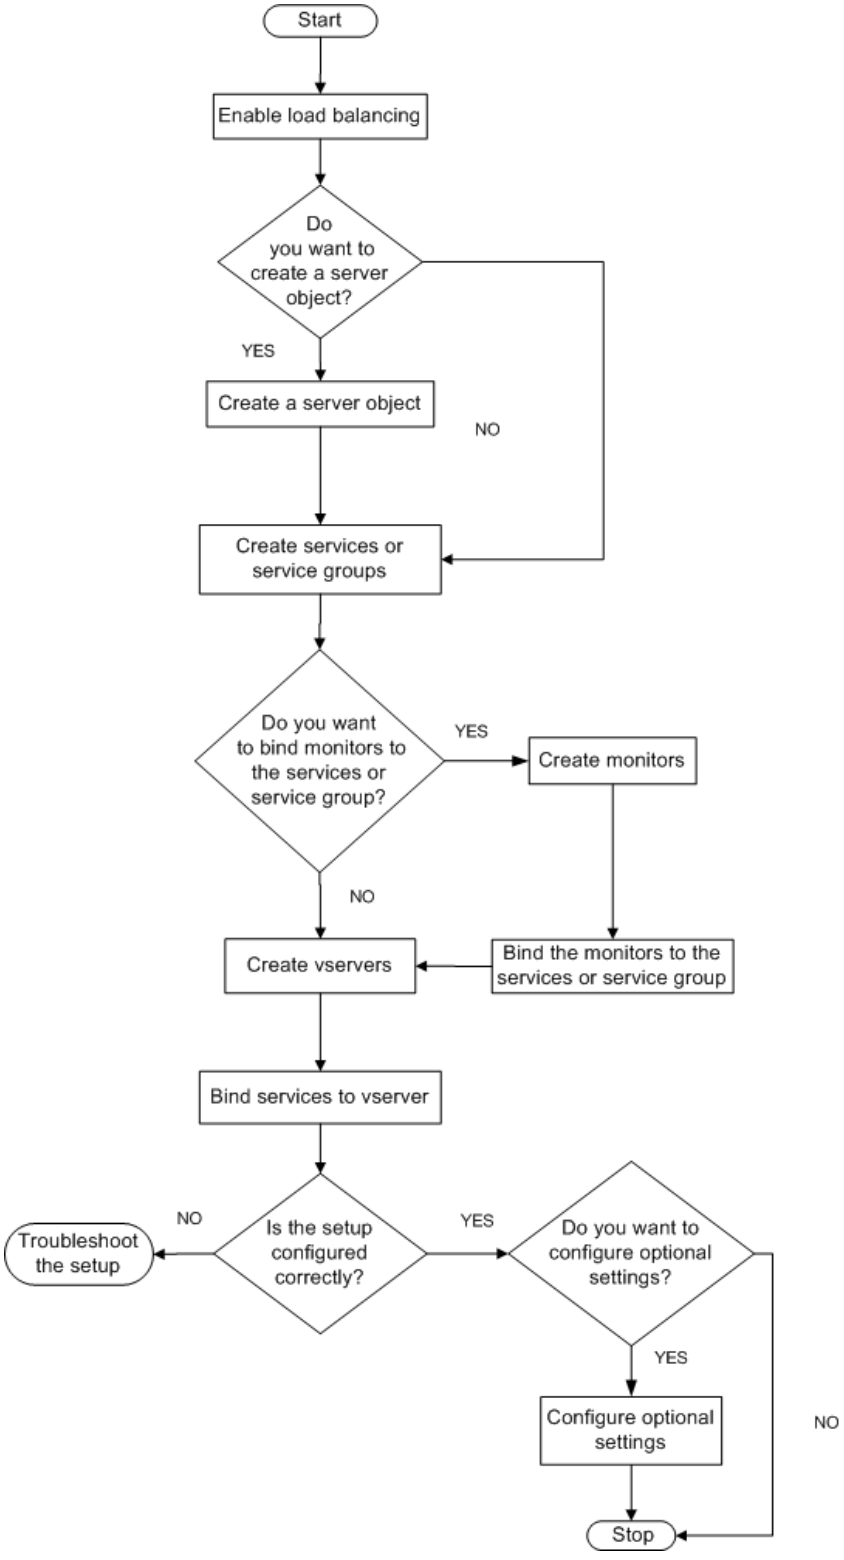
To configure load balancing, you must first create services. Then, you create vservers and bind the services to the vservers. By default, the NetScaler binds a monitor to each service. After binding the services, verify your configuration by making sure that all of the settings are correct.

Note: After you deploy the configuration, you can display statistics that show how the entities in the configuration are performing. Use the statistical utility or the `stat lb vserver <vserverName>` command.

Optionally, you can assign weights to a service. The load balancing method then uses the assigned weight to select a service. For getting started, however, you can limit optional tasks to configuring some basic persistence settings, for sessions that must maintain a connection to a particular server, and some basic configuration-protection settings.

The following flow chart illustrates the sequence of the configuration tasks.

Figure 1. Sequence of Tasks to Configure Load Balancing



Start
Enable load balancing
Do you want to create a server object?
YES
Create a server object
NO
Create services or service groups
Do you want to bind monitors to the services or service group?
YES
Create monitors
NO
Create vservers
Bind the monitors to the services or service group
Bind services to vserver
Is the setup configured correctly?
NO
Troubleshoot the setup
YES
Do you want to configure optional settings?
YES
Configure optional settings
NO
Stop

Enabling Load Balancing

Before configuring load balancing, make sure that the load balancing feature is enabled.

To enable load balancing by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable load balancing and verify that it is enabled:

- `enable feature lb`
- `show feature`

Example

```
> enable feature lb
 Done
> show feature

      Feature                Acronym          Status
      -------                -------          ------
1)    Web Logging              WL               OFF
2)    Surge Protection         SP               OFF
3)    Load Balancing           LB               ON
.
.
.
9)    SSL Offloading           SSL              ON
.
.
.
Done
```

To enable load balancing by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change basic features**.
3. In the **Configure Basic Features** dialog box, select the **Load Balancing** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** message, click **Yes**.

Configuring Services and a Vserver

When you have identified the services you want to load balance, you can implement your initial load balancing configuration by creating the service objects, creating a load balancing vserver, and binding the service objects to the vserver.

To implement the initial load balancing configuration by using the NetScaler command line

At the NetScaler command prompt, type the following commands to implement and verify the initial configuration:

- `add service <name> <IPaddress> <serviceType> <port>`
- `add lb vserver <vServerName> <serviceType> [<IPaddress> <port>]`
- `bind lb vserver <name> <serviceName>`
- `show service bindings <serviceName>`

  Example

```
> add service service-HTTP-1 10.102.29.5 HTTP 80
 Done
> add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
 Done
> bind lb vserver vserver-LB-1 service-HTTP-1
 Done
> show service bindings service-HTTP-1
        service-HTTP-1 (10.102.29.5:80) - State : DOWN

                1)      vserver-LB-1 (10.102.29.60:80) - State : DOWN
 Done
```

To implement the initial load balancing configuration by using the configuration utility

1. In the navigation pane, click **Load Balancing**.
2. In the details pane, under **Getting Started**, click **Load Balancing wizard**, and follow the instructions to create a basic load balancing setup.
3. Return to the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
4. Select the vserver that you configured and verify that the parameters displayed at the bottom of the page are correctly configured.
5. Click **Open**.
6. Verify that each service is bound to the vserver by confirming that the **Active** check box is selected for each service on the **Services** tab.

Choosing and Configuring Persistence Settings

You must configure persistence on a vserver if you want to maintain the states of connections on the servers represented by that vserver (for example, connections used in e-commerce). The NetScaler then uses the configured load balancing method for the initial selection of a server, but forwards to that same server all subsequent requests from the same client.

If persistence is configured, it overrides the load balancing methods once the server has been selected. If the configured persistence applies to a service that is down, the NetScaler uses the load balancing methods to select a new service, and the new service becomes persistent for subsequent requests from the client. If the selected service is in an Out Of Service state, it continues to serve the outstanding requests but does not accept new requests or connections. After the shutdown period elapses, the existing connections are closed. The following table lists the types of persistence that you can configure.

Table 1. Limitations on Number of Simultaneous Persistent Connections

Persistence Type	Persistent Connections
Source IP, SSL Session ID, Rule, DESTIP, SRCIPDESTIP	250K
CookieInsert, URL passive, Custom Server ID	Memory limit. In case of CookieInsert, if time out is not 0, any number of connections is allowed until limited by memory.

If the configured persistence cannot be maintained because of a lack of resources on a NetScaler, the load balancing methods are used for server selection. Persistence is maintained for a configured period of time, depending on the persistence type. Some persistence types are specific to certain vservers. The following table shows the relationship.

Table 2. Persistence Types Available for Each Type of Vserver

Persistence TypeHeader 1	HTTP	HTTPS	TCP	UDP/IP	SSL_Bridge
Source IP	YES	YES	YES	YES	YES
CookieInsert	YES	YES	NO	NO	NO
SSL Session ID	NO	YES	NO	NO	YES
URL Passive	YES	YES	NO	NO	NO
Custom Server ID	YES	YES	NO	NO	NO
Rule	YES	YES	NO	NO	NO

SRCIPDESTIP	N/A	N/A	YES	YES	N/A
DESTIP	N/A	N/A	YES	YES	N/A

You can also specify persistence for a group of vservers. When you enable persistence on the group, the client requests are directed to the same selected server regardless of which vserver in the group receives the client request. When the configured time for persistence elapses, any vserver in the group can be selected for incoming client requests.

Two commonly used persistence types are persistence based on cookies and persistence based on server IDs in URLs. For more information about all persistence types, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Configuring Persistence Based on Cookies

When you enable persistence based on cookies, the NetScaler adds an HTTP cookie into the Set-Cookie header field of the HTTP response. The cookie contains information about the service to which the HTTP requests must be sent. The client stores the cookie and includes it in all subsequent requests, and the NetScaler uses it to select the service for those requests. You can use this type of persistence on vservers of type HTTP or HTTPS.

The NetScaler inserts the cookie <NSC_XXXX>= <ServiceIP> <ServicePort>

where:

- <NSC_XXXX> is the vserver ID that is derived from the vserver name.
- <ServiceIP> is the hexadecimal value of the IP address of the service.
- <ServicePort> is the hexadecimal value of the port of the service.

The NetScaler encrypts ServiceIP and ServicePort when it inserts a cookie, and decrypts them when it receives a cookie.

Note: If the client is not allowed to store the HTTP cookie, the subsequent requests do not have the HTTP cookie, and persistence is not honored.

By default, the NetScaler sends HTTP cookie version 0, in compliance with the Netscape specification. It can also send version 1, in compliance with RFC 2109.

You can configure a timeout value for persistence that is based on HTTP cookies. Note the following:

- If HTTP cookie version 0 is used, the NetScaler inserts the absolute Coordinated Universal Time (GMT) of the cookie's expiration (the expires attribute of the HTTP cookie), calculated as the sum of the current GMT time on a NetScaler, and the timeout value.
- If an HTTP cookie version 1 is used, the NetScaler inserts a relative expiration time (Max-Age attribute of the HTTP cookie). In this case, the client software calculates the actual expiration time.

Note: Most client software currently installed (Microsoft Internet Explorer and Netscape browsers) understand HTTP cookie version 0; however, some HTTP proxies understand HTTP cookie version 1.

If you set the timeout value to 0, the NetScaler does not specify the expiration time, regardless of the HTTP cookie version used. The expiration time then depends on the client software, and such cookies are not valid if that software is shut down. This persistence type

does not consume any system resources. Therefore, it can accommodate an unlimited number of persistent clients.

An administrator can use the procedure in the following table to change the HTTP cookie version.

To change the HTTP cookie version by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, click **Change HTTP Parameters**.
3. In the **Configure HTTP Parameters** dialog box, under **Cookie**, select **Version 0** or **Version 1**.

Note: For information about the parameters, see the "Load Balancing" chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To configure persistence based on cookies by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure persistence based on cookies and verify the configuration:

- `set lb vserver <name> -persistenceType COOKIEINSERT`
- `show lb vserver <name>`

Example

```
> set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
 Done
> show lb vserver vserver-LB-1
        vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
        .
        .
        .
        Persistence: COOKIEINSERT (version 0)   Persistence Timeout: 2 min
        .
        .
        .
 Done
>
```

To configure persistence based on cookies by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the vserver for which you want to configure persistence (for example, **vserver-LB-1**), and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Method and Persistence** tab, in the **Persistence** list, select **COOKIEINSERT**.
4. In the **Time-out (min)** text box, type the time-out value (for example, 2).
5. Click **OK**.
6. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the **Details** section at the bottom of the pane.

Configuring Persistence Based on Server IDs in URLs

The NetScaler can maintain persistence based on the server IDs in the URLs. In a technique called URL passive persistence, the NetScaler extracts the server ID from the server response and embeds it in the URL query of the client request. The server ID is an IP address and port specified as a hexadecimal number. The NetScaler extracts the server ID from subsequent client requests and uses it to select the server.

URL passive persistence requires configuring either a payload expression or a policy infrastructure expression specifying the location of the server ID in the client requests. For more information about expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Note: If the server ID cannot be extracted from the client requests, server selection is based on the load balancing method.

Example: Payload Expression

The expression, URLQUERY contains sid= configures the system to extract the server ID from the URL query of a client request, after matching token sid=. Thus, a request with the URL http://www.citrix.com/index.asp?&sid;=c0a864100050 is directed to the server with the IP address10.102.29.10 and port 80.

The timeout value does not affect this type of persistence, which is maintained as long as the server ID can be extracted from the client requests. This persistence type does not consume any system resources, so it can accommodate an unlimited number of persistent clients.

Note: For information about the parameters, see the “Load Balancing” chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To configure persistence based on server IDs in URLs by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure persistence based on server IDs in URLs and verify the configuration:

- `set lb vserver <name> -persistenceType URLPASSIVE`
- `show lb vserver <name>`

Example

```
> set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
 Done
> show lb vserver vserver-LB-1
        vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
        .
        .
        .
        Persistence: URLPASSIVE Persistence Timeout: 2 min
        .
        .
        .
 Done
>
```

To configure persistence based on server IDs in URLs by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the vserver for which you want to configure persistence (for example, **vserver-LB-1**), and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Method and Persistence** tab, in the **Persistence** list, select **URLPASSIVE**.
4. In the **Time-out (min)** text box, type the time-out value (for example, 2).
5. In the **Rule** text box, enter a valid expression. Alternatively, click **Configure** next to the **Rule** text box and use the **Create Expression** dialog box to create an expression.
6. Click **OK**.
7. Verify that the vserver for which you configured persistence is correctly configured by selecting the vserver and viewing the **Details** section at the bottom of the pane.

Configuring Features to Protect the Load Balancing Configuration

You can configure URL redirection to provide notifications of vserver malfunctions, and you can configure backup vservers to take over if a primary vserver becomes unavailable.

Configuring URL Redirection

You can configure a redirect URL to communicate the status of the NetScaler in the event that a vserver of type HTTP or HTTPS is down or disabled. This URL can be a local or remote link. The NetScaler uses HTTP 302 redirect.

Redirects can be absolute URLs or relative URLs. If the configured redirect URL contains an absolute URL, the HTTP redirect is sent to the configured location, regardless of the URL specified in the incoming HTTP request. If the configured redirect URL contains only the domain name (relative URL), the HTTP redirect is sent to a location after appending the incoming URL to the domain configured in the redirect URL.

Note: If a load balancing vserver is configured with both a backup vserver and a redirect URL, the backup vserver takes precedence over the redirect URL. In this case, a redirect is used when both the primary and backup vservers are down.

To configure a vserver to redirect client requests to a URL by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure a vserver to redirect client requests to a URL and verify the configuration:

- `set lb vserver <name> -redirectURL <URL>`
- `show lb vserver <name>`

Example

```
> set lb vserver vserver-LB-1 -redirectURL http://www.newdomain.com/mysite/maintenance
 Done
> show lb vserver vserver-LB-1
        vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
        State: DOWN
        Last state change was at Wed Jun 17 08:56:34 2009 (+666 ms)
        .
        .
        .
        Redirect URL: http://www.newdomain.com/mysite/maintenance
        .
        .
        .
 Done
>
```

To configure a vserver to redirect client requests to a URL by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the vserver for which you want to configure URL redirection (for example, **vserver-LB-1**), and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Advanced** tab, in the **Redirect URL** text box, type the URL (for example, `http://www.newdomain.com/mysite/maintenance`), and then click **OK**.
4. Verify that the redirect URL you configured for the server appears in the **Details** section at the bottom of the pane.

Configuring Backup Vservers

If the primary vserver is down or disabled, the NetScaler can direct the connections or client requests to a backup vserver that forwards the client traffic to the services. The NetScaler can also send a notification message to the client regarding the site outage or maintenance. The backup vserver is a proxy and is transparent to the client.

You can configure a backup vserver when you create a vserver or when you change the optional parameters of an existing vserver. You can also configure a backup vserver for an existing backup vserver, thus creating cascaded backup vservers. The maximum depth of cascading backup vservers is 10. The NetScaler searches for a backup vserver that is up and accesses that vserver to deliver the content.

You can configure URL redirection on the primary for use when the primary and the backup vservers are down or have reached their thresholds for handling requests.

Note: If no backup vserver exists, an error message appears, unless the vserver is configured with a redirect URL. If both a backup vserver and a redirect URL are configured, the backup vserver takes precedence.

To configure a backup vserver by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure a backup server and verify the configuration:

- `set lb vserver <name> [-backupVserver <string>]`
- `show lb vserver <name>`

Example

```
> set lb vserver vserver-LB-1 -backupVserver vserver-LB-2
 Done
> show lb vserver vserver-LB-1
        vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
        State: DOWN
        Last state change was at Wed Jun 17 08:56:34 2009 (+661 ms)
        .
        .
        .
        Backup: vserver-LB-2
        .
        .
        .
 Done
>
```

To set up a backup vserver by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the vserver for which you want to configure the backup vserver (for example, **vserver-LB-1**), and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Advanced** tab, in the **Backup Virtual Server** list, select the backup vserver (for example, **vserver-LB-2**, and then click **OK**.
4. Verify that the backup vserver you configured appears in the **Details** section at the bottom of the pane.

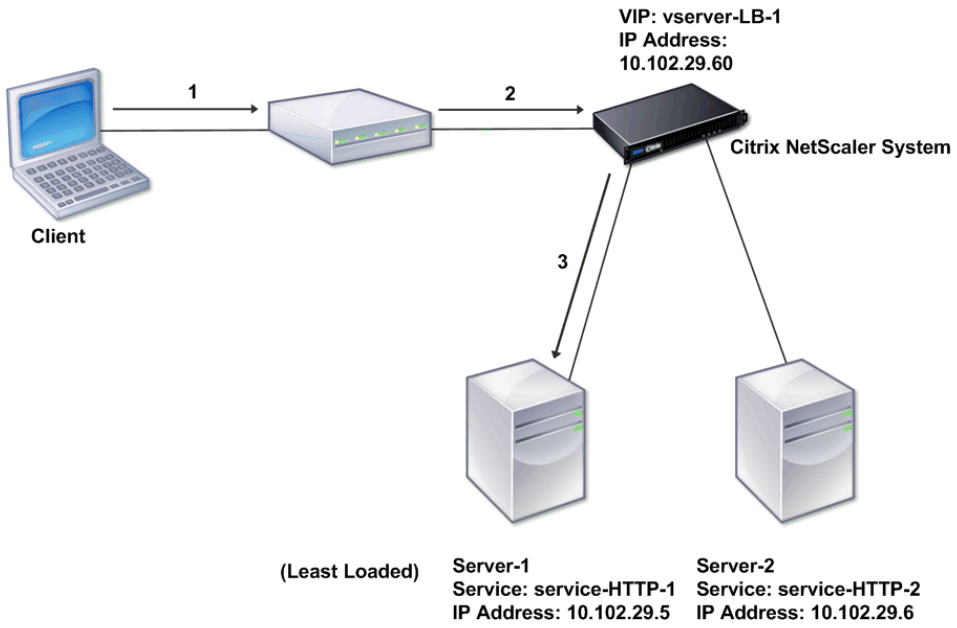
   Note: If the primary server goes down and then comes back up, and you want the backup vserver to function as the primary server until you explicitly reestablish the primary virtual server, select the **Disable Primary When Down** check box.

A Typical Load Balancing Scenario

In a load balancing setup, the NetScalers are logically located between the client and the server farm, and they manage traffic flow to the servers.

The following figure shows the topology of a basic load balancing configuration.

Figure 1. Basic Load Balancing Topology



The vserver selects the service and assigns it to serve client requests. Consider the scenario in the preceding figure, where the services service-HTTP-1 and service-HTTP-2 are created and bound to the vserver named vserver-LB-1. Vserver-LB-1 forwards the client request to either service-HTTP-1 or service-HTTP-2. The system selects the service for each request by using the Least Connections load balancing method. The following table lists the names and values of the basic entities that must be configured on the system.

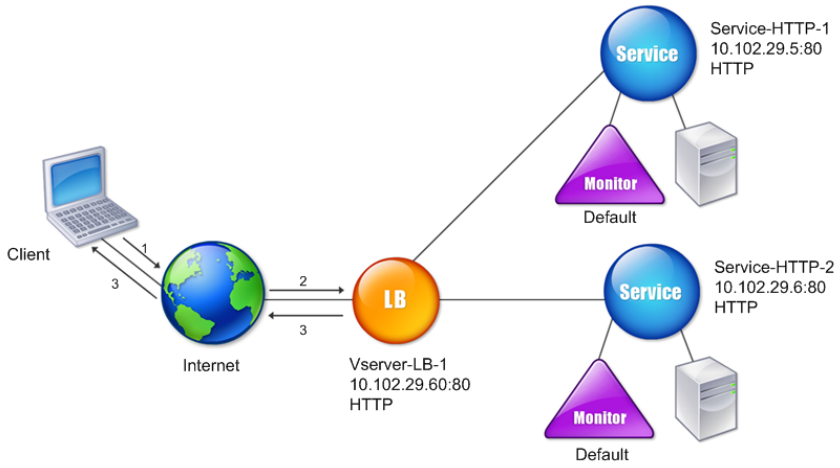
Table 1. LB Configuration Parameter Values

Entity Type	Required parameters and sample values			
	Name	IP Address	Port	Protocol
Vserver	vserver-LB-1	10.102.29.60	80	HTTP
Services	service-HTTP-1	10.102.29.5	8083	HTTP
	service-HTTP-2	10.102.29.6	80	HTTP

Monitors	Default	None	None	None

The following figure shows the load balancing sample values and required parameters that are described in the preceding table.

Figure 2. Load Balancing Entity Model



The following tables list the commands used to configure this load balancing setup by using the NetScaler command line.

Table 2. Initial Configuration Tasks

Task	Command
To enable load balancing	enable feature lb
To create a service named service-HTTP-1	add service service-HTTP-1 10.102.29.5 HTTP 80
To create a service named service-HTTP-2	add service service-HTTP-2 10.102.29.6 HTTP 80
To create a vserver named vserver-LB-1	add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
To bind a service named service-HTTP-1 to a vserver named vserver-LB-1	bind lb vserver vserver-LB-1 service-HTTP-1
To bind a service named service-HTTP-2 to a vserver named vserver-LB-1	bind lb vserver vserver-LB-1 service-HTTP-2

For more information about the initial configuration tasks, see Enabling Load Balancing and Configuring Services and a Vserver.

Table 3. Verification Tasks

Task	Command
To view the properties of a vserver named vserver-LB-1	show lb vserver vserver-LB-1
To view the statistics of a vserver named vserver-LB-1	stat lb vserver vserver-LB-1
To view the properties of a service named service-HTTP-1	show service service-HTTP-1
To view the statistics of a service named service-HTTP-1	stat service service-HTTP-1
To view the bindings of a service named service-HTTP-1	show service bindings service-HTTP-1

Table 4. Customization Tasks

Task	Command
To configure persistence on a vserver named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType SOURCEIP -persistenceMask 255.255.255.255 -timeout 2
To configure COOKIEINSERT persistence on a vserver named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
To configure URLPassive persistence on a vserver named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
To configure a vserver to redirect the client request to a URL on a vserver named vserver-LB-1	set lb vserver vserver-LB-1 -redirectURL http://www.newdomain.com/mysite/maintenance
To set a backup vserver on a vserver named vserver-LB-1	set lb vserver vserver-LB-1 -backupVserver vserver-LB-2

For more information about configuring persistence, see Choosing and Configuring Persistence Settings. For information about configuring a vserver to redirect a client request to a URL and setting up a backup vserver, see Configuring Features to Protect the Load Balancing Configuration.

Accelerating Load Balanced Traffic by Using Compression

Compression is a popular means of optimizing bandwidth usage, and most web browsers support compressed data. If you enable the compression feature, the Citrix® NetScaler® intercepts requests from clients and determines whether the client can accept compressed content. After receiving the HTTP response from the server, the NetScaler examines the content to determine whether it is compressible. If the content is compressible, the NetScaler compresses it, modifies the response header to indicate the type of compression performed, and forwards the compressed content to the client.

NetScaler compression is a policy-based feature. A policy filters requests and responses to identify responses to be compressed, and specifies the type of compression to apply to each response. The NetScaler provides several built-in policies to compress common MIME types such as text/html, text/plain, text/xml, text/css, text/rtf, application/msword, application/vnd.ms-excel, and application/vnd.ms-powerpoint. You can also create custom policies. The NetScaler does not compress compressed MIME types such as application/octet-stream, binary, bytes, and compressed image formats such as GIF and JPEG.

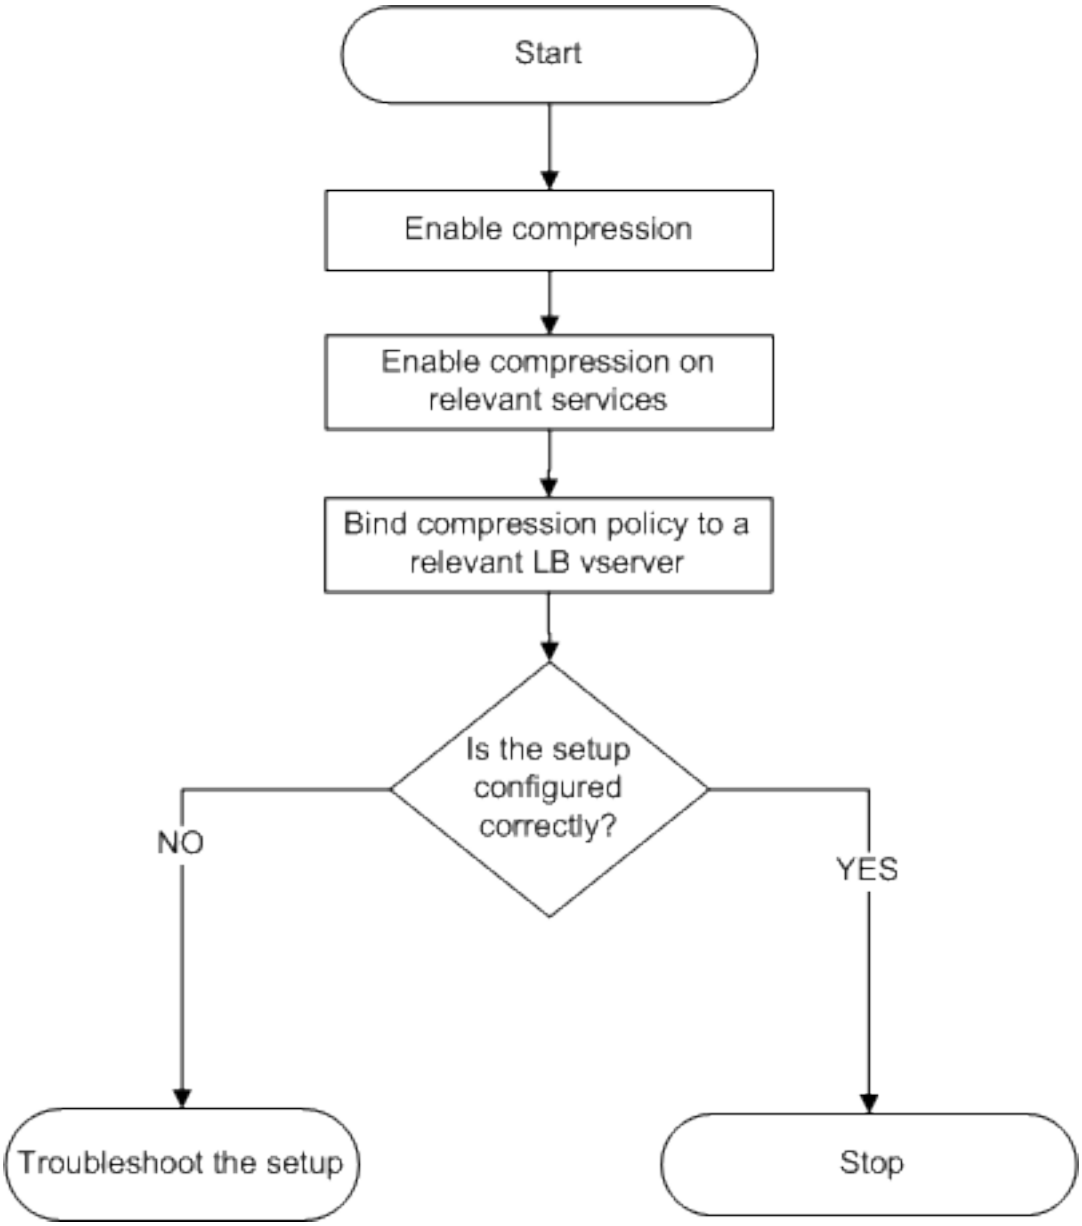
To configure compression, you must enable it globally and on each service that will provide responses that you want compressed. If you have configured vservers for load balancing or content switching, you should bind the polices to the vservers. Otherwise, the policies apply to all traffic that passes through the NetScaler.

Note: For more information about compression, see the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

Compression Configuration Task Sequence

The following flow chart shows the sequence of tasks for configuring basic compression in a load balancing setup.

Figure 1. Sequence of Tasks to Configure Compression



Note: The steps in the above figure assume that load balancing has already been configured. For information about configuring load balancing, or for more information about services, see the *Citrix NetScaler Traffic Management Guide* at

http://support.citrix.com/article/CTX128670.

If you want to configure something other than a basic compression setup, (for example, if you need to configure optional parameters in addition to the required parameters) see the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

Enabling Compression

By default, compression is not enabled. You must enable the compression feature to allow compression of HTTP responses that are sent to the client.

To enable compression by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable compression and verify the configuration:

- `enable ns feature CMP`
- `show ns feature`

Example

```
> enable ns feature CMP
Done
> show ns feature

Feature                  Acronym          Status
-------                  -------          ------
1)    Web Logging              WL              ON
2)    Surge Protection         SP              OFF
.
7)    Compression Control      CMP             ON
8)    Priority Queuing         PQ              OFF
.
Done
```

To enable compression by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change basic features**.
3. In the **Configure Basic Features** dialog box, select the **Compression** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** dialog box, click **Yes**.

Configuring Services to Compress Data

In addition to enabling compression globally, you must enable it on each service that will deliver files to be compressed. To create a service, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To enable compression on a service by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable compression on a service and verify the configuration:

- `set service <name> -CMP YES`
- `show service <name>`

Example

```
> show service SVC_HTTP1
SVC_HTTP1 (10.102.29.18:80) - HTTP
State: UP
Last state change was at Tue Jun 16 06:19:14 2009 (+737 ms)
Time since last state change: 0 days, 03:03:37.200
Server Name: 10.102.29.18
Server ID : 0   Monitor Threshold : 0
Max Conn: 0     Max Req: 0      Max Bandwidth: 0 kbits
Use Source IP: NO
Client Keepalive(CKA): NO
Access Down Service: NO
TCP Buffering(TCPB): NO
HTTP Compression(CMP): YES
Idle timeout: Client: 180 sec   Server: 360 sec
Client IP: DISABLED
Cacheable: NO
SC: OFF
SP: OFF
Down state flush: ENABLED

1)      Monitor Name: tcp-default
State: DOWN     Weight: 1
Probes: 1095    Failed [Total: 1095 Current: 1095]
Last response: Failure - TCP syn sent, reset received.
Response Time: N/A
Done
```

To enable compression on a service by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Services**.
2. In the details pane, select the service for which you want to configure compression (for example, **service-HTTP-1**), and then click **Open**.
3. On the **Advanced** tab, under **Settings**, select the **Compression** check box, and then click **OK.**
4. Verify that, when the service is selected, `HTTP Compression(CMP): ON` appears in the **Details** section at the bottom of the pane.

Binding a Compression Policy to a Virtual Server

If you bind a policy to a virtual server, the policy is evaluated only by the services associated with that virtual server. You can bind compression policies to a virtual server either from the **Configure Virtual Server (Load Balancing)** dialog box or from the **Compression Policy Manager** dialog box. This topic includes instructions to bind compression policies to a load balancing virtual server by using the **Configure Virtual Server (Load Balancing)** dialog box. For information about how you can bind a compression policy to a load balancing virtual server by using the **Compression Policy Manager** dialog box, see Configuring and Binding Policies with the Policy Manager. the "Configuring Advanced Policies" chapter in the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

To bind or unbind a compression policy to a virtual server by using the NetScaler command line

At the NetScaler command prompt, type the following commands to bind or unbind a compression policy to a load balancing virtual server and verify the configuration:

- `(bind|unbind) lb vserver <name> -policyName <string>`
- `show lb vserver <name>`

Example

```
> bind lb vserver lbvip -policyName ns_cmp_msapp
Done
> show lb vserver lbvip
lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
State: UP
Last state change was at Thu May 28 05:37:21 2009 (+685 ms)
Time since last state change: 19 days, 04:26:50.470
Effective State: UP
Client Idle Timeout: 180 sec
Down state flush: ENABLED
Disable Primary Vserver On Down : DISABLED
Port Rewrite : DISABLED
No. of Bound Services :  1 (Total)       1 (Active)
Configured Method: LEASTCONNECTION
Current Method: Round Robin, Reason: Bound service's state changed to UP
Mode: IP
Persistence: NONE
```

```
Vserver IP and Port insertion: OFF
Push: DISABLED  Push VServer:
Push Multi Clients: NO
Push Label Rule:

Bound Service Groups:
1)      Group Name: Service-Group-1

1) Service-Group-1 (10.102.29.252: 80) - HTTP State: UP Weight:

1)      Policy : ns_cmp_msapp Priority:0
Done
```

To bind or unbind a compression policy to a load balancing virtual server by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the virtual server to which you want to bind or unbind a compression policy (for example, **Vserver-LB-1**), and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Policies** tab, click **Compression**.
4. Do one of the following:
   - To bind a compression policy, click **Insert Policy**, and then select the policy you want to bind to the virtual server.
   - To unbind a compression policy, click the name of the policy you want to unbind from the virtual server, and then click **Unbind Policy**.
5. Click **OK.**

Securing Load Balanced Traffic by Using SSL

The Citrix® NetScaler® SSL offload feature transparently improves the performance of web sites that conduct SSL transactions. By offloading CPU-intensive SSL encryption and decryption tasks from the local web server to the NetScaler, SSL offloading ensures secure delivery of web applications without the performance penalty incurred when the server processes the SSL data. Once the SSL traffic is decrypted, it can be processed by all standard services. The SSL protocol works seamlessly with various types of HTTP and TCP data and provides a secure channel for transactions using such data.

To configure SSL, you must first enable it. Then, you configure HTTP or TCP services and an SSL virtual server on the NetScaler, and bind the services to the vserver. You must also add a certificate-key pair and bind it to the SSL virtual server. If you use Outlook Web Access servers, you must create an action to enable SSL support and a policy to apply the action. An SSL virtual server intercepts incoming encrypted traffic and decrypts it by using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the NetScaler for appropriate processing.

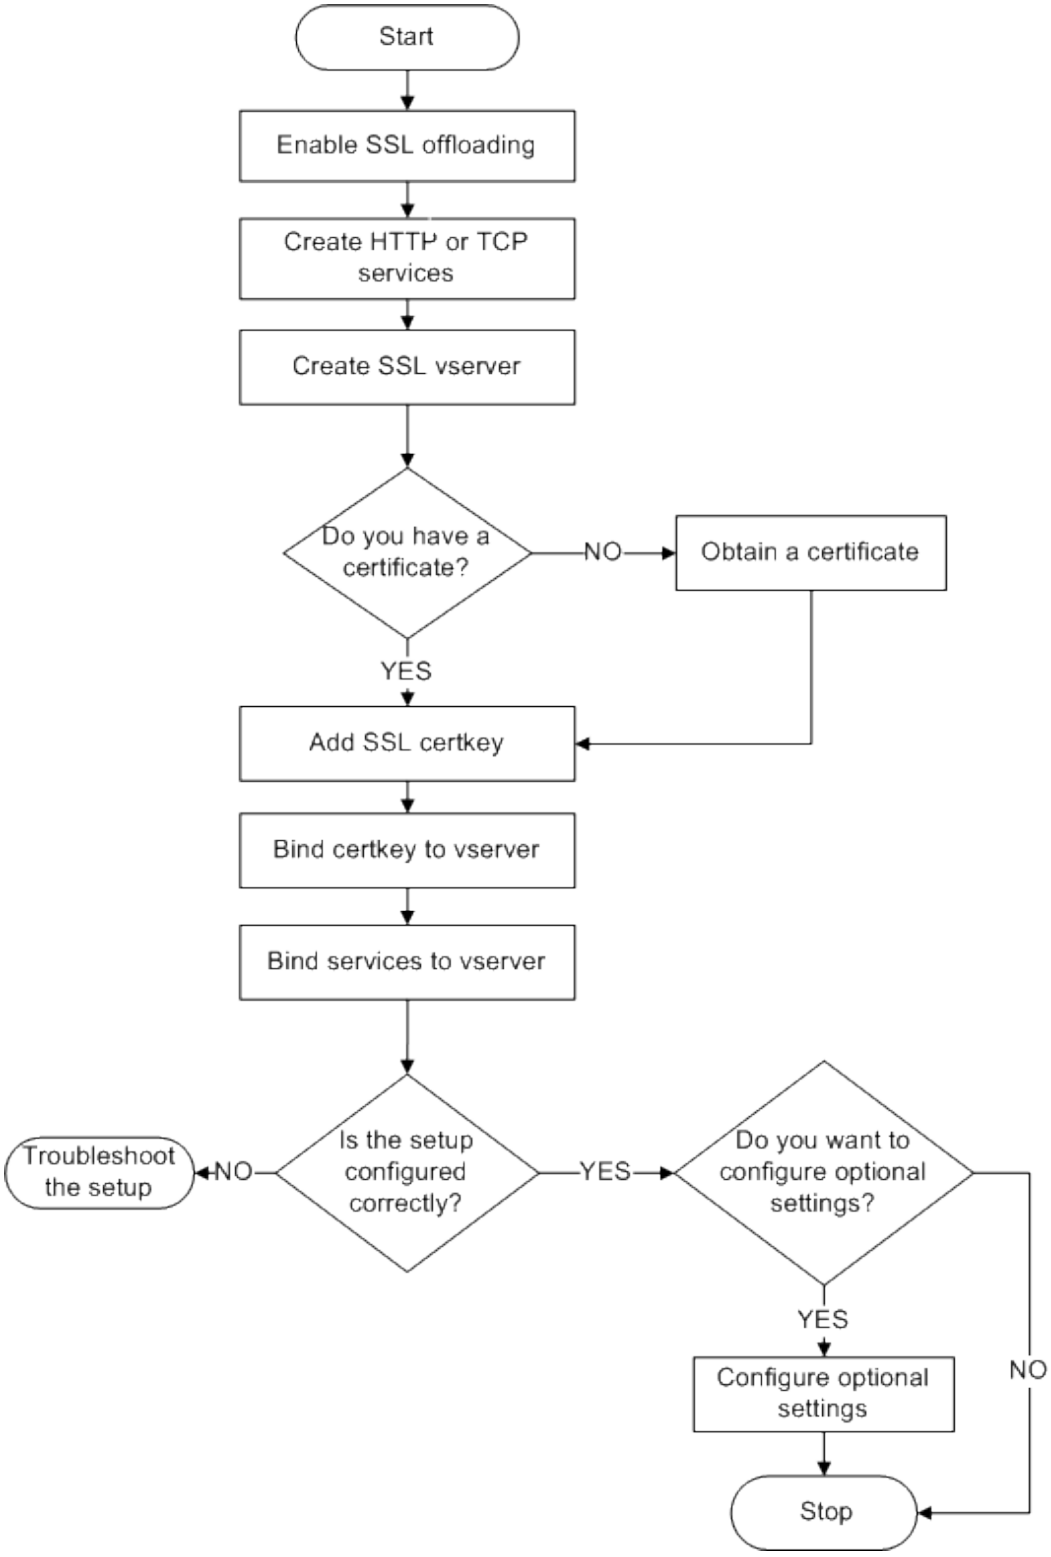
SSL Configuration Task Sequence

To configure SSL, you must first enable it. Then, you must create an SSL virtual server and HTTP or TCP services on the NetScaler. Finally, you must bind a valid SSL certificate and the configured services to the SSL virtual server.

An SSL virtual server intercepts incoming encrypted traffic and decrypts it using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the NetScaler for appropriate processing.

The following flow chart shows the sequence of tasks for configuring a basic SSL offload setup.

Figure 1. Sequence of Tasks to Configure SSL Offloading



Start
Enable SSL offloading
Create HTTP or TCP services
Create SSL vserver
Do you have a certificate?
NO
Obtain a certificate
YES
Add SSL certkey
Bind certkey to vserver
Bind services to vserver
Troubleshoot the setup
NO
Is the setup configured correctly?
YES
Do you want to configure optional settings?
YES
Configure optional settings
NO
Stop

Enabling SSL Offload

You should enable the SSL feature before configuring SSL offload. You can configure SSL-based entities on the system without enabling the SSL feature, but they will not work until you enable SSL.

To enable SSL by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable SSL Offload and and verify the configuration:

- `enable ns feature SSL`
- `show ns feature`

Example

```
> enable ns feature ssl
Done
> show ns feature
Feature Acronym Status
------- ------- ------
1) Web Logging WL ON
2) SurgeProtection SP OFF
3) Load Balancing LB ON . . .
 9) SSL Offloading SSL ON
10) Global Server Load Balancing GSLB ON . .
Done >
```

To enable SSL by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change basic features**.
3. Select the **SSL Offloading** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** message box, click **Yes**.

Creating HTTP Services

A service on the NetScaler represents an application on a server. Once configured, services are in the disabled state until the NetScaler can reach the server on the network and monitor its status. This topic covers the steps to create an HTTP service.

Note: For TCP traffic, perform the procedures in this and the following topics, but create TCP services instead of HTTP services.

To add an HTTP service by using the NetScaler command line

At the NetScaler command prompt, type the following commands to add a HTTP service and verify the configuration:

- `add service <name> (<IP> | <serverName>) <serviceType> <port>`
- `show service <name>`

```
> add service SVC_HTTP1 10.102.29.18 HTTP 80
 Done
> show service SVC_HTTP1
        SVC_HTTP1 (10.102.29.18:80) - HTTP
        State: UP
        Last state change was at Wed Jul 15 06:13:05 2009
        Time since last state change: 0 days, 00:00:15.350
        Server Name: 10.102.29.18
        Server ID : 0   Monitor Threshold : 0
        Max Conn: 0     Max Req: 0      Max Bandwidth: 0 kbits
        Use Source IP: NO
        Client Keepalive(CKA): NO
        Access Down Service: NO
        TCP Buffering(TCPB): NO
        HTTP Compression(CMP): YES
        Idle timeout: Client: 180 sec   Server: 360 sec
        Client IP: DISABLED
        Cacheable: NO
        SC: OFF
        SP: OFF
        Down state flush: ENABLED

1)      Monitor Name: tcp-default
              State: UP       Weight: 1
              Probes: 4       Failed [Total: 0 Current: 0]
              Last response: Success - TCP syn+ack received.
              Response Time: N/A
```

Done

To add an HTTP service by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Services**.
2. In details pane, click **Add**.
3. In the **Create Service** dialog box, in the **Service Name**, **Server**, and **Port** text boxes, type the name of the service, IP address, and port (for example, `SVC_HTTP1`, `10.102.29.18`, and `80`).
4. In the **Protocol** list, select the type of the service (for example, `HTTP`).
5. Click **Create**, and then click **Close**. The HTTP service you configured appears in the **Services** page.
6. Verify that the parameters you configured are correctly configured by selecting the service and viewing the **Details** section at the bottom of the pane.

For more information about services, see the “Load Balancing” chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Adding an SSL-Based Vserver

In a basic SSL offloading setup, the SSL virtual server intercepts encrypted traffic, decrypts it, and sends the clear text messages to the services that are bound to the virtual server. Offloading CPU-intensive SSL processing to the NetScaler allows the back-end servers to process a greater number of requests.

To add an SSL-based vserver by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create an SSL-based vserver and verify the configuration:

- `add lb vserver <name> <serviceType> [<IPAddress> <port>]`
- `show lb vserver <name>`

Example

```
> add lb vserver vserver-SSL-1 SSL 10.102.29.50 443
Done
> show lb vserver vserver-SSL-1
vserver-SSL-1 (10.102.29.50:443) - SSL Type: ADDRESS
State: DOWN[Certkey not bound] Last state change was at Tue Jun 16 06:33:08 2009 (
Time since last state change: 0 days, 00:03:44.120
Effective State: DOWN Client Idle Timeout: 180 sec
Down state flush: ENABLED
Disable Primary Vserver On Down : DISABLED
No. of Bound Services : 0 (Total) 0 (Active)
Configured Method: LEASTCONNECTION Mode: IP
Persistence: NONE
Vserver IP and Port insertion: OFF
Push: DISABLED Push VServer: Push Multi Clients: NO Push Label Rule: Done
```

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based vserver before you enable it.

To add an SSL-based vserver by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Virtual Servers**.
2. In the details pane, click **Add**.
3. In the **Create Virtual Server (SSL Offload)** dialog box, in the **Name**, **IP Address**, and **Port** text boxes, type the name of the vserver, IP address, and port (for example, `Vserver-SSL-1`, `10.102.29.50`, and `443`).
4. In the **Protocol** list, select the type of the vserver, for example, **SSL.**
5. Click **Create**, and then click **Close**.
6. Verify that the parameters you configured are correctly configured by selecting the vserver and viewing the **Details** section at the bottom of the pane. The vserver is marked as DOWN because a certificate-key pair and services have not been bound to it.

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based vserver before you enable it.

Binding Services to the SSL Vserver

After decrypting the incoming data, the SSL vserver forwards the data to the services that you have bound to the vserver.

Data transfer between the NetScaler and the servers can be encrypted or in clear text. If the data transfer between the NetScaler and the servers is encrypted, the entire transaction is secure from end to end. For more information about configuring the system for end-to-end security, see the "Secure Socket Layer (SSL) Acceleration" chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To bind a service to a vserver by using the NetScaler command line

At the NetScaler command prompt, type the following commands to bind service to the SSL vserver and verify the configuration:

- `bind lb vserver <name> <serviceName>`
- `show lb vserver <name>`

Example

```
> bind lb vserver vserver-SSL-1 SVC_HTTP1
Done
> show lb vserver vserver-SSL-1 vserver-SSL-1 (10.102.29.50:443) - SSL Type:
ADDRESS State: DOWN[Certkey not bound]
Last state change was at Tue Jun 16 06:33:08 2009 (+174 ms)
Time since last state change: 0 days, 00:31:53.70
Effective State: DOWN Client Idle
Timeout: 180 sec
Down state flush: ENABLED Disable Primary Vserver On Down :
DISABLED No. of Bound Services : 1 (Total) 0 (Active)
Configured Method: LEASTCONNECTION Mode: IP Persistence: NONE Vserver IP and
Port insertion: OFF Push: DISABLED Push VServer: Push Multi Clients: NO Push Label Ru

1) SVC_HTTP1 (10.102.29.18: 80) - HTTP
State: DOWN Weight: 1
Done
```

To bind a service to a vserver by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Virtual Servers**.
2. In the details pane, select a vserver, and then click **Open**.
3. On the **Services** tab, in the **Active** column, select the check boxes next to the services that you want to bind to the selected vserver.
4. Click **OK.**
5. Verify that the **Number of Bound Services** counter in the **Details** section at the bottom of the pane is incremented by the number of services that you bound to the vserver.

Adding a Certificate Key Pair

An SSL certificate is an integral element of the SSL Key-Exchange and encryption/decryption process. The certificate is used during SSL handshake to establish the identity of the SSL server. You can use a valid, existing SSL certificate that you have on the NetScaler, or you can create your own SSL certificate. The NetScaler supports RSA/DSA certificates of up to 4096 bits.

Note: Citrix recommends that you use a valid SSL certificate that has been issued by a trusted certificate authority. Invalid certificates and self-created certificates are not compatible with all SSL clients.

Before a certificate can be used for SSL processing, you must pair it with its corresponding key. The certificate key pair is then bound to the vserver and used for SSL processing.

To add a certificate key pair by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create a certificate key pair and verify the configuration:

- `add ssl certKey <certkeyName> -cert <string> [-key <string>]`
- `show sslcertkey <name>`

Example

```
> add ssl certKey CertKey-SSL-1 -cert ns-root.cert -key ns-root.key
 Done
> show sslcertkey CertKey-SSL-1
      Name: CertKey-SSL-1 Status: Valid,
      Days to expiration:4811 Version: 3
      Serial Number: 00 Signature Algorithm: md5WithRSAEncryption Issuer: C=US,ST=California,L=San
      Jose,O=Citrix ANG,OU=NS Internal,CN=de fault
      Validity Not Before: Oct 6 06:52:07 2006 GMT Not After : Aug 17 21:26:47 2022 GMT
      Subject: C=US,ST=California,L=San Jose,O=Citrix ANG,OU=NS Internal,CN=d efault Public Key Algori
      size: 1024
 Done
```

To add a certificate key pair by using the configuration utility

1. In the navigation pane, expand **SSL**, and then click **Certificates**.
2. In the details pane, click **Add**.
3. In the **Install Certificate** dialog box, in the **Certificate-Key Pair Name** text box, type a name for the certificate key pair you want to add, for example, `Certkey-SSL-1`.
4. Under **Details**, in **Certificate File Name**, click **Browse (Appliance)** to locate the certificate. Both the certificate and the key are stored in the /nsconfig/ssl/ folder on the appliance. To use a certificate present on the local system, select **Local**.
5. Select the certificate you want to use, and then click **Select**.
6. In **Private Key File Name**, click **Browse (Appliance)** to locate the private key file. To use a private key present on the local system, select **Local**.
7. Select the key you want to use and click **Select.** To encrypt the key used in the certificate key pair, type the password to be used for encryption in the **Password** text box.
8. Click **Install**.
9. Double-click the certificate key pair and, in the **Certificate Details** window, verify that the parameters have been configured correctly and saved.

Binding an SSL Certificate Key Pair to the Vserver

After you have paired an SSL certificate with its corresponding key, you must bind the certificate key pair to the SSL vserver so that it can be used for SSL processing. Secure sessions require establishing a connection between the client computer and an SSL-based virtual server on the NetScaler. SSL processing is then carried out on the incoming traffic at the virtual server. Therefore, before enabling the SSL virtual server on the NetScaler, you need to bind a valid SSL certificate to the SSL virtual server.

To bind an SSL certificate key pair to a vserver by using the NetScaler command line

At the NetScaler command prompt, type the following commands to bind an SSL certificate key pair to a vserver and verify the configuration:

- `bind ssl vserver <vServerName> -certkeyName <string>`
- show ssl vserver <name>

  Example

```
 > bind ssl vserver Vserver-SSL-1 -certkeyName CertKey-SSL-1
Done
> show ssl vserver Vserver-SSL-1

    Advanced SSL configuration for VServer Vserver-SSL-1:
    DH: DISABLED
    Ephemeral RSA: ENABLED Refresh Count: 0
    Session Reuse: ENABLED Timeout: 120 seconds
    Cipher Redirect: ENABLED
    SSLv2 Redirect: ENABLED
    ClearText Port: 0
    Client Auth: DISABLED
    SSL Redirect: DISABLED
    Non FIPS Ciphers: DISABLED
    SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1) CertKey Name: CertKey-SSL-1 Server Certificate
1) Cipher Name: DEFAULT
   Description: Predefined Cipher Alias
Done
```

To bind an SSL certificate key pair to a vserver by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Virtual Servers**.
2. Select the vserver to which you want to bind the certificate key pair, for example, **Vserver-SSL-1**, and click **Open**.
3. In the **Configure Virtual Server (SSL Offload)** dialog box, on the **SSL Settings** tab, under **Available**, select the certificate key pair that you want to bind to the vserver (for example, **Certkey-SSL-1**), and then click **Add**.
4. Click **OK.**
5. Verify that the certificate key pair that you selected appears in the **Configured** area.

Configuring Support for Outlook Web Access

If you use Outlook Web Access (OWA) servers on your NetScaler, you must configure the NetScaler to insert a special header field, FRONT-END-HTTPS: ON, in HTTP requests directed to the OWA servers, so that the servers generate URL links as https:// instead of http://.

Note: You can enable OWA support for HTTP-based SSL vservers and services only. You cannot apply it for TCP-based SSL vservers and services.

To configure OWA support, do the following:

- Create an SSL action to enable OWA support.
- Create an SSL policy.
- Bind the policy to the SSL vserver.

Creating an SSL Action to Enable OWA Support

Before you can enable OWA support, you must creat an SSL action. SSL actions are bound to SSL policies and triggered when incoming data matches the rule specified by the policy.

To create an SSL action to enable OWA support by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create an SSL action to enable OWA support and verify the configuration:

- `add ssl action <name> -OWASupport ENABLED`
- `show SSL action <name>`

```
 > add ssl action Action-SSL-OWA -OWASupport enabled
Done
> show SSL action Action-SSL-OWA
  Name: Action-SSL-OWA
  Data Insertion Action: OWA
  Support: ENABLED
Done
```

To create an SSL action to enable OWA support by using the configuration utility

1. In the navigation pane, expand **SSL**, and then click **Policies**.
2. In the details pane, on the **Actions** tab, click **Add**.
3. In the **Create SSL Action** dialog box, in the **Name** text box, type `Action-SSL-OWA`.
4. Under **Outlook Web Access**, select **Enabled**.
5. Click **Create**, and then click **Close**.
6. Verify that **Action-SSL-OWA** appears in the **SSL Actions** page.

Creating SSL Policies

SSL policies are created by using the policy infrastructure. Each SSL policy has an SSL action bound to it, and the action is carried out when incoming traffic matches the rule that has been configured in the policy.

To create an SSL policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure an SSL policy and verify the configuration:

- `add ssl policy <name> -rule <expression> -reqAction <string>`
- `show ssl policy <name>`

Example

```
> add ssl policy Policy-SSL-1 -rule ns_true -reqaction Action-SSL-OWA
Done
> show ssl policy Policy-SSL-1
Name: Policy-SSL-1      Rule: ns_true
Action: Action-SSL-OWA  Hits: 0
Policy is bound to following entities
1)      PRIORITY : 0
Done
```

To create an SSL policy by using the configuration utility

1. In the navigation pane, expand **SSL**, and then click **Policies**.
2. In the details pane, click **Add**.
3. In the **Create SSL Policy** dialog box, in the **Name** text box, type the name of the SSL Policy (for example, `Policy-SSL-1`).
4. In **Request Action**, select the configured SSL action that you want to associate with this policy (for example, **Action-SSL-OWA**). The `ns_true` general expression applies the policy to all successful SSL handshake traffic. However, if you need to filter specific responses, you can create policies with a higher level of detail. For more information about configuring granular policy expressions, see Understanding Policies and Expressions.
5. In **Named Expressions**, choose the built-in general expression `ns_true` and click **Add Expression**. The expression `ns_true` now appears in the Expression text box.
6. Click **Create**, and then click **Close**.
7. Verify that the policy is correctly configured by selecting the policy and viewing the **Details** section at the bottom of the pane.

Binding the SSL Policy to an SSL Vserver

After you configure an SSL policy for OWA, bind the policy to a vserver that will intercept incoming Outlook traffic. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered and the action associated with it is carried out.

To bind an SSL policy to an SSL vserver by using the NetScaler command line

At the NetScaler command prompt, type the following commands to bind an SSL policy to an SSL vserver and verify the configuration:

- `bind ssl vserver <vServerName> -policyName <string>`
- `show ssl vserver <name>`

Example

```
> bind ssl vserver Vserver-SSL-1 -policyName Policy-SSL-1
 Done
> show ssl vserver Vserver-SSL-1
        Advanced SSL configuration for VServer Vserver-SSL-1:
        DH: DISABLED
        Ephemeral RSA: ENABLED          Refresh Count: 0
        Session Reuse: ENABLED          Timeout: 120 seconds
        Cipher Redirect: ENABLED
        SSLv2 Redirect: ENABLED
        ClearText Port: 0
        Client Auth: DISABLED
        SSL Redirect: DISABLED
        Non FIPS Ciphers: DISABLED
        SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1)      CertKey Name: CertKey-SSL-1 Server Certificate

1)      Policy Name: Policy-SSL-1
                        Priority: 0
1)      Cipher Name: DEFAULT

To bind an SSL policy to an SSL vserver by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Virtual Servers**.
2. In the details pane, select the vserver (for example, **Vserver-SSL-1**), and then click **Open**.
3. In the **Configure Virtual Server (SSL Offload)** dialog box, click **Insert Policy**, and then select the policy that you want to bind to the SSL vserver. Optionally, you can double-click the **Priority** field and type a new priority level.
4. Click **OK.**

Features at a Glance

Citrix® NetScaler® features can be configured independently or in combinations to address specific needs. Although some features fit more than one category, the numerous NetScaler features can generally be categorized as application switching and traffic management features, application acceleration features, application security and firewall features, and an application visibility feature.

To understand the order in which the features perform their processing, see Processing Order of Features.

Application Switching and Traffic Management Features

SSL Offloading

Transparently offloads SSL encryption and decryption from web servers, freeing server resources to service content requests. SSL places a heavy burden on an application's performance and can render many optimization measures ineffective. SSL offload and acceleration allow all the benefits of Citrix Request Switching technology to be applied to SSL traffic, ensuring secure delivery of web applications without degrading end-user performance.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Access Control Lists

Compares incoming packets to the Access Control Lists (ACLs). If a packet matches an ACL rule, the action specified in the rule is applied to the packet. Otherwise, the default action (ALLOW) is applied and the packet is processed normally by the system. For the system to compare incoming packets to the ACLs, you need to apply the ACLs. All ACLs are enabled by default, but you have to apply them in order for the NetScaler to compare incoming packets against them. If an ACL is not required to be a part of the lookup table, but still needs to be retained in the configuration, it should be disabled before the ACLs are applied. A NetScaler does not compare incoming packets to disabled ACLs.

For more information, see the *Citrix NetScaler Networking Guide* at http://support.citrix.com/article/CTX128671.

Load Balancing

Load balancing decisions are based on a variety of algorithms, including round robin, least connections, weighted least bandwidth, weighted least packets, minimum response time, and hashing based on URL, domain source IP or destination IP. Both the TCP and UDP protocols are supported, so the NetScaler can load balance all traffic that uses those protocols as the underlying carrier (for example, HTTP, HTTPS, UDP, DNS, FTP, NNTP, and general firewall traffic). In addition, the NetScaler can maintain session persistence based on source IP, cookie, server, group or SSL session. It allows users to apply custom Extended Content Verification (ECV) to servers, caches, firewalls and other infrastructure devices to ensure that these systems are functioning properly and are providing the right content to users. It can also perform health checks using ping, TCP, or HTTP URL, and the user can create monitors based on Perl scripts.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Content Switching

Determines which server to send the request to based on the configured content switching policies. Policy rules can be configured based on the IP address, URL, and HTTP headers. This allows switching decisions to be based on user and device characteristics such as who the user is, what type of agent is being used, and what content the user requested.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Global Server Load Balancing (GSLB)

Extends the traffic management capabilities of a NetScaler to include distributed Internet sites and global enterprises. Whether installations are spread across multiple network locations or multiple clusters in a single location, the NetScaler maintains availability and distributes traffic across them. It makes intelligent DNS decisions to prevent users from being sent to a site that is down or overloaded. When the proximity-based GSLB method is enabled, the NetScaler can make load balancing decisions based on the proximity of the client's local DNS server (LDNS) in relation to different sites. The main benefit of the proximity-based GSLB method is faster response time resulting from the selection of the closest available site.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Dynamic Routing

Enables routers to obtain topology information, routes, and IP addresses from neighboring routers automatically. When dynamic routing is enabled, the corresponding routing process listens to route updates and advertises routes. The routing processes can also be placed in passive mode. Routing protocols enable an upstream router to load balance traffic to identical vservers hosted on two standalone NetScaler units using the Equal Cost Multipath technique.

For more information, see the *Citrix NetScaler Networking Guide* at http://support.citrix.com/article/CTX128671.

Link Load Balancing

Load balances multiple WAN links and provides link failover, further optimizing network performance and ensuring business continuity. Ensures that network connections remain highly available, by applying intelligent traffic control and health checks to distribute traffic efficiently across upstream routers. Identifies the best WAN link to route both incoming and outbound traffic based on policies and network conditions, and protects applications against WAN or Internet link failure by providing rapid fault detection and failover.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

TCP Optimization

Transfers certain TCP tasks from your managed servers to the NetScaler, reducing CPU load on your managed servers and improving performance.

For more information, see the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

Web Interface on NetScaler

Provides access to XenApp and XenDesktop resources, which include applications, content, and desktops. Users access resources through a standard Web browser or by using the Citrix XenApp plug-in. The Web Interface runs as a service on port 8080 on the NetScaler appliance. To create Web Interface sites, Java is executed on Apache Tomcat Web server version 6.0.26 on the NetScaler appliance.

Note: Web Interface is supported only on NetScaler nCore releases.

For more information, see the *Citrix NetScaler Administration Guide* at http://support.citrix.com/article/CTX128667.

Load Balancing of Branch Repeaters for WAN Optimization

To provide high-scale WAN optimization, the branch repeaters deployed at data centers can be load balanced through NetScaler appliances. The bandwidth and number of concurrent sessions can be improved significantly.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

OpenCloud Bridge

The Citrix NetScaler® OpenCloud Bridge™ feature, a fundamental part of the Citrix® OpenCloud framework, is a tool used to build a cloud-extended data center. The OpenCloud Bridge enables you to connect one or more NetScaler appliances or VPXs on the cloud-to your network without reconfiguring your network. Cloud hosted applications appear as though they are running on one contiguous enterprise network.The primary purpose of the OpenCloud Bridge is to enable companies to move their applications to the cloud while reducing costs and the risk of application failure. In addition, the OpenCloud Bridge increases network security in cloud environments. An OpenCloud Bridge is a Layer-2 network bridge that connects a NetScaler appliance or VPX on a cloud instance to a NetScaler appliance or VPX on your LAN. The connection is made through a tunnel that uses the Generic Routing Encapsulation (GRE) protocol. The GRE protocol provides a mechanism for encapsulating packets from a wide variety of network protocols to be forwarded over another protocol. Then Internet Protocol security (IPsec) protocol suite is used to secure the communication between the peers in the OpenCloud Bridge.

For more information, see the *Citrix NetScaler Networking Guide* at http://support.citrix.com/article/CTX128671.

DataStream™

The DataStream feature of NetScaler provides an intelligent mechanism for request switching at the database layer by distributing requests based on the SQL query being sent.

When deployed in front of database servers, a NetScaler ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and on the basis of database names, usernames, character sets, and packet size.

You can either configure load balancing to switch requests based on load balancing algorithms or elaborate the switching criteria by configuring content switching to make a

decision based on SQL query parameters, such as user name and database name, command parameters. You can further configure monitors to track the state of database servers.

The advanced policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process the requests. The advanced expressions evaluate traffic associated with MySQL database servers. You can use request-based expressions (expressions that begin with `MYSQL.CLIENT` and `MYSQL.REQ`) in advanced policies to make request switching decisions at the content switching virtual server bind point and response-based expressions (expressions that begin with `MYSQL.RES`) to evaluate server responses to user-configured health monitors. For more information about these expressions, see the "Evaluating Connections to Database Servers" chapter in the *Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Note: DataStream is supported only for MySQL databases. For information about the DataStream feature, see the "DataStream" chapter in the *Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Application Acceleration Features

AppCompress

Provides transparent compression for HTML and text files using the gzip compression protocol. The typical 4:1 compression ratio yields up to 50% reduction in bandwidth requirements out of the data center. This also results in significantly improved end-user response time by reducing the amount of data that must be delivered to the user's browser.

For more information, see the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

Cache Redirection

Manages the flow of traffic to a reverse proxy, transparent proxy, or forward proxy cache farm. Inspects all requests, and identifies non-cacheable requests and sends them directly to the origin servers over persistent connections. By intelligently redirecting non-cacheable requests back to the origin web servers, the NetScaler frees cache resources and increases cache hit rates while reducing overall bandwidth consumption and response delays for these requests.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

AppCache

Helps optimize web content and application data delivery by providing a fast in-memory HTTP/1.1 and HTTP/1.0 compliant web caching for both static and dynamic content. This on-board cache stores the results of incoming application requests even when an incoming request is secured or the data compressed, and then reuses the data to fulfill subsequent requests for the same information. By serving data directly from the on-board cache, the NetScaler can reduce page regeneration times by eliminating the need to funnel static and dynamic content requests to the server.

For more information, see the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

TCP Buffering

Buffers the server's response and delivers it to the client at the client's speed, thus offloading the server faster and thereby improving the performance of web sites. For more information, see the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

Application Security and Firewall Features

Denial of Service Attack (DoS) Defense

Detects and stops malicious distributed denial-of-service (DDoS) attacks and other types of malicious attacks before they reach your servers, preventing them from affecting network and application performance. The NetScaler identifies legitimate clients and elevates their priority, leaving suspect clients unable to consume a disproportionate percentage of resources and cripple your site. A NetScaler provides application-level protection from the following types of malicious attacks:

- SYN flood attacks
- Pipeline attacks
- Teardop attacks
- Land attacks
- Fraggle attacks
- Zombie connection attacks

The NetScaler aggressively defends against these types of attacks by preventing the allocation of server resources for these connections. This insulates servers from the overwhelming flood of packets associated with these events.

The NetScaler also protects network resources from ICMP based attacks by using ICMP rate limiting and aggressive ICMP packet inspection. It performs strong IP reassembly, drops a variety of suspicious and malformed packets, and applies Access Control Lists (ACLs) to site traffic for further protection.

For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

Content Filtering

Provides protection from malicious attacks for web sites at the Layer 7 level. The NetScaler inspects each incoming request according to user-configured rules based on HTTP headers, and performs the action the user configured. Actions can include resetting the connection, dropping the request, or sending an error message to the user's browser. This allows the NetScaler to screen unwanted requests and reduces your servers' exposure to attacks.

This feature can also analyze HTTP GET and POST requests and filter out known bad signatures, allowing it to defend your servers against HTTP-based attacks such as variants of the Nimda and Code Red viruses.

For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

Responder

Functions like an advanced filter and can be used to generate responses from the NetScaler to the client. Some common uses of this feature are generation of redirect responses, user defined responses or resets.

For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

Rewrite

Modifies HTTP headers and body text. You can use it to add HTTP headers to an HTTP request or response, make modifications to individual HTTP headers, or delete HTTP headers. It also lets you modify the HTTP body in requests and responses.

When the NetScaler receives a request or sends a response, it checks for rewrite rules, and if applicable rules exist, it applies them to the request or response before passing it on to the web server or client computer.

For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

Priority Queuing

Prioritizes user requests to ensure that the most important traffic is serviced first during surges in request volume. You can establish priority based on request URLs, cookies, or a variety of other factors. The NetScaler places requests in a three-tier queue based on their configured priority, enabling business-critical transactions to flow smoothly even during surges or site attacks.

For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

Surge Protection

Regulates the flow of user requests to servers and controls the number of users that can simultaneously access the resources on the servers, queuing any additional requests once your servers have reached their capacity. By controlling the rate at which connections can be established, the NetScaler blocks surges in requests from being passed on to your servers, thus preventing site overload.

For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

Access Gateway

Citrix Access Gateway is a secure application access solution that provides administrators granular application-level policy and action controls to secure access to applications and data while allowing users to work from anywhere. It gives IT administrators a single point of control and tools to help ensure compliance with regulations and the highest levels of information security across and outside the enterprise. At the same time, it empowers users with a single point of access—optimized for roles, devices, and networks—to the

enterprise applications and data they need. This unique combination of capabilities helps maximize the productivity of today's mobile workforce.

For more information, see Access Gateway.

Application Firewall

Protects applications from misuse by hackers and malware, such as cross site scripting attacks, buffer overflow attacks, SQL injection attacks, and forceful browsing, by filtering traffic between each protected web server and users that connect to any web site on that web server. The Application Firewall examines all traffic for evidence of attacks on web server security or misuse of web server resources, and takes the appropriate action to prevent these attacks from succeeding.

For more information, see the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

Application Visibility Feature

EdgeSight for NetScaler

Support for application performance monitoring based on end user experience. This solution leverages the HTML injection feature to obtain various time values, which are used by EdgeSight server for analysis and report generation. EdgeSight for NetScaler provides a way to monitor the performance benefits of a NetScaler and determine potential bottlenecks in a network.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Enhanced Application Visiblity Using AppFlow

The Citrix® NetScaler® appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits this information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called *flow records*, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.

To limit the types of flows to monitor, by sampling and filtering the application traffic, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

Note: The AppFlow feature is supported only by Citrix® nCore™ software.

Getting Started with Citrix NetScaler VPX

Intended for system and network administrators who install and configure complex networking equipment, this section of the library describes initial setup and basic configuration of the Citrix® NetScaler® VPX™ product, including the following topics.

Citrix NetScaler VPX Overview	Defines NetScaler VPX and includes a description of the virtualization platforms on which NetScaler VPX can be hosted.
Understanding the NetScaler	What a NetScaler is and where it fits in a network, with descriptions of entities used in typical configurations and the order in which data is processed by the various features.
Installing NetScaler Virtual Appliances on XenServer	Prerequisites and tasks for installing NetScaler VPX on XenServer.
Installing NetScaler Virtual Appliances on VMware ESX	Prerequisites and tasks for installing NetScaler VPX on VMware ESX 4.0 and VMware ESX 3.5.
Configuring the Basic System Settings	Tasks for setting up an initial configuration by using the NetScaler VPX Console in XenCenter and tasks for configuring a NetScaler VPX virtual appliance.
Understanding Common Network Topologies	Describes the four common deployment topologies: Two-Arm Multiple Subnet, Two-Arm Transparent, One-Arm Single Subnet, and One-Arm Multiple Subnet. Includes topology diagrams, sample values, and references.
Configuring System Management Settings	Procedures for configuring basic system management settings, such as VLANs, SNMP, and DNS.
Load Balancing Traffic on a Citrix NetScaler	Basic introduction to the load balancing feature. Includes procedures for configuring a basic load balancing setup to deliver a Web application, and procedures for configuring persistence, URL redirection, and backup vservers.
Accelerating Load Balanced Traffic by Using Compression	Basic introduction to the compression feature. Includes procedures for configuring a NetScaler to compress application traffic.

Securing Load Balanced Traffic by Using SSL	Basic introduction to the SSL offload feature. Includes procedures for configuring a NetScaler to secure application traffic by using SSL.
Features at a Glance	Brief description of all the features, with links to documentation for the features.

Citrix NetScaler VPX Overview

The Citrix® NetScaler® VPX™ product is a virtual NetScaler appliance that can be hosted on Citrix XenServer® and VMware ESX or ESXi, and Microsoft Hyper-V virtualization platforms.

A NetScaler virtual appliance installed on the Citrix XenServer or Microsoft Server 2008 R2 supports all the features of a physical NetScaler, except interface-related events and tagged VLANs. A NetScaler virtual appliance installed on the VMware ESX platform does not support interface-related events, but does support tagged VLANs. For the VLAN tagging feature to work, you must set the port group's VLAN ID to 4095 on the VSwitch of VMware ESX server. For more information about setting a VLAN ID on the VSwitch of VMware ESX server, see http://www.vmware.com/.

This overview covers only aspects that are unique to NetScaler VPX. For an overview of NetScaler VPX functionality, see Understanding the NetScaler.

Note: The terms *NetScaler*, *NetScaler appliance*, and *appliance* are used interchangeably with *NetScaler virtual appliance* unless stated otherwise.

Citrix NetScaler VPX Overview

The Citrix® NetScaler® VPX™ product is a virtual NetScaler appliance that can be hosted on Citrix XenServer® and VMware ESX or ESXi, and Microsoft Hyper-V virtualization platforms.

A NetScaler virtual appliance installed on the Citrix XenServer or Microsoft Server 2008 R2 supports all the features of a physical NetScaler, except interface-related events and tagged VLANs. A NetScaler virtual appliance installed on the VMware ESX platform does not support interface-related events, but does support tagged VLANs. For the VLAN tagging feature to work, you must set the port group's VLAN ID to 4095 on the VSwitch of VMware ESX server. For more information about setting a VLAN ID on the VSwitch of VMware ESX server, see http://www.vmware.com/.

This overview covers only aspects that are unique to NetScaler VPX. For an overview of NetScaler VPX functionality, see Understanding the NetScaler.

Note: The terms *NetScaler*, *NetScaler appliance*, and *appliance* are used interchangeably with *NetScaler virtual appliance* unless stated otherwise.

NetScaler VPX Setup for the XenServer Platform

When you set up NetScaler® VPX™ on XenServer®, you must use the XenCenter® client to install the first NetScaler virtual appliance. Subsequent virtual appliances can be added by using either the XenCenter client or Citrix® Command Center.

XenServer

The XenServer® product is a server virtualization platform that offers near bare-metal virtualization performance for virtualized server and client operating systems. XenServer uses the Xen® hypervisor to virtualize each server on which it is installed, enabling each server to host multiple virtual machines simultaneously.

The following figure shows the bare-metal solution architecture of NetScaler® VPX™ on XenServer.

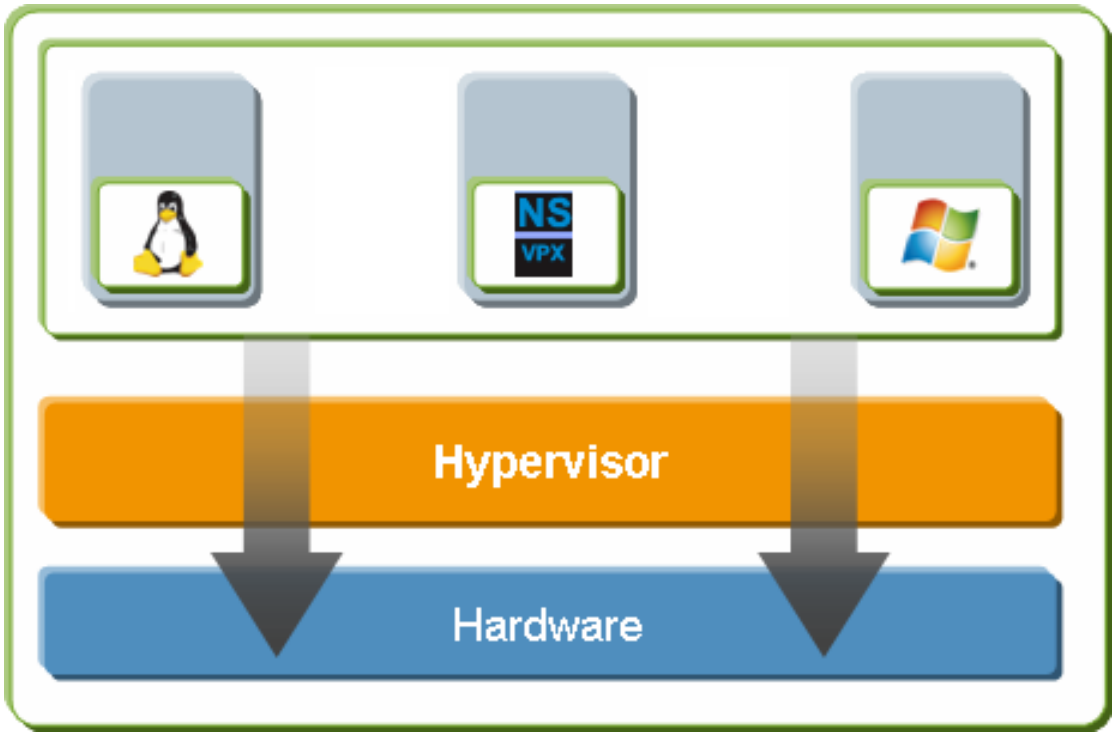

Figure 1. NetScaler VPX on XenServer

The bare-metal solution architecture has the following components:

Hardware or physical layer:

Physical hardware components including memory, CPU, network cards, and disk drives.

Xen hypervisor:

Thin layer of software that runs on top of the hardware. The Xen hypervisor gives each virtual machine a dedicated view of the hardware.

Virtual machine:

Operating system hosted on the hypervisor and appearing to the user as a separate physical computer. However, the machine shares physical resources with other virtual machines, and it is portable because the virtual machine is abstracted from physical hardware.

A NetScaler VPX virtual machine, or *virtual appliance*, is installed on the Xen hypervisor and uses paravirtualized drivers to access storage and network resources. It appears to the users as an independent NetScaler appliance with its own network identity, user authorization and authentication capabilities, configuration, applications, and data. The paravirtualization technique enables the virtual machines and the hypervisor to work together to achieve high performance for I/O and for CPU and memory virtualization.

For more information about XenServer, see the XenServer documentation at http://support.citrix.com/product/xens/.

XenCenter

XenCenter® is a graphical virtualization-management interface for XenServer®, enabling you to manage servers, resource pools, and shared storage, and to deploy, manage, and monitor virtual machines from your Windows desktop machine.

Use XenCenter to install NetScaler VPX on XenServer.

For more information about XenCenter, see the XenServer documentation at http://support.citrix.com/product/xens/.

Command Center

Command Center is a management and monitoring solution for Citrix application networking products that include NetScaler, NetScaler VPX, Citrix Access Gateway™ Enterprise Edition, Citrix® Branch Repeater™, Branch Repeater VPX™, and Citrix Repeater™. Command Center enables network administrators and operations teams to manage, monitor, and troubleshoot the entire global application delivery infrastructure from a single, unified console.

This centralized management solution simplifies operations by providing administrators with enterprise-wide visibility and automating management tasks that need to be executed across multiple devices.

Command Center is available with Citrix NetScaler Enterprise and Platinum editions.

You can use Command Center to provision NetScaler VPX on XenServer, and then you can manage and monitor the virtual appliances from Command Center.

Note: You must use the XenCenter client to manage XenServer. You cannot manage XenServer from Command Center.

For more information about Command Center, see the Command Center documentation.

NetScaler VPX Setup for the VMware ESX Platform

The NetScaler® VPX™ setup for the VMware ESX platform requires a VMware ESX or ESXi server and the vSphere client.

VMware ESX and ESXi are virtualization products based on bare-metal architecture, offered by VMware, Inc. Citrix NetScaler VPX can be hosted on a VMware ESX or ESXi server.

For more information about VMware ESX, see http://www.vmware.com/.

The vSphere client is a graphical interface for managing virtual machines on VMware ESX servers. You use the vSphere client to allocate resources on the ESX server to virtual appliances installed on the server or to deallocate resources. For example, you can allocate virtual network ports to a virtual appliance.

For more information about VMware vSphere client, see http://www.vmware.com/.

Understanding the NetScaler

The Citrix® NetScaler® product is an application switch that performs application-specific traffic analysis to intelligently distribute, optimize, and secure Layer 4-Layer 7 (L4-L7) network traffic for web applications. For example, a NetScaler makes load balancing decisions on individual HTTP requests rather than on the basis of long-lived TCP connections, so that the failure or slowdown of a server is managed much more quickly and with less disruption to clients. The NetScaler feature set can be broadly categorized as consisting of switching features, security and protection features, and server-farm optimization features.

Switching Features

When deployed in front of application servers, a NetScaler ensures optimal distribution of traffic by the way in which it directs client requests. Administrators can segment application traffic according to information in the body of an HTTP or TCP request, and on the basis of L4-L7 header information such as URL, application data type, or cookie. Numerous load balancing algorithms and extensive server health checks improve application availability by ensuring that client requests are directed to the appropriate servers.

Security and Protection Features

NetScaler security and protection features protect web applications from application-layer attacks. A NetScaler allows legitimate client requests and can block malicious requests. It provides built-in defenses against denial-of-service (DoS) attacks and supports features that protect applications against legitimate surges in application traffic that would otherwise overwhelm the servers. An available built-in firewall protects web applications from application-layer attacks, including buffer overflow exploits, SQL injection attempts, cross-site scripting attacks, and more. In addition, the firewall provides identity theft protection by securing confidential corporate information and sensitive customer data.

Optimization Features

Optimization features offload resource-intensive operations such as Secure Sockets Layer (SSL) processing, data compression, client keep-alive, TCP buffering, and the caching of static and dynamic content from servers. This improves the performance of the servers in the server farm and therefore speeds up applications. A NetScaler supports several transparent TCP optimizations, which mitigate problems caused by high latency and congested network links, accelerating the delivery of applications while requiring no configuration changes to clients or servers.

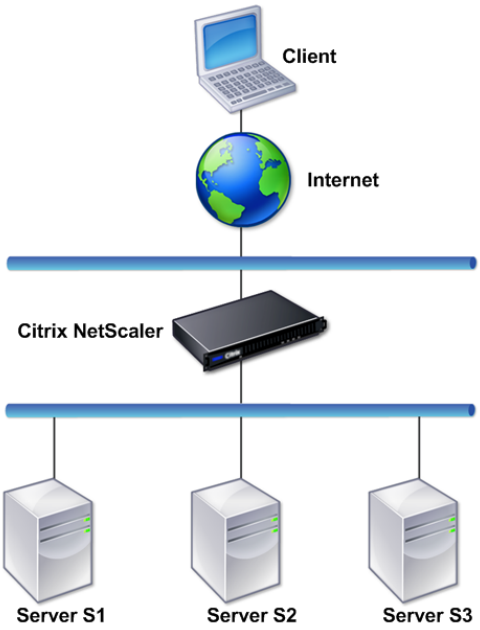
Where Does a NetScaler Fit in the Network?

A NetScaler resides between the clients and the servers, so that client requests and server responses pass through it. In a typical installation, virtual servers (vservers) configured on the NetScaler provide connection points that clients use to access the applications behind the NetScaler. In this case, the NetScaler owns public IP addresses that are associated with its vservers, while the real servers are isolated in a private network. It is also possible to operate the NetScaler in a transparent mode as an L2 bridge or L3 router, or even to combine aspects of these and other modes.

Physical Deployment Modes

A NetScaler logically residing between clients and servers can be deployed in either of two physical modes: inline and one-arm. In inline mode, multiple network interfaces are connected to different Ethernet segments, and the NetScaler is placed between the clients and the servers. The NetScaler has a separate network interface to each client network and a separate network interface to each server network. The NetScaler and the servers can exist on different subnets in this configuration. It is possible for the servers to be in a public network and the clients to directly access the servers through the NetScaler, with the NetScaler transparently applying the L4-L7 features. Usually, vservers (described later) are configured to provide an abstraction of the real servers. The following figure shows a typical inline deployment.

Figure 1. Inline Deployment



In one-arm mode, only one network interface of the NetScaler is connected to an Ethernet segment. The NetScaler in this case does not isolate the client and server sides of the network, but provides access to applications through configured vservers. One-arm mode can simplify network changes needed for NetScaler installation in some environments.

For examples of inline (two-arm) and one-arm deployment, see Understanding Common Network Topologies.

Citrix NetScaler as an L2 Device

A NetScaler functioning as an L2 device is said to operate in L2 mode. In L2 mode, the NetScaler forwards packets between network interfaces when all of the following conditions are met:

- The packets are destined to another device's media access control (MAC) address.
- The destination MAC address is on a different network interface.
- The network interface is a member of the same virtual LAN (VLAN).

By default, all network interfaces are members of a pre-defined VLAN, VLAN 1. Address Resolution Protocol (ARP) requests and responses are forwarded to all network interfaces that are members of the same VLAN. To avoid bridging loops, L2 mode must be disabled if another L2 device is working in parallel with the NetScaler.

For information about how the L2 and L3 modes interact, see Configuring Modes of Packet Forwarding.

For information about configuring L2 mode, see Enabling and Disabling Layer 2 Mode.

Citrix NetScaler as a Packet Forwarding Device

A NetScaler can function as a packet forwarding device, and this mode of operation is called L3 mode. With L3 mode enabled, the NetScaler forwards any received unicast packets that are destined for an IP address that it does not have internally configured, if there is a route to the destination. A NetScaler can also route packets between VLANs.

In both modes of operation, L2 and L3, a NetScaler generally drops packets that are in:

- Multicast frames
- Unknown protocol frames destined for a NetScaler's MAC address (non-IP and non-ARP)
- Spanning Tree protocol (unless BridgeBPDUs is ON)

For information about how the L2 and L3 modes interact, see Configuring Modes of Packet Forwarding.

For information about configuring the L3 mode, see Enabling and Disabling Layer 3 Mode.

How a NetScaler Communicates with Clients and Servers

A NetScaler is usually deployed in front of a server farm and functions as a transparent TCP proxy between clients and servers, without requiring any client-side configuration. This basic mode of operation is called Request Switching technology and is the core of NetScaler functionality. Request Switching enables a NetScaler to multiplex and offload the TCP connections, maintain persistent connections, and manage traffic at the request (application layer) level. This is possible because the NetScaler can separate the HTTP request from the TCP connection on which the request is delivered.

Depending on the configuration, a NetScaler may process the traffic before forwarding the request to a server. For example, if the client attempts to access a secure application on the server, the NetScaler might perform the necessary SSL processing before sending traffic to the server.

To facilitate efficient and secure access to server resources, a NetScaler uses a set of IP addresses collectively known as NetScaler-owned IP addresses. To manage your network traffic, you assign NetScaler-owned IP addresses to virtual entities that become the building blocks of your configuration. For example, to configure load balancing, you create virtual servers (vservers) to receive client requests and distribute them to services, which are entities representing the applications on your servers.

Understanding NetScaler-Owned IP Addresses

To function as a proxy, a NetScaler uses a variety of IP addresses. The key NetScaler-owned IP addresses are:

NetScaler IP address (NSIP)

The NSIP is the IP address for management and general system access to the NetScaler itself, and for HA communication.

Mapped IP address (MIP)

A MIP is used for server-side connections. It is not the IP address of the NetScaler. In most cases, when the NetScaler receives a packet, it replaces the source IP address with a MIP before sending the packet to the server. With the servers abstracted from the clients, the NetScaler manages connections more efficiently.

Virtual server IP address (VIP)

A VIP is the IP address associated with a vserver. It is the public IP address to which clients connect. A NetScaler managing a wide range of traffic may have many VIPs configured.

Subnet IP address (SNIP)

When the NetScaler is attached to multiple subnets, SNIPs can be configured for use as MIPs providing access to those subnets. SNIPs may be bound to specific VLANs and interfaces.

IP Set

An IP set is a set of IP addresses, which are configured on the NetScaler appliance as SNIPs or MIPs. An IP set is identified with a meaningful name that helps in identifying the usage of the IP addresses contained in it.

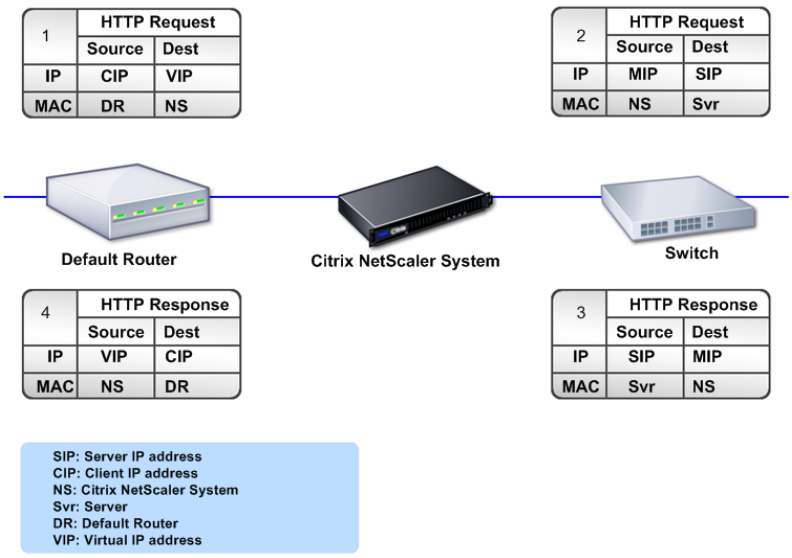
Net Profile

A net profile (or network profile) contains an IP address or an IP set. A net profile can be bound to load balancing or content switching virtual servers, services, service groups, or monitors. During communication with physical servers or peers, the NetScaler appliance uses the addresses specified in the profile as the source IP address.

How Traffic Flows Are Managed

Because a NetScaler functions as a TCP proxy, it translates IP addresses before sending packets to a server. When you configure a vserver, clients connect to a VIP on the NetScaler instead of directly connecting to a server. Based on the settings on the vserver, the NetScaler selects an appropriate server and sends the client's request to that server. By default, the NetScaler uses a MIP or SNIP to establish connections with the server, as shown in the following figure.

Figure 1. Vserver-Based Connections



Note: You can use SNIP instead of MIP in the preceding figure.

In the absence of a vserver, when a NetScaler receives a request, it transparently forwards the request to the server. This is called the transparent mode of operation. When operating in transparent mode, a NetScaler translates the source IP addresses of incoming client requests to the MIP or SNIP but does not change the destination IP address. For this mode to work, L2 or L3 mode needs to be configured appropriately.

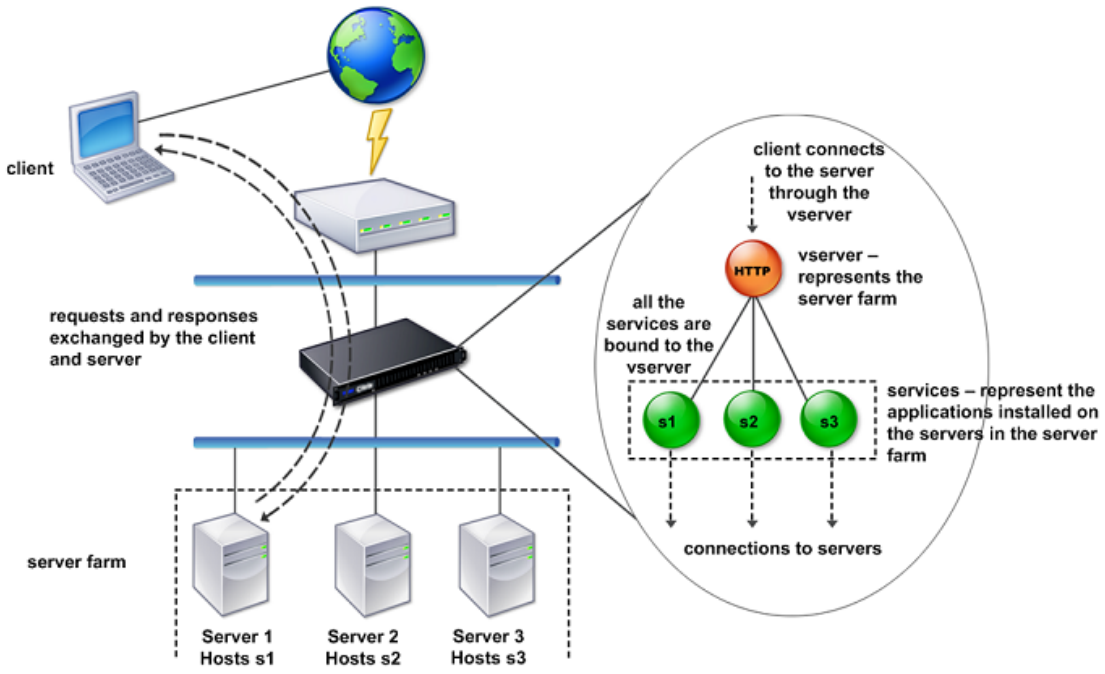
For cases in which the servers need the actual client IP address, the NetScaler can be configured to modify the HTTP header by inserting the client IP address as an additional field, or configured to use the client IP address instead of the MIP or SNIP for connections to the servers.

Traffic Management Building Blocks

The configuration of a NetScaler is typically built up with a series of virtual entities that serve as building blocks for traffic management. The building block approach helps separate traffic flows. Virtual entities are abstractions, typically representing IP addresses, ports, and protocol handlers for processing traffic. Clients access applications and resources through these virtual entities. The most commonly used entities are vservers and services. Vservers represent groups of servers in a server farm or remote network, and services represent specific applications on each server.

Most features and traffic settings are enabled through virtual entities. For example, you can configure a NetScaler to compress all server responses to a client that is connected to the server farm through a particular vserver. To configure the NetScaler for a particular environment, you need to identify the appropriate features and then choose the right mix of virtual entities to deliver them. Most features are delivered through a cascade of virtual entities that are bound to each other. In this case, the virtual entities are like blocks being assembled into the final structure of a delivered application. You can add, remove, modify, bind, enable, and disable the virtual entities to configure the features. The following figure shows the concepts covered in this section.

Figure 1. How Traffic Management Building Blocks Work

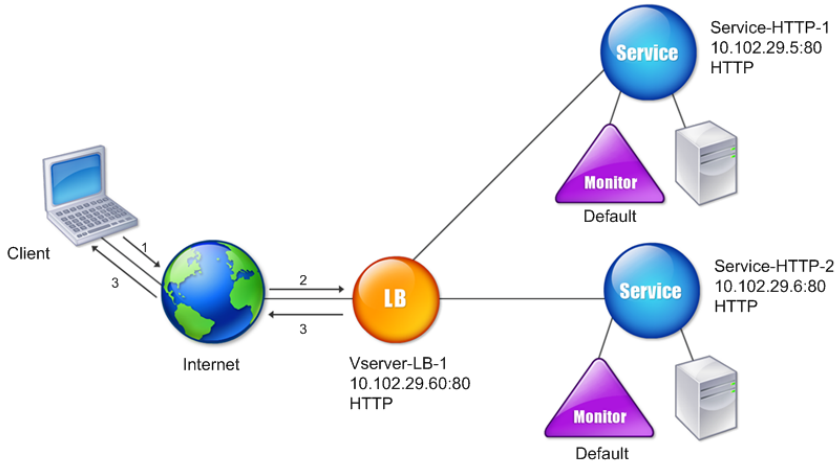


A Simple Load Balancing Configuration

In the example shown in the following figure, the NetScaler is configured to function as a load balancer. For this configuration, you need to configure virtual entities specific to load balancing and bind them in a specific order. As a load balancer, a NetScaler distributes client requests across several servers and thus optimizes the utilization of resources.

The basic building blocks of a typical load balancing configuration are services and load balancing vservers. The services represent the applications on the servers. The vservers abstract the servers by providing a single IP address to which the clients connect. To ensure that client requests are sent to a server, you need to bind each service to a vserver. That is, you must create services for every server and bind the services to a vserver. Clients use the VIP to connect to a NetScaler. When the NetScaler receives client requests on the VIP, it sends them to a server determined by the load balancing algorithm. Load balancing uses a virtual entity called a monitor to track whether a specific configured service (server plus application) is available to receive requests.

Figure 1. Load Balancing Virtual Server, Services, and Monitors



In addition to configuring the load balancing algorithm, you can configure several parameters that affect the behavior and performance of the load balancing configuration. For example, you can configure the vserver to maintain persistence based on source IP address. The NetScaler then directs all requests from any specific IP address to the same server.

Understanding Virtual Servers

A vserver is a named NetScaler entity that external clients can use to access applications hosted on the servers. It is represented by an alphanumeric name, virtual IP address (VIP), port, and protocol. The name of the vserver is only of local significance and is designed to make the vserver easier to identify. When a client attempts to access applications on a server, it sends a request to the VIP instead of the IP address of the physical server. When the NetScaler receives a request on the VIP, it terminates the connection at the vserver and uses its own connection with the server on behalf of the client. The port and protocol settings of the vserver determine the applications that the vserver represents. For example, a web server can be represented by a vserver and a service whose port and protocol are set to 80 and HTTP, respectively. Multiple vservers can use the same VIP but different protocols and ports.

Vservers are points for delivering features. Most features, like compression, caching, and SSL offload, are normally enabled on a vserver. When the NetScaler receives a request on a VIP, it chooses the appropriate vserver by the port on which the request was received and its protocol. The NetScaler then processes the request as appropriate for the features configured on the vserver.

In most cases, vservers work in tandem with services. You can bind multiple services to a vserver. These services represent the applications running on physical servers in a server farm. After the NetScaler processes requests received on a VIP, it forwards them to the servers as determined by the load balancing algorithm configured on the vserver. The following figure shows these concepts.

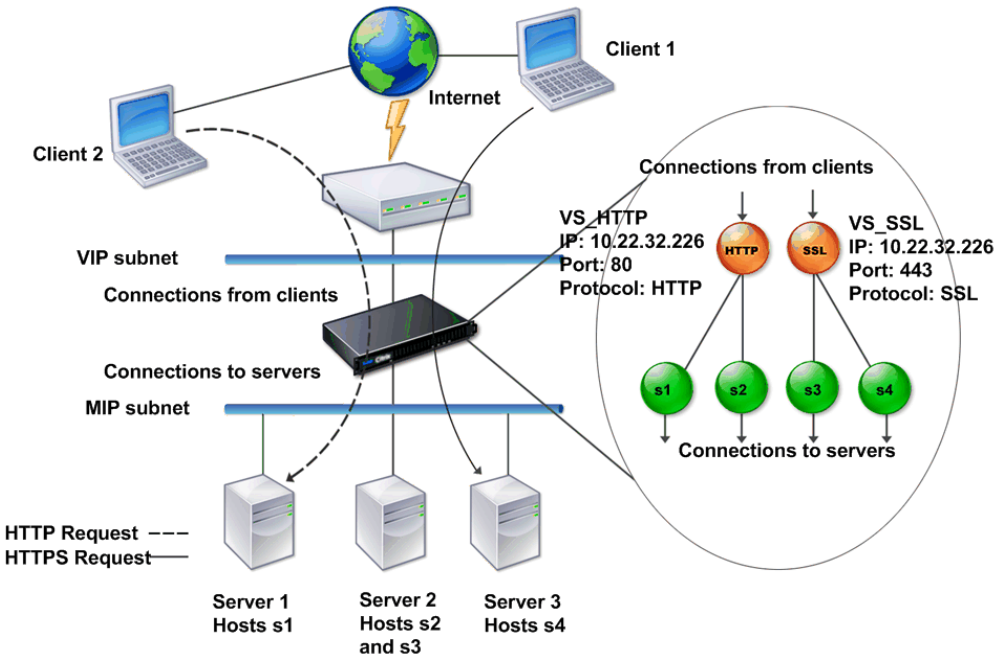


Figure 1. Multiple Virtual Servers on a Single VIP

The preceding figure shows a configuration consisting of two vservers with a common VIP but different ports and protocols. Each of these vservers has two services bound to it. The services s1 and s2 are bound to VS_HTTP and represent the HTTP applications on Server 1 and Server 2. The services s3 and s4 are bound to VS_SSL and represent the SSL applications on Server 2 and Server 3 (Server 2 provides both HTTP and SSL applications). When the NetScaler receives an HTTP request on the VIP, it processes the request based on the settings of VS_HTTP and sends it to either Server 1 or Server 2. Similarly, when the NetScaler receives an HTTPS request on the VIP, it processes it based on the settings of VS_SSL and it sends it to either Server 2 or Server 3.

Vservers are not always represented by specific IP address, port numbers, or protocols. They can be represented by wildcards, in which case they are known as wildcard vservers. For example, when you configure a vserver with a wildcard instead of a VIP, but with a specific port number, the NetScaler intercepts and processes all traffic conforming to that protocol and destined for the predefined port. For vservers with wildcards instead of VIPs and port numbers, the NetScaler intercepts and processes all traffic conforming to the protocol.

Vservers can be grouped into the following categories:

Load balancing virtual server

Receives and redirects requests to an appropriate server. Choice of the appropriate server is based on which of the various load balancing methods the user configures.

Cache redirection virtual server

Redirects client requests for dynamic content to origin servers and static content to cache servers. Cache redirection vservers often work in conjunction with load balancing vservers.

Content switching virtual server

Directs traffic to a server on the basis of the content that the client has requested. For example, you can create a content switching vserver that directs all client requests for images to a server that serves images only. Content switching vservers often work in conjunction with load balancing vservers.

Virtual private network (VPN) virtual server

Decrypts tunneled traffic and sends it to intranet applications.

SSL virtual server

Receives and decrypts SSL traffic, and then redirects to an appropriate server. Choosing the appropriate server is similar to choosing a load balancing virtual server.

Understanding Services

Services represent applications on a server. While services are normally combined with vservers, in the absence of a vserver, a service can still manage application-specific traffic. For example, you can create an HTTP service on a NetScaler to represent a web server application. When the client attempts to access a web site hosted on the web server, the NetScaler intercepts the HTTP requests and creates a transparent connection with the web server.

In service-only mode, a NetScaler functions as a proxy. It terminates client connections, uses a SNIP or MIP to establish a connection to the server, and translates incoming client requests to the SNIP or MIP. Although the clients send requests directly to the IP address of the server, the server sees them as coming from the SNIP or MIP. The NetScaler translates the IP addresses, port numbers, and sequence numbers.

A service is also a point for applying features. Consider the example of SSL acceleration. To use this feature, you must create an SSL service and bind an SSL certificate to the service. When the NetScaler receives an HTTPS request, it decrypts the traffic and sends it, in clear text, to the server. Only a limited set of features can be configured in the service-only case.

Services use entities called monitors to track the health of applications. Every service has a default monitor, which is based on the service type, bound to it. As specified by the settings configured on the monitor, the NetScaler sends probes to the application at regular intervals to determine its state. If the probes fail, the NetScaler marks the service as down. In such cases, the NetScaler responds to client requests with an appropriate error message or re-routes the request as determined by the configured load balancing policies.

Understanding Policies and Expressions

A policy defines specific details of traffic filtering and management on a NetScaler. It consists of two parts: the expression and the action. The expression defines the types of requests that the policy matches. The action tells the NetScaler what to do when a request matches the expression. As an example, the expression might be to match a specific URL pattern to a type of security attack, with the action being to drop or reset the connection. Each policy has a priority, and the priorities determine the order in which the policies are evaluated.

When a NetScaler receives traffic, the appropriate policy list determines how to process the traffic. Each policy on the list contains one or more expressions, which together define the criteria that a connection must meet to match the policy.

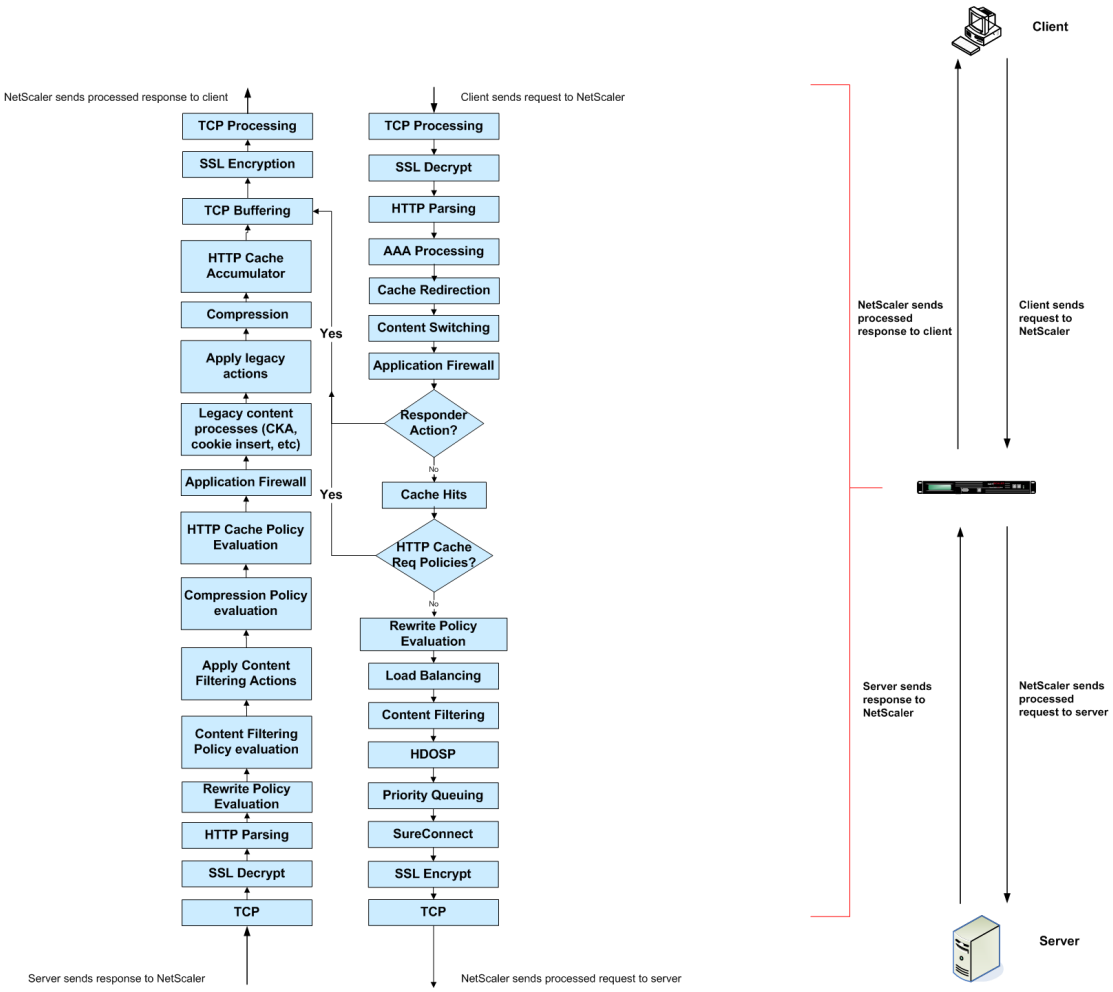
For all policy types except Rewrite policies, a NetScaler implements only the first policy that a request matches, not any additional policies that it might also match. For Rewrite policies, the NetScaler evaluates the policies in order and, in the case of multiple matches, performs the associated actions in that order. Policy priority is important for getting the results you want.

Processing Order of Features

Depending on requirements, you can choose to configure multiple features. For example, you might choose to configure both compression and SSL offload. As a result, an outgoing packet might be compressed and then encrypted before being sent to the client.

The following figure shows the L7 packet flow in the NetScaler.

Figure 1. L7 Packet Flow Diagram



The following figure shows the DataStream packet flow in the NetScaler. DataStream is supported only for MySQL databases. For information about the DataStream feature, see DataStream.

Installing NetScaler Virtual Appliances on XenServer

To install Citrix® NetScaler® virtual appliances on Citrix® XenServer®, you must first install XenServer on a machine with adequate system resources. To perform the NetScaler VPX installation, you use Citrix® XenCenter®, which must be installed on a remote machine that can connect to the XenServer host through the network.

Note: After the initial configuration of the NetScaler appliance, if you want to upgrade the appliance to the latest software release, see Upgrading or Downgrading the System Software.

Prerequisites for Installing NetScaler Virtual Appliances on XenServer

Before you begin installing a virtual appliance, do the following:

- Install XenServer® version 5.6 or later on hardware that meets the minimum requirements.
- Install XenCenter® on a management workstation that meets the minimum system requirements.

  Obtain VPX license files. For more information about VPX licenses, see the *NetScaler VPX Licensing Guide* at http://support.citrix.com/article/ctx122426.

XenServer Hardware Requirements

The following table describes the minimum hardware requirements for a XenServer platform running NetScaler nCore VPX.

Table 1. Minimum System Requirements for XenServer Running NetScaler nCore VPX

Component	Requirement
CPU	2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT or AMD-V) enabled **Note:** To run NetScaler VPX, hardware support for virtualization must be enabled on the XenServer host. Make sure that the BIOS option for virtualization support is not disabled. Consult your BIOS documentation for more details.
RAM	3 gigabytes (GB)
Disk space	Locally attached storage (PATA, SATA, SCSI) with 40 GB of disk space **Note:** XenServer installation creates a 4 GB partition for the XenServer host control domain; the remaining space is available for NetScaler VPX and other virtual machines.
Network Interface Card (NIC)	1 one gigabits per second (Gbps) NIC; 2 one Gbps NICs recommended

For information about installing XenServer, see the XenServer documentation at http://support.citrix.com/product/xens/.

The following table lists the virtual computing resources that XenServer must provide for each NetScaler nCore VPX.

Table 2. Minimum Virtual Computing Resources Required for Running NetScaler nCore VPX

Component	Requirement
Memory	2 GB
Virtual CPU (VCPU)	2
Virtual network interfaces	1

Note: For production use of NetScaler VPX, it is recommended that CPU priority (in virtual machine properties) be set to the highest level in order to improve scheduling behavior and network latency.

XenCenter System Requirements

XenCenter® is a Windows client application. It cannot run on the same machine as the XenServer® host. The following table describes the minimum system requirements.

Table 3. Minimum System Requirements for XenCenter Installation

Component	Requirement
Operating system	Windows XP, Windows Server 2003, or Windows Vista
.NET framework	Version 2.0 or later
CPU	750 megahertz (MHz) Recommended: 1 gigahertz (GHz) or faster
RAM	1 GB Recommended: 2 GB
Network Interface Card (NIC)	100 megabits per second (Mbps) or faster NIC

For information about installing XenCenter, see the XenServer documentation at http://support.citrix.com/product/xens/.

Installing NetScaler Virtual Appliances on XenServer by Using XenCenter

After you have installed and configured XenServer and XenCenter, you can use XenCenter to install virtual appliances on XenServer. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running XenServer.

After you have used XenCenter to install the initial NetScaler virtual appliance (.xva image) on XenServer, you have the option to use Command Center to provision NetScaler VPX. For more information, see the Command Center documentation.

To install NetScaler virtual appliances on XenServer by using XenCenter

1. Start XenCenter on your workstation.
2. On the **Server** menu, click **Add**.
3. In the **Add New Server** dialog box, in the **Hostname** text box, type the IP address or DNS name of the XenServer that you want to connect to.
4. In the **User Name** and **Password** text boxes, type the administrator credentials, and then click **Connect**. The XenServer name appears in the navigation pane with a green circle, which indicates that the XenServer is connected.
5. In the navigation pane, click the name of the XenServer on which you want to install NetScaler VPX.
6. On the **VM** menu, click **Import**.
7. In the **Import** dialog box, in **Import file** name, browse to the location at which you saved the NetScaler VPX .xva image file. Make sure that the **Exported VM** option is selected, and then click **Next**.
8. Select the XenServer on which you want to install the virtual appliance, and then click **Next**.
9. Select the local storage repository in which to store the virtual appliance, and then click **Import** to begin the import process.
10. You can add, modify, or delete virtual network interfaces as required. When finished, click **Next**.
11. Click **Finish** to complete the import process.

    Note: To view the status of the import process, click the **Log** tab.
12. If you want to install another virtual appliance, repeat steps 5 through 11.

Installing NetScaler Virtual Appliances on VMware ESX

Before installing Citrix® NetScaler® virtual appliances on VMware ESX, make sure that VMware ESX server is installed on a machine with adequate system resources. To install virtual appliances on VMware ESX version 4.0, you use VMware vSphere client. On VMware ESX version 3.5, you use the VMware Open Virtualization Format (OVF) tool. The client or tool must be installed on a remote machine that can connect to VMware ESX through the network.

After the installation, you can use vSphere client 4.0 to manage virtual appliances on VMware ESX 4.0, or you can use VMware Infrastructure (VI) client 2.5 to manage virtual appliances on VMware ESX 3.5.

Note:

The VMware vSphere client shows the guest operating system as "Sun Solaris 10" for NetScaler VPX. This is by design because VMware ESX 3.5 does not recognize FreeBSD.

After the initial configuration of the NetScaler appliance, if you want to upgrade the appliance to the latest software release, see Upgrading or Downgrading the System Software.

Prerequisites for Installing NetScaler Virtual Appliances on VMware

Before you begin installing a virtual appliance, do the following:

- Install VMware ESX version 3.5 or later on hardware that meets the minimum requirements.
- Install VMware Client on a management workstation that meets the minimum system requirements.
- Install VMware OVF Tool (required for VMware ESX version 3.5) on a management workstation that meets the minimum system requirements.
- Download the NetScaler VPX setup files.
- Label the physical network ports of VMware ESX.
- Obtain NetScaler VPX license files. For more information about NetScaler VPX licenses, see the *NetScaler VPX Licensing Guide* at http://support.citrix.com/article/ctx122426.

VMware ESX Hardware Requirements

The following table describes the minimum system requirements for VMware EXS servers running NetScaler nCore VPX.

Table 1. Minimum System Requirements for VMware ESX Servers Running NetScaler nCore VPX

Component	Requirement
CPU	2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT or AMD-V) enabled **Note:** To run NetScaler VPX, hardware support for virtualization must be enabled on the VMware ESX host. Make sure that the BIOS option for virtualization support is not disabled. For more information, see your BIOS documentation.
RAM	3 GB

Disk space	Locally attached storage (PATA, SATA, SCSI) with 40 GB of disk space available
Network	1 one gigabits per second (Gbps) NIC; 2 one Gbps NICs recommended (The network interfaces should be E1000.)

For information about installing VMware ESX, see http://www.vmware.com/.

The following table lists the virtual computing resources that the VMware ESX server must provide for each NetScaler nCore VPX.

Table 2. Minimum Virtual Computing Resources Required for Running NetScaler nCore VPX

Component	Requirement
Memory	2 GB
Virtual CPU (VCPU)	2
Virtual network interfaces	1 **Note:** If the virtual appliance is installed on ESX 3.5 or ESXi 3.5, you can install a maximum of 4 virtual network interfaces. If the virtual appliance is installed on ESX 4.0, the maximum is 10.
Disk space	20 GB **Note:** This is in addition to any disk requirements for the hypervisor.

Note: For production use of NetScaler VPX, the full memory allocation must be reserved. CPU MHz should also be reserved at least equal to the MHz of one CPU core in the system.

VMware vSphere Client 4.0 System Requirements

VMware vSphere is a client application that can run on Windows and Linux operating systems. It cannot run on the same machine as the VMware ESX server. The following table describes the minimum system requirements.

Table 3. Minimum System Requirements for VMware vSphere Client Installation

Component	Requirement
Operating system	For detailed requirements from VMware, search for the "vSphere Compatibility Matrixes" PDF file at http://kb.vmware.com/.
CPU	750 megahertz (MHz); 1 gigahertz (GHz) or faster recommended

RAM	1 GB; 2 GB recommended
Network Interface Card (NIC)	100 Mbps or faster NIC

For information about installing vSphere client 4.0, see http://www.vmware.com/.

Note: When you connect the vSphere client 4.0 to ESX 3.5, the vSphere client downgrades to VMware Infrastructure (VI) client version 2.5, which is the only version that is compatible with ESX 3.5.

OVF Tool 1.0 System Requirements

OVF Tool is a client application that can run on Windows and Linux systems. It cannot run on the same machine as the VMware ESX server. You need to use VMware OVF Tool version 1.0 for installing virtual appliances on ESX 3.5. The following table describes the minimum system requirements.

Table 4. Minimum System Requirements for OVF Tool Installation

Component	Requirement
Operating system	For detailed requirements from VMware, search for the "OVF Tool User Guide" PDF file at http://kb.vmware.com/.
CPU	750 MHz minimum, 1 GHz or faster recommended.
RAM	1 GB Minimum, 2 GB recommended.
Network Interface Card (NIC)	100 Mbps or faster NIC

For information about installing OVF, search for the "OVF Tool User Guide" PDF file at http://kb.vmware.com/.

Downloading the NetScaler VPX Setup Files

The NetScaler VPX setup package for VMWare ESX follows the Open Virtual Machine (OVF) format standard. You can download the files from MyCitrix.com. You will need a My Citrix account to log on. If you do not have a My Citrix account, access the home page at http://www.mycitrix.com, click the **New Users** link, and follow the instructions to create a new My Citrix account.

Once logged in, navigate the following path from the My Citrix home page:

MyCitrix.com > Downloads > NetScaler > Virtual Appliances.

Copy the following files to a workstation on the same network as the ESX server. Copy all three files into the same folder.

- NSVPX-ESX-<release number>-<build number>-disk1.vmdk (for example, NSVPX-ESX-9.3-39.8-disk1.vmdk)

- NSVPX-ESX-<release number>-<build number>.ovf (for example, NSVPX-ESX-9.3-39.8.ovf)
- NSVPX-ESX-<release number>-<build number>.mf (for example, NSVPX-ESX-9.3-39.8.mf)

Labeling the Physical Network Ports of VMware ESX

Before installing a NetScaler virtual appliance, you need to label at least one physical network port of VMware ESX in a particular format. The labeling format is NS_NIC_1_1, NS_NIC_1_2, and so on. These ports will be used by the virtual appliances that you install. An interface can be used by more than one virtual appliance.

To label the physical network ports of VMware ESX server

1. Log on to the VMware ESX server by using the vSphere client.
2. On the vSphere client, select the **Configuration** tab, and then click **Networking**.
3. At the top-right corner, click **Add Networking**, to start the **Add Network Wizard**.
4. In **Connection Type**, select **Virtual Machine**, and then click **Next**.
5. Scroll through the list of vSwitch physical adapters, and choose the physical port that will map to interface 1/1 on the virtual appliances.
6. Enter **NS_NIC_1_1** as the name of the vSwitch that will be associated with interface 1/1 of the virtual appliances.
7. Click **Next** to finish the vSwitch creation. Repeat the procedure, beginning with step 2, to add any additional interfaces to be used by your virtual appliances. Label the interfaces sequentially, in the correct format (for example, **NS_NIC_1_2**).

Installing NetScaler Virtual Appliances on VMware ESX 4.0

After you have installed and configured VMware ESX 4.0, you can use VMware vSphere client to install virtual appliances on the VMware ESX. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running VMware ESX.

To install NetScaler virtual appliances on VMware ESX 4.0 by using VMware vSphere Client

1. Start the VMware vSphere client on your workstation.
2. In the **IP address / Name** text box, type the IP address of the VMware ESX server that you want to connect to.
3. In the **User Name** and **Password** text boxes, type the administrator credentials, and then click **Login**.
4. On the **File** menu, click **Deploy OVF Template**.
5. In the **Deploy OVF Template** dialog box, in **Deploy from file**, browse to the location at which you saved the NetScaler VPX setup files, select the .ovf file, and click **Next**.
6. Map the networks shown in the VPX OVF template to the networks that you configured on the ESX host. Click **Next** to start installing VPX on VMware ESX. When installation is complete, a pop-up window informs you of the successful installation.
7. You are now ready to start the NetScaler VPX. In the navigation pane, select the NetScaler VPX that you have just installed and, from the right-click menu, select **Power On**. Click the **Console** tab to emulate a console port.
8. If you want to install another virtual appliance, repeat steps 4 through 6.

Installing NetScaler Virtual Appliances on VMware ESX 3.5

To install virtual appliances on ESX 3.5, you need to use the VMware OVF tool, version 1.0. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running VMware ESX. After installation, you can use the VMware Infrastructure (VI) client 2.5 to manage the virtual appliances on VMware ESX version 3.5.

Note: You cannot use version 4.0 of the vSphere client for installing virtual appliances on ESX 3.5. If you connect the vSphere 4.0 client to ESX 3.5, the vSphere client downgrades to VI client version 2.5, which supports only the OVF 0.9 standard. The NetScaler VPX installation package is based on the OVF 1.0.

To install NetScaler virtual appliances on VMware ESX 3.5 by using the VMware OVF Tool

1. On your workstation, open the command-line interface and execute the following command:

   ```
   ovftool <path of the NetScaler VPX OVF file>
   vi://<Username>:<Password>@<IP address of the ESX server>
   ```

   For example, in Windows command shell, type:

   ```
   ovftool c:/NetScalerVPX vi://root:free@<10.217.20.14>
   ```

2. When the OVF tool has installed the virtual appliances on the ESX server, use the VI client to log on to the VMware ESX server on which you performed the installation.

3. In the navigation pane, right-click a virtual appliance that you want to enable, and then click **Power On**. Repeat this for each virtual appliance you want to enable.

4. Click the **Console** tab to emulate a console port.

Installing Citrix NetScaler Virtual Appliances on Microsoft Server 2008 R2

To install Citrix® NetScaler® virtual appliances on Microsoft Windows Server 2008 R2, you must first install Windows Server 2008 R2, with the Hyper-V role enabled, on a machine with adequate system resources. While installing the Hyper-V role, make sure you specify the network interface cards (NICs) on the server that Hyper-V will use to create the virtual networks. You can reserve some NICs for the host. Use Hyper-V Manager to perform the NetScaler VPX installation.

NetScaler VPX for Hyper-V is delivered in virtual hard disk (VHD) format. It includes the default configuration for elements such as CPU, network interfaces, and hard-disk size and format. After you install NetScaler VPX, you can configure the network adapters on VPX, add virtual NICs, and then assign the NetScaler IP address, subnet mask, and gateway, and complete the basic configuration of the virtual appliance.

Note:

NetScaler VPX for Hyper-V does not support L2 mode.

After the initial configuration of the NetScaler appliance, if you want to upgrade the appliance to the latest software release, see Upgrading or Downgrading the System Software.

Prerequisites for Installing NetScaler VPX on Microsoft Server 2008 R2

Before you begin installing a virtual appliance, do the following:

- Enable the Hyper-V role on Windows Server 2008 R2. For more information, see http://technet.microsoft.com/en-us/library/ee344837(WS.10).aspx.
- Download the VPX setup files.
- Obtain NetScaler VPX license files. For more information about NetScaler VPX licenses, see the *NetScaler VPX Licensing Guide* at http://support.citrix.com/article/ctx122426.

Microsoft Server 2008 R2 Hardware Requirements

The following table describes the minimum system requirements for Microsoft Server 2008 R2.

Table 1. Minimum System Requirements for Microsoft Server 2008 R2

Component	Requirement
CPU	1.4 GHz 64-bit processor
RAM	3 GB
Disk Space	32 GB or greater

For more information about Windows Server 2008 R2 system requirements, see http://www.microsoft.com/windowsserver2008/en/us/system-requirements.aspx.

For information about installing Microsoft Server 2008 R2, see http://technet.microsoft.com/en-us/library/dd379511(WS.10).aspx.

The following table lists the virtual computing resources for each NetScaler nCore VPX.

Table 2. Minimum Virtual Computing Resources Required for Running NetScaler nCore VPX

Component	Requirement
RAM	2 GB
Virtual CPU	2
Disk Space	20 GB
Virtual Network Interfaces	1

Downloading the NetScaler VPX Setup Files

NetScaler VPX for Hyper-V is delivered in virtual hard disk (VHD) format. You can download the files from MyCitrix.com. You will need a My Citrix account to log on. If you do not have a My Citrix account, access the home page at http://www.mycitrix.com, click the **New Users** link, and follow the instructions to create a new My Citrix account.

To download the NetScaler VPX setup files

1. In a Web browser, go to http://www.citrix.com/ and click **My Citrix**.
2. Type your user name and password.
3. Click **Downloads**.
4. In **Search Downloads by Product**, select **NetScaler**.
5. Under **Virtual Appliances**, click **NetScaler VPX**.
6. Copy the compressed file to your server.

Installing NetScaler VPX on Microsoft Server 2008 R2

After you have enabled the Hyper-V role on Microsoft Server 2008 R2 and extracted the VPX files, you can use Hyper-V Manager to install NetScaler VPX. After you import the virtual machine, you need to configure the virtual NICs by associating them to the virtual networks created by Hyper-V.

You can configure a maximum of eight virtual NICs. Even if the physical NIC is DOWN, the virtual appliance assumes that the virtual NIC is UP, because it can still communicate with the other virtual appliances on the same host (server).

Note: You cannot change any settings while the virtual appliance is running. Shut down the virtual appliance and then make changes.

To install NetScaler VPX on Microsoft Server 2008 R2 by using Hyper-V Manager

1. To start Hyper-V Manager, click **Start**, point to **Administrative Tools**, and then click **Hyper-V Manager**.
2. In the navigation pane, under **Hyper-V Manager**, select the server on which you want to install NetScaler VPX.
3. On the **Action** menu, click **Import Virtual Machine**.
4. In the **Import Virtual Machine** dialog box, in **Location**, specify the path of the folder that contains the NetScaler VPX software files, and then select **Copy the virtual machine (create a new unique ID)**. This folder is the parent folder that contains the Snapshots, Virtual Hard Disks, and Virtual Machines folders.

   Note: If you received a compressed file, make sure that you extract the files into a folder before you specify the path to the folder.
5. Click **Import**.
6. Verify that the virtual appliance that you imported is listed under **Virtual Machines**.
7. To install another virtual appliance, repeat steps 2 through 6.

   Important: Make sure that you extract the files to a different folder in step 4.

To configure virtual NICs on the NetScaler VPX

1. Select the virtual appliance that you imported, and then on the **Action** menu, select **Settings**.
2. In the **Settings for** <virtual appliance name> dialog box, click **Add Hardware** in the left pane.
3. In the right pane, from the list of devices, select **Network Adapter**.
4. Click **Add**.
5. Verify that **Network Adapter** (**not connected**) appears in the left pane.
6. Select the network adapter in the left pane.
7. In the right pane, from the **Network** drop-down list, select the virtual network to connect the adapter to.
8. To select the virtual network for additional network adapters that you want to use, repeat steps 6 and 7.
9. Click **Apply**, and then click **OK**.

To configure NetScaler VPX

1. Right-click the virtual appliance that you previously installed, and then select **Start**.
2. Access the console by double-clicking the virtual appliance.
3. Type the NetScaler IP address, subnet mask, and gateway for your virtual appliance.

You have completed the basic configuration of your virtual appliance. Type the IP address in a Web browser to access the virtual appliance.

Configuring the Basic System Settings

After installing a Citrix® NetScaler® VPX virtual appliance, you need to access it to configure the basic settings. Initially, you must access the NetScaler command line through the respective management application of the virtualization host (either Citrix XenCenter for Citrix XenServer or VMware vSphere client for VMware ESX) to specify a NetScaler IP (NSIP) address, subnet mask, and default gateway. The NSIP is the management address at which you can then access the NetScaler command line, through an SSH client, or access the configuration utility. You can use either of these access methods, or the console, to continue with basic configuration.

To access the configuration utility, type the NSIP into the address field of any browser (for example, `http://<NSIP_address>`). You need Java RunTime Environment (JRE) version 1.6 or later.

Setting Up the Initial Configuration by Using the NetScaler VPX Console

Your first task after installing a NetScaler virtual appliance on a virtualization host is to use the NetScaler VPX console in the XenCenter client or vSphere client to configure the following initial settings.

Note: If you have installed a virtual appliance on XenServer by using Command Center, you do not have to configure these settings. Command Center implicitly configures the settings during installation. For more information about provisioning VPX from Command Center, see the Command Center documentation.

NetScaler IP address (NSIP):

The IP address at which you access a NetScaler or a NetScaler virtual appliance for management purposes. A physical NetScaler or virtual appliance can have only one NSIP. You must specify this IP address when you configure the virtual appliance for the first time. You cannot remove an NSIP address.

Netmask:

The subnet mask associated with the NSIP address.

Default Gateway:

You must add a default gateway on the virtual appliance if you want access it through SSH or the configuration utility from an administrative workstation or laptop that is on a different network.

To configure the initial settings on the virtual appliance through the VPX Console by using the management application

1. Connect to the XenServer or VMware ESX server on which the virtual appliance is installed by using XenCenter or vSphere client, respectively.
2. In the details pane, on the **Console** tab, log on to the virtual appliance by using the administrator credentials.
3. At the prompts, enter the NSIP address, subnet mask, and default gateway, and then save the configuration.

After you have set up an initial configuration through the NetScaler VPX Console in the management application, you can use either the NetScaler command-line interface or the configuration utility to complete the configuration or to change the initial settings.

Configuring NetScaler VPX by Using the Command-Line Interface

You can use the NetScaler command-line to set up the NSIP, Mapped IP (MIP), Subnet IP (SNIP), and hostname. You can also configure advanced network settings and change the time zone.

For information about MIP, SNIP, other NetScaler-owned IP addresses, and network settings, see the *Citrix NetScaler Networking Guide* at http://support.citrix.com/article/CTX128671.

To complete initial configuration by using the NetScaler command line

1. Use either the SSH client or the NetScaler VPX Console in XenCenter to access the NetScaler command line.
2. Log on to the virtual appliance, using the administrator credentials.
3. At the NetScaler command prompt, type `config ns` to run the configuration script.
4. To complete the initial configuration, follow the prompts.

You have now completed the basic configuration of the virtual appliance. To continue the configuration process, choose one of the following options:

Citrix NetScaler Load Balancing Switch.

If you are configuring the virtual appliance as a standard NetScaler load balancing switch with other licensed features, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Citrix Application Firewall.

If you are configuring the virtual appliance as a standalone application firewall, see the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

For more information about the various features supported on NetScaler VPX, see Features at a Glance.

Configuring NetScaler VPX by Using the Configuration Utility

To use the Setup Wizard to set up the NetScaler virtual appliance, you must access the configuration utility from your Web browser. You can use the Setup Wizard to configure the NSIP, MIP, SNIP, hostname, and default gateway. You can also configure settings for a Web application by using an application template. You can also configure the NetScaler VPX as a load balancer for Citrix XenDesktop® or Citrix XenApp™.

For information about MIP, SNIP, and network settings, see the *Citrix NetScaler Networking Guide* at http://support.citrix.com/article/CTX128671.

For information about application templates, see the *Citrix NetScaler AppExpert Guide* at http://support.citrix.com/article/CTX128682.

For information about the load balancing feature of a virtual appliance, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To configure initial settings by using the configuration utility

1. In the address field of a Web browser, type: `http://<NSIP address>`
2. In **User Name** and **Password**, type the administrator credentials.
3. In **Start in**, select **Configuration**, and then click **Login**.
4. In the **Setup Wizard**, click **Next** and follow the instructions.

You have now completed the basic configuration of the virtual appliance. To continue the configuration process, choose one of the following options:

Citrix NetScaler Load Balancing Switch.

If you are configuring the virtual appliance as a standard NetScaler load balancing switch with other licensed features, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Citrix Application Firewall.

If you are configuring the virtual appliance as a standalone application firewall, see the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

For more information about the various features supported by NetScaler VPX, see Features at a Glance.

Understanding Common Network Topologies

As described in Physical Deployment Modes, you can deploy the Citrix® NetScaler® appliance either inline between the clients and servers or in one-arm mode. Inline mode uses a two-arm topology, which is the most common type of deployment.

Setting Up Common Two-Arm Topologies

In a two-arm topology, one network interface is connected to the client network and another network interface is connected to the server network, ensuring that all traffic flows through the NetScaler. This topology might require you to reconnect your hardware and also might result in a momentary downtime. The basic variations of two-arm topology are multiple subnets, typically with the NetScaler on a public subnet and the servers on a private subnet, and transparent mode, with both the NetScaler and the servers on the public network.

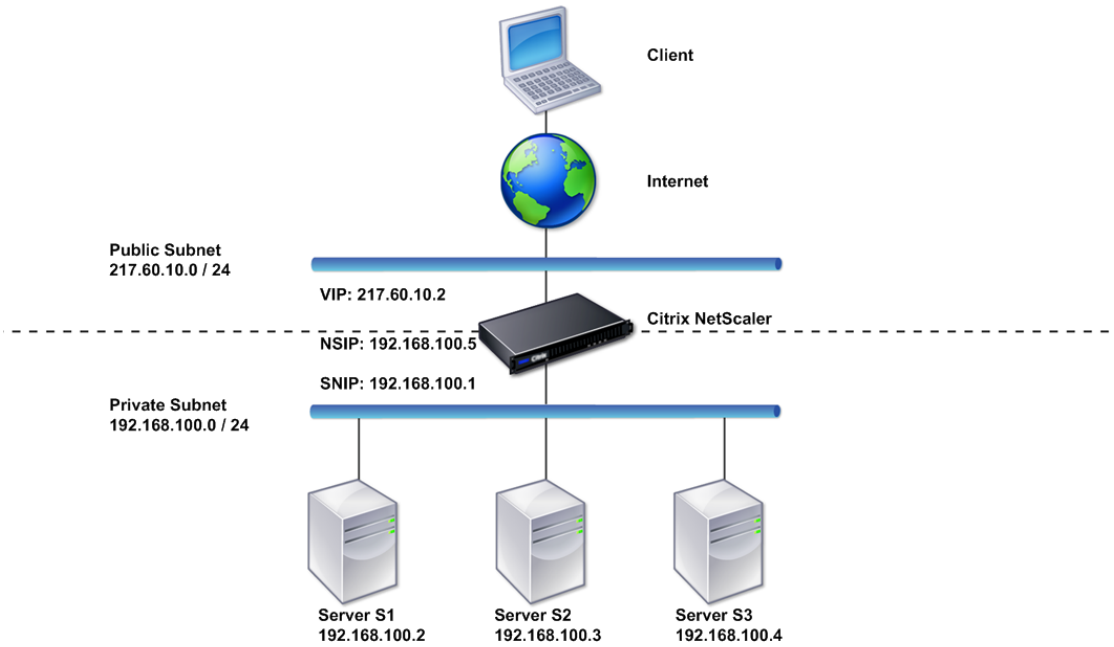
Setting Up a Simple Two-Arm Multiple Subnet Topology

One of the most commonly used topologies has the NetScaler inline between the clients and the servers, with a vserver configured to handle the client requests. This configuration is used when the clients and servers reside on different subnets. In most cases, the clients and servers reside on public and private subnets, respectively.

For example, consider a NetScaler deployed in two-arm mode for managing servers S1, S2, and S3, with a vserver of type HTTP configured on the NetScaler, and with HTTP services running on the servers. The servers are on a private subnet and a SNIP is configured on the NetScaler to communicate with the servers. The Use SNIP (USNIP) option must be enabled on the NetScaler so that it uses the SNIP instead of the MIP.

As shown in the following figure, the VIP and a SNIP are on public subnet 217.60.10.0, and the NSIP, the servers, and another SNIP are on private subnet 192.168.100.0/24.

Figure 1. Topology Diagram for Two-Arm Mode, Multiple Subnets



Task overview: To deploy a NetScaler in two-arm mode with multiple subnets

1. Configure the NSIP and default gateway, as described in Configuring a NetScaler by Using the Command Line Interface.

2. Configure the SNIP, as described in the Configuring Subnet IP Addresses (SNIPs).

3. Enable the USNIP option, as described in the To enable or disable USNIP mode by using the NetScaler command line.

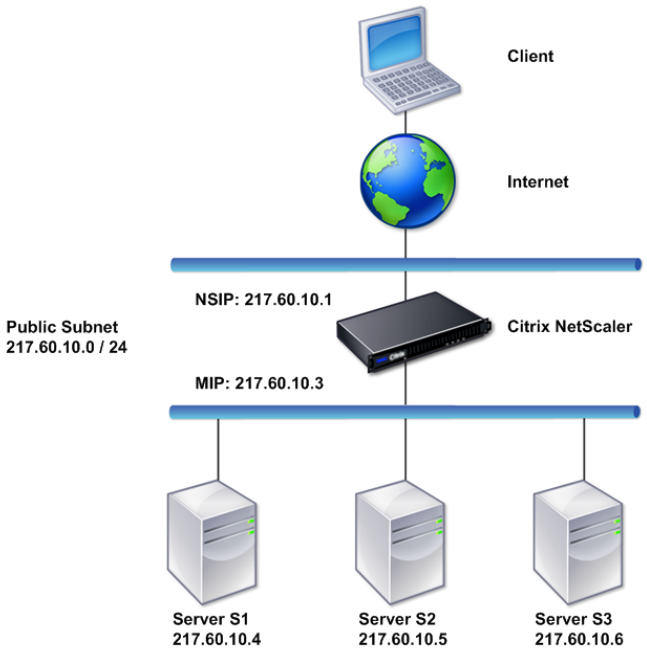
4. Configure the vserver and the services, as described in the Creating a Virtual Server and Configuring Services.

5. Connect one of the network interfaces to a private subnet and the other interface to a public subnet.

Setting Up a Simple Two-Arm Transparent Topology

Use transparent mode if the clients need to access the servers directly, with no intervening vserver. The server IP addresses must be public because the clients need to be able to access them. In the example shown in the following figure, a NetScaler is placed between the client and the server, so the traffic must pass through the NetScaler. You must enable L2 mode for bridging the packets. The NSIP and MIP are on the same public subnet, 217.60.10.0/24.

Figure 1. Topology Diagram for Two-Arm, Transparent Mode



Task overview: To deploy a NetScaler in two-arm, transparent mode

1. Configure the NSIP, MIP, and default gateway, as described in Configuring a NetScaler by Using the Command Line Interface.
2. Enable L2 mode, as described in the Enabling and Disabling Layer 2 Mode.
3. Configure the default gateway of the managed servers as the MIP.
4. Connect the network interfaces to the appropriate ports on the switch.

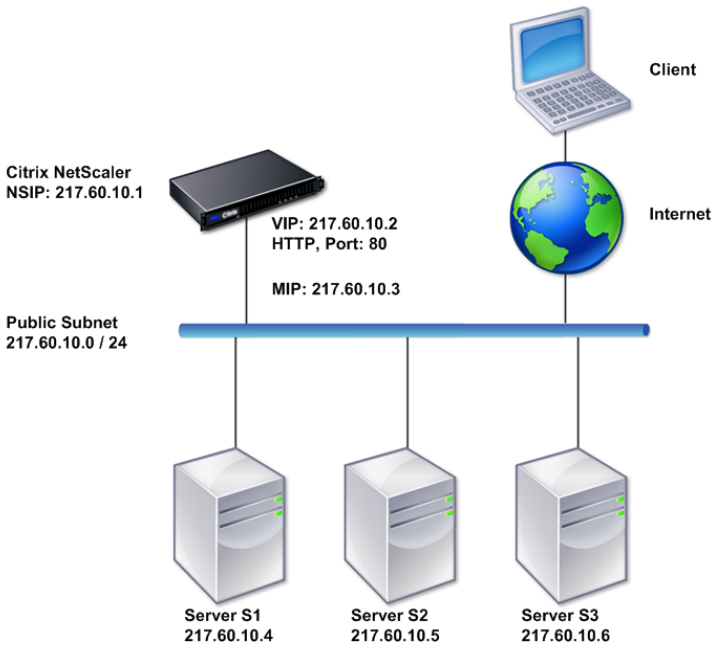
Setting Up Common One-Arm Topologies

The two basic variations of one-arm topology are with a single subnet and with multiple subnets.

Setting Up a Simple One-Arm Single Subnet Topology

You can use a one-arm topology with a single subnet when the clients and servers reside on the same subnet. For example, consider a NetScaler deployed in one-arm mode for managing servers S1, S2, and S3. A vserver of type HTTP is configured on a NetScaler, and HTTP services are running on the servers. As shown in the following figure, the NetScaler IP address (NSIP), the Mapped IP address (MIP), and the server IP addresses are on the same public subnet, 217.60.10.0/24.

Figure 1. Topology Diagram for One-Arm Mode, Single Subnet



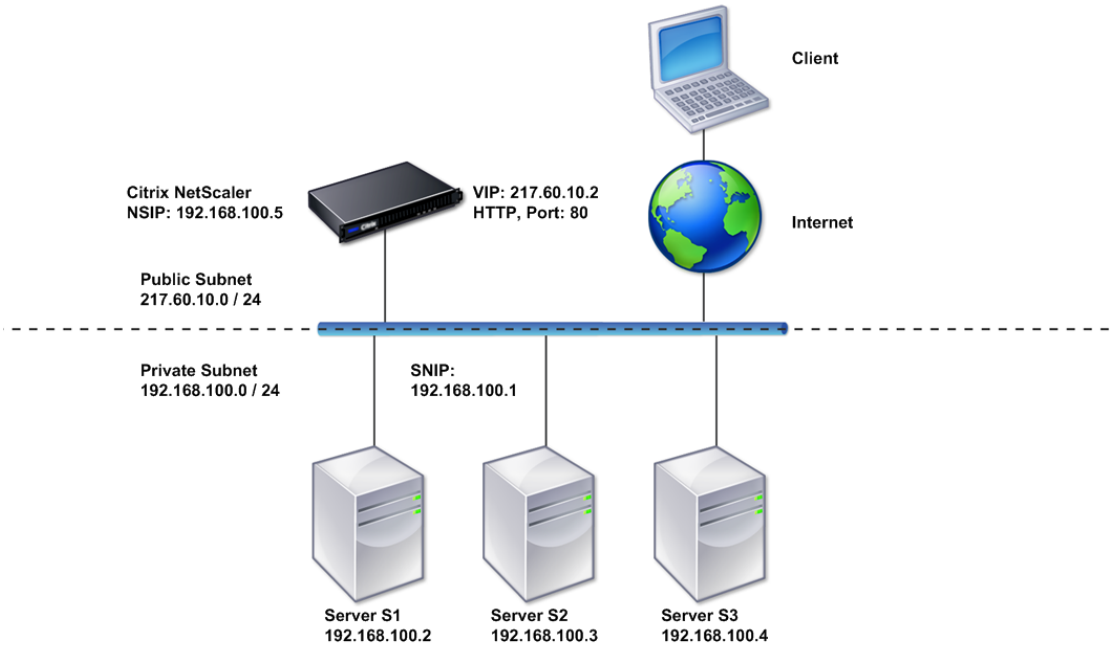
Task overview: To deploy a NetScaler in one-arm modewith a single subnet

1. Configure the NSIP, MIP, and the default gateway, as described in Configuring a NetScaler by Using the Command Line Interface.
2. Configure the vserver and the services, as described in Creating a Virtual Server and Configuring Services.
3. Connect one of the network interfaces to the switch.

Setting Up a Simple One-Arm Multiple Subnet Topology

You can use a one-arm topology with multiple subnets when the clients and servers reside on the different subnets. For example, consider a NetScaler deployed in one-arm mode for managing servers S1, S2, and S3, with the servers connected to switch SW1 on the network. A vserver of type HTTP is configured on the NetScaler, and HTTP services are running on the servers. These three servers are on the private subnet, so a subnet IP address (SNIP) is configured to communicate with them. The Use Subnet IP address (USNIP) option must be enabled so that the NetScaler uses the SNIP instead of a MIP. As shown in the following figure, the virtual IP address (VIP) is on public subnet 217.60.10.0/24; the NSIP, SNIP, and the server IP addresses are on private subnet 192.168.100.0/24.

Figure 1. Topology Diagram for One-Arm Mode, Multiple Subnets



Task overview: To deploy a NetScaler in one-arm mode with multiple subnets

1. Configure the NSIP and the default gateway, as described in Configuring a NetScaler by Using the Command Line Interface.

2. Configure the SNIP and enable the USNIP option, as described in the Configuring Subnet IP Addresses (SNIPs).

3. Configure the vserver and the services, as described in Creating a Virtual Server and Configuring Services.

4. Connect one of the network interfaces to the switch.

Configuring System Management Settings

Once your initial configuration is in place, you can configure settings to define the behavior of the Citrix® NetScaler® appliance and facilitate connection management. You have a number of options for handling HTTP requests and responses. Routing, bridging, and MAC based forwarding modes are available for handling packets not addressed to the NetScaler. You can define the characteristics of your network interfaces and can aggregate the interfaces. To prevent timing problems, you can synchronize the NetScaler clock with a Network Time Protocol (NTP) server. The NetScaler can operate in various DNS modes, including as an authoritative domain name server (ADNS). You can set up SNMP for system management and customize syslog logging of system events. Before deployment, verify that your configuration is complete and correct.

Configuring System Settings

Configuration of system settings includes basic tasks such as configuring HTTP ports to enable connection keep-alive and server offload, setting the maximum number of connections for each server, and setting the maximum number of requests per connection. You can enable client IP address insertion for situations in which a proxy IP address is not suitable, and you can change the HTTP cookie version.

You can also configure a NetScaler to open FTP connections on a controlled range of ports instead of ephemeral ports for data connections. This improves security, because opening all ports on the firewall is insecure. You can set the range anywhere from 1,024 to 64,000.

Before deployment, go through the verification checklists to verify your configuration. To configure HTTP parameters and the FTP port range, use the NetScaler configuration utility.

You can modify the types of HTTP parameters described in the following table.

Table 1. HTTP Parameters

Parameter Type	Specifies
HTTP Port Information	The Web server HTTP ports used by your managed servers. If you specify the ports, the NetScaler can perform request switching for any client request that has a destination port matching a specified port. **Note:** If an incoming client request is not destined for a service or a virtual server that is specifically configured on the NetScaler, the destination port in the request must match one of the globally configured HTTP ports. This allows the NetScaler to perform connection keep-alive and server off-load.

Limits	The maximum number of connections to each managed server, and the maximum number of requests sent over each connection. For example, if set **Max Connections** to 500, and the NetScaler is managing three servers, it can open a maximum of 500 connections to each of the three servers. By default, the NetScaler can create an unlimited number of connections to any of the servers it manages. To specify an unlimited number of requests per connection, set **Max Requests** to 0. **Note:** If you are using the Apache HTTP server, you must set **Max Connections** equal to the value of the MaxClients parameter in the Apache httpd.conf file. Setting this parameter is optional for other web servers.
Client IP Insertion	Enable/disable insertion of the client's IP address into the HTTP request header. You can specify a name for the header field in the adjacent text box. When a Web server managed by a NetScaler receives a mapped IP address or a subnet IP address, the server identifies it as the client's IP address. Some applications need the client's IP address for logging purposes or to dynamically determine the content to be served by the web server. You can enable insertion of the actual client IP address into the HTTP header request sent from the client to one, some, or all servers managed by the NetScaler. You can then access the inserted address through a minor modification to the server (using an Apache module, ISAPI interface, or NSAPI interface).
Cookie Version	The HTTP cookie version to use when COOKIEINSERT persistence is configured on a virtual server. The default, version 0, is the most common type on the Internet. Alternatively, you can specify version 1.
Requests/Responses	Options for handling certain types of requests, and enable/disable logging of HTTP error responses.
Server Header Insertion	Insert a server header in NetScaler-generated HTTP responses.

To configure HTTP parameters by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change HTTP parameters**.
3. In the **Configure HTTP parameters** dialog box, specify values for some or all of the parameters that appear under the headings listed in the table above.
4. Click **OK**.

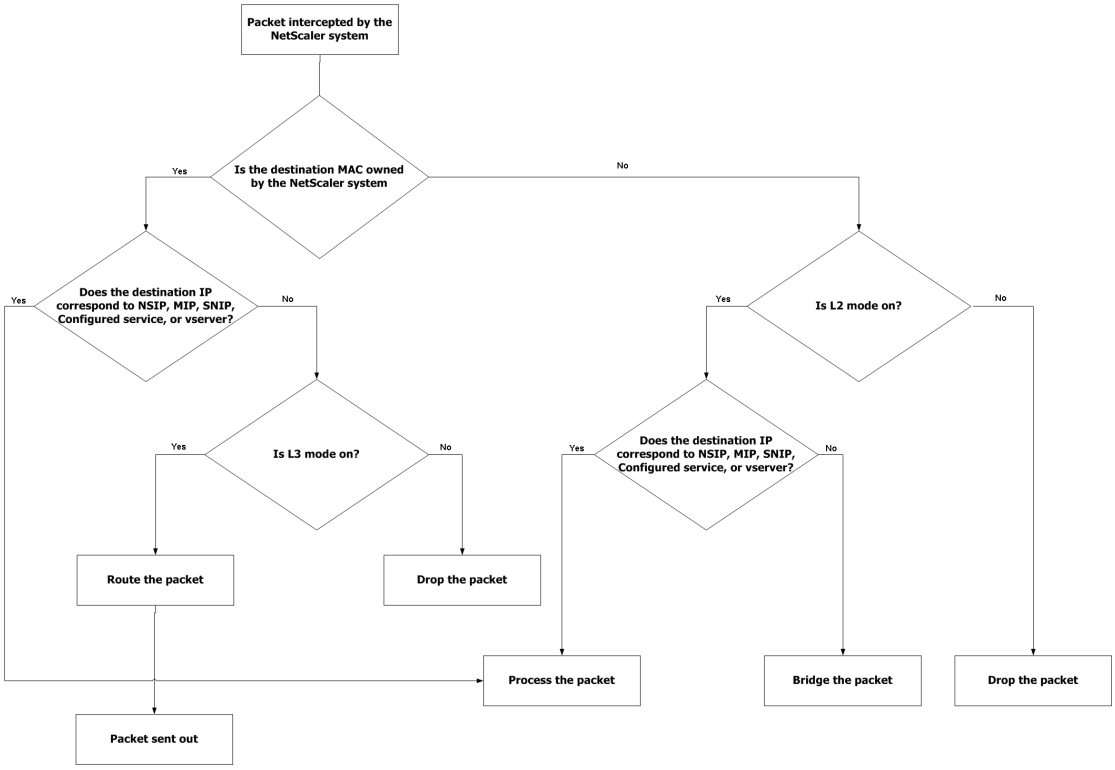
To set the FTP port range by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change global system settings**.
3. Under **FTP Port Range**, in the **Start Port** and **End Port** text boxes, type the lowest and highest port numbers, respectively, for the range you want to specify (for example, 5000 and 6000).
4. Click **OK**.

Configuring Modes of Packet Forwarding

The NetScaler can either route or bridge packets that are not destined for an IP address owned by the NetScaler (that is, the IP address is not the NSIP, a MIP, a SNIP, a configured service, or a configured vserver). By default, L3 mode (routing) is enabled and L2 mode (bridging) is disabled, but you can change the configuration. The following flow chart shows how the NetScaler evaluates packets and either processes, routes, bridges, or drops them.

Figure 1. Interaction between Layer 2 and Layer 3 Modes



A NetScaler can use the following modes to forward the packets it receives:

- Layer 2 (L2) Mode
- Layer 3 (L3) Mode
- MAC-Based Forwarding Mode

Enabling and Disabling Layer 2 Mode

Layer 2 mode controls the Layer 2 forwarding (bridging) function. You can use this mode to configure a NetScaler to behave as a Layer 2 device and bridge the packets that are not destined for it. When this mode is enabled, packets are not forwarded to any of the MAC addresses, because the packets can arrive on any interface of the NetScaler and each interface has its own MAC address.

With Layer 2 mode disabled (which is the default), a NetScaler drops packets that are not destined for one of its MAC address. If another Layer 2 device is installed in parallel with a NetScaler, Layer 2 mode must be disabled to prevent bridging (Layer 2) loops. You can use the configuration utility or the command line to enable Layer 2 mode.

Note: The NetScaler does not support spanning tree protocol. To avoid loops, if you enable L2 mode, do not connect two interfaces on the NetScaler to the same broadcast domain.

To enable or disable Layer 2 mode by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable/disable Layer 2 mode and verify that it has been enabled/disabled:

- `enable ns mode <Mode>`
- `disable ns mode <Mode>`
- `show ns mode`

Examples

```
> enable ns mode l2
 Done
> show ns mode

      Mode                  Acronym          Status
      -------               -------          ------
 1)    Fast Ramp               FR              ON
 2)    Layer 2 mode             L2              ON
 .
 .
 .
 Done
>

> disable ns mode l2
```

```
 Done
> show ns mode

      Mode                  Acronym          Status
      -------               -------          ------
1)    Fast Ramp               FR               ON
2)    Layer 2 mode            L2               OFF
.
.
.
 Done
>
```

To enable or disable Layer 2 mode by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change modes**.
3. In the **Configure Modes** dialog box, to enable Layer 2 mode, select the **Layer 2 Mode** check box. To disable Layer 2 mode, clear the check box.
4. Click **OK**. The **Enable/Disable Mode(s)?** message appears in the details pane.
5. Click **Yes**.

Enabling and Disabling Layer 3 Mode

Layer 3 mode controls the Layer 3 forwarding function. You can use this mode to configure a NetScaler to look at its routing table and forward packets that are not destined for it. With Layer 3 mode enabled (which is the default), a NetScaler performs route table lookups and forwards all packets that are not destined for any NetScaler-owned IP address. If you disable Layer 3 mode, the NetScaler drops these packets.

To enable or disable Layer 3 mode by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable/disable Layer 3 mode and verify that it has been enabled/disabled:

- `enable ns mode <Mode>`
- `disable ns mode <Mode>`
- `show ns mode`

Examples

```
> enable ns mode l3
 Done
> show ns mode

      Mode                    Acronym          Status
      -------                 -------          ------
 1)   Fast Ramp                 FR               ON
 2)   Layer 2 mode               L2               OFF
 .
 .
 .
 9)   Layer 3 mode (ip forwarding)   L3               ON
 .
 .
 .
 Done
>

> disable ns mode l3
 Done
> show ns mode

      Mode                    Acronym          Status
      -------                 -------          ------
```

```
1)    Fast Ramp                  FR              ON
2)    Layer 2 mode                L2              OFF
.
.
.
9)    Layer 3 mode (ip forwarding)  L3              OFF
.
.
.
Done
>
```

To enable or disable Layer 3 mode by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change modes**.
3. In the **Configure Modes** dialog box, to enable Layer 3 mode, select the **Layer 3 Mode (IP Forwarding)** check box. To disable Layer 3 mode, clear the check box.
4. Click **OK**. The **Enable/Disable Mode(s)?** message appears in the details pane.
5. Click **Yes**.

Enabling and Disabling MAC-Based Forwarding Mode

You can use MAC-based forwarding to process traffic more efficiently and avoid multiple-route or ARP lookups when forwarding packets, because the NetScaler remembers the MAC address of the source. To avoid multiple lookups, the NetScaler caches the source MAC address of every connection for which it performs an ARP lookup, and it returns the data to the same MAC address.

MAC-based forwarding is useful when you use VPN devices because the NetScaler ensures that all traffic flowing through a particular VPN passes through the same VPN device.

The following figure shows the process of MAC-based forwarding.

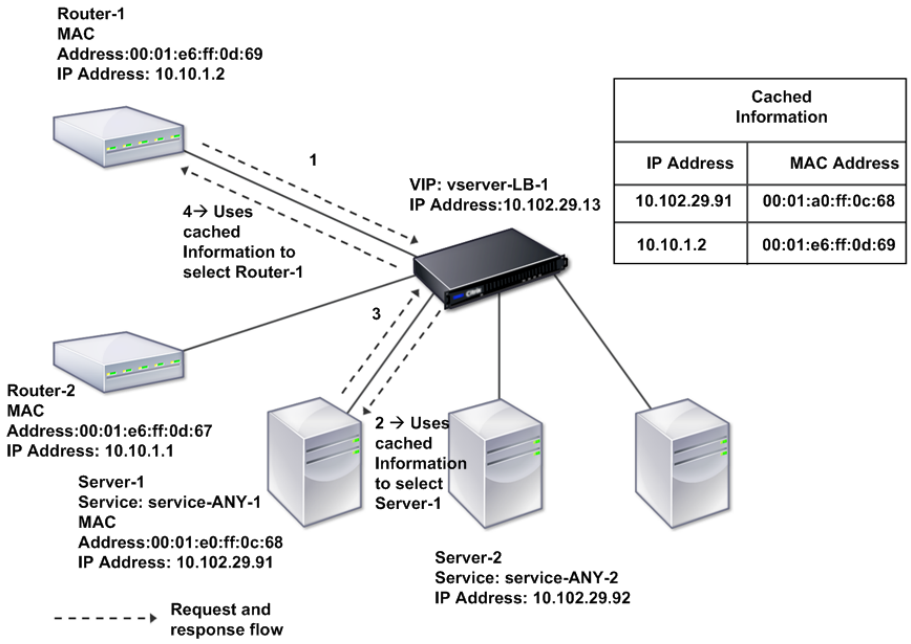


Figure 1. MAC-Based Forwarding Process

When MAC-based forwarding is enabled, a NetScaler caches the MAC address of:

- The source (a transmitting device such as router, firewall, or VPN device) of the inbound connection.
- The server that responds to the requests.

When a server responds through a NetScaler, the NetScaler sets the destination MAC address of the response packet to the cached address, ensuring that the traffic flows in a symmetric manner, and then forwards the response to the client. The process bypasses the route table lookup and ARP lookup functions. However, when a NetScaler initiates a connection, it uses the route and ARP tables for the lookup function. To enable MAC-based forwarding, use the configuration utility or the command line.

Some deployments require the incoming and outgoing paths to flow through different routers. In these situations, MAC-based forwarding breaks the topology design. For a global server load balancing (GSLB) site that requires the incoming and outgoing paths to flow through different routers, you must disable MAC-based forwarding and use the NetScaler unit's default router as the outgoing router.

With MAC-based forwarding disabled and Layer 2 or Layer 3 connectivity enabled, a route table can specify separate routers for outgoing and incoming connections. To disable MAC-based forwarding, use the configuration utility or the command line.

To enable or disable MAC-based forwarding by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable/disable MAC-based forwarding mode and verify that it has been enabled/disabled:

- `enable ns mode <Mode>`
- `disable ns mode <Mode>`
- `show ns mode`

Example

```
> enable ns mode mbf
 Done
> show ns mode

      Mode                  Acronym          Status
      -------               -------          ------
 1)   Fast Ramp               FR               ON
 2)   Layer 2 mode             L2               OFF
 .
 .
 .
 6)   MAC-based forwarding      MBF              ON
 .
 .
 .
 Done
>

> disable ns mode mbf
 Done
```

```
> show ns mode

      Mode                    Acronym          Status
      -------                 -------          ------
 1)   Fast Ramp                 FR               ON
 2)   Layer 2 mode               L2               OFF
 .
 .
 .
 6)   MAC-based forwarding       MBF              OFF
 .
 .
 .
 Done
>
```

To enable or disable MAC-based forwarding by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features** group, click **Change modes**.
3. In the **Configure Modes** dialog box, to enable MAC-based forwarding mode, select the **MAC Based Forwarding** check box. To disable MAC-based forwarding mode, clear the check box.
4. Click **OK**. The **Enable/Disable Mode(s)?** message appears in the details pane.
5. Click **Yes**.

Configuring Clock Synchronization

You can configure your NetScaler to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network. NTP uses User Datagram Protocol (UDP) port 123 as its transport layer. You have to add NTP servers in the NTP configuration file so that the NetScaler periodically gets updates from these servers.

If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site at http://www.ntp.org/.

To configure clock synchronization on your NetScaler

1. Log on to the NetScaler command line and enter the `shell` command.

2. At the shell prompt, copy the ntp.conf file from the /etc directory to the /nsconfig directory. If the file already exists in the /nsconfig directory, make sure that you remove the following entries from the ntp.conf file:

   ```
   restrict localhost

   restrict 127.0.0.2
   ```

   These entries are required only if you want to run the device as a time server. However, this feature is not supported on the NetScaler.

3. Edit /nsconfig/ntp.conf by typing the IP address for the desired NTP server under the file's server and restrict entries.

4. Create a file named rc.netscaler in the /nsconfig directory, if the file does not already exist in the directory.

5. Edit /nsconfig/rc.netscaler by adding the following entry: `/usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &`

   This entry starts the ntpd service, checks the ntp.conf file, and logs messages in the /var/log directory.

   Note: If the time difference between the NetScaler and the time server is more than 1000 sec, the ntpd service terminates with a message to the NetScaler log. To avoid this, you need to start ntpd with the **-g** option,which forcibly syncs the time. Add the following entry in /nsconfig/rc.netscaler:

   ```
   /usr/sbin/ntpd -g -c /nsconfig/ntp.conf -l /var/log/ntpd.log &
   ```

   If you do not want to forcibly sync the time when there is a large difference, you can set the date manually and then start ntpd again. You can check the time difference between the NetScaler and the time server by executing the following command in the shell:

   ntpdate -q <IP address or domain name of the NTP server>

6. Reboot the NetScaler to enable clock synchronization.

   Note: If you want to start time synchronization before you restart the NetScaler, you can enter the

   /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ ntpd.log &

   command (which you added to the rc.netscaler file in step 5) at the shell prompt.

Configuring DNS

You can configure a NetScaler to function as an Authoritative Domain Name Server (ADNS), DNS proxy server, End Resolver, or Forwarder. You can add DNS resource records such as SRV Records, AAAA Records, A Records, MX Records, NS Records, CNAME Records, PTR Records, and SOA Records. Also, the NetScaler can balance the load on external DNS servers.

A common practice is to configure a NetScaler as a forwarder. For this configuration, you need to add external name servers. After you have added the external servers, you should verify that your configuration is correct.

For other configurations, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

You can add, remove, enable, and disable external name servers. You can create a name server by specifying its IP address, or you can configure an existing vserver as the name server.

When adding name servers, you can specify IP addresses or virtual IP addresses (VIPs). If you use IP addresses, the NetScaler load balances requests to the configured name servers in a round robin manner. If you use VIPs, you can specify any load balancing method. For information about using a VIP, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To add a name server by using the NetScaler command line

At the NetScaler command prompt, type the following commands to add a name server and verify the configuration:

- `add dns nameServer <IP>`
- `show dns nameServer <IP>`

  Example

```
> add dns nameServer 10.102.29.10
 Done
> show dns nameServer 10.102.29.10
1)      10.102.29.10  -  State: DOWN
 Done
>
```

To add a name server by using the configuration utility

1. In the navigation pane, expand **DNS**, and then click **Name Servers**.
2. In the details pane, click **Add**.
3. In the **Create Name Server** dialog box, select **IP Address**.
4. In the **IP Address** text box, type the IP address of the name server (for example, `10.102.29.10`). If you are adding an external name server, clear the **Local** check box.
5. Click **Create**, and then click **Close**.
6. Verify that the name server you added appears in the **Name Servers** pane.

Configuring SNMP

The Simple Network Management Protocol (SNMP) network management application, running on a external computer, queries the SNMP agent on the NetScaler. The agent searches the management information base (MIB) for data requested by the network management application and sends the data to the application.

SNMP monitoring uses traps messages and alarms. SNMP traps messages are asynchronous events that the agent generates to signal abnormal conditions, which are indicated by alarms. For example, if you want to be informed when CPU utilization is above 90 percent, you can set up an alarm for that condition. The following figure shows a network with a NetScaler that has SNMP enabled and configured.

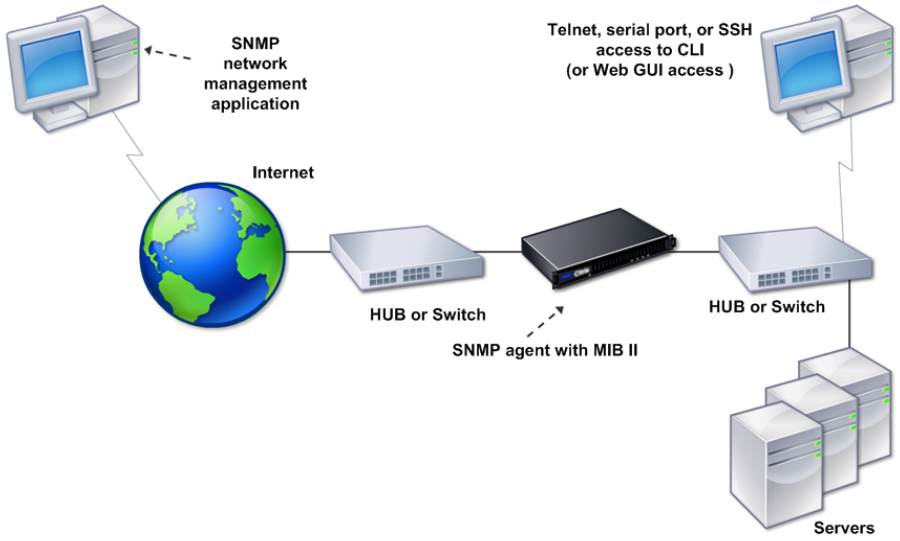

Figure 1. SNMP on the NetScaler

The SNMP agent on a NetScaler supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3). Because it operates in bilingual mode, the agent can handle SNMPv2 queries, such as Get-Bulk, and SNMPv1 queries. The SNMP agent also sends traps compliant with SNMPv2 and supports SNMPv2 data types, such as counter64. SNMPv1 managers (programs on other servers that request SNMP information from the NetScaler) use the NS-MIB-smiv1.mib file when processing SNMP queries. SNMPv2 managers use the NS-MIB-smiv2.mib file.

The NetScaler supports the following enterprise-specific MIBs:

A subset of standard MIB-2 groups

Provides MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.

A system enterprise MIB

Provides system-specific configuration and statistics.

To configure SNMP, you specify which managers can query the SNMP agent, add SNMP trap listeners that will receive the SNMP trap messages, and configure SNMP Alarms.

Adding SNMP Managers

You can configure a workstation running a management application that complies with SNMP version 1, 2, or 3 to access a NetScaler. Such a workstation is called an SNMP manager. If you do not specify an SNMP manager on the NetScaler, the NetScaler accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the NetScaler accepts and responds to SNMP queries from only those specific IP addresses. When specifying the IP address of an SNMP manager, you can use the netmask parameter to grant access from entire subnets. You can add a maximum of 100 SNMP managers or networks.

To add an SNMP manager by using the NetScaler command line

At the NetScaler command prompt, type the following commands to add an SNMP manager and verify the configuration:

- `add snmp manager <IPAddress> ... [-netmask <netmask>]`
- `show snmp manager <IPAddress>`

  Example

```
> add snmp manager 10.102.29.5 -netmask 255.255.255.255
 Done
> show snmp manager 10.102.29.5
1)     10.102.29.5       255.255.255.255
 Done
>
```

To add an SNMP manager by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Managers**.
2. In the details pane, click **Add**.
3. In the **Add SNMP Manager** dialog box, in the **IP Address** text box, type the IP address of the workstation running the management application (for example, `10.102.29.5`).
4. Click **Create**, and then click **Close**.
5. Verify that the SNMP manager you added appears in the **Details** section at the bottom of the pane.

Adding SNMP Traps Listeners

After configuring the alarms, you need to specify the trap listener to which the NetScaler will send the trap messages. Apart from specifying parameters like IP address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

To add an SNMP trap listener by using the NetScaler command line

At the NetScaler command prompt, type the following command to add an SNMP trap and verify that it has been added:

- `add snmp trap specific <IP>`
- `show snmp trap`

Example

```
> add snmp trap specific 10.102.29.3
 Done
> show snmp trap
Type       DestinationIP    DestinationPort  Version    SourceIP       Min-Severity   Community
----      -------------   ---------------  -------    --------      ------------  ---------
generic    10.102.29.9     162           V2       NetScaler IP    N/A          public
generic    10.102.29.5     162           V2       NetScaler IP    N/A          public
generic    10.102.120.101   162           V2       NetScaler IP    N/A          public
.
.
.
specific   10.102.29.3     162           V2       NetScaler IP    -           public
 Done
>
```

To add an SNMP trap listener by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Traps**.
2. In the details pane, click **Add**.
3. In the **Add SNMP Trap Destination** dialog box, in the **Destination IP Address** text box, type the IP address (for example, `10.102.29.3`).
4. Click **Create** and then click **Close**.
5. Verify that the SNMP trap you added appears in the **Details** section at the bottom of the pane.

Configuring SNMP Alarms

You configure alarms so that the NetScaler generates a trap message when an event corresponding to one of the alarms occurs. Configuring an alarm consists of enabling the alarm and setting the severity level at which a trap is generated. There are five severity levels: Critical, Major, Minor, Warning, and Informational. A trap is sent only when the severity of the alarm matches the severity specified for the trap.

Some alarms are enabled by default. If you disable an SNMP alarm, the NetScaler will not generate trap messages when corresponding events occur. For example, if you disable the Login-Failure SNMP alarm, the NetScaler will not generate a trap message when a login failure occurs.

To enable or disable an alarm by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable or disable an alarm and verify that it has been enabled or disabled:

- `set snmp alarm <trapName> [-state ENABLED | DISABLED ]`
- `show snmp alarm <trapName>`

Example

```
> set snmp alarm LOGIN-FAILURE -state ENABLED
 Done
> show snmp alarm LOGIN-FAILURE
   Alarm                  Alarm Threshold    Normal Threshold  Time  State     Severity     Logging
   -----                  ---------------    ----------------  ----  --------  ------------ --------
 1) LOGIN-FAILURE              N/A              N/A             N/A   ENABLED   -            ENABLED
 Done
>
```

To set the severity of the alarm by using the NetScaler command line

At the NetScaler command prompt, type the following commands to set the severity of the alarm and verify that the severity has been set correctly:

- `set snmp alarm <trapName> [-severity <severity>]`
- `show snmp alarm <trapName>`

Example

```
> set snmp alarm LOGIN-FAILURE -severity Major
 Done
> show snmp alarm LOGIN-FAILURE
   Alarm                    Alarm Threshold    Normal Threshold  Time  State     Severity     Logging
   -----                   ---------------   ----------------  ----  --------  ------------ --------
 1) LOGIN-FAILURE               N/A              N/A             N/A   ENABLED    Major       ENABLED
 Done
>
```

To configure alarms by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Alarms**.
2. In the details pane, select an alarm (for example, **LOGIN-FAILURE**), and then click **Open**.
3. In the **Configure SNMP Alarm** dialog box, to enable the alarm, select the **Enable** check box. To disable the alarm, clear the **Enable** check box.
4. In the **Severity** drop-down list, select a severity option (for example, **Major**).
5. Click **OK**, and then click **Close**.
6. Verify that the parameters for the SNMP alarm you configured are correctly configured by viewing the **Details** section at the bottom of the pane.

Configuring Syslog

You can customize logging of NetScaler and Access Gateway Enterprise Edition access events for the needs of your site. You can direct these logs either to files on the NetScaler or to external log servers. The NetScaler uses the Audit Server Logging feature for logging the states and status information collected by different modules in the kernel and by user-level daemons.

Syslog is used to monitor a NetScaler and to log connections, statistics, and so on. You can customize the two logging functions for system events messaging and syslog. The NetScaler internal event message generator passes log entries to the syslog server. The syslog server accepts these log entries and logs them. For more information about the Audit Server Logging feature, see the *Citrix NetScaler Administration Guide* at http://support.citrix.com/article/CTX128667.

Verifying the Configuration

After you finish configuring your system, complete the following checklists to verify your configuration.

Configuration Checklist

- The build running is:
- There are no incompatibility issues. (Incompatibility issues are documented in the build's release notes.)
- The port settings (speed, duplex, flow control, monitoring) are the same as the switch's port.
- Enough mapped IP addresses have been configured to support all server-side connections during peak times.
  - The number of configured mapped IP addresses is: ____
  - The expected number of simultaneous server connections is:

    [ ] 62,000 [ ] 124,000 [ ] Other____

Topology Configuration Checklist

The routes have been used to resolve servers on other subnets.

The routes entered are:

_____

- If the NetScaler is in a public-private topology, reverse NAT has been configured.
- The failover (high availability) settings configured on the NetScaler resolve in a one arm or two-arm configuration. All unused network interfaces have been disabled:
  _____
  _____
- If the NetScaler is placed behind an external load balancer, then the load balancing policy on the external load balancer is not "least connection."

  The load balancing policy configured on the external load balancer is:
  _____
- If the NetScaler is placed in front of a firewall, the session time-out on the firewall is set to a value greater than or equal to 300 seconds.

  The value configured for the session time-out is: _____

Server Configuration Checklist

- "Keep-alive" has been enabled on all the servers.

  The value configured for the keep-alive time-out is: _____

- The default gateway has been set to the correct value. (The default gateway should either be a NetScaler or upstream router.) The default gateway is: _____

- The server port settings (speed, duplex, flow control, monitoring) are the same as the switch port settings.

  _____

- If the Microsoft® Internet Information Server is used, buffering is enabled on the server.

- If an Apache Server is used, the MaxConn (maximum number of connections) parameter is configured on the server and on the NetScaler.

  The MaxConn (maximum number of connections) value that has been set is: _____

- If a NetScape® Enterprise Server™ is used, the maximum requests per connection parameter is set on the NetScaler.

  The maximum requests per connection value that has been set is: _____

Software Features Configuration Checklist

- Does the Layer 2 mode feature need to be disabled? (Disable if another Layer 2 device is working in para

  Reason for enabling or disabling:

  _____

- Does the MAC-based forwarding feature need to be disabled? (If the MAC address used by return traffic is

  Reason for enabling or disabling:

  _____

- Does host-based reuse need to be disabled? (Is there virtual hosting on the servers?)

  Reason for enabling or disabling:

  _____

- Do the default settings of the surge protection feature need to be changed?

  Reason for changing or not changing:

  _____

Access Checklist

- The system IPs can be pinged from the client-side network.

- The system IPs can be pinged from the server-side network.
- The managed server(s) can be pinged through the NetScaler.
- Internet hosts can be pinged from the managed servers.
- The managed server(s) can be accessed through the browser.
- The Internet can be accessed from managed server(s) using the browser.
- The system can be accessed using SSH.
- Admin access to all managed server(s) is working.

Note: When you are using the ping utility, ensure that the pinged server has ICMP ECHO enabled, or your ping will not succeed.

Firewall Checklist

The following firewall requirements have been met:

- UDP 161 (SNMP)
- UDP 162 (SNMP trap)
- TCP/UDP 3010 (GUI)
- HTTP 80 (GUI)
- TCP 22 (SSH)

Load Balancing Traffic on a NetScaler

The load balancing feature distributes client requests across multiple servers to optimize resource utilization. In a real-world scenario with a limited number of servers providing service to a large number of clients, a server can become overloaded and degrade the performance of the server farm. A Citrix® NetScaler® appliance uses load balancing criteria to prevent bottlenecks by forwarding each client request to the server best suited to handle the request when it arrives.

To configure load balancing, you define a virtual server (vserver) to proxy multiple servers in a server farm and balance the load among them.

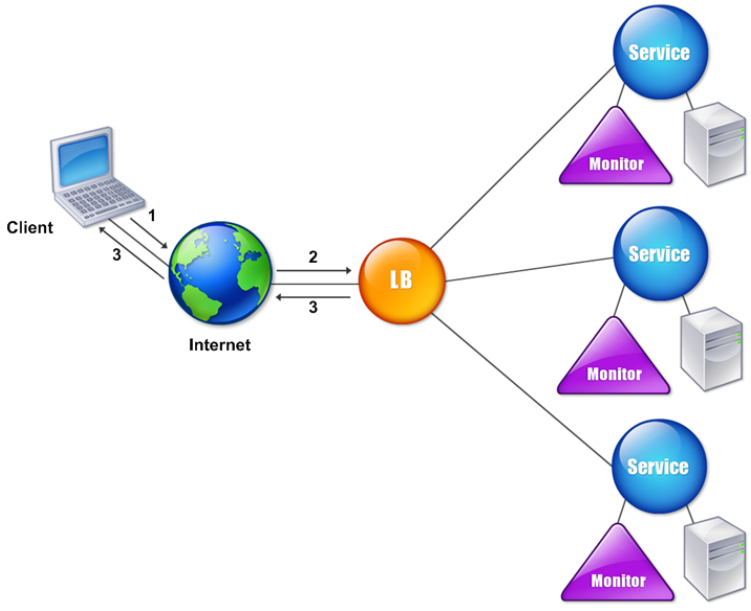
How Load Balancing Works

When a client initiates a connection to the server, a vserver terminates the client connection and initiates a new connection with the selected server, or reuses an existing connection with the server, to perform load balancing. The load balancing feature provides traffic management from Layer 4 (TCP and UDP) through Layer 7 (FTP, HTTP, and HTTPS).

The NetScaler uses a number of algorithms, called load balancing methods, to determine how to distribute the load among the servers. The default load balancing method is the Least Connections method.

A typical load balancing deployment consists of the entities described in the following figure.

Figure 1. Load Balancing Architecture



The entities function as follows:

- **Vserver**. An entity that is represented by an IP address, a port, and a protocol. The vserver IP address (VIP) is usually a public IP address. The client sends connection requests to this IP address. The vserver represents a bank of servers.

- **Service**. A logical representation of a server or an application running on a server. Identifies the server's IP address, a port, and a protocol. The services are bound to the vservers.

- **Server object**. An entity that is represented by an IP address. The server object is created when you create a service. The IP address of the service is taken as the name of the server object. You can also create a server object and then create services by using the server object.

- **Monitor**. An entity that tracks the health of the services. The NetScaler periodically probes the servers using the monitor bound to each service. If a server does not respond within a specified response timeout, and the specified number of probes fails, the service is marked DOWN. The NetScaler then performs load balancing among the remaining services.

Configuring Load Balancing

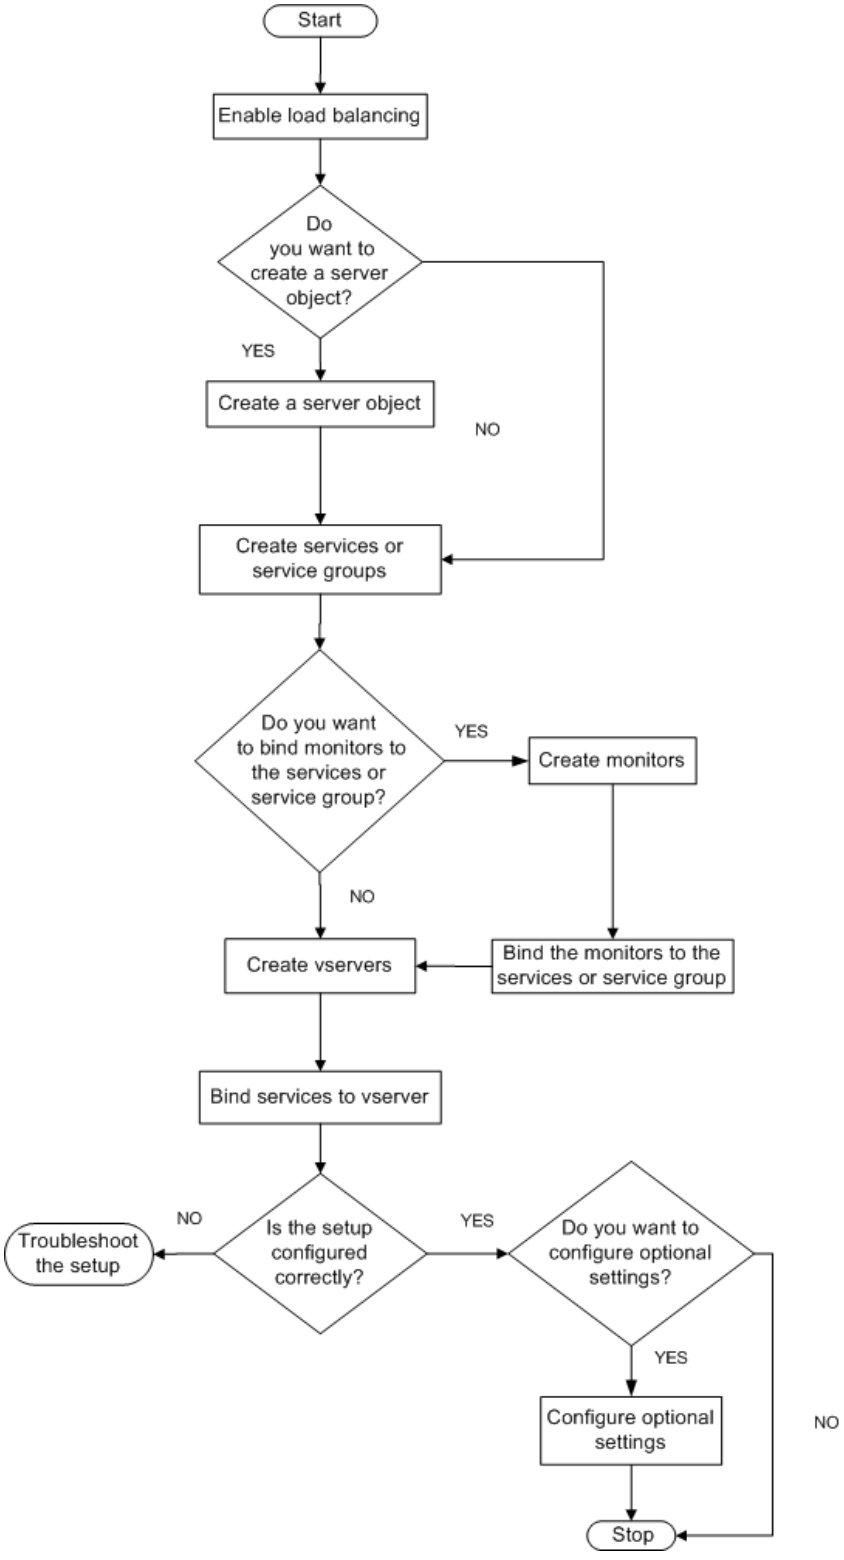
To configure load balancing, you must first create services. Then, you create vservers and bind the services to the vservers. By default, the NetScaler binds a monitor to each service. After binding the services, verify your configuration by making sure that all of the settings are correct.

Note: After you deploy the configuration, you can display statistics that show how the entities in the configuration are performing. Use the statistical utility or the `stat lb vserver <vserverName>` command.

Optionally, you can assign weights to a service. The load balancing method then uses the assigned weight to select a service. For getting started, however, you can limit optional tasks to configuring some basic persistence settings, for sessions that must maintain a connection to a particular server, and some basic configuration-protection settings.

The following flow chart illustrates the sequence of the configuration tasks.

Figure 1. Sequence of Tasks to Configure Load Balancing



Start
Enable load balancing
Do you want to create a server object?
YES
Create a server object
NO
Create services or service groups
Do you want to bind monitors to the services or service group?
YES
Create monitors
NO
Create vservers
Bind the monitors to the services or service group
Bind services to vserver
Is the setup configured correctly?
NO
Troubleshoot the setup
YES
Do you want to configure optional settings?
YES
Configure optional settings
NO
Stop

Enabling Load Balancing

Before configuring load balancing, make sure that the load balancing feature is enabled.

To enable load balancing by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable load balancing and verify that it is enabled:

- `enable feature lb`
- `show feature`

Example

```
> enable feature lb
 Done
> show feature

      Feature                Acronym          Status
      -------                -------          ------
1)    Web Logging              WL               OFF
2)    Surge Protection         SP               OFF
3)    Load Balancing           LB               ON
.
.
.
9)    SSL Offloading           SSL              ON
.
.
.
Done
```

To enable load balancing by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change basic features**.
3. In the **Configure Basic Features** dialog box, select the **Load Balancing** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** message, click **Yes**.

Configuring Services and a Vserver

When you have identified the services you want to load balance, you can implement your initial load balancing configuration by creating the service objects, creating a load balancing vserver, and binding the service objects to the vserver.

To implement the initial load balancing configuration by using the NetScaler command line

At the NetScaler command prompt, type the following commands to implement and verify the initial configuration:

- `add service <name> <IPaddress> <serviceType> <port>`
- `add lb vserver <vServerName> <serviceType> [<IPaddress> <port>]`
- `bind lb vserver <name> <serviceName>`
- `show service bindings <serviceName>`

Example

```
> add service service-HTTP-1 10.102.29.5 HTTP 80
 Done
> add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
 Done
> bind lb vserver vserver-LB-1 service-HTTP-1
 Done
> show service bindings service-HTTP-1
        service-HTTP-1 (10.102.29.5:80) - State : DOWN

                1)      vserver-LB-1 (10.102.29.60:80) - State : DOWN
 Done
```

To implement the initial load balancing configuration by using the configuration utility

1. In the navigation pane, click **Load Balancing**.
2. In the details pane, under **Getting Started**, click **Load Balancing wizard**, and follow the instructions to create a basic load balancing setup.
3. Return to the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
4. Select the vserver that you configured and verify that the parameters displayed at the bottom of the page are correctly configured.
5. Click **Open**.
6. Verify that each service is bound to the vserver by confirming that the **Active** check box is selected for each service on the **Services** tab.

Choosing and Configuring Persistence Settings

You must configure persistence on a vserver if you want to maintain the states of connections on the servers represented by that vserver (for example, connections used in e-commerce). The NetScaler then uses the configured load balancing method for the initial selection of a server, but forwards to that same server all subsequent requests from the same client.

If persistence is configured, it overrides the load balancing methods once the server has been selected. If the configured persistence applies to a service that is down, the NetScaler uses the load balancing methods to select a new service, and the new service becomes persistent for subsequent requests from the client. If the selected service is in an Out Of Service state, it continues to serve the outstanding requests but does not accept new requests or connections. After the shutdown period elapses, the existing connections are closed. The following table lists the types of persistence that you can configure.

Table 1. Limitations on Number of Simultaneous Persistent Connections

Persistence Type	Persistent Connections
Source IP, SSL Session ID, Rule, DESTIP, SRCIPDESTIP	250K
CookieInsert, URL passive, Custom Server ID	Memory limit. In case of CookieInsert, if time out is not 0, any number of connections is allowed until limited by memory.

If the configured persistence cannot be maintained because of a lack of resources on a NetScaler, the load balancing methods are used for server selection. Persistence is maintained for a configured period of time, depending on the persistence type. Some persistence types are specific to certain vservers. The following table shows the relationship.

Table 2. Persistence Types Available for Each Type of Vserver

Persistence TypeHeader 1	HTTP	HTTPS	TCP	UDP/IP	SSL_Bridge
Source IP	YES	YES	YES	YES	YES
CookieInsert	YES	YES	NO	NO	NO
SSL Session ID	NO	YES	NO	NO	YES
URL Passive	YES	YES	NO	NO	NO
Custom Server ID	YES	YES	NO	NO	NO
Rule	YES	YES	NO	NO	NO

SRCIPDESTIP	N/A	N/A	YES	YES	N/A
DESTIP	N/A	N/A	YES	YES	N/A

You can also specify persistence for a group of vservers. When you enable persistence on the group, the client requests are directed to the same selected server regardless of which vserver in the group receives the client request. When the configured time for persistence elapses, any vserver in the group can be selected for incoming client requests.

Two commonly used persistence types are persistence based on cookies and persistence based on server IDs in URLs. For more information about all persistence types, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Configuring Persistence Based on Cookies

When you enable persistence based on cookies, the NetScaler adds an HTTP cookie into the Set-Cookie header field of the HTTP response. The cookie contains information about the service to which the HTTP requests must be sent. The client stores the cookie and includes it in all subsequent requests, and the NetScaler uses it to select the service for those requests. You can use this type of persistence on vservers of type HTTP or HTTPS.

The NetScaler inserts the cookie <NSC_XXXX>= <ServiceIP> <ServicePort>

where:

- <NSC_XXXX> is the vserver ID that is derived from the vserver name.
- <ServiceIP> is the hexadecimal value of the IP address of the service.
- <ServicePort> is the hexadecimal value of the port of the service.

The NetScaler encrypts ServiceIP and ServicePort when it inserts a cookie, and decrypts them when it receives a cookie.

Note: If the client is not allowed to store the HTTP cookie, the subsequent requests do not have the HTTP cookie, and persistence is not honored.

By default, the NetScaler sends HTTP cookie version 0, in compliance with the Netscape specification. It can also send version 1, in compliance with RFC 2109.

You can configure a timeout value for persistence that is based on HTTP cookies. Note the following:

- If HTTP cookie version 0 is used, the NetScaler inserts the absolute Coordinated Universal Time (GMT) of the cookie's expiration (the expires attribute of the HTTP cookie), calculated as the sum of the current GMT time on a NetScaler, and the timeout value.
- If an HTTP cookie version 1 is used, the NetScaler inserts a relative expiration time (Max-Age attribute of the HTTP cookie). In this case, the client software calculates the actual expiration time.

Note: Most client software currently installed (Microsoft Internet Explorer and Netscape browsers) understand HTTP cookie version 0; however, some HTTP proxies understand HTTP cookie version 1.

If you set the timeout value to 0, the NetScaler does not specify the expiration time, regardless of the HTTP cookie version used. The expiration time then depends on the client software, and such cookies are not valid if that software is shut down. This persistence type

does not consume any system resources. Therefore, it can accommodate an unlimited number of persistent clients.

An administrator can use the procedure in the following table to change the HTTP cookie version.

To change the HTTP cookie version by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, click **Change HTTP Parameters**.
3. In the **Configure HTTP Parameters** dialog box, under **Cookie**, select **Version 0** or **Version 1**.

Note: For information about the parameters, see the "Load Balancing" chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To configure persistence based on cookies by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure persistence based on cookies and verify the configuration:

- `set lb vserver <name> -persistenceType COOKIEINSERT`
- `show lb vserver <name>`

Example

```
> set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
 Done
> show lb vserver vserver-LB-1
        vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
        .
        .
        .
        Persistence: COOKIEINSERT (version 0)   Persistence Timeout: 2 min
        .
        .
        .
 Done
>
```

To configure persistence based on cookies by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the vserver for which you want to configure persistence (for example, **vserver-LB-1**), and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Method and Persistence** tab, in the **Persistence** list, select **COOKIEINSERT**.
4. In the **Time-out (min)** text box, type the time-out value (for example, 2).
5. Click **OK**.
6. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the **Details** section at the bottom of the pane.

Configuring Persistence Based on Server IDs in URLs

The NetScaler can maintain persistence based on the server IDs in the URLs. In a technique called URL passive persistence, the NetScaler extracts the server ID from the server response and embeds it in the URL query of the client request. The server ID is an IP address and port specified as a hexadecimal number. The NetScaler extracts the server ID from subsequent client requests and uses it to select the server.

URL passive persistence requires configuring either a payload expression or a policy infrastructure expression specifying the location of the server ID in the client requests. For more information about expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Note: If the server ID cannot be extracted from the client requests, server selection is based on the load balancing method.

Example: Payload Expression

The expression, URLQUERY contains sid= configures the system to extract the server ID from the URL query of a client request, after matching token sid=. Thus, a request with the URL http://www.citrix.com/index.asp?&sid;=c0a864100050 is directed to the server with the IP address10.102.29.10 and port 80.

The timeout value does not affect this type of persistence, which is maintained as long as the server ID can be extracted from the client requests. This persistence type does not consume any system resources, so it can accommodate an unlimited number of persistent clients.

Note: For information about the parameters, see the “Load Balancing” chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To configure persistence based on server IDs in URLs by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure persistence based on server IDs in URLs and verify the configuration:

- `set lb vserver <name> -persistenceType URLPASSIVE`
- `show lb vserver <name>`

  Example

```
> set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
 Done
> show lb vserver vserver-LB-1
        vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
        .
        .
        .
        Persistence: URLPASSIVE Persistence Timeout: 2 min
        .
        .
        .
 Done
>
```

To configure persistence based on server IDs in URLs by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the vserver for which you want to configure persistence (for example, **vserver-LB-1**), and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Method and Persistence** tab, in the **Persistence** list, select **URLPASSIVE**.
4. In the **Time-out (min)** text box, type the time-out value (for example, 2).
5. In the **Rule** text box, enter a valid expression. Alternatively, click **Configure** next to the **Rule** text box and use the **Create Expression** dialog box to create an expression.
6. Click **OK**.
7. Verify that the vserver for which you configured persistence is correctly configured by selecting the vserver and viewing the **Details** section at the bottom of the pane.

Configuring Features to Protect the Load Balancing Configuration

You can configure URL redirection to provide notifications of vserver malfunctions, and you can configure backup vservers to take over if a primary vserver becomes unavailable.

Configuring URL Redirection

You can configure a redirect URL to communicate the status of the NetScaler in the event that a vserver of type HTTP or HTTPS is down or disabled. This URL can be a local or remote link. The NetScaler uses HTTP 302 redirect.

Redirects can be absolute URLs or relative URLs. If the configured redirect URL contains an absolute URL, the HTTP redirect is sent to the configured location, regardless of the URL specified in the incoming HTTP request. If the configured redirect URL contains only the domain name (relative URL), the HTTP redirect is sent to a location after appending the incoming URL to the domain configured in the redirect URL.

Note: If a load balancing vserver is configured with both a backup vserver and a redirect URL, the backup vserver takes precedence over the redirect URL. In this case, a redirect is used when both the primary and backup vservers are down.

To configure a vserver to redirect client requests to a URL by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure a vserver to redirect client requests to a URL and verify the configuration:

- `set lb vserver <name> -redirectURL <URL>`
- `show lb vserver <name>`

Example

```
> set lb vserver vserver-LB-1 -redirectURL http://www.newdomain.com/mysite/maintenance
 Done
> show lb vserver vserver-LB-1
        vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
        State: DOWN
        Last state change was at Wed Jun 17 08:56:34 2009 (+666 ms)
        .
        .
        .
        Redirect URL: http://www.newdomain.com/mysite/maintenance
        .
        .
        .
 Done
>
```

To configure a vserver to redirect client requests to a URL by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the vserver for which you want to configure URL redirection (for example, **vserver-LB-1**), and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Advanced** tab, in the **Redirect URL** text box, type the URL (for example, `http://www.newdomain.com/mysite/maintenance`), and then click **OK**.
4. Verify that the redirect URL you configured for the server appears in the **Details** section at the bottom of the pane.

Configuring Backup Vservers

If the primary vserver is down or disabled, the NetScaler can direct the connections or client requests to a backup vserver that forwards the client traffic to the services. The NetScaler can also send a notification message to the client regarding the site outage or maintenance. The backup vserver is a proxy and is transparent to the client.

You can configure a backup vserver when you create a vserver or when you change the optional parameters of an existing vserver. You can also configure a backup vserver for an existing backup vserver, thus creating cascaded backup vservers. The maximum depth of cascading backup vservers is 10. The NetScaler searches for a backup vserver that is up and accesses that vserver to deliver the content.

You can configure URL redirection on the primary for use when the primary and the backup vservers are down or have reached their thresholds for handling requests.

Note: If no backup vserver exists, an error message appears, unless the vserver is configured with a redirect URL. If both a backup vserver and a redirect URL are configured, the backup vserver takes precedence.

To configure a backup vserver by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure a backup server and verify the configuration:

- `set lb vserver <name> [-backupVserver <string>]`
- `show lb vserver <name>`

Example

```
> set lb vserver vserver-LB-1 -backupVserver vserver-LB-2
 Done
> show lb vserver vserver-LB-1
        vserver-LB-1 (10.102.29.60:80) - HTTP   Type: ADDRESS
        State: DOWN
        Last state change was at Wed Jun 17 08:56:34 2009 (+661 ms)
        .
        .
        .
        Backup: vserver-LB-2
        .
        .
        .
 Done
>
```

To set up a backup vserver by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the vserver for which you want to configure the backup vserver (for example, **vserver-LB-1**), and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Advanced** tab, in the **Backup Virtual Server** list, select the backup vserver (for example, **vserver-LB-2**, and then click **OK**.
4. Verify that the backup vserver you configured appears in the **Details** section at the bottom of the pane.

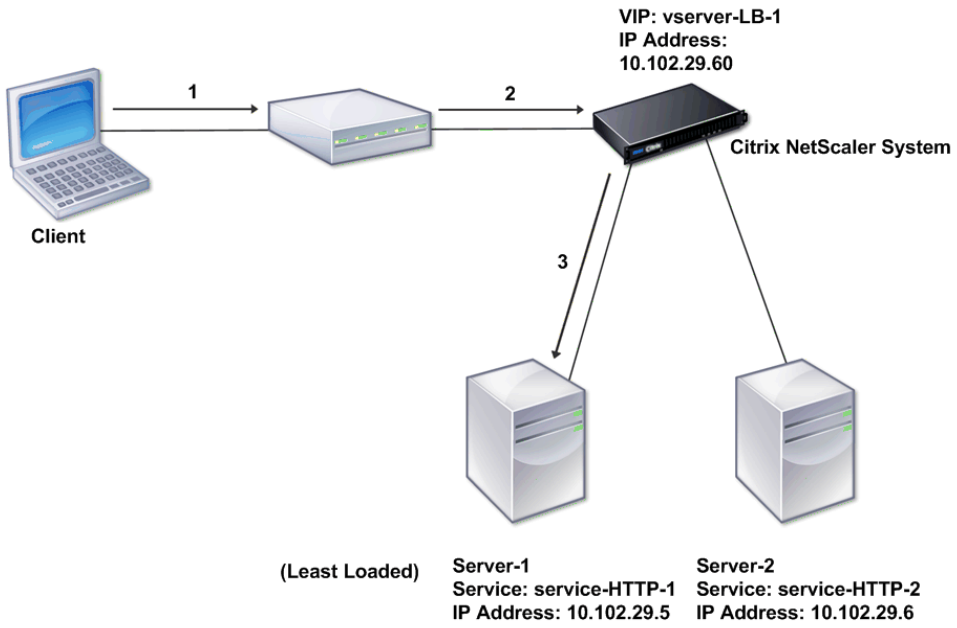
   Note: If the primary server goes down and then comes back up, and you want the backup vserver to function as the primary server until you explicitly reestablish the primary virtual server, select the **Disable Primary When Down** check box.

A Typical Load Balancing Scenario

In a load balancing setup, the NetScalers are logically located between the client and the server farm, and they manage traffic flow to the servers.

The following figure shows the topology of a basic load balancing configuration.

Figure 1. Basic Load Balancing Topology



The vserver selects the service and assigns it to serve client requests. Consider the scenario in the preceding figure, where the services service-HTTP-1 and service-HTTP-2 are created and bound to the vserver named vserver-LB-1. Vserver-LB-1 forwards the client request to either service-HTTP-1 or service-HTTP-2. The system selects the service for each request by using the Least Connections load balancing method. The following table lists the names and values of the basic entities that must be configured on the system.

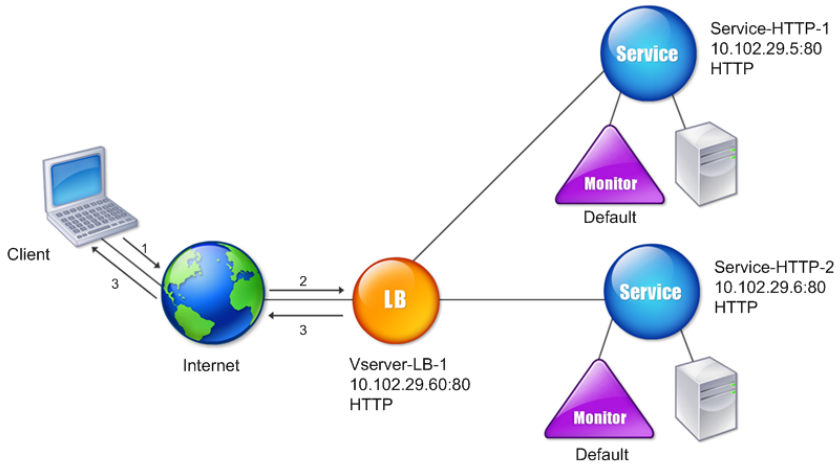
Table 1. LB Configuration Parameter Values

Entity Type	Required parameters and sample values			
	Name	IP Address	Port	Protocol
Vserver	vserver-LB-1	10.102.29.60	80	HTTP
Services	service-HTTP-1	10.102.29.5	8083	HTTP
	service-HTTP-2	10.102.29.6	80	HTTP

Monitors	Default	None	None	None

The following figure shows the load balancing sample values and required parameters that are described in the preceding table.

Figure 2. Load Balancing Entity Model



The following tables list the commands used to configure this load balancing setup by using the NetScaler command line.

Table 2. Initial Configuration Tasks

Task	Command
To enable load balancing	enable feature lb
To create a service named service-HTTP-1	add service service-HTTP-1 10.102.29.5 HTTP 80
To create a service named service-HTTP-2	add service service-HTTP-2 10.102.29.6 HTTP 80
To create a vserver named vserver-LB-1	add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
To bind a service named service-HTTP-1 to a vserver named vserver-LB-1	bind lb vserver vserver-LB-1 service-HTTP-1
To bind a service named service-HTTP-2 to a vserver named vserver-LB-1	bind lb vserver vserver-LB-1 service-HTTP-2

For more information about the initial configuration tasks, see Enabling Load Balancing and Configuring Services and a Vserver.

Table 3. Verification Tasks

Task	Command
To view the properties of a vserver named vserver-LB-1	show lb vserver vserver-LB-1
To view the statistics of a vserver named vserver-LB-1	stat lb vserver vserver-LB-1
To view the properties of a service named service-HTTP-1	show service service-HTTP-1
To view the statistics of a service named service-HTTP-1	stat service service-HTTP-1
To view the bindings of a service named service-HTTP-1	show service bindings service-HTTP-1

Table 4. Customization Tasks

Task	Command
To configure persistence on a vserver named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType SOURCEIP -persistenceMask 255.255.255.255 -timeout 2
To configure COOKIEINSERT persistence on a vserver named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
To configure URLPassive persistence on a vserver named vserver-LB-1	set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
To configure a vserver to redirect the client request to a URL on a vserver named vserver-LB-1	set lb vserver vserver-LB-1 -redirectURL http://www.newdomain.com/mysite/maintenance
To set a backup vserver on a vserver named vserver-LB-1	set lb vserver vserver-LB-1 -backupVserver vserver-LB-2

For more information about configuring persistence, see Choosing and Configuring Persistence Settings. For information about configuring a vserver to redirect a client request to a URL and setting up a backup vserver, see Configuring Features to Protect the Load Balancing Configuration.

Accelerating Load Balanced Traffic by Using Compression

Compression is a popular means of optimizing bandwidth usage, and most web browsers support compressed data. If you enable the compression feature, the Citrix® NetScaler® intercepts requests from clients and determines whether the client can accept compressed content. After receiving the HTTP response from the server, the NetScaler examines the content to determine whether it is compressible. If the content is compressible, the NetScaler compresses it, modifies the response header to indicate the type of compression performed, and forwards the compressed content to the client.

NetScaler compression is a policy-based feature. A policy filters requests and responses to identify responses to be compressed, and specifies the type of compression to apply to each response. The NetScaler provides several built-in policies to compress common MIME types such as text/html, text/plain, text/xml, text/css, text/rtf, application/msword, application/vnd.ms-excel, and application/vnd.ms-powerpoint. You can also create custom policies. The NetScaler does not compress compressed MIME types such as application/octet-stream, binary, bytes, and compressed image formats such as GIF and JPEG.

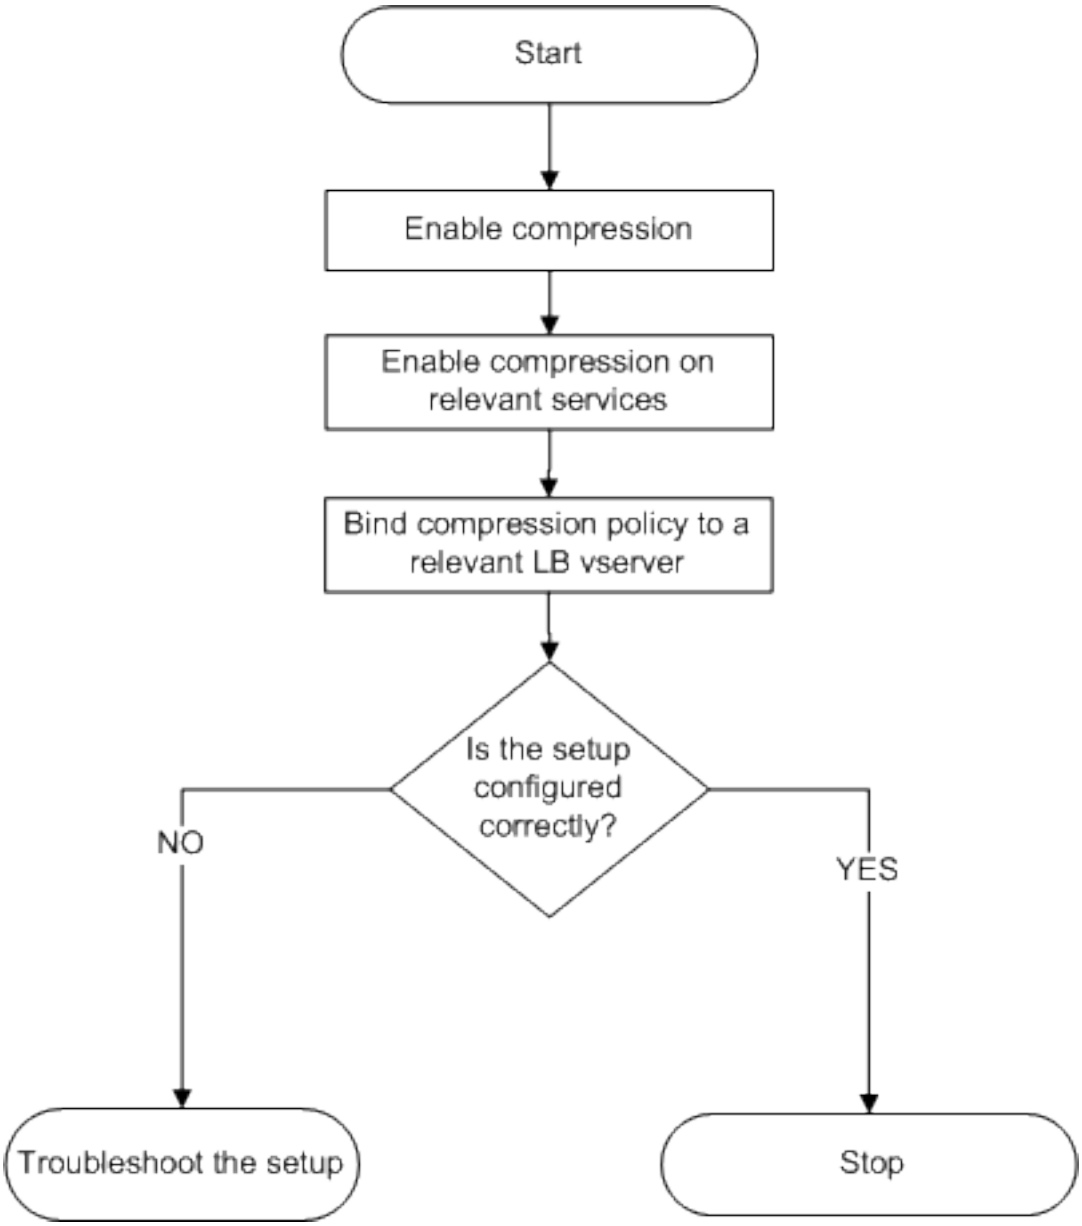
To configure compression, you must enable it globally and on each service that will provide responses that you want compressed. If you have configured vservers for load balancing or content switching, you should bind the polices to the vservers. Otherwise, the policies apply to all traffic that passes through the NetScaler.

Note: For more information about compression, see the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

Compression Configuration Task Sequence

The following flow chart shows the sequence of tasks for configuring basic compression in a load balancing setup.

Figure 1. Sequence of Tasks to Configure Compression



Note: The steps in the above figure assume that load balancing has already been configured. For information about configuring load balancing, or for more information about services, see the *Citrix NetScaler Traffic Management Guide* at

http://support.citrix.com/article/CTX128670.

If you want to configure something other than a basic compression setup, (for example, if you need to configure optional parameters in addition to the required parameters) see the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

Enabling Compression

By default, compression is not enabled. You must enable the compression feature to allow compression of HTTP responses that are sent to the client.

To enable compression by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable compression and verify the configuration:

- `enable ns feature CMP`
- `show ns feature`

Example

```
> enable ns feature CMP
Done
> show ns feature

Feature                  Acronym          Status
-------                  -------          ------
1)    Web Logging              WL              ON
2)    Surge Protection          SP              OFF
.
7)    Compression Control      CMP             ON
8)    Priority Queuing         PQ              OFF
.
Done
```

To enable compression by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change basic features**.
3. In the **Configure Basic Features** dialog box, select the **Compression** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** dialog box, click **Yes**.

Configuring Services to Compress Data

In addition to enabling compression globally, you must enable it on each service that will deliver files to be compressed. To create a service, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To enable compression on a service by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable compression on a service and verify the configuration:

- `set service <name> -CMP YES`
- `show service <name>`

Example

```
> show service SVC_HTTP1
SVC_HTTP1 (10.102.29.18:80) - HTTP
State: UP
Last state change was at Tue Jun 16 06:19:14 2009 (+737 ms)
Time since last state change: 0 days, 03:03:37.200
Server Name: 10.102.29.18
Server ID : 0   Monitor Threshold : 0
Max Conn: 0     Max Req: 0      Max Bandwidth: 0 kbits
Use Source IP: NO
Client Keepalive(CKA): NO
Access Down Service: NO
TCP Buffering(TCPB): NO
HTTP Compression(CMP): YES
Idle timeout: Client: 180 sec   Server: 360 sec
Client IP: DISABLED
Cacheable: NO
SC: OFF
SP: OFF
Down state flush: ENABLED

1)      Monitor Name: tcp-default
State: DOWN     Weight: 1
Probes: 1095    Failed [Total: 1095 Current: 1095]
Last response: Failure - TCP syn sent, reset received.
Response Time: N/A
Done
```

To enable compression on a service by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Services**.
2. In the details pane, select the service for which you want to configure compression (for example, **service-HTTP-1**), and then click **Open**.
3. On the **Advanced** tab, under **Settings**, select the **Compression** check box, and then click **OK.**
4. Verify that, when the service is selected, `HTTP Compression(CMP): ON` appears in the **Details** section at the bottom of the pane.

Binding a Compression Policy to a Virtual Server

If you bind a policy to a virtual server, the policy is evaluated only by the services associated with that virtual server. You can bind compression policies to a virtual server either from the **Configure Virtual Server (Load Balancing)** dialog box or from the **Compression Policy Manager** dialog box. This topic includes instructions to bind compression policies to a load balancing virtual server by using the **Configure Virtual Server (Load Balancing)** dialog box. For information about how you can bind a compression policy to a load balancing virtual server by using the **Compression Policy Manager** dialog box, see Configuring and Binding Policies with the Policy Manager. the "Configuring Advanced Policies" chapter in the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

To bind or unbind a compression policy to a virtual server by using the NetScaler command line

At the NetScaler command prompt, type the following commands to bind or unbind a compression policy to a load balancing virtual server and verify the configuration:

- `(bind|unbind) lb vserver <name> -policyName <string>`
- `show lb vserver <name>`

Example

```
> bind lb vserver lbvip -policyName ns_cmp_msapp
Done
> show lb vserver lbvip
lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
State: UP
Last state change was at Thu May 28 05:37:21 2009 (+685 ms)
Time since last state change: 19 days, 04:26:50.470
Effective State: UP
Client Idle Timeout: 180 sec
Down state flush: ENABLED
Disable Primary Vserver On Down : DISABLED
Port Rewrite : DISABLED
No. of Bound Services :  1 (Total)       1 (Active)
Configured Method: LEASTCONNECTION
Current Method: Round Robin, Reason: Bound service's state changed to UP
Mode: IP
Persistence: NONE
```

```
Vserver IP and Port insertion: OFF
Push: DISABLED  Push VServer:
Push Multi Clients: NO
Push Label Rule:

Bound Service Groups:
1)      Group Name: Service-Group-1

1) Service-Group-1 (10.102.29.252: 80) - HTTP State: UP Weight:

1)      Policy : ns_cmp_msapp Priority:0
Done
```

To bind or unbind a compression policy to a load balancing virtual server by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, select the virtual server to which you want to bind or unbind a compression policy (for example, **Vserver-LB-1**), and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Policies** tab, click **Compression**.
4. Do one of the following:
   - To bind a compression policy, click **Insert Policy**, and then select the policy you want to bind to the virtual server.
   - To unbind a compression policy, click the name of the policy you want to unbind from the virtual server, and then click **Unbind Policy**.
5. Click **OK.**

Securing Load Balanced Traffic by Using SSL

The Citrix® NetScaler® SSL offload feature transparently improves the performance of web sites that conduct SSL transactions. By offloading CPU-intensive SSL encryption and decryption tasks from the local web server to the NetScaler, SSL offloading ensures secure delivery of web applications without the performance penalty incurred when the server processes the SSL data. Once the SSL traffic is decrypted, it can be processed by all standard services. The SSL protocol works seamlessly with various types of HTTP and TCP data and provides a secure channel for transactions using such data.

To configure SSL, you must first enable it. Then, you configure HTTP or TCP services and an SSL virtual server on the NetScaler, and bind the services to the vserver. You must also add a certificate-key pair and bind it to the SSL virtual server. If you use Outlook Web Access servers, you must create an action to enable SSL support and a policy to apply the action. An SSL virtual server intercepts incoming encrypted traffic and decrypts it by using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the NetScaler for appropriate processing.

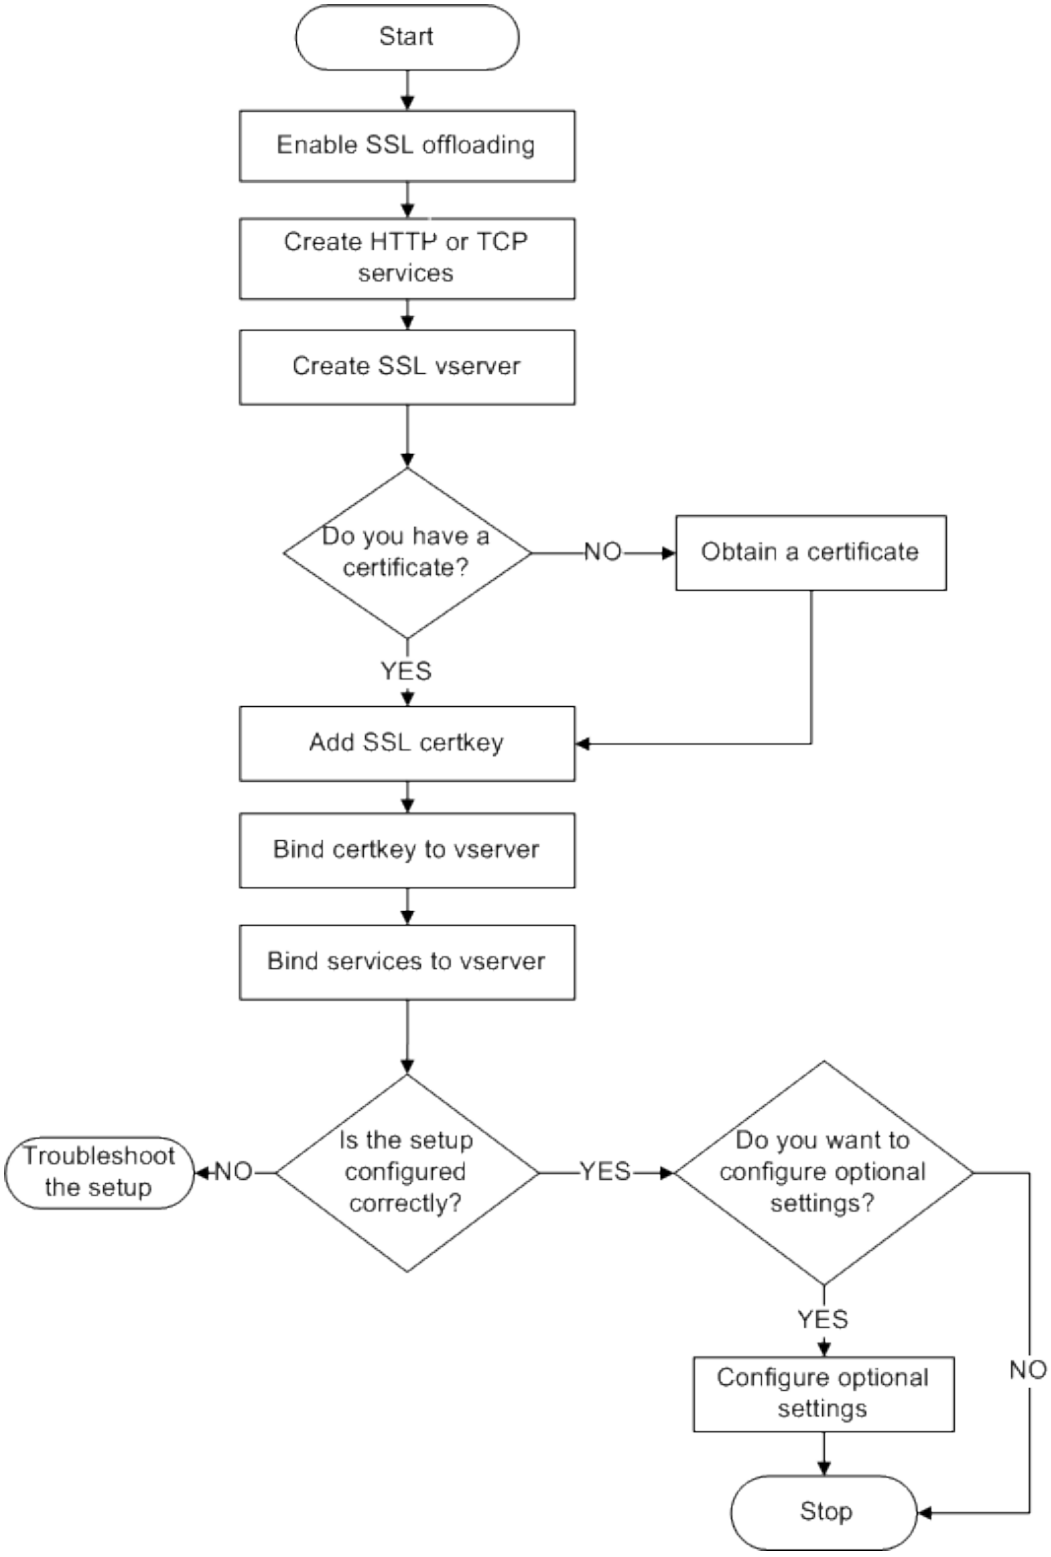
SSL Configuration Task Sequence

To configure SSL, you must first enable it. Then, you must create an SSL virtual server and HTTP or TCP services on the NetScaler. Finally, you must bind a valid SSL certificate and the configured services to the SSL virtual server.

An SSL virtual server intercepts incoming encrypted traffic and decrypts it using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the NetScaler for appropriate processing.

The following flow chart shows the sequence of tasks for configuring a basic SSL offload setup.

Figure 1. Sequence of Tasks to Configure SSL Offloading



Start
Enable SSL offloading
Create HTTP or TCP services
Create SSL vserver
Do you have a certificate?
NO
Obtain a certificate
YES
Add SSL certkey
Bind certkey to vserver
Bind services to vserver
Troubleshoot the setup
NO
Is the setup configured correctly?
YES
Do you want to configure optional settings?
YES
Configure optional settings
NO
Stop

Enabling SSL Offload

You should enable the SSL feature before configuring SSL offload. You can configure SSL-based entities on the system without enabling the SSL feature, but they will not work until you enable SSL.

To enable SSL by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable SSL Offload and and verify the configuration:

- `enable ns feature SSL`
- `show ns feature`

Example

```
> enable ns feature ssl
Done
> show ns feature
Feature Acronym Status
------- ------- ------
1) Web Logging WL ON
2) SurgeProtection SP OFF
3) Load Balancing LB ON . . .
 9) SSL Offloading SSL ON
10) Global Server Load Balancing GSLB ON . .
Done >
```

To enable SSL by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change basic features**.
3. Select the **SSL Offloading** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** message box, click **Yes**.

Creating HTTP Services

A service on the NetScaler represents an application on a server. Once configured, services are in the disabled state until the NetScaler can reach the server on the network and monitor its status. This topic covers the steps to create an HTTP service.

Note: For TCP traffic, perform the procedures in this and the following topics, but create TCP services instead of HTTP services.

To add an HTTP service by using the NetScaler command line

At the NetScaler command prompt, type the following commands to add a HTTP service and verify the configuration:

- `add service <name> (<IP> | <serverName>) <serviceType> <port>`
- `show service <name>`

```
> add service SVC_HTTP1 10.102.29.18 HTTP 80
 Done
> show service SVC_HTTP1
        SVC_HTTP1 (10.102.29.18:80) - HTTP
        State: UP
        Last state change was at Wed Jul 15 06:13:05 2009
        Time since last state change: 0 days, 00:00:15.350
        Server Name: 10.102.29.18
        Server ID : 0   Monitor Threshold : 0
        Max Conn: 0     Max Req: 0      Max Bandwidth: 0 kbits
        Use Source IP: NO
        Client Keepalive(CKA): NO
        Access Down Service: NO
        TCP Buffering(TCPB): NO
        HTTP Compression(CMP): YES
        Idle timeout: Client: 180 sec   Server: 360 sec
        Client IP: DISABLED
        Cacheable: NO
        SC: OFF
        SP: OFF
        Down state flush: ENABLED

1)      Monitor Name: tcp-default
              State: UP       Weight: 1
              Probes: 4       Failed [Total: 0 Current: 0]
              Last response: Success - TCP syn+ack received.
              Response Time: N/A
```

Done

To add an HTTP service by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Services**.
2. In details pane, click **Add**.
3. In the **Create Service** dialog box, in the **Service Name**, **Server**, and **Port** text boxes, type the name of the service, IP address, and port (for example, `SVC_HTTP1`, `10.102.29.18`, and `80`).
4. In the **Protocol** list, select the type of the service (for example, `HTTP`).
5. Click **Create**, and then click **Close**. The HTTP service you configured appears in the **Services** page.
6. Verify that the parameters you configured are correctly configured by selecting the service and viewing the **Details** section at the bottom of the pane.

For more information about services, see the “Load Balancing” chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Adding an SSL-Based Vserver

In a basic SSL offloading setup, the SSL virtual server intercepts encrypted traffic, decrypts it, and sends the clear text messages to the services that are bound to the virtual server. Offloading CPU-intensive SSL processing to the NetScaler allows the back-end servers to process a greater number of requests.

To add an SSL-based vserver by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create an SSL-based vserver and verify the configuration:

- `add lb vserver <name> <serviceType> [<IPAddress> <port>]`
- `show lb vserver <name>`

Example

```
> add lb vserver vserver-SSL-1 SSL 10.102.29.50 443
Done
> show lb vserver vserver-SSL-1
vserver-SSL-1 (10.102.29.50:443) - SSL Type: ADDRESS
State: DOWN[Certkey not bound] Last state change was at Tue Jun 16 06:33:08 2009 (
Time since last state change: 0 days, 00:03:44.120
Effective State: DOWN Client Idle Timeout: 180 sec
Down state flush: ENABLED
Disable Primary Vserver On Down : DISABLED
No. of Bound Services : 0 (Total) 0 (Active)
Configured Method: LEASTCONNECTION Mode: IP
Persistence: NONE
Vserver IP and Port insertion: OFF
Push: DISABLED Push VServer: Push Multi Clients: NO Push Label Rule: Done
```

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based vserver before you enable it.

To add an SSL-based vserver by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Virtual Servers**.
2. In the details pane, click **Add**.
3. In the **Create Virtual Server (SSL Offload)** dialog box, in the **Name**, **IP Address**, and **Port** text boxes, type the name of the vserver, IP address, and port (for example, `Vserver-SSL-1`, `10.102.29.50`, and `443`).
4. In the **Protocol** list, select the type of the vserver, for example, **SSL.**
5. Click **Create**, and then click **Close**.
6. Verify that the parameters you configured are correctly configured by selecting the vserver and viewing the **Details** section at the bottom of the pane. The vserver is marked as DOWN because a certificate-key pair and services have not been bound to it.

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based vserver before you enable it.

Binding Services to the SSL Vserver

After decrypting the incoming data, the SSL vserver forwards the data to the services that you have bound to the vserver.

Data transfer between the NetScaler and the servers can be encrypted or in clear text. If the data transfer between the NetScaler and the servers is encrypted, the entire transaction is secure from end to end. For more information about configuring the system for end-to-end security, see the "Secure Socket Layer (SSL) Acceleration" chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To bind a service to a vserver by using the NetScaler command line

At the NetScaler command prompt, type the following commands to bind service to the SSL vserver and verify the configuration:

- `bind lb vserver <name> <serviceName>`
- `show lb vserver <name>`

Example

```
> bind lb vserver vserver-SSL-1 SVC_HTTP1
Done
> show lb vserver vserver-SSL-1 vserver-SSL-1 (10.102.29.50:443) - SSL Type:
ADDRESS State: DOWN[Certkey not bound]
Last state change was at Tue Jun 16 06:33:08 2009 (+174 ms)
Time since last state change: 0 days, 00:31:53.70
Effective State: DOWN Client Idle
Timeout: 180 sec
Down state flush: ENABLED Disable Primary Vserver On Down :
DISABLED No. of Bound Services : 1 (Total) 0 (Active)
Configured Method: LEASTCONNECTION Mode: IP Persistence: NONE Vserver IP and

To bind a service to a vserver by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Virtual Servers**.
2. In the details pane, select a vserver, and then click **Open**.
3. On the **Services** tab, in the **Active** column, select the check boxes next to the services that you want to bind to the selected vserver.
4. Click **OK.**
5. Verify that the **Number of Bound Services** counter in the **Details** section at the bottom of the pane is incremented by the number of services that you bound to the vserver.

Adding a Certificate Key Pair

An SSL certificate is an integral element of the SSL Key-Exchange and encryption/decryption process. The certificate is used during SSL handshake to establish the identity of the SSL server. You can use a valid, existing SSL certificate that you have on the NetScaler, or you can create your own SSL certificate. The NetScaler supports RSA/DSA certificates of up to 4096 bits.

Note: Citrix recommends that you use a valid SSL certificate that has been issued by a trusted certificate authority. Invalid certificates and self-created certificates are not compatible with all SSL clients.

Before a certificate can be used for SSL processing, you must pair it with its corresponding key. The certificate key pair is then bound to the vserver and used for SSL processing.

To add a certificate key pair by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create a certificate key pair and verify the configuration:

- `add ssl certKey <certkeyName> -cert <string> [-key <string>]`
- `show sslcertkey <name>`

Example

```
> add ssl certKey CertKey-SSL-1 -cert ns-root.cert -key ns-root.key
 Done
> show sslcertkey CertKey-SSL-1
      Name: CertKey-SSL-1 Status: Valid,
      Days to expiration:4811 Version: 3
      Serial Number: 00 Signature Algorithm: md5WithRSAEncryption Issuer: C=US,ST=California,L=San
      Jose,O=Citrix ANG,OU=NS Internal,CN=de fault
      Validity Not Before: Oct 6 06:52:07 2006 GMT Not After : Aug 17 21:26:47 2022 GMT
      Subject: C=US,ST=California,L=San Jose,O=Citrix ANG,OU=NS Internal,CN=d efault Public Key Algori
      size: 1024
 Done
```

To add a certificate key pair by using the configuration utility

1. In the navigation pane, expand **SSL**, and then click **Certificates**.
2. In the details pane, click **Add**.
3. In the **Install Certificate** dialog box, in the **Certificate-Key Pair Name** text box, type a name for the certificate key pair you want to add, for example, `Certkey-SSL-1`.
4. Under **Details**, in **Certificate File Name**, click **Browse (Appliance)** to locate the certificate. Both the certificate and the key are stored in the /nsconfig/ssl/ folder on the appliance. To use a certificate present on the local system, select **Local**.
5. Select the certificate you want to use, and then click **Select**.
6. In **Private Key File Name**, click **Browse (Appliance)** to locate the private key file. To use a private key present on the local system, select **Local**.
7. Select the key you want to use and click **Select.** To encrypt the key used in the certificate key pair, type the password to be used for encryption in the **Password** text box.
8. Click **Install**.
9. Double-click the certificate key pair and, in the **Certificate Details** window, verify that the parameters have been configured correctly and saved.

Binding an SSL Certificate Key Pair to the Vserver

After you have paired an SSL certificate with its corresponding key, you must bind the certificate key pair to the SSL vserver so that it can be used for SSL processing. Secure sessions require establishing a connection between the client computer and an SSL-based virtual server on the NetScaler. SSL processing is then carried out on the incoming traffic at the virtual server. Therefore, before enabling the SSL virtual server on the NetScaler, you need to bind a valid SSL certificate to the SSL virtual server.

To bind an SSL certificate key pair to a vserver by using the NetScaler command line

At the NetScaler command prompt, type the following commands to bind an SSL certificate key pair to a vserver and verify the configuration:

- `bind ssl vserver <vServerName> -certkeyName <string>`
- show ssl vserver <name>

  Example

```
 > bind ssl vserver Vserver-SSL-1 -certkeyName CertKey-SSL-1
Done
> show ssl vserver Vserver-SSL-1

    Advanced SSL configuration for VServer Vserver-SSL-1:
    DH: DISABLED
    Ephemeral RSA: ENABLED Refresh Count: 0
    Session Reuse: ENABLED Timeout: 120 seconds
    Cipher Redirect: ENABLED
    SSLv2 Redirect: ENABLED
    ClearText Port: 0
    Client Auth: DISABLED
    SSL Redirect: DISABLED
    Non FIPS Ciphers: DISABLED
    SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1) CertKey Name: CertKey-SSL-1 Server Certificate
1) Cipher Name: DEFAULT
   Description: Predefined Cipher Alias
Done
```

To bind an SSL certificate key pair to a vserver by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Virtual Servers**.
2. Select the vserver to which you want to bind the certificate key pair, for example, **Vserver-SSL-1**, and click **Open**.
3. In the **Configure Virtual Server (SSL Offload)** dialog box, on the **SSL Settings** tab, under **Available**, select the certificate key pair that you want to bind to the vserver (for example, **Certkey-SSL-1**), and then click **Add**.
4. Click **OK.**
5. Verify that the certificate key pair that you selected appears in the **Configured** area.

Configuring Support for Outlook Web Access

If you use Outlook Web Access (OWA) servers on your NetScaler, you must configure the NetScaler to insert a special header field, FRONT-END-HTTPS: ON, in HTTP requests directed to the OWA servers, so that the servers generate URL links as https:// instead of http://.

Note: You can enable OWA support for HTTP-based SSL vservers and services only. You cannot apply it for TCP-based SSL vservers and services.

To configure OWA support, do the following:

- Create an SSL action to enable OWA support.
- Create an SSL policy.
- Bind the policy to the SSL vserver.

Creating an SSL Action to Enable OWA Support

Before you can enable OWA support, you must creat an SSL action. SSL actions are bound to SSL policies and triggered when incoming data matches the rule specified by the policy.

To create an SSL action to enable OWA support by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create an SSL action to enable OWA support and verify the configuration:

- `add ssl action <name> -OWASupport ENABLED`
- `show SSL action <name>`

```
 > add ssl action Action-SSL-OWA -OWASupport enabled
Done
> show SSL action Action-SSL-OWA
  Name: Action-SSL-OWA
  Data Insertion Action: OWA
  Support: ENABLED
Done
```

To create an SSL action to enable OWA support by using the configuration utility

1. In the navigation pane, expand **SSL**, and then click **Policies**.
2. In the details pane, on the **Actions** tab, click **Add**.
3. In the **Create SSL Action** dialog box, in the **Name** text box, type `Action-SSL-OWA`.
4. Under **Outlook Web Access**, select **Enabled**.
5. Click **Create**, and then click **Close**.
6. Verify that **Action-SSL-OWA** appears in the **SSL Actions** page.

Creating SSL Policies

SSL policies are created by using the policy infrastructure. Each SSL policy has an SSL action bound to it, and the action is carried out when incoming traffic matches the rule that has been configured in the policy.

To create an SSL policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure an SSL policy and verify the configuration:

- `add ssl policy <name> -rule <expression> -reqAction <string>`
- `show ssl policy <name>`

Example

```
> add ssl policy Policy-SSL-1 -rule ns_true -reqaction Action-SSL-OWA
Done
> show ssl policy Policy-SSL-1
Name: Policy-SSL-1      Rule: ns_true
Action: Action-SSL-OWA  Hits: 0
Policy is bound to following entities
1)      PRIORITY : 0
Done
```

To create an SSL policy by using the configuration utility

1. In the navigation pane, expand **SSL**, and then click **Policies**.
2. In the details pane, click **Add**.
3. In the **Create SSL Policy** dialog box, in the **Name** text box, type the name of the SSL Policy (for example, `Policy-SSL-1`).
4. In **Request Action**, select the configured SSL action that you want to associate with this policy (for example, **Action-SSL-OWA**). The `ns_true` general expression applies the policy to all successful SSL handshake traffic. However, if you need to filter specific responses, you can create policies with a higher level of detail. For more information about configuring granular policy expressions, see Understanding Policies and Expressions.
5. In **Named Expressions**, choose the built-in general expression `ns_true` and click **Add Expression**. The expression `ns_true` now appears in the Expression text box.
6. Click **Create**, and then click **Close**.
7. Verify that the policy is correctly configured by selecting the policy and viewing the **Details** section at the bottom of the pane.

Binding the SSL Policy to an SSL Vserver

After you configure an SSL policy for OWA, bind the policy to a vserver that will intercept incoming Outlook traffic. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered and the action associated with it is carried out.

To bind an SSL policy to an SSL vserver by using the NetScaler command line

At the NetScaler command prompt, type the following commands to bind an SSL policy to an SSL vserver and verify the configuration:

- `bind ssl vserver <vServerName> -policyName <string>`
- `show ssl vserver <name>`

Example

```
> bind ssl vserver Vserver-SSL-1 -policyName Policy-SSL-1
 Done
> show ssl vserver Vserver-SSL-1
        Advanced SSL configuration for VServer Vserver-SSL-1:
        DH: DISABLED
        Ephemeral RSA: ENABLED          Refresh Count: 0
        Session Reuse: ENABLED          Timeout: 120 seconds
        Cipher Redirect: ENABLED
        SSLv2 Redirect: ENABLED
        ClearText Port: 0
        Client Auth: DISABLED
        SSL Redirect: DISABLED
        Non FIPS Ciphers: DISABLED
        SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1)      CertKey Name: CertKey-SSL-1 Server Certificate

1)      Policy Name: Policy-SSL-1
                        Priority: 0
1)      Cipher Name: DEFAULT
        Description: Predefined Cipher Alias
 Done
>
```

To bind an SSL policy to an SSL vserver by using the configuration utility

1. In the navigation pane, expand **SSL Offload**, and then click **Virtual Servers**.
2. In the details pane, select the vserver (for example, **Vserver-SSL-1**), and then click **Open**.
3. In the **Configure Virtual Server (SSL Offload)** dialog box, click **Insert Policy**, and then select the policy that you want to bind to the SSL vserver. Optionally, you can double-click the **Priority** field and type a new priority level.
4. Click **OK.**

Features at a Glance

Citrix® NetScaler® features can be configured independently or in combinations to address specific needs. Although some features fit more than one category, the numerous NetScaler features can generally be categorized as application switching and traffic management features, application acceleration features, application security and firewall features, and an application visibility feature.

To understand the order in which the features perform their processing, see Processing Order of Features.

Application Switching and Traffic Management Features

SSL Offloading

Transparently offloads SSL encryption and decryption from web servers, freeing server resources to service content requests. SSL places a heavy burden on an application's performance and can render many optimization measures ineffective. SSL offload and acceleration allow all the benefits of Citrix Request Switching technology to be applied to SSL traffic, ensuring secure delivery of web applications without degrading end-user performance.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Access Control Lists

Compares incoming packets to the Access Control Lists (ACLs). If a packet matches an ACL rule, the action specified in the rule is applied to the packet. Otherwise, the default action (ALLOW) is applied and the packet is processed normally by the system. For the system to compare incoming packets to the ACLs, you need to apply the ACLs. All ACLs are enabled by default, but you have to apply them in order for the NetScaler to compare incoming packets against them. If an ACL is not required to be a part of the lookup table, but still needs to be retained in the configuration, it should be disabled before the ACLs are applied. A NetScaler does not compare incoming packets to disabled ACLs.

For more information, see the *Citrix NetScaler Networking Guide* at http://support.citrix.com/article/CTX128671.

Load Balancing

Load balancing decisions are based on a variety of algorithms, including round robin, least connections, weighted least bandwidth, weighted least packets, minimum response time, and hashing based on URL, domain source IP or destination IP. Both the TCP and UDP protocols are supported, so the NetScaler can load balance all traffic that uses those protocols as the underlying carrier (for example, HTTP, HTTPS, UDP, DNS, FTP, NNTP, and general firewall traffic). In addition, the NetScaler can maintain session persistence based on source IP, cookie, server, group or SSL session. It allows users to apply custom Extended Content Verification (ECV) to servers, caches, firewalls and other infrastructure devices to ensure that these systems are functioning properly and are providing the right content to users. It can also perform health checks using ping, TCP, or HTTP URL, and the user can create monitors based on Perl scripts.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Content Switching

Determines which server to send the request to based on the configured content switching policies. Policy rules can be configured based on the IP address, URL, and HTTP headers. This allows switching decisions to be based on user and device characteristics such as who the user is, what type of agent is being used, and what content the user requested.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Global Server Load Balancing (GSLB)

Extends the traffic management capabilities of a NetScaler to include distributed Internet sites and global enterprises. Whether installations are spread across multiple network locations or multiple clusters in a single location, the NetScaler maintains availability and distributes traffic across them. It makes intelligent DNS decisions to prevent users from being sent to a site that is down or overloaded. When the proximity-based GSLB method is enabled, the NetScaler can make load balancing decisions based on the proximity of the client's local DNS server (LDNS) in relation to different sites. The main benefit of the proximity-based GSLB method is faster response time resulting from the selection of the closest available site.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Dynamic Routing

Enables routers to obtain topology information, routes, and IP addresses from neighboring routers automatically. When dynamic routing is enabled, the corresponding routing process listens to route updates and advertises routes. The routing processes can also be placed in passive mode. Routing protocols enable an upstream router to load balance traffic to identical vservers hosted on two standalone NetScaler units using the Equal Cost Multipath technique.

For more information, see the *Citrix NetScaler Networking Guide* at http://support.citrix.com/article/CTX128671.

Link Load Balancing

Load balances multiple WAN links and provides link failover, further optimizing network performance and ensuring business continuity. Ensures that network connections remain highly available, by applying intelligent traffic control and health checks to distribute traffic efficiently across upstream routers. Identifies the best WAN link to route both incoming and outbound traffic based on policies and network conditions, and protects applications against WAN or Internet link failure by providing rapid fault detection and failover.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

TCP Optimization

Transfers certain TCP tasks from your managed servers to the NetScaler, reducing CPU load on your managed servers and improving performance.

For more information, see the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

Web Interface on NetScaler

Provides access to XenApp and XenDesktop resources, which include applications, content, and desktops. Users access resources through a standard Web browser or by using the Citrix XenApp plug-in. The Web Interface runs as a service on port 8080 on the NetScaler appliance. To create Web Interface sites, Java is executed on Apache Tomcat Web server version 6.0.26 on the NetScaler appliance.

Note: Web Interface is supported only on NetScaler nCore releases.

For more information, see the *Citrix NetScaler Administration Guide* at http://support.citrix.com/article/CTX128667.

Load Balancing of Branch Repeaters for WAN Optimization

To provide high-scale WAN optimization, the branch repeaters deployed at data centers can be load balanced through NetScaler appliances. The bandwidth and number of concurrent sessions can be improved significantly.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

OpenCloud Bridge

The Citrix NetScaler® OpenCloud Bridge™ feature, a fundamental part of the Citrix® OpenCloud framework, is a tool used to build a cloud-extended data center. The OpenCloud Bridge enables you to connect one or more NetScaler appliances or VPXs on the cloud-to your network without reconfiguring your network. Cloud hosted applications appear as though they are running on one contiguous enterprise network.The primary purpose of the OpenCloud Bridge is to enable companies to move their applications to the cloud while reducing costs and the risk of application failure. In addition, the OpenCloud Bridge increases network security in cloud environments. An OpenCloud Bridge is a Layer-2 network bridge that connects a NetScaler appliance or VPX on a cloud instance to a NetScaler appliance or VPX on your LAN. The connection is made through a tunnel that uses the Generic Routing Encapsulation (GRE) protocol. The GRE protocol provides a mechanism for encapsulating packets from a wide variety of network protocols to be forwarded over another protocol. Then Internet Protocol security (IPsec) protocol suite is used to secure the communication between the peers in the OpenCloud Bridge.

For more information, see the *Citrix NetScaler Networking Guide* at http://support.citrix.com/article/CTX128671.

DataStream™

The DataStream feature of NetScaler provides an intelligent mechanism for request switching at the database layer by distributing requests based on the SQL query being sent.

When deployed in front of database servers, a NetScaler ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and on the basis of database names, usernames, character sets, and packet size.

You can either configure load balancing to switch requests based on load balancing algorithms or elaborate the switching criteria by configuring content switching to make a

decision based on SQL query parameters, such as user name and database name, command parameters. You can further configure monitors to track the state of database servers.

The advanced policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process the requests. The advanced expressions evaluate traffic associated with MySQL database servers. You can use request-based expressions (expressions that begin with `MYSQL.CLIENT` and `MYSQL.REQ`) in advanced policies to make request switching decisions at the content switching virtual server bind point and response-based expressions (expressions that begin with `MYSQL.RES`) to evaluate server responses to user-configured health monitors. For more information about these expressions, see the "Evaluating Connections to Database Servers" chapter in the *Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

Note: DataStream is supported only for MySQL databases. For information about the DataStream feature, see the "DataStream" chapter in the *Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Application Acceleration Features

AppCompress

Provides transparent compression for HTML and text files using the gzip compression protocol. The typical 4:1 compression ratio yields up to 50% reduction in bandwidth requirements out of the data center. This also results in significantly improved end-user response time by reducing the amount of data that must be delivered to the user's browser.

For more information, see the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

Cache Redirection

Manages the flow of traffic to a reverse proxy, transparent proxy, or forward proxy cache farm. Inspects all requests, and identifies non-cacheable requests and sends them directly to the origin servers over persistent connections. By intelligently redirecting non-cacheable requests back to the origin web servers, the NetScaler frees cache resources and increases cache hit rates while reducing overall bandwidth consumption and response delays for these requests.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

AppCache

Helps optimize web content and application data delivery by providing a fast in-memory HTTP/1.1 and HTTP/1.0 compliant web caching for both static and dynamic content. This on-board cache stores the results of incoming application requests even when an incoming request is secured or the data compressed, and then reuses the data to fulfill subsequent requests for the same information. By serving data directly from the on-board cache, the NetScaler can reduce page regeneration times by eliminating the need to funnel static and dynamic content requests to the server.

For more information, see the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

TCP Buffering

Buffers the server's response and delivers it to the client at the client's speed, thus offloading the server faster and thereby improving the performance of web sites. For more information, see the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX128681.

Application Security and Firewall Features

Denial of Service Attack (DoS) Defense

Detects and stops malicious distributed denial-of-service (DDoS) attacks and other types of malicious attacks before they reach your servers, preventing them from affecting network and application performance. The NetScaler identifies legitimate clients and elevates their priority, leaving suspect clients unable to consume a disproportionate percentage of resources and cripple your site. A NetScaler provides application-level protection from the following types of malicious attacks:

- SYN flood attacks
- Pipeline attacks
- Teardop attacks
- Land attacks
- Fraggle attacks
- Zombie connection attacks

The NetScaler aggressively defends against these types of attacks by preventing the allocation of server resources for these connections. This insulates servers from the overwhelming flood of packets associated with these events.

The NetScaler also protects network resources from ICMP based attacks by using ICMP rate limiting and aggressive ICMP packet inspection. It performs strong IP reassembly, drops a variety of suspicious and malformed packets, and applies Access Control Lists (ACLs) to site traffic for further protection.

For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

Content Filtering

Provides protection from malicious attacks for web sites at the Layer 7 level. The NetScaler inspects each incoming request according to user-configured rules based on HTTP headers, and performs the action the user configured. Actions can include resetting the connection, dropping the request, or sending an error message to the user's browser. This allows the NetScaler to screen unwanted requests and reduces your servers' exposure to attacks.

This feature can also analyze HTTP GET and POST requests and filter out known bad signatures, allowing it to defend your servers against HTTP-based attacks such as variants of the Nimda and Code Red viruses.

For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

Responder

Functions like an advanced filter and can be used to generate responses from the NetScaler to the client. Some common uses of this feature are generation of redirect responses, user defined responses or resets.

For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

Rewrite

Modifies HTTP headers and body text. You can use it to add HTTP headers to an HTTP request or response, make modifications to individual HTTP headers, or delete HTTP headers. It also lets you modify the HTTP body in requests and responses.

When the NetScaler receives a request or sends a response, it checks for rewrite rules, and if applicable rules exist, it applies them to the request or response before passing it on to the web server or client computer.

For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

Priority Queuing

Prioritizes user requests to ensure that the most important traffic is serviced first during surges in request volume. You can establish priority based on request URLs, cookies, or a variety of other factors. The NetScaler places requests in a three-tier queue based on their configured priority, enabling business-critical transactions to flow smoothly even during surges or site attacks.

For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

Surge Protection

Regulates the flow of user requests to servers and controls the number of users that can simultaneously access the resources on the servers, queuing any additional requests once your servers have reached their capacity. By controlling the rate at which connections can be established, the NetScaler blocks surges in requests from being passed on to your servers, thus preventing site overload.

For more information, see the *Citrix NetScaler Application Security Guide* at http://support.citrix.com/article/CTX128674.

Access Gateway

Citrix Access Gateway is a secure application access solution that provides administrators granular application-level policy and action controls to secure access to applications and data while allowing users to work from anywhere. It gives IT administrators a single point of control and tools to help ensure compliance with regulations and the highest levels of information security across and outside the enterprise. At the same time, it empowers users with a single point of access—optimized for roles, devices, and networks—to the

enterprise applications and data they need. This unique combination of capabilities helps maximize the productivity of today's mobile workforce.

For more information, see Access Gateway.

Application Firewall

Protects applications from misuse by hackers and malware, such as cross site scripting attacks, buffer overflow attacks, SQL injection attacks, and forceful browsing, by filtering traffic between each protected web server and users that connect to any web site on that web server. The Application Firewall examines all traffic for evidence of attacks on web server security or misuse of web server resources, and takes the appropriate action to prevent these attacks from succeeding.

For more information, see the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

Application Visibility Feature

EdgeSight for NetScaler

Support for application performance monitoring based on end user experience. This solution leverages the HTML injection feature to obtain various time values, which are used by EdgeSight server for analysis and report generation. EdgeSight for NetScaler provides a way to monitor the performance benefits of a NetScaler and determine potential bottlenecks in a network.

For more information, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Enhanced Application Visiblity Using AppFlow

The Citrix® NetScaler® appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits this information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called *flow records*, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.

To limit the types of flows to monitor, by sampling and filtering the application traffic, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

Note: The AppFlow feature is supported only by Citrix® nCore™ software.

Licensing, Upgrading, and Downgrading

The following topics describe the migration instructions for setting up a new version of a NetScaler with a list of all new and deprecated commands, parameters, and SNMP OIDs.

New and Deprecated Commands, Parameters, and SNMP OIDs	Lists the foundational changes that affect the base system and its configuration, including new and deprecated commands, parameters, and SNMP OIDs.
Upgrading or Downgrading the System Software	Describes the licensing framework and the procedure for upgrading or downgrading the system software across releases and within a release.

New and Deprecated Commands, Parameters, and SNMP OIDs

Welcome to the NetScaler 9.3 system software release. There are new commands, parameters, and SNMP OIDs in this release. Some commands, parameters, and SNMP OIDs will be deprecated in this release. For complete descriptions of the new commands and parameters, see the *Citrix NetScaler Command Reference Guide* at http://support.citrix.com/article/CTX128678. For complete descriptions of the SNMP OIDs, see the *Citrix NetScaler SNMP OID Reference Guide* at http://support.citrix.com/article/CTX128676.

New and Deprecated Commands, Parameters, and SNMP OIDs

Welcome to the NetScaler 9.3 system software release. There are new commands, parameters, and SNMP OIDs in this release. Some commands, parameters, and SNMP OIDs will be deprecated in this release. For complete descriptions of the new commands and parameters, see the *Citrix NetScaler Command Reference Guide* at http://support.citrix.com/article/CTX128678. For complete descriptions of the SNMP OIDs, see the *Citrix NetScaler SNMP OID Reference Guide* at http://support.citrix.com/article/CTX128676.

New Commands

The following table lists all the new commands in release 9.3.

Table 1. New Commands

Command Group	Command
Basic	show servicegroupbindings count servicegroupbindings unset serviceGroup
AAA	unset aaa parameter
Application Firewall	update appfw customSettings update appfw xmlerrorpage update appfw htmlerrorpage
Authentication	add authentication negotiateAction rm authentication negotiateAction set authentication negotiateAction show authentication negotiateAction add authentication negotiatePolicy rm authentication negotiatePolicy set authentication negotiatePolicy show authentication negotiatePolicy
Authorization	stat authorization policybinding stat authorization policylabel
Cache Redirection	stat cache policybinding stat cache policylabel

DB	add db user rm db user set db user show db user
Domain Name Service (DNS)	stat dns records
Load Balancing	set lb parameter show lb parameter
Network	set arpparam show arpparam stat bridge add netbridge rm netbridge show netbridge bind netbridge unbind netbridge
NetScaler	show ns savedConfig set ns encryptionParams show ns encryptionParams show ns rollbackcmd stat ns memory
ACL	clear ns simpleacl6 add ns simpleacl6 rm ns simpleacl6 show ns simpleacl6 stat ns simpleacl6

AppFlow	add ns appflowCollector rm ns appflowCollector show ns appflowCollector set ns appflowParam show ns appflowParam
NTP	show ntp status
Policy	add policy stringmap rm policy stringmap set policy stringmap bind policy stringmap unbind policy stringmap show policy stringmap
Responder	stat responder policybinding stat responder policylabel
Rewrite	stat rewrite policybinding stat rewrite policylabel
SNMP	set snmp manager
System	stat system memory set system group
Web Interface	install wi package uninstall wi package add wi site rm wi site set wi site bind wi site unbind wi site show wi site

Cloud Bridge	add ipsec peer show ipsec peer rm ipsec peer set ipsec parameter unset ipsec parameter show ipsec parameter

Deprecated Commands

The following commands are deprecated in release 9.3.

- rm appfw customSettings
- show appfw customSettings
- import appfw customSettings
- update appfw customSettings

New Parameters

The following table lists all the new parameters in release 9.3.

Table 1. New Parameters

Command Group	Command
Basic	show servicegroupbindings [**-servicegroupname**] stat serviceGroupMember [**-servername**] disable server [**-graceful** (YES | NO)] add service [**-healthmonitor** (YES | NO)] [**-hashid** <positive_integer>] [**-appflowlog** (ENABLED | DISABLED)] set service [**-healthmonitor** (YES | NO)] [**-hashid** <positive_integer>] [**-appflowlog** (YES | NO)] unset service [**-hashid** <positive_integer>] [**-appflowlog** (ENABLED | DISABLED)] disable service [**-graceful** (YES | NO)] add serviceGroup [**-healthmonitor** (YES | NO)] [**-appflowlog** (ENABLED | DISABLED)] set serviceGroup [**-healthmonitor** (YES | NO)] [**-appflowlog** (ENABLED | DISABLED)] unset serviceGroup [**-servicegroupname**] [**-servername**] [**-maxclient**] [**-maxreq**] [**-cacheable**] [**-cip**] [**-usip**] [**-useproxyport**] [**-sc**] [**-sp**] [**-rtspsessionidremap**] [**-clttimeout**] [**-svrtimeout**] [**-cka**] [**-tcpb**] [**-cmp**] [**-maxbandwidth**] [**-monthreshold**] [**-appflowlog**] disable serviceGroup [**-graceful** (YES | NO)]
AAA	unset aaa parameter [**-defaultauthtype**] [**-maxaaausers**]

Application Firewall	set appfw settings [**-cookiepostencryptprefix** <string>] add appfw profile [**-cookietransforms** (ON | OFF)] [**-cookieencryption** <cookieEncryption>] [**-cookieproxying** (none | sessionOnly)] [**-addcookieflags** <addCookieFlags>] [**-striphtmlcomments** <stripHtmlComments>] [**-fileuploadmaxnum** <positive_integer>] set appfw profile [**-cookietransforms** (ON | OFF)] [**-cookieencryption** <cookieEncryption>] [**-cookieproxying** (none | sessionOnly)] [**-addcookieflags** <addCookieFlags>] [**-striphtmlcomments** <stripHtmlComments>] [**-fileuploadmaxnum** <positive_integer>] bind appfw profile [**-xmlsqlinjection** <string>] [**-xmlxss** <string>] unbind appfw profile [**-xmlsqlinjection** <string>] [**-xmlxss** <string>] import appfw wsdl [**-comment** <string>] [**-overwrite**] import appfw customSettings [**-comment** <string>] [**-overwrite**] import appfw xmlschema [**-comment** <string>] [**-overwrite**] import appfw xmlerrorpage [**-comment** <string>] [**-overwrite**] import appfw htmlerrorpage [**-comment** <string>] [**-overwrite**] update appfw customSettings [**-name**] [**-type**] update appfw xmlerrorpage [**-name**] [**-type**] update appfw htmlerrorpage [**-name**] [**-type**]

Audit	add audit syslogAction [**-appflowexport** (ENABLED | DISABLED)] set audit syslogAction [**-appflowexport** (ENABLED |DISABLED)] unset audit syslogAction [**-appflowexport** (ENABLED | DISABLED)] set audit syslogParams [**-appflowexport** (ENABLED |DISABLED)] unset audit syslogParams [**-appflowexport**] add audit nslogAction [**-appflowexport**] set audit nslogAction [**-appflowexport** (ENABLED | DISABLED)] unset audit nslogAction [**-appflowexport**] set audit nslogParams [**-appflowexport** (ENABLED |DISABLED)] unset audit nslogParams [**-appflowexport**]

Authentication	add authentication negotiateAction [**-name**] [**-domain** <string>] [**-domainuser** <string>] [**-domainuserpasswd**] [**-ou** <string>] rm authentication negotiateAction [**-name**] set authentication negotiateAction [**-name**] [**-domain** <string>] [**-domainuser** <string>] [**-domainuserpasswd**] [**-ou** <string>] show authentication negotiateAction [**-name**] add authentication negotiatePolicy [**-name**] [**-rule**] [**-reqaction**] rm authentication negotiatePolicy [**-name**] set authentication negotiatePolicy [**-name**] [**-rule** <expression>] [**-reqaction** <string>] show authentication negotiatePolicy [**-name**] add authentication vserver [**-appflowlog** (ENABLED | DISABLED)] set authentication vserver [**-appflowlog** (ENABLED | DISABLED)]
Authorization	stat authorization policybinding [**-name**] stat authorization policylabel [**-labelname**] [**-bindings**]
Cache Redirection	stat cache policybinding [**-name**] stat cache policylabel [**-labelname**] [**-bindings**] add cr vserver [**-useportrange** (ON | OFF)] [**-appflowlog** (ENABLED |DISABLED)] set cr vserver [**-useportrange** (ON | OFF)] [**-appflowlog** (ENABLED |DISABLED)] unset cr vserver [**-useportrange**] [**-appflowlog**]

Content Switching	add cs vserver [**-mysqlprotocolversion** <positive_integer>] [**-mysqlserverversion** <string>] [**-mysqlcharacterset** <positive_integer>] [**-mysqlservercapabilities** <positive_integer>] [**-appflowlog**] set cs vserver [**-mysqlprotocolversion**] [**-mysqlserverversion**] [**-mysqlcharacterset**] [**-mysqlservercapabilities**] [**-appflowlog** (ENABLED | DISABLED)] unset cs vserver [**-mysqlprotocolversion**] [**-mysqlserverversion**] [**-mysqlcharacterset**] [**-mysqlservercapabilities**] [**-appflowlog**]
DB	add db user [**-username**] [**-password**] rm db user [**-username**] set db user [**-username**] [**-password**] show db user [**-username**] [**-loggedin**]
Domain Name Service (DNS)	stat dns records [**-dnsrecordtype**] add dns policy [**-cachebypass** (YES | NO)] set dns policy [**-cachebypass** (YES | NO)]
Global Server Load Balancing	add gslb service [**-healthmonitor** (YES | NO)] [**-hashid** hashid] [**-appflowlog** (ENABLED |DISABLED)] set gslb service [**-healthmonitor** (YES | NO)] [**-hashid** <positive_integer>] [**-appflowlog** (ENABLED | DISABLED)] add gslb vserver [**-dnsrecordtype** <dnsRecordType>] [**-appflowlog** (ENABLED | DISABLED)] set gslb vserver [**-dnsrecordtype** <dnsRecordType>] [**-appflowlog** (ENABLED | DISABLED)]

Load Balancing	add lb monitor [**-validatecred** (YES | NO)] [**-domain** <string>] [**-evalrule** <expression>] [**-mssqlprotocolversion** <mssqlProtocolVersion>] set lb monitor [**-validatecred** (YES | NO)] [**-domain** <string>] [**-evalrule** <expression>] add lb vserver [**-mysqlprotocolversion** <positive_integer>] [**-mysqlserverversion** <string>] [**-mysqlcharacterset** <positive_integer>] [**-mysqlservercapabilities** <positive_integer>] [**-appflowlog** (ENABLED |DISABLED)] set lb vserver [**-mysqlprotocolversion** <positive_integer>] [**-mysqlserverversion** <string>] [**-mysqlcharacterset** <positive_integer>] [**-mysqlservercapabilities** <positive_integer>] [**-appflowlog** (ENABLED | DISABLED)] unset lb vserver [**-redirecturl**] [**-mysqlprotocolversion**] [**-mysqlserverversion**] [**-mysqlcharacterset**] [**-mysqlservercapabilities**] [**-appflowlog**] set lb sipParameters [**-sip503ratethreshold** <positive_integer>] set lb parameter [**-httponlycookieflag** (ENABLED | DISABLED)] [**-useportforhashlb** (YES | NO)] [**-preferdirectroute** (YES | NO)] [**-startuprrfactor** <positive_integer>] [**-monitorskipmaxclient** (ENABLED | DISABLED)] [**-monitorconnectionclose** (RESET | FIN)] show lb parameter [**-format**] [**-level**]

Network	set arpparam [**-timeout** <positive_integer>] add vlan [**-aliasname** <string>] set vlan [**-aliasname** <string>] set ipTunnelParam [**-srciproundrobin** (YES | NO)] add ipTunnel [**-secure** (YES | NO)] add netbridge [**-name**] rm netbridge [**-name**] show netbridge [**-name**] bind netbridge [**-name**] [**-tunnel** <string> ...] [**-vlan** <positive_integer> ...] [**-ipaddress** <ip_addr|ipv6_addr] unbind netbridge [**-name**] [**-tunnel** <string> ...] [**-vlan** <positive_integer> ...] [**-ipaddress** <ip_addr|ipv6_addr]

NTP	set ntp server [**-preferredntpserver** (YES | NO)]
Policy	add policy stringmap [**-name**] [**-comment** <string>] rm policy stringmap [**-name**] set policy stringmap [**-name**] [**-comment** <string>] bind policy stringmap [**-name**] [**-key**] unbind policy stringmap [**-name**] [**-key**] show policy stringmap [**-name**]
Responder	stat responder policybinding [**-name**] add responder policy [**-logaction** <string>] set responder policy [**-logaction** <string>] unset responder policy [**-logaction**] stat responder policylabel [**-labelname**] [**-bindings**]

Rewrite	stat rewrite policybinding [**-name**] add rewrite action [**-bypasssafetycheck** (YES | NO)] stat rewrite policylabel [**-labelname**] [**-bindings**]
SNMP	add snmp manager [**-ipaddress**] [**-domainresolveretry** <integer>] rm snmp manager [**-ipaddress**] set snmp manager [**-ipaddress**] [**-netmask**] <netmask> [**-domainresolveretry** <integer>] show snmp manager [**-ipaddress**]
SSL	convert ssl pkcs12 [**-password**] [**-pempassphrase**] create ssl certReq [**-countryname** <string>] [**-statename** <string>] [**-organizationname** <string>] [**-organizationunitname** <string>] [**-localityname** <string>] [**-commonname** <string>] [**-emailaddress** <string>] [**-challengepassword**] [**-companyname** <string>] create ssl cert [**-pempassphrase**] set ssl parameter [**-pushflag** <positive_integer>] [**-dropreqwithnohostheader** (YES | NO)] [**-pushenctriggertimeout** <positive_integer>] set ssl service [**-pushenctrigger** <pushEncTrigger>] set ssl vserver [**-pushenctrigger** <pushEncTrigger>] add ssl ocspResponder [**-insertclientcert** (YES | NO)] set ssl ocspResponder [**-insertclientcert** (YES | NO)] unset ssl ocspResponder [**-insertclientcert** (YES | NO)]

System	add system user [**-promptstring** <string>] set system user [**-promptstring** <string>] add system group [**-promptstring** <string>] set system group [**-groupname**] [**-promptstring** <string>] set system parameter [**-promptstring** <string>]
Traffic Management	add tm sessionAction [**-persistentcookie** (ENABLED | DISABLED)] [**-persistentcookievalidity** <mins>] set tm sessionAction [**-persistentcookie** (ENABLED | DISABLED)] [**-persistentcookievalidity** <positive_integer>] set tm sessionParameter [**-persistentcookie** (ENABLED | DISABLED)] [**-persistentcookievalidity** <positive_integer>] unset tm sessionParameter [**-persistentcookie**] add tm trafficAction [**-persistentcookie** (ENABLED | DISABLED)] set tm trafficAction [**-persistentcookie** (ENABLED | DISABLED)]
Network	ping6 [**-v** <vlanid>]
Access Gateway	add vpn vserver [**-appflowlog** (ENABLED | DISABLED)] set vpn vserver [**-appflowlog** (ENABLED | DISABLED)]

Web Interface	install wi package [**-jre** <URL>] [**-wi** <URL>] [**-clearsites**] [**-maxsites** <maxSites>] add wi site [**-sitepath**] [**-agurl**] [**-wiauthenticationmethods** (Explicit | Anonymous)] [**-sitetype** (XenAppWeb | XenAppServices)] [**-publishedresourcetype** <publishedResourceType>] [**-kioskmode** (ON | OFF)] rm wi site [**-sitepath**] set wi site [**-sitepath**] [**-agurl** <string>] [**-staurl** <string>] [**-sessionreliability** (ON | OFF)] [**-usetwotickets** (ON | OFF)] [**-secondstaurl** <string>] [**-wiauthenticationmethods** (Explicit | Anonymous)] [**-authenticationpoint** (WebInterface | AccessGateway)] [**-publishedresourcetype** <publishedResourceType>] [**-kioskmode** (ON | OFF)] bind wi site [**-sitepath**] [**-farmname**] [**-xmlserveraddresses**] [**-xmlport** <positive_integer>] [**-transport** <transport>] [**-loadbalance** (ON | OFF)] unbind wi site [**-sitepath**] [**-farmname**] show wi site [**-sitepath**]
Cloud Bridge	add ipsec peer [**-name**] [**-fqdn**] [**-peerfqdn**] [**-localip**] [**-peerip**] [**-encalgo** (AES | 3DES)] [**-hashalgo** <hashAlgo>] [**-lifetime** <positive_integer>] [**-psk**] [**-publickey** <string>] show ipsec peer [**-name**] rm ipsec peer [**-name**] set ipsec parameter [**-encalgo** (AES | 3DES)] [**-hashalgo** <hashAlgo>] [**-lifetime** <positive_integer>] unset ipsec parameter [**-encalgo**] [**-hashalgo**] [**-lifetime**]

Deprecated Parameters

The following parameters are deprecated in release 9.3.

- add appfw profile **-stripcomments**
- set appfw profile **-stripcomments**
- add gslb vserver **-iptype**
- set gslb vserver **-iptype**
- unset lb vserver **-redirecturl**
- set ns tcpParam **-recvbuffsize**

New SNMP OIDs

The following table lists the new SNMP OIDs in release 9.3.

Table 1. New SNMP OIDs

OID	Description
ACL	
1.3.6.1.4.1.5951.4.1.1.22.6	Statistical information about the configured SimpleACL6s, in the rs9000 product family of NetScaler products.
1.3.6.1.4.1.5951.4.1.1.22.6.1	Total packets that matched a SimpleACL6 with action BRIDGE and were bridged by NetScaler.
1.3.6.1.4.1.5951.4.1.1.22.6.2	Packets dropped because they match a simple deny ACL6.
1.3.6.1.4.1.5951.4.1.1.22.6.3	Total packets that matched a SimpleACL6 with action ALLOW and got consumed by NetScaler.
1.3.6.1.4.1.5951.4.1.1.22.6.4	Packets matching a simple ACL6.
1.3.6.1.4.1.5951.4.1.1.22.6.5	Packets not matching any simple ACL6.
1.3.6.1.4.1.5951.4.1.1.22.6.6	Number of simple ACL6s configured.
Networking	
1.3.6.1.4.1.5951.4.1.1.24.1.25	VLAN alias name if configured.
1.3.6.1.4.1.5951.4.1.1.70	This table contains information about the IPv6 addresses configured on the NetScaler. This is indexed on nsInetAddressType and nsInetAddress.
1.3.6.1.4.1.5951.4.1.1.70.1.1	The address type of nsInetAddress.
1.3.6.1.4.1.5951.4.1.1.70.1.2	The IPv4/IPv6 address configured on the NetScaler.
1.3.6.1.4.1.5951.4.1.1.70.1.3	The netmask length.
1.3.6.1.4.1.5951.4.1.1.70.1.4	The IP address type.
1.3.6.1.4.1.5951.4.1.1.70.1.5	The IP address mode.
1.3.6.1.4.1.5951.4.1.1.70.1.6	The number of unused ports free on this IP address.
1.3.6.1.4.1.5951.4.1.1.70.1.7	The vLAN to which this IP address is bound.
1.3.6.1.4.1.5951.4.1.1.70.1.8	The bridge group to which this IP address is bound.

Application Firewall	
1.3.6.1.4.1.5951.4.1.1.64.1.32	Number of requests returning XML generic error from the backend server.
1.3.6.1.4.1.5951.4.1.1.64.1.33	Number of Signature violations seen by the Application Firewall.
1.3.6.1.4.1.5951.4.1.1.64.2.1.33	Number of requests returning XML generic violation from the backend server.
1.3.6.1.4.1.5951.4.1.1.64.2.1.34	Number of Signature violations seen by the Application Firewall.
Load Balancing	
1.3.6.1.4.1.5951.4.1.3.6.1.6	Number of times MSTS RDP Cookie got parsed on this vserver.
DNS	
1.3.6.1.4.1.5951.4.1.10.2.26	The name of the DNS key that is due for expiry.
1.3.6.1.4.1.5951.4.1.10.2.27	The amount of time for the key to expire.
1.3.6.1.4.1.5951.4.1.10.2.28	The unit of the time of expiry.
1.3.6.1.4.1.5951.4.1.10.2.29	The new name of the entity after the name was changed.
1.3.6.1.4.1.5951.4.1.10.2.30	The old name of the entity.

Deprecated SNMP OIDs

The following SNMP OIDs are deprecated in release 9.3.

- 1.3.6.1.4.1.5951.4.1.1.23.13
- 1.3.6.1.4.1.5951.4.1.1.63.2
- 1.3.6.1.4.1.5951.4.1.1.63.3
- 1.3.6.1.4.1.5951.4.1.1.63.5
- 1.3.6.1.4.1.5951.4.1.10.2.21
- 1.3.6.1.4.1.5951.4.1.10.2.22

Upgrading or Downgrading the System Software

NetScaler 9.3 offers new and updated features with increased functionality. A comprehensive list of enhancements is listed in the release notes accompanying the release announcement. Take a moment to read this document before you upgrade your software.

It is important to understand the licensing framework and types of licenses before you upgrade your software. A software edition upgrade may require new licenses, such as upgrading from the standard edition to the enterprise edition, the standard edition to the platinum edition, or the enterprise edition to the platinum edition.

Changes to the Licensing Framework

The licensing framework has changed since release 8.1, build 65.5. For more information, see http://support.citrix.com/article/ctx121062.

Citrix NetScaler Application Accelerator users have been upgraded to the Citrix Access Gateway Enterprise Edition without any change in functionality.

NetScaler Licenses

A NetScaler must be properly licensed before it can be deployed to distribute, optimize, or secure network traffic for Web applications. After you have obtained the licenses, you must install the licenses on your appliance, and then verify that the features corresponding to these licenses are enabled.

Obtaining NetScaler Licenses

The procedure to obtain NetScaler licenses has changed. For more information, see http://support.citrix.com/article/ctx121062.

Installing NetScaler Licenses

Install each license to use the feature controlled by that license.

To install the licenses by using the NetScaler command line

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials.
3. Switch to the shell prompt, create a license subdirectory in the nsconfig directory, if it does not exist, and copy the new license file(s) to this directory.

   Example

   ```
   login: nsroot
   Password: nsroot
   Last login: Mon Aug  4 03:37:27 2008 from 10.102.29.9
   Done
   > shell
   Last login: Mon Aug  4 03:51:42 from 10.103.25.64
   root@ns# mkdir /nsconfig/license
   root@ns# cd /nsconfig/license
   ```

   Copy the new license file(s) to this directory.

To install the licenses by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler, such as `http://192.168.100.1`.
2. In **User Name** and **Password**, type the administrator credentials.
3. In **Start in**, select **Configuration**, and then click **Login**, as shown in the following figure.

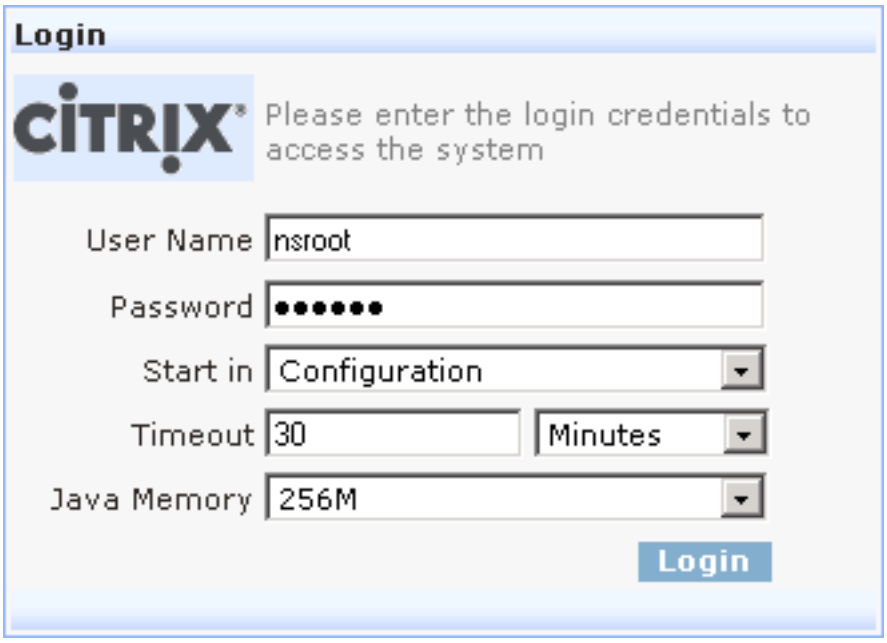

Figure 1. Login Screen

4. In the navigation pane, expand **System**, and then click **Licenses**.
5. In the **Licenses** pane, click **Manage Licenses**. If the /nsconfig/license directory does not exist, you are prompted to create it.
6. In the **Manage Licenses** dialog box, click **Add**.
7. In the **Select License Files** dialog box, navigate to the location of the license files and select the file you want to upload (for example, Citrix NetScaler IPv6 - Option.lic).
8. Click **Select**.
9. After your file is uploaded to the license directory, click **OK**.
10. When prompted to restart the NetScaler, do one of the following:
    - If you plan to upgrade your software, click **No**.
    - If you don’t plan to upgrade your software, click **Yes** to restart the NetScaler.

Verifying the Licensed Features

Before using a feature, make sure that your license supports the feature.

To verify the licensed features by using the NetScaler command line

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials.
3. At the command prompt, enter the sh ns license command to display the features supported by the license.

   Example

   ```
   sh ns license
         License status:
                        Web Logging: YES
                  Surge Protection: YES
                    .......

                    HTML Injection: YES
    Done
   ```

To verify the licensed features by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler, such as `http://192.168.100.1`.

2. In **User Name** and **Password**, type the administrator credentials.

3. In **Start in**, select **Configuration**, and then click **Login**, as shown in the following figure.

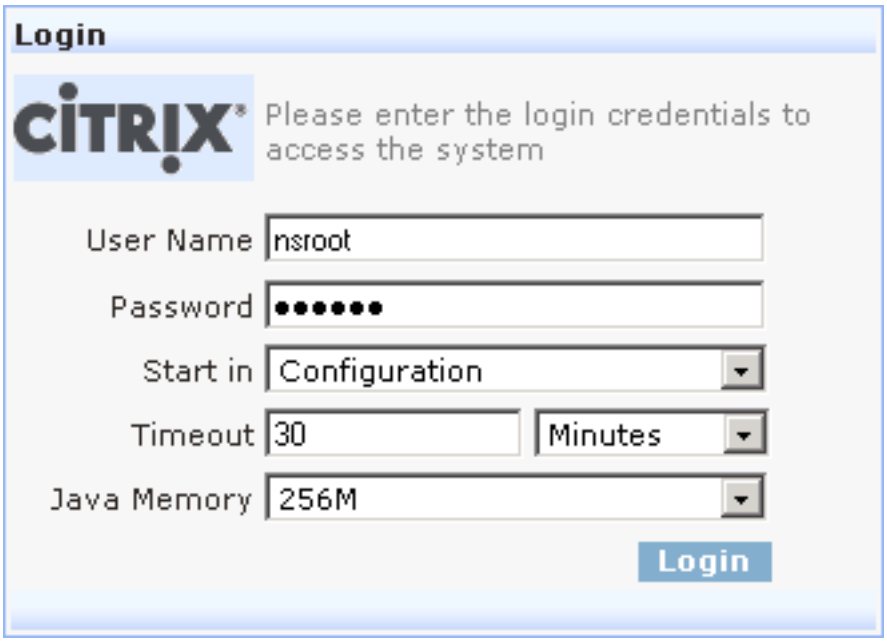

Figure 1. Login Screen

4. In the navigation pane, expand **System**, and then click **Licenses**. You will see a green check mark next to the licensed features.

Enabling or Disabling a Feature

When you use the NetScaler for the first time, you need to enable a feature before you can use its functionality. If you configure a feature before it is enabled, a warning message appears. The configuration is saved but it will apply only after the feature is enabled.

To enable a feature by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable a feature and verify the configuration:

- `enable feature <FeatureName>`
- `show feature`

Example

```
enable feature lb cs
done
 >show feature

      Feature                Acronym          Status
      -------                -------          ------
1)    Web Logging              WL               OFF
2)    Surge Protection         SP               ON
3)    Load Balancing           LB               ON
4)    Content Switching        CS               ON
5)    Cache Redirection        CR               ON
.
.
.
24)   NetScaler Push           push             OFF
Done
```

The example shows how to enable load balancing (lb) and content switching (cs).
If the license key is not available for a particular feature, the following error message appears for that feature:

```
ERROR: feature(s) not licensed
```

Note: To enable an optional feature, you need a feature-specific license. For example, if you have purchased and installed the Citrix NetScaler Enterprise Edition license and need to enable the Integrated Caching feature, you first need to purchase and install the AppCache license.

To disable a feature by using the NetScaler command line

At the NetScaler command prompt, type the following commands to disable a feature and verify the configuration:

- `disable feature <FeatureName>`
- `show feature`

Example

```
> disable feature lb
 Done
> show feature

      Feature                 Acronym          Status
      -------                 -------          ------
1)    Web Logging               WL               OFF
2)    Surge Protection          SP               ON
3)    Load Balancing            LB               OFF
4)    Content Switching         CS               ON
.
.
.
24)   NetScaler Push            push             OFF
Done
>
```

The example shows how to disable load balancing (lb).

Access Gateway Universal License

The Access Gateway universal license limits the number of concurrent user sessions to the number of licenses purchased. If you purchase 100 licenses, you can have 100 concurrent sessions at any time. When a user ends a session, that license is released for the next user. A user who logs on to the Access Gateway from more than one computer occupies a license for each session.

If all licenses are occupied, no additional connections can be opened until a user ends a session or the administrator terminates the session using the configuration utility. When a connection is closed, the license is released and can be used for a new user.

Obtaining the Universal License

You need the following information before going to the Citrix Web site for the universal license.

The license code

You can find the code on the Access Gateway CD, in an email you receive from Citrix, or from the Subscription Advantage Management-Renewal-Information (SAMRI) system.

Your user ID and password for My Citrix

Register at My Citrix (www.mycitrix.com) to receive your user ID and password.

Note: If you cannot locate either the license code or your user ID and password, contact Citrix Customer Service.

The host name of the Access Gateway

The entry field for this name on My Citrix is case-sensitive, so make sure that you copy the host name exactly as it is configured on the NetScaler.

The number of licenses you want to include in the license file

You do not have to download all of the licenses you are entitled to at once. For example, if your company purchased 100 licenses, you can choose to download 50. You can allocate the rest in another license file at a later time. Multiple license files can be installed on the Access Gateway.

Note: Before obtaining your licenses, make sure you configure the host name of the NetScaler using the Setup Wizard and then restart the NetScaler.

To obtain your universal license

1. In a Web browser, go to http://www.citrix.com/ and click **My Citrix**.
2. Enter your user name and password. If this is the first time you are logging on to the site, you are asked for additional background information.
3. Under **My Tools**, point to **Choose a toolbox**, and click **Activation System/Manage Assets**.
4. In the **Current Tool** drop-down menu, **select Activate/Allocate** and follow the directions to obtain your license file.

Installing the Universal License

To install the license, see Installing NetScaler Licenses. After installation, verify that the license was installed correctly.

Verifying Installation of the Universal License

Before proceeding, verify that your universal license is installed correctly.

To verify installation of the universal license by using the NetScaler command line

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials.
3. Use the show license command to verify that “SSL VPN = YES” and that Maximum Users has increased from 5 to the expected number of concurrent users.

To verify installation of the universal license by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler, such as `http://192.168.100.1`.
2. In **User Name** and **Password**, type the administrator credentials.
3. In the navigation pane, expand **System**, and then click **Licenses**.
4. In the Licenses pane, you will see a green check mark next to **Access Gateway**. The field **Maximum Access Gateway Users Allowed** displays the number of concurrent user sessions licensed on the NetScaler.

Upgrading to Release 9.3

You can upgrade to release 9.3 on a standalone NetScaler or a high availability (HA) pair by using the configuration utility or the NetScaler command line.

Important:

If an IPv6 address is configured as the NetScaler IP (NSIP) address, upgrading from release 8.1 to release 9.3 changes the NSIP address to the subnet IP (SNIP) address. To add the NSIP address after the upgrade, at the NetScaler command line, type:

```
rm ns ip6
```

```
add ns ip6 <ipv6 address> -type NSIP.
```

There is no change if the NSIP address is an IPv4 address.

Upgrading a Standalone NetScaler

Before upgrading the system software, make sure that you have the required licenses. For more information, see NetScaler Licenses. Software upgrades from 8.x to 9.x do not require a new license.

Note: When upgrading from release 8.0, 8.1, 9.0, 9.1, or 9.2, you have the option to use the configuration utility. All upgrades can be performed by using the command line, which is the recommended option. When using the upgrade wizard in the configuration utility to upgrade from release 8.0, do not use the **Device** option to upload your software.

To upgrade a standalone NetScaler running release 8.0, 8.1, 9.0, 9.1, or 9.2 by using the command line

In the following procedure, <release> and <releasenumber> represent the release version you are upgrading to, and <targetbuildnumber> represents the build number that you are upgrading to. Refer to the table below for specific values.

Note: The 9.2 and 9.3 installation package name contains hyphens instead of underscores. The target build number for 9.2 and 9.3 classic contains _cl, for example build-9.2-25_cl.tgz and build-9.3-25_cl.tgz. The target build number for 9.2 and 9.3 nCore contains _nc, for example build-9.2-12_nc.tgz and build-9.3-12_nc.tgz. Older releases use the underscore as stated in the following procedure.

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.

2. Log on to the NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:`save config`

3. Create a copy of the ns.conf file. At the shell prompt, type:

   a. cd /nsconfig

   b. cp ns.conf ns.conf-.NS<releasenumber><currentbuildnumber>

   You should backup a copy of the configuration file on another computer.

4. Create a <releasenumber>nsinstall subdirectory in the /var/nsinstall directory.

5. Change directory to /var/nsinstall/<releasenumber>nsinstall, create a directory named build_<targetbuildnumber>, and change to this directory.

6. Download or copy the installation package (build_<release>_<build number>._nc.tgz) and the documentation bundle (ns-<releasenumber>-<build number>-doc.tgz) to this directory and extract the contents of the installation package. To download the installation package from the Citrix Web site, follow the steps below:

   a. Go to MyCitrix.com, log on using your credentials, and click **Support > Downloads**.

b. In the **Search Downloads by Product list**, select **Citrix NetScaler**.

c. Under **Firmware**, click the release and build number to download.

d. Click **Get Firmware**.

e. Click **Show Documentation** and then click **Get Documentation**.

7. Run the installns script to install the new version of the system software.

   Note: To install a FIPS appliance, run the installns script with the -F option. To automatically clean up the flash, run the installns script with the -c option.

   Warning: When upgrading to the NetScaler 9.3 nCore build, the installation script prompts you to delete the /var directory if the swap partition is smaller than 32 gigabytes (GB). If you receive this prompt, type N, save any important files located in /var to a backup location, and then re-run the installation script.

   If the free space available on the flash drive is insufficient to install the new build, the NetScaler prompts you to initiate a cleanup of the flash drive. For more information, see Auto Cleanup.

8. When prompted, restart the NetScaler.

Example

```
login: nsroot
Password: nsroot
Last login: Mon Aug  4 03:37:27 2008 from 10.102.29.9
Done
> save config
> shell
Last login: Mon Aug  4 03:51:42 from 10.103.25.64
root@NSnnn# cd /nsconfig
root@NSnnn# cp ns.conf ns.conf.NS9.3-15
root@NSnnn# cd /var/nsinstall
root@NSnnn# cd 9.3nsinstall
root@NSnnn# mkdir build_25
root@NSnnn# cd build_25
root@NSnnn# ftp ... get build-9.3-25.tgz
root@NSnnn# get ns-9.3-25-doc.tgz
root@NSnnn# tar xzvf build-9.3-25.tgz
root@NSnnn# ./installns
installns version (9.3-25) kernel (ns-9.3-25.gz)
...
...
...
Copying ns-9.3-25.gz to /flash/ns-9.3-25.gz ...
```

```
Changing /flash/boot/loader.conf for ns-9.3-25 ...
Installing documentation...

Installation has completed.

Reboot NOW? [Y/N] Y
```

To upgrade a standalone NetScaler running release 8.0, 8.1, 9.0, 9.1, or 9.2 by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler, such as `http://10.102.29.50`.
2. In **User Name** and **Password**, type the administrator credentials.
3. 
   In **Start in**, select **Configuration**, and then click **Login**, as shown in the following figure.
4. In the configuration utility, in the navigation pane, click **System**.
5. In the **System Overview** page, click **Upgrade Wizard**.
6. Follow the instructions to upgrade the software.
7. When prompted, select **Reboot**.

   Note: After the upgrade, close all browser instances and clear your computer's cache before accessing the appliance.

Upgrading a High Availability Pair

To upgrade the system software on NetScaler units in a high availability pair, you need to upgrade the software first on the secondary node and then on the primary node.

To upgrade NetScaler units in a high availability pair running release 8.0, 8.1, 9.0, 9.1, or 9.2 by using the NetScaler command line

Machine A is the primary node and machine B is the secondary node before the upgrade.

On machine B (original secondary node)

1. Follow the procedure for upgrading a standalone node as described in Upgrading a Standalone NetScaler.

2. After the NetScaler restarts, log on using the administrator credentials and enter the show ha node command to verify that the NetScaler is a secondary node and synchronization and propagation are disabled.

   Example

```
login: nsroot
Password: nsroot
Last login: Mon Aug  4 08:37:26 2008 from 10.102.29.9
Done
show ha node
        2 nodes:
1)      Node ID:      0
        IP:       10.0.4.2
        Node State: UP
        Master State: Secondary
        ...
        Sync State: AUTO DISABLED
        Propagation: AUTO DISABLED
        ...
Done
```

Note: Before upgrading the primary node (machine A), you have the option to test the new release by entering the force failover command on the secondary node (machine B). When you do so, machine B becomes the primary node. If machine B does not function as expected, enter the force failover command on the new primary node (machine B) forcing it to again become the secondary node, and contact Citrix Customer Service before proceeding. If machine B properly assumes the role of primary node, proceed with upgrading the former primary node (machine A).

On machine A (original primary node)

3. Follow the procedure for upgrading a standalone node as described in Upgrading a Standalone NetScaler.

4. After the NetScaler restarts, log on using the administrator credentials and enter the show ha node command to verify that the NetScaler is a secondary node and synchronization is disabled.

On machine B (new primary node)

5. Enter the show ha node command to verify whether machine B is the primary node.

On machine A (new secondary node)

6. Enter the show ns runningconfig command to verify whether the configuration of machine A has been synchronized with that of machine B

On machine B (new primary node)

7. Enter the save ns config command to save the configuration.

Machine B (original secondary node) is now the primary node and machine A (original primary node) is now the secondary node.

To upgrade NetScaler units in a high availability pair running release 8.0, 8.1, 9.0, 9.1, or 9.2 by using the configuration utility

1. Log on to the secondary node and perform the upgrade as described in To upgrade a standalone NetScaler running release 8.0, 8.1, 9.0, 9.1, or 9.2 by using the configuration utility.

   Note: Before upgrading the primary node (machine A), you have the option to test the new release by entering the force failover command at the NetScaler command line on the secondary node (machine B). When you do so, machine B becomes the primary node. If machine B does not function as expected, enter the force failover command at the NetScaler command line on the new primary node (machine B) forcing it to again become the secondary node, and contact Citrix Customer Service before proceeding. If machine B properly assumes the role of primary node, proceed with upgrading the former primary node (machine A).

2. Log on to the primary node and perform the upgrade as described in To upgrade a standalone NetScaler running release 8.0, 8.1, 9.0, 9.1, or 9.2 by using the configuration utility.

Upgrading to a Later Build within Release 9.3

You can upgrade from an earlier 9.3 build to a later 9.3 build on a standalone NetScaler or a high availability pair. This procedure can be performed by using the configuration utility or the NetScaler command line.

Upgrading a Standalone NetScaler to a Later Build

In the following procedure, <targetbuildnumber> is the build number that you are upgrading to within the 9.3 release.

To upgrade a standalone NetScaler running release 9.3 to a later build by using the NetScaler command line

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

   save config
3. Create a copy of the ns.conf file. At the shell prompt, type:

   a. cd /nsconfig

   b. cp ns.conf ns.conf.NS9.3-<currentbuildnumber>
4. Change directory to /var/nsinstall/9.3nsinstall, create a directory named build_<targetbuildnumber>, and change to this directory.
5. Download or copy the installation package (build-9.3-<targetbuildnumber>_nc.tgz) and the documentation bundle (ns-9.3-<targetbuildnumber>-doc.tgz) to this directory and extract the contents of the installation package.
6. Run the **installns** script to install the new version of the system software.

   Note: To install a FIPS appliance, run the installns script with the -F option. To automatically clean up the flash, run the installns script with the -c option.

   If the free space available on the flash drive is insufficient to install the new build, the NetScaler prompts you to initiate a cleanup of the flash drive. For more information, see Auto Cleanup.
7. When prompted, restart the NetScaler.

Example

```
login: nsroot
Password: nsroot
Last login: Mon Aug  4 03:37:27 2008 from 10.102.29.9
Done
> save config
> shell
Last login: Mon Aug  4 03:51:42 from 10.103.25.64
root@NSnnn# cd /nsconfig
root@NSnnn# cp ns.conf ns.conf.NS9.3-15
root@NSnnn# cd /var/nsinstall
root@NSnnn# cd 9.3nsinstall
root@NSnnn# mkdir build_25
root@NSnnn# cd build_25
root@NSnnn# ftp ... get build-9.3-25.tgz
root@NSnnn# get ns-9.3-25-doc.tgz
root@NSnnn# tar xzvf build-9.3-25.tgz
root@NSnnn# ./installns
installns version (9.3-25) kernel (ns-9.3-25.gz)
...
...
...
Copying ns-9.3-25.gz to /flash/ns-9.3-25.gz ...
Changing /flash/boot/loader.conf for ns-9.3-25 ...
Installing documentation...

Installation has completed.

Reboot NOW? [Y/N] Y
```

To upgrade a standalone NetScaler running release 9.3 to a later build by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler, such as `http://10.102.29.50`.
2. In **User Name** and **Password**, type the administrator credentials.
3. 
   In **Start in**, select **Configuration**, and then click **Login**, as shown in the following figure.
4. In the configuration utility, in the navigation pane, click **System**.
5. In the **System Overview** page, click **Upgrade Wizard**.
6. Follow the instructions to upgrade the software.
7. When prompted, select **Reboot**.

   Note: After the upgrade, close all browser instances and clear your computer's cache before accessing the appliance.

Upgrading a NetScaler High Availability Pair to a Later Build

To upgrade the system software on NetScaler units in a high availability pair, you need to upgrade the software first on the secondary node and then on the primary node.

Warning: In certain rare cases, synchronization and propagation are disabled if you upgrade only one of the nodes in an HA pair to a later build.

To determine whether synchronization and propagation are disabled, at the NetScaler command line type:

show ha node

Note: In an HA setup, both nodes must run NetScaler nCore or NetScaler classic. If the nodes are running NetScaler classic and you want to migrate to NetScaler nCore of the same NetScaler release, propagation and synchronization are not supported during the migration process. Once migration is complete, you have to manually enable propagation and synchronization. The same applies if you migrate from NetScaler nCore to NetScaler classic.

If synchronization and propagation are disabled, a new command added on the new primary node will not be propagated to the new secondary node. Also, if you restart the new secondary node, it will not synchronize and fetch the running configuration from the new primary node, but it will use the configuration that was last saved before the node was restarted.

To resolve this situation, upgrade both of the nodes to the same build as soon as possible and make sure that no new command is added on the new primary node when a different build is running on the new secondary node.

In the following procedure, machine A is the original primary and machine B is the original secondary node, and <targetbuildnumber> is the build number that you are upgrading to within the 9.3 release.

To upgrade a NetScaler high availability pair to a later build

On machine B (original secondary node)

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

   save config

3. Create a copy of the ns.conf file. At the shell prompt, type:

   a. cd **/nsconfig**

   b. cp **ns.conf ns.conf.NS9.3-**<currentbuildnumber>
4. Disable synchronization and propagation manually by entering the following commands in the order shown at the NetScaler command line:

   a. set HA node **-haSync** DISABLED

   b. set HA node **-haProp** DISABLED

   c. save config

   On machine A (original primary node)

5. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
6. Log on to the NetScaler by using the administrator credentials.
7. Disable synchronization and propagation manually by entering the following commands in the order shown at the NetScaler command line:

   a. set HA node **-haSync** DISABLED

   b. set HA node **-haProp** DISABLED

   c. save config

   On machine B (original secondary node)

8. Change directory to /var/nsinstall/9.3nsinstall, create a directory named build_<targetbuildnumber>, and change to this directory.
9. Download or copy the installation package (build-9.3-<targetbuildnumber>_nc.tgz) and the documentation bundle (ns-9.3-<targetbuildnumber>-doc.tgz) to this directory and extract the contents of the installation package.
10. Run the `installns` script to install the new version of the system software.

    Note: To install a FIPS appliance, run the installns script with the -F option. To automatically clean up the flash, run the installns script with the -c option.

    If the free space available on the flash drive is insufficient to install the new build, the NetScaler prompts you to initiate a cleanup of the flash drive. For more information, see Auto Cleanup.
11. When prompted, restart the NetScaler.
12. After the NetScaler restarts, log on using the administrator credentials and enter the show ha node command to verify that the NetScaler is a secondary node.

    Note: Before upgrading the primary node (machine A), you have the option to test the new build by entering the force failover command on the secondary node

(machine B). When you do so, machine B becomes the primary node. If machine B does not function as expected, enter the force failover command on the new primary node (machine B) forcing it to again become the secondary node, and contact Citrix Customer Service before proceeding. If machine B properly assumes the role of primary node, proceed with upgrading the former primary node (machine A) by following steps 13 through 19.

On machine A (original primary node)

13. Follow the procedure for upgrading a standalone node.
14. After the NetScaler restarts, log on using the administrator credentials and enter the show ha node command to verify that the NetScaler is a secondary node.
15. Enable synchronization and propagation manually by entering the following commands in the order shown at the NetScaler command line:
    a. set HA node **-haSync** ENABLED
    b. set HA node **-haProp** ENABLED
    c. save config

On machine B (new primary node)

16. Enter the show ha node command to verify that machine B is the primary node.
17. Enable synchronization and propagation by entering the following command in the order shown at the NetScaler command line:
    a. set HA node **-haSync** ENABLED
    b. set HA node **-haProp** ENABLED
    c. save config

On machine A (new secondary node)

18. Enter the show ns runningconfig command to verify that the configuration of machine A has been synchronized with that of machine B.

On machine B (new primary node)

19. Enter the save ns config command to save the current configuration.

Machine B (original secondary node) is now the primary node and machine A (original primary node) is now the secondary node.

Upgrading from the Classic Release to the nCore Release

To take advantage of the higher throughput and faster processing provided by nCore, you can upgrade your appliance from a classic build to an nCore build, either within the same release or from an earlier release to a later release.

Citrix nCore is supported by NetScaler MPX appliances and NetScaler VPX virtual appliances. Before you upgrade your appliance, make sure that your appliance meets the following requirements.

Following are the physical appliances that support nCore:

- MPX 5500
- MPX 7500/9500
- MPX 9700/10500/12500/15500
- MPX 9700/10500/12500/15500 10G
- MPX 9700/10500/12500/15500 10G FIPS
- MPX 11500/13500/14500/16500/18500/20500
- MPX 17500/19500/21500

If you are upgrading the software on the NetScaler VPX virtual appliance, make sure that that the following minimum memory and virtual CPU (VCPU) requirements are met.

- 2 GB RAM
- 2 VCPUs

For more information about upgrading to a later release, see Upgrading to release 9.3.

For more information about upgrading to a later build, see Upgrading to a Later Build within Release 9.3.

Downgrading from Release 9.3

You can downgrade to any release on a standalone NetScaler or a high availability pair by using the NetScaler command line.

Caution: Loss in configuration may occur when downgrading. You should compare the configurations before and after the downgrade, and then manually readd any missing entries.

This procedure provides steps to downgrade from release 9.3 to an earlier release. For downgrading to an earlier build within release 9.3, see Downgrading to an Earlier Build within Release 9.3.

Note: Downgrading using the configuration utility is not supported.

Downgrading a Standalone NetScaler

In the following procedure, <release> and <releasenumber> represent the release version you are downgrading to, and <targetbuildnumber> represents the build number that you are downgrading to. Refer to the table below for specific values.

Table 1. Release Version Values

Release Version	<release>	<releasenumber>
9.2	9.2	9.2
9.1	9.1	9.1
9.0	9.0	9.0
8.1	rhodes	8.1
8.0	andes	8.0
7.0	sierra	7.0

To downgrade a standalone NetScaler

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.

2. Log on to the NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

   save config

3. Create a copy of the ns.conf file. At the shell prompt, type:

   a. cd **/nsconfig**

   b. cp **ns.conf ns.conf.NS9.3-**<currentbuildnumber>
4. Copy the <releasenumber> configuration file (ns.conf.NS<releasenumber>) to ns.conf. At the shell prompt, type:

   cp **ns.conf.NS**<releasenumber> **ns.conf**

   Note: ns.conf.NS<releasenumber> is the backup configuration file that is automatically created when the system software is upgraded from release version <releasenumber> to the current release version. There may be some loss in configuration when downgrading. After the appliance restarts, compare the configuration saved in step 3 with the running configuration, and make any adjustments for features and entities configured before the downgrade. Save the running configuration after making the changes.

   Important: If you are downgrading from release 9.3 to release 7.0 and routing is enabled, perform step 5. Otherwise, skip to step 6.

5. If routing is enabled, the ZebOS.conf file will contain the configuration. At the shell prompt, type:

   a. cd **/nsconfig**

   b. cp **ZebOS.conf ZebOS.conf.NS**9.3-<currentbuildnumber>

   c. cp **ZebOS.conf.NS7.0 ZebOS.conf**
6. Change directory to /var/nsinstall/<releasenumber>nsinstall, or create one if it does not exist.

7. Change directory to build_<targetbuildnumber>, or create one if it does not exist.

8. Download or copy the installation package (build_<release>_<targetbuildnumber>.tgz) and the documentation bundle (ns-<releasenumber>-<targetbuildnumber>-doc.tgz) to this directory and extract the contents of the installation package.

9. Run the `installns` script to install the new version of the system software. If the free space available on the flash drive is insufficient to install the new build, the NetScaler prompts you to initiate a cleanup of the flash drive. For more information, see Auto Cleanup.

10. When prompted, restart the NetScaler.

Example

```
login: nsroot
Password: nsroot
Last login: Tue Aug  5 01:38:25 2008 from 10.102.29.9
Done
> save config
> shell

Installation has completed.

Reboot NOW? [Y/N] Y
```

Downgrading a High Availability Pair

To downgrade the system software on NetScaler units in a high availability pair, you need to downgrade the software first on the secondary node and then on the primary node. For instructions on downgrading each node separately, see Downgrading a Standalone NetScaler.

Downgrading to an Earlier Build within Release 9.3

You can downgrade from a later 9.3 build to an earlier 9.3 build on a standalone NetScaler or a high availability pair. This procedure must be performed by using the NetScaler command line.

Caution: Loss in configuration may occur when downgrading. You should compare the configurations before and after the downgrade, and then manually readd any missing entries.

Downgrading a Standalone NetScaler to an Earlier Build

In the procedure below, <targetbuildnumber> is the build number that you are downgrading to within the same release.

To downgrade a standalone NetScaler to an earlier build

1. Open an SSH connection to the NetScaler by using an SSH client, such as PuTTY.
2. Log on to the NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

   save config
3. Create a copy of the ns.conf file. At the shell prompt, type:

   a. cd /nsconfig

   b. cp ns.conf ns.conf.NS9.3-<currentbuildnumber>
4. Copy ns.conf.NS9.3-<targetbuildnumber> to ns.conf, if it exists. At the shell prompt, type:

   cp ns.conf.NS9.3-<targetbuildnumber> ns.conf

   Caution: If ns.conf.NS9.3-<targetbuildnumber> does not exist, loss in configuration may occur when downgrading to an earlier build. The errors and warnings appear only on the console. Please watch the console closely for these errors and warnings. After the appliance restarts, compare the configuration saved in step 3 with the running configuration, and make any adjustments for features and entities configured before the downgrade. Save the running configuration after making the changes.
5. Change directory to /var/nsinstall/9.3nsinstall.
6. Change directory to build_<targetbuildnumber>, or create one if it does not exist.
7. Download or copy the installation package (build-9.3-<targetbuildnumber>_nc.tgz) and the documentation bundle (ns-9.3-<targetbuildnumber>-doc.tgz) to this directory and extract the contents of the installation package.
8. Run the installns script to install the old version of the system software. If the free space available on the flash drive is insufficient to install the new build, the NetScaler prompts you to initiate a cleanup of the flash drive. For more information, see Auto Cleanup.
9. When prompted, restart the NetScaler.

Example

```
login: nsroot
Password: nsroot

Downgrading a NetScaler High Availability Pair to an Earlier Build

To downgrade the system software on NetScaler units in a high availability pair, you need to downgrade the software first on the secondary node and then on the primary node. For instructions on downgrading each node separately, see Downgrading a Standalone NetScaler to an Earlier Build.

Note: Note: In an HA setup, both nodes must run NetScaler nCore or NetScaler classic. If the nodes are running NetScaler classic and you want to migrate to NetScaler nCore of the same NetScaler release, propagation and synchronization are not supported during the migration process. Once migration is complete, you have to manually enable propagation and synchronization. The same applies if you migrate from NetScaler nCore to NetScaler classic.

Auto Cleanup

The cleanup procedure has been simplified in the later versions of release 7.0 (build 48 and later) and in releases 8.0, 8.1, 9.0, 9.1, and 9.2. You no longer have to manually delete build files from the flash drive. During the installation process, if the free space on the flash drive is found to be insufficient, the NetScaler prompts you to initiate the cleanup process.

Note: To automatically clean up the flash, run the installns script with the -c option.

When downgrading to release 7.0, the prompt looks like this:

```
Installation path for kernel will be /flash
Size of kernel ns-7.0-21.7.gz is 58003.323 kilobytes
Available space on /flash/ filesystem is 25075 kilobytes
Available space on /flash/ filesystem is insufficient to install ns-7.0-21.7.gz
Do you want Auto Cleanup [Y/N] ?
```

When upgrading to release 8.1, the prompt looks like this:

```
Installation path for kernel is /flash
Size of kernel ns-8.1-32.2.gz is 61062.235 kilobytes
Available space on /flash/ filesystem is 59108 kilobytes
Available space on /flash/ filesystem is insufficient to install ns-8.1-32.2.gz
Do you want installns to free space by archiving older releases? [Y/ N]
```

To initiate the cleanup process, press Y. Messages similar to the following appear:

```
Archiving older releases ...
  Creating the archive directory /var/nsbackup/ns_2007_2_16_1_6_26 ...
  Move //flash//ns-6.1-97.4.m.gz /var/nsbackup/ ns_2007_2_16_1_6_26ns-6.1-97.4.m.gz ...
  Move //flash//ns-8.1-32.2.gz /var/nsbackup/ns_2007_2_16_1_6_26ns-8.1-32.2.gz ...
Archive operation completed, free space is 156452, required space is 61062.235
```

The installation process automatically continues after successful completion of the cleanup.

Hardware Installation

The following sections describe the hardware installation and initial configuration for all NetScaler hardware platforms.

Introduction to the Hardware Platforms	Describes the NetScaler hardware platforms and provides detailed information about each platform and its components
Preparing for Installation	Describes how to unpack the NetScaler appliance and prepare the site and rack for installing the appliance. Lists the cautions and warnings that you should review before you install the appliance.
Installing the Hardware	Describes the steps to install the rails, mount the hardware, connect the cables, and turn on the appliance.
Initial Configuration	Describes how to perform initial configuration of your NetScaler appliance and assign management and network IP addresses.

Introduction to the Hardware Platforms

The NetScaler hardware platforms range from the single processor MPX 5500 and 7000 platforms to the high-capacity, fault-tolerant MPX 17500/19500/21500 hardware platforms. The various NetScaler hardware platforms are similar in that they use the same types of components, but different models provide different hardware capabilities. All NetScaler hardware platforms support the NetScaler operating system.

Some of the hardware platforms are available as dedicated application firewall appliances or secure application access appliances.

Introduction to the Hardware Platforms

The NetScaler hardware platforms range from the single processor MPX 5500 and 7000 platforms to the high-capacity, fault-tolerant MPX 17500/19500/21500 hardware platforms. The various NetScaler hardware platforms are similar in that they use the same types of components, but different models provide different hardware capabilities. All NetScaler hardware platforms support the NetScaler operating system.

Some of the hardware platforms are available as dedicated application firewall appliances or secure application access appliances.

Common Hardware Components

Each platform has front panel and back panel hardware components. The front panel has an LCD display and an RS232 serial console port. The number, type, and location of ports—copper Ethernet, copper and fiber SPF, SFP+, and XFP—vary by hardware platform. The back panel provides access to the power supply, fan, CompactFlash card, solid-state drive, and hard disk drive.

LCD Display

The LCD display on the front of every appliance displays messages about the current operating status of the appliance. These messages communicate whether your appliance has started properly and is operating normally. If the appliance is not operating normally, the LCD displays troubleshooting messages.

The LCD displays real-time statistics, diagnostic information, and active alerts. The dimensions of the LCD limit the display to two lines of 16 characters each, causing the displayed information to flow through a sequence of screens. Each screen shows information about a specific function.

The LCD has a neon backlight. Normally, the backlight glows steadily. When there is an active alert, it blinks rapidly. If the alert information exceeds the LCD screen size, the backlight blinks at the beginning of each display screen. When the appliance shuts down, the backlight remains on for one minute and then automatically turns off.

There are nine types of display screens on the LCD display. The first two screens in the following list, the booting screen and the startup screen, appear when your appliance is starting up. The other screens, except the out-of-service screen, can appear while the appliance is operating. They show configuration information, alerts, HTTP information, network traffic information, CPU load information, and port information for your appliance.

Booting Screen.

The booting screen is displayed immediately after the appliance is turned on. The first line displays the hardware platform, as shown in the following figure.

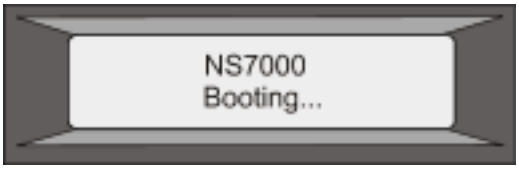

Figure 1. LCD Booting Screen

The newer MPX appliances display NSMPX followed by the platform number in the first line. For example, the MPX 7500/9500 appliances display NSMPX-7500. To view the model number, at the NetScaler command line, type show license. Scroll to the end of the command output to view the model number.

Startup Screen.

The startup screen is displayed for a few seconds after the appliance successfully begins operation. The first line displays the hardware platform, and the second line displays the software version and build number, as shown in the following figure.

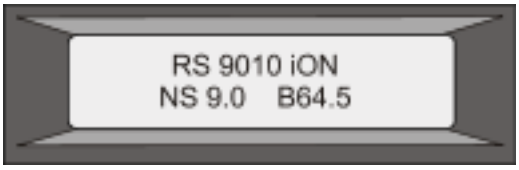

Figure 2. LCD Startup Screen

Out-of-Service Screen.

The out-of-service screen is displayed when the appliance has undergone a controlled shutdown, as shown in the following figure.

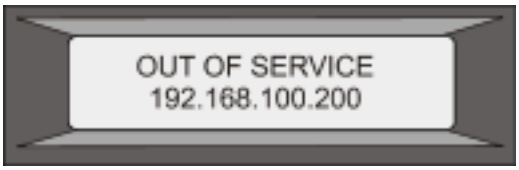

Figure 3. LCD Out-of-service Screen

Configuration Screen.

The first line displays the appliance status (STA, PRI, or SEC) and uptime. STA indicates that the appliance is in standalone mode, PRI indicates that the appliance is a primary node in a high availability (HA) pair, and SEC indicates that the appliance is a secondary node in an HA pair. Appliance uptime is displayed in HH:MM format. The second line displays the IP address of the appliance, as shown in the following figure.

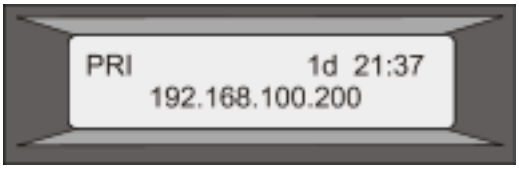

Figure 4. LCD Configuration Screen

Alert Screen.

An unknown alert is displayed differently than a known alert, as shown in the following figures. In either case, the first line displays the appliance status (STA, PRI, or SEC). STA indicates that the appliance is in standalone mode, PRI indicates that the appliance is a primary node in a high availability (HA) pair, and SEC indicates that the appliance is a secondary node in an HA pair. The second line displays the IP address of the appliance.

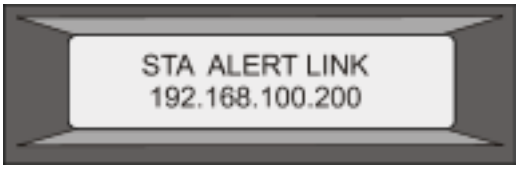

Figure 5. LCD Known Alert Screen

Figure 6. LCD Unknown Alert Screen

HTTP Statistics Screen.

The first line displays the rate of HTTP GETS per second. The second line displays the rate of HTTP POSTS per second, as shown in the following figure.

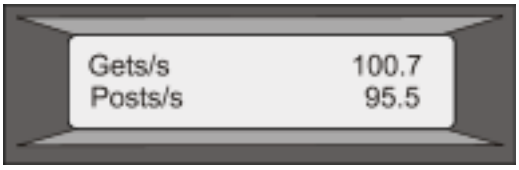

Figure 7. LCD HTTP Statistics Screen

Network Traffic Statistics Screen.

The first line displays the rate at which data is received, in megabits per second. The second line displays the rate of data transmission, in megabits per second, as shown in the following figure.

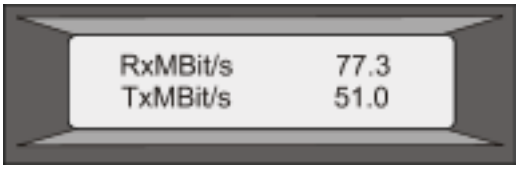

Figure 8. LCD Network Traffic Statistics Screen

CPU Load, Memory, and Connections Screen.

The first line displays CPU utilization and memory utilization as percentages. The second line displays the ratio of the number of server connections to the number of client connections.

Note: If the number of server or client connections exceeds 99,999, the number is displayed in thousands, indicated by the letter K.

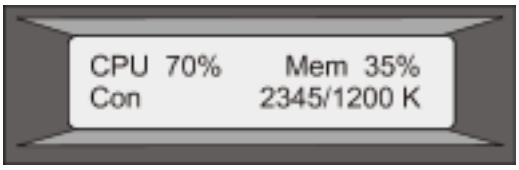

Figure 9. LCD CPU Load, Memory, and Connections Screen

Port Information Screen.

The S row displays port speed, flow control, and duplex information. The R row displays megabits received per second on the interface. The first port in each row is the management port.

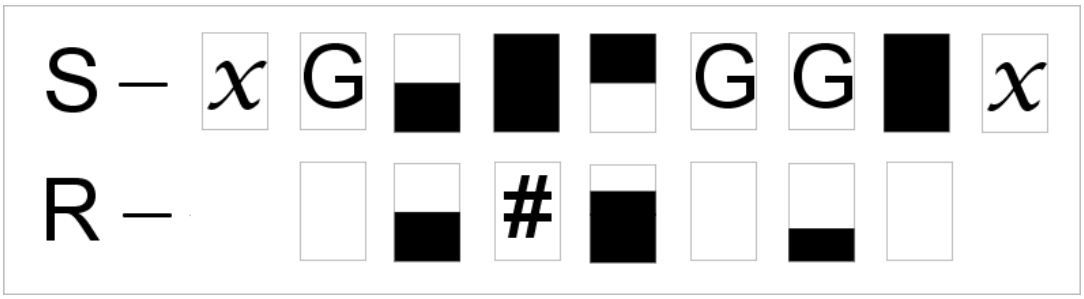

Figure 10. Port Information for an 8-port Appliance

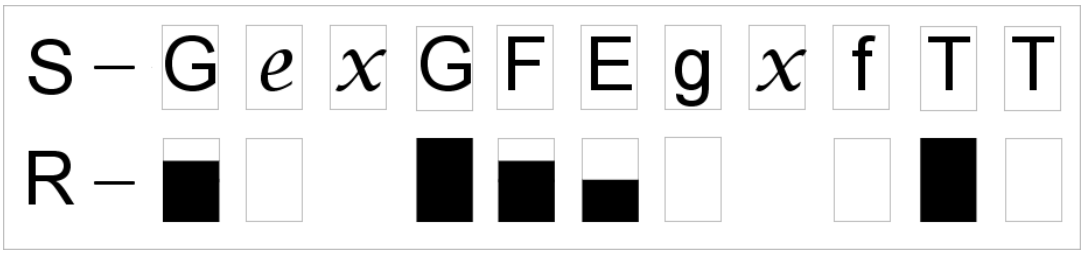

Figure 11. Port Information for a 10-port Appliance

The following table defines the various abbreviations and symbols that appear in the S row of the port information screen.

Table 1. Port Abbreviations and Symbols for S Row

S row abbreviation/symbol	Indicates

	A rate of 10 megabits per second, full duplex mode, and flow control OFF.
	A rate of 100 megabits per second, full duplex mode, and flow control OFF.
	A rate of 1 gigabit per second, full duplex mode, and flow control OFF.
	A rate of 10 gigabits per second, full duplex mode, and flow control OFF.
	A disconnected port. **Note:** The R row does not display an abbreviation or symbol for a disconnected port.
	Receive flow control regardless of speed or duplex mode.
	Transmit flow control regardless of speed or duplex mode.
	Receive and transmit flow control regardless of speed or duplex mode.

	A rate of 10 megabits per second, half duplex mode, and flow control OFF.
	A rate of 100 megabits per second, half duplex mode, and flow control OFF.
	A rate of 1 gigabit per second, half duplex mode, and flow control OFF.

The following table defines the various abbreviations and symbols that appear in the R row of the port information screen.

Table 2. Port Abbreviations and Symbols for R Row

R row abbreviation/symbol	Indicates
	The port is disabled.
	Receive speed is about 10% of line speed.
	Receive speed is about 50% of line speed.
	Receive speed is about 75% of line speed.
	Receive speed is about 100% of line speed.

Ports

Ports are used to connect the appliance to external devices. NetScaler appliances support RS232 serial ports, 10/100/1000Base-T copper Ethernet ports, 1-gigabit copper and fiber SFP ports, and 10-gigabit fiber SFP+ and XFP ports. All NetScaler appliances have a combination of some or all of these ports. For details on the type and number of ports available on your appliance, see the section describing that platform.

RS232 Serial Port

The RS232 serial console port on the front panel of each appliance provides a connection between the appliance and a computer, allowing direct access to the appliance for initial configuration or troubleshooting.

All hardware platforms ship with an appropriate serial cable used to connect your computer to the appliance. For instructions on connecting your computer to the appliance, see Installing the Hardware.

Copper Ethernet Ports

The copper Ethernet ports installed on many models of the appliance are standard RJ45 ports.

There are two types of copper Ethernet ports that may be installed on your appliance:

10/100BASE-T port

This type of port has a maximum transmission speed of 100 megabits per second (Mbps). Most platforms have at least one 10/100BASE-T port.

10/100/1000BASE-T port

This type of port has a maximum transmission speed of 1 gigabit per second, ten times faster than the other type of copper Ethernet port. Most platforms have at least one 10/100/1000Base-T port.

To connect any of these ports to your network, you plug one end of a standard Ethernet cable into the port and plug the other end into the appropriate network connector.

Management Ports

Management ports are standard copper Ethernet ports (RJ45) that are used for direct access to the appliance for system administration functions.

SFP, SFP+, and XFP Ports

An SFP port can operate at a speed of 1 Gbps. It accepts either a copper SFP transceiver for operation as a copper Ethernet port or a fiber SFP transceiver for operation as a fiber optic port.

The SFP+ and XFP ports are high-speed ports that can operate at speeds of 10 Gbps. You need a fiberoptic cable to connect to an SFP+ or XFP port. If the other end of the fiberoptic cable is attached to a 1GE SPF port, the 10GE SFP+ port automatically negotiates to match the speed of the 1GE SPF port.

The following tables list the maximum distance specifications for NetScaler pluggable media (SFP, SFP+, and XFP transceivers).

Note:

The tables are categorized by 1GE pluggable media and 10GE pluggable media.

The SFP+ modules are dual-speed capable and support both 1GE and 10GE, depending on the peer switch that the model connects to. These are listed in both tables.

Both tables have the following columns:

- SKU: Citrix maintains multiple SKUs for the same part.
- Description: The price list description of the part.
- Transmit Wavelength: The nominal transmit wavelength.
- Cable/Fiber Type: Fiber characteristics affect the maximum transmit distance achievable. This is especially true with 10GE on multi-mode fiber (MMF), where various dispersion components become dominant. For more information, see http://www.thefoa.org/tech/ref/basic/fiber.html.
- Typical Reach: Maximum transmit distance.
- Products: Some chassis are available with different media options. Use the appropriate data sheet to confirm that your particular chassis type supports the media.

1 GE Pluggable Media

The following table lists the maximum distance specifications for 1GE transceivers.

Table 1. Copper SFP (1GE) Distance Specifications

SKU	Description	Transmitter Wavelength (nm)	Cable Type	Typical Reach (m)	Products

EW3A0000235, EW3B0000235, EW3C0000235, EW3D0000235, EW3E0000235, EW3F0000235, EW3P0000143, EW3X0000235, EW3Z0000087	Citrix NetScaler SFP Gigabit Ethernet Copper (100m) - **4 Pack**	n/a	Category 5 (Cat-5) Copper Cable	100 m	MPX 7500/9500, MPX 9700/10500/12500/15500, 12000, 10010, 9500, 9010, 9010 FIPS

LED Port-Status Indicators

Note: This section applies to the MPX 5500, MPX 7500/9500, MPX 9700/10500/12500/15500, MPX 17500/19500/21500, MPX 11500/13500/14500/16500/18500/20500, and MPX 17550/19550/20550/21550 appliances.

The port LEDs show whether the link is established and traffic is flowing through the port. The following table describes the LED indicators for each port. There are two LED indicators for each port type.

Table 10. LED port-status indicators

Port Type	LED Location	LED Function	LED Color	LED Indicates
SFP+ (10 Gbps)	Left	Link/ Activity	Off	No link.
			Solid green	Link is established but no traffic is passing through the port.
			Blinking green	Traffic is passing through the port.
	Right	Speed	Off	No connection.
			Solid green	Traffic rate of 10 gigabits per second.
SFP (1 Gbps)	Left	Link/ Activity	Off	No link.
			Solid green	Link is established but no traffic is passing through the port.
			Blinking green	Traffic is passing through the port.
	Right	Speed	Off	No connection.
			Yellow	Traffic rate of 1 gigabit per second.

Ethernet (RJ45)	Left	Speed	Off	No connection, or a traffic rate of 10 megabits per second (Mbps).
			Green	Traffic rate of 100 Mbps.
			Yellow	Traffic rate of 1 gigabit per second.
	Right	Link/ Activity	Off	No link.
			Solid green	Link is established but no traffic is passing through the port.
			Blinking green	Traffic is passing through the port.
Management (RJ45)	Left	Speed	Off	No connection, or a traffic rate of 10 megabits per second (Mbps).
			Green	Traffic rate of 100 Mbps.
			Amber	Traffic rate of 1 gigabit per second.
	Right	Link/ Activity	Off	No link.
			Solid yellow	Link is established but no traffic is passing through the port.
			Blinking yellow	Traffic is passing through the port.

Power Supply

Appliances are configured with either a single power supply or, for higher capacity fault tolerant models, a dual power supply configuration.

The appliance ships with a standard power cord that plugs into the appliance's power supply and an NEMA 5-15 plug on the other end for connecting to the power outlet on the rack or in the wall.

For power-supply specifications, see Hardware Platforms, which describes the various platforms and includes a table summarizing the hardware specifications.

Note: If you suspect that a power-supply fan is not working, please see the description of your platform. On some platforms, what appears to be the fan does not turn, and the actual fan turns only when necessary.

For each power supply, a bi-color LED indicator shows the condition of the power supply.

Table 1. LED Power Supply Indicators

Power Supply Type	LED Color	LED Indicates
AC	OFF	No power to any power supply.
	Flashing RED	No power to this power supply.
	Flashing GREEN	Power supply is in standby mode.
	GREEN	Power supply is functional.
	RED	Power supply failure.
DC	OFF	No power to any power supply.
	Flashing RED	No power to this power supply.
	Flashing BLUE	Power supply is in standby mode.
	BLUE	Power supply is functional.
	RED	Power supply failure.

CompactFlash Card

The CompactFlash card contains the operating system for all hardware platforms except for the MPX 11500/13500/14500/16500/18500/20500, MPX 17500/19500/21500, and MPX 17550/19550/20550/21550 appliances. CompactFlash is mounted as /flash.

Solid-State Drive

The solid-state drive on the MPX 11500/13500/14500/16500/18500/20500, MPX 17500/19500/21500, and MPX 17550/19550/20550/21550 appliances contains the operating system. It is mounted as /flash.

Hard Disk Drive

The hard disk drive contains logs and other data files on all hardware platforms. It is mounted as /var.

Hardware Platforms

The various NetScaler hardware platforms offer a wide range of features, communication ports, and processing capacities. All the MPX platforms have multicore processors.

Citrix NetScaler 7000

The Citrix NetScaler 7000 appliance is a 1U appliance, with 1 single-core processor, and 1 gigabyte (GB) of memory.

Note: NetScaler 9.3 nCore release is not supported on this hardware platform.

The following figure shows the front panel of the 7000.

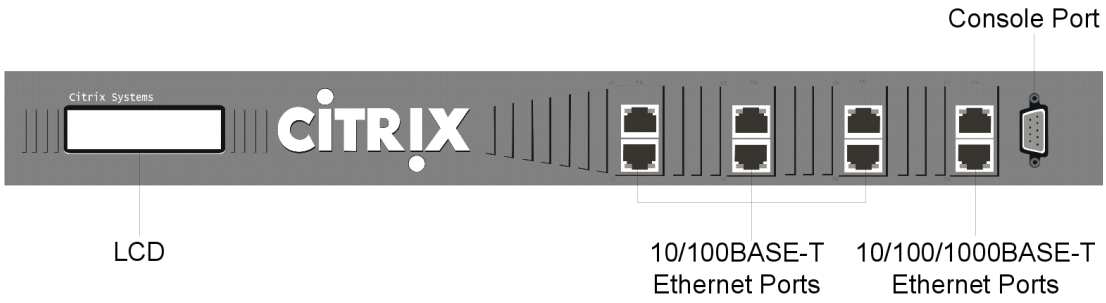

Figure 1. Citrix NetScaler 7000, front panel

The 7000 has the following ports:

- Six 10/100BASE-T copper Ethernet ports, named 1/1, 1/2, 1/3, 1/4, 1/5, and 1/6. Port 1/1 is the upper-left port, port 1/2 is the port beneath it, and the other 10/100BASE-T ports are named sequentially as you move from left to right, top to bottom.
- Two 10/100/1000BASE-T copper Ethernet ports, named 1/7 and 1/8. Port 1/7 is the upper port, and port 1/8 is the port beneath it.
- RS232 serial Console Port.

Note: The network port numbers on all appliances consist of two numbers separated by a forward slash. The first number is the port adapter slot number. The second number is the interface port number. Ports on appliances are numbered sequentially starting with 1.

The following figure shows the back panel of the 7000.

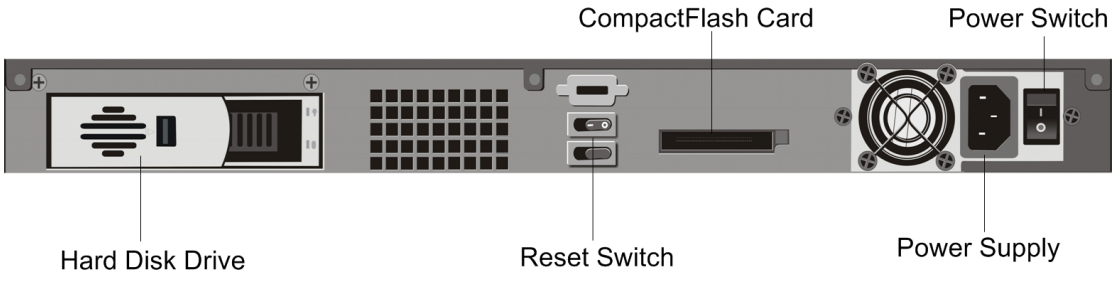

Figure 2. Citrix NetScaler 7000, back panel

The following components are visible on the back panel of the 7000:

- Removable Hard Disk Drive that is used to store user data.
- Appliance Reset Switch, which signals the 7000 to perform an orderly shutdown after saving all data.
- Removable CompactFlash Card that is used to store the operating system.
- Power Switch, which turns off power to the 7000 just as if you were to unplug it.
- Power Supply rated at 250 watts, 110-220 volts.

Citrix NetScaler 9010

The Citrix NetScaler 9010 appliance is a 2U appliance, with 1 single-core processor, and 2 GB of memory.

Note: NetScaler 9.3 nCore release is not supported on this hardware platform.

There are three models of the 9010: the copper Ethernet version, the fiber SFP (Small Form Factor Pluggable) version, and the FIPS (Federal Information Processing Standards) version. The following figure shows the front panel of the 9010 model with copper Ethernet ports.

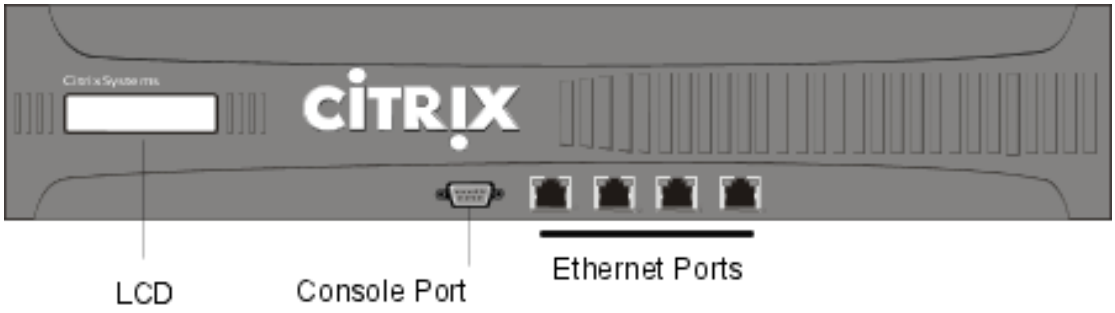

Figure 1. Citrix NetScaler 9010 front panel, with copper Ethernet ports

The following figure shows the front panel of the 9010 with fiber SFP ports.

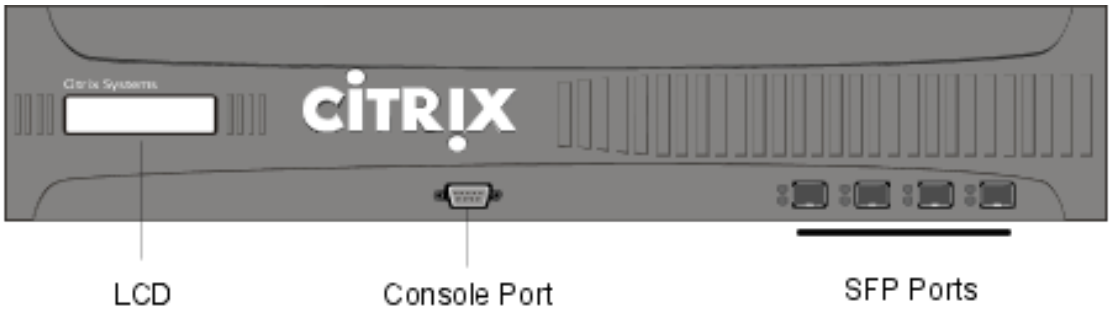

Figure 2. Citrix NetScaler 9010 front panel, with SFP ports

Depending on the model, the following components are visible on the front panel of the 9010:

- RS232 serial Console Port.
- Network ports
    - 9010, copper Ethernet model. Four copper Ethernet 10/100/1000BASE-T ports, numbered 1/1, 1/2, 1/3, and 1/4 from left to right.

- 9010, SFP model. Four SFP ports, numbered 1/1, 1/2, 1/3, and 1/4 from left to right. When facing the bezel, the upper LEDs to the left of each optical SFP port inset represent connectivity. They are lit and amber in color when active. The lower LEDs represent throughput. They are lit and green when active.

- 9010 FIPS model. Four ports, numbered 1/1, 1/2, 1/3, and 1/4 from left to right.

Note: The network port numbers on all appliances consist of two numbers separated by a forward slash. The first number is the port adapter slot number. The second number is the interface port number. Ports on appliances are numbered sequentially starting with 1.

The following figure shows the back panel of the 9010 models.

Note: The back panels of the three 9010 models are the same.

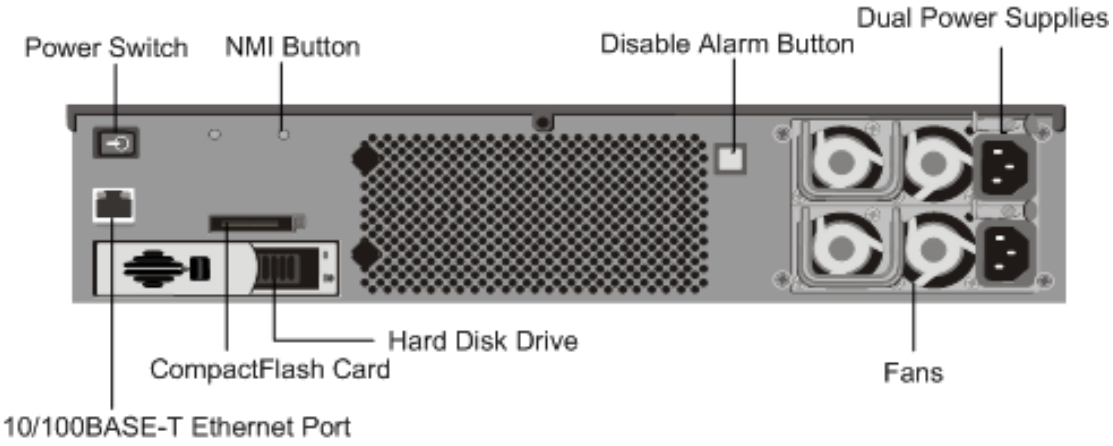

Figure 3. Citrix NetScaler 9010, back panel

The following components are visible on the back panel of the 9010 models:

- Power Switch, which turns off power to the 9010, just as if you were to unplug both power supplies.

- Non-maskable interrupt (NMI) Button that is used at the request of Technical Support and produces a core dump on the NetScaler. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.

- Disable Alarm Button, which silences the alarm that the 9010 sounds when it is receiving power from only one of its power supplies. Press this button to prevent the power alarm from sounding when you have plugged the 9010 into only one power outlet or when one power supply is malfunctioning and you wish to continue operating the 9010 until it is repaired.

- Dual Power Supplies, each rated at 500 watts, 110-220 volts. You plug separate power cords into the power supplies and connect them to separate wall sockets. The 9010 functions properly with a single power supply; the extra power supply serves as a backup.

- 10/100BASE-T copper Ethernet port, numbered 0/1.

- Removable CompactFlash Card that is used to store the operating system.
- Removable Hard Disk Drive that is used to store user data.

Citrix NetScaler 10010

The Citrix NetScaler 10010 appliance is a 2U appliance, with 1 single-core processor, and 4 GB of memory.

Note: NetScaler 9.3 nCore release is not supported on this hardware platform.

The following figure shows the front panel of the 10010.

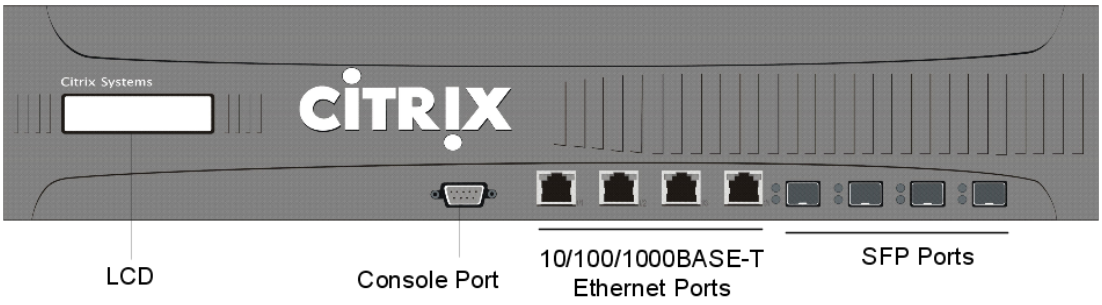

Figure 1. Citrix NetScaler 10010, front panel

Depending on the model, the following components are visible on the front panel of the 10010:

- RS232 serial Console Port.
- Four copper Ethernet 10/100/1000BASE-T ports, numbered 1/5, 1/6, 1/7, and 1/8 from left to right.
- Four Small Form Factor Pluggable (SFP) ports, numbered 1/1, 1/2, 1/3, and 1/4 from left to right. When facing the bezel, the upper LEDs to the left of each optical SFP port inset represent connectivity. They are lit and amber in color when active. The lower LEDs represent throughput. They are lit and green when active.

Note: The network port numbers on all appliances consist of two numbers separated by a forward slash. The first number is the port adapter slot number. The second number is the interface port number. Ports on appliances are numbered sequentially starting with 1.

The following figure shows the back panel of the 10010.

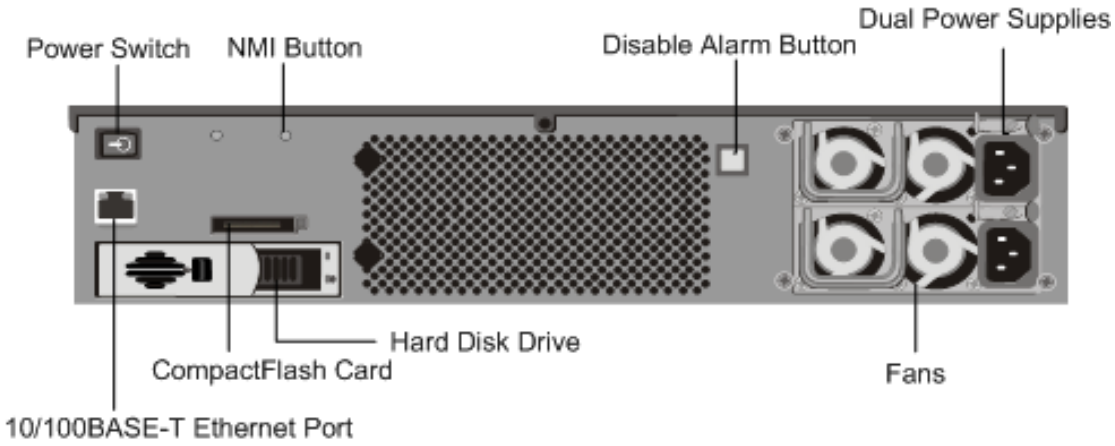

Figure 2. Citrix NetScaler 10010, back panel

The following components are visible on the back panel of the 10010:

- Power Switch, which turns off power to the 10010, just as if you were to unplug both power supplies.
- Non-maskable interrupt (NMI) button, which signals the 10010 to perform an orderly shutdown after saving all files. You must use a pen, pencil, or other pointed object to press this button, which is located inside a small hole to prevent it being pressed accidentally.
- Disable Alarm Button, which silences the alarm that the 10010 sounds when it is receiving power from only one of its power supplies. Press this button to prevent the power alarm from sounding when you have plugged the 10010 into only one power outlet or when one power supply is malfunctioning and you wish to continue operating the 10010 until it is repaired.
- Dual Power Supplies, each rated at 500 watts, 110-220 volts. You plug separate power cords into the power supplies and connect them to separate wall sockets. The 10010 functions properly with a single power supply; the extra power supply serves as a backup.
- 10/100BASE-T copper Ethernet port, numbered 0/1.
- Removable CompactFlash Card that is used to store the operating system.
- Removable Hard Disk Drive that is used to store user data.

Citrix NetScaler 12000

The Citrix NetScaler 12000 appliance is a 2U appliance, with 2 single-core processors, and 4 GB of memory. The 12000 is a high-capacity, fault-tolerant hardware platform intended for heavy use in data center environments.

Note: NetScaler 9.3 nCore release is not supported on this hardware platform.

The 12000 comes in four models: the fiber model, the copper model, the mixed model, and the 10G model. The following figure shows the front panel of the 12000 fiber model.

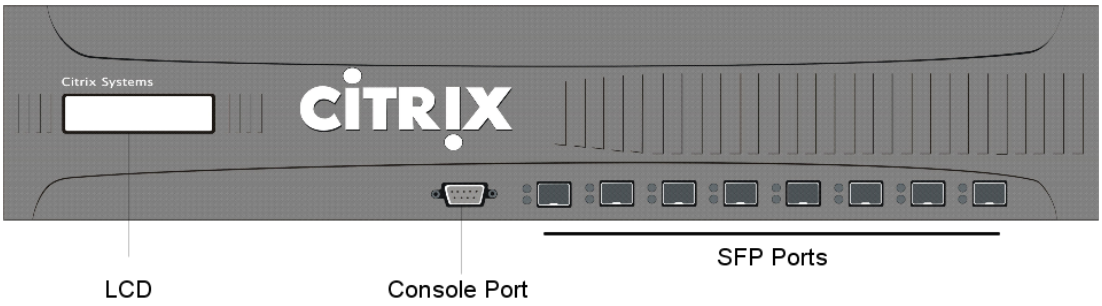

Figure 1. Citrix NetScaler 12000 fiber, front panel

The fiber model has eight fiber Small Form Factor Pluggable (SPF) ports. The copper model has eight copper SFP ports instead of eight fiber SFP ports, located in the same places. The mixed model has four copper SFP ports located in the left four positions and four fiber SFP ports located in the right four positions.

The following figure shows the front panel of the 12000-10G model.

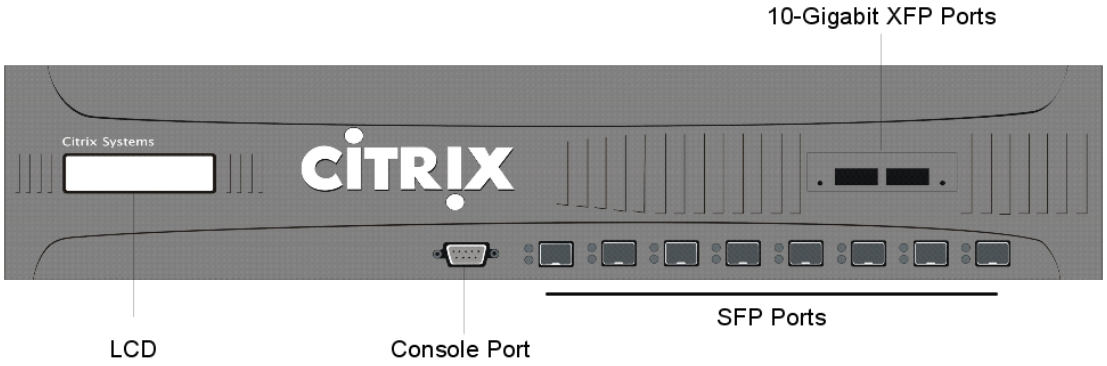

Figure 2. Citrix 12000-10G, front panel

Depending on the model, the following components are visible on the front panel of the 12000:

- RS232 serial Console Port.

- Network ports
  - 12000 Fiber. Eight fiber SFP ports, numbered 1/1, 1/2, 1/3, 1/4, 1/5, 1/6, 1/7, and 1/8 from left to right.
  - 12000 Copper. Eight copper SFP ports, numbered 1/1, 1/2, 1/3, 1/4, 1/5, 1/6, 1/7, and 1/8 from left to right.
  - 12000 Mixed. Four copper SFP ports, numbered 1/1, 1/2, 1/3, and 1/4, and four fiber SFP ports, numbered 1/5, 1/6, 1/7, and 1/8 from left to right.
  - 12000-10G. Eight SFP ports, numbered 1/1, 1/2, 1/3, 1/4, 1/5, 1/6, 1/7, and 1/8 from left to right, and two XFP (10-Gigabit Small Form Factor Pluggable) ports, numbered 1/9 and 1/10. When facing the bezel, the upper LEDs to the left of each optical SFP port represent connectivity. They are lit and amber in color when active. The lower LEDs represent throughput. They are lit and green when active.

  Note: The network port numbers on all appliances consist of two numbers separated by a forward slash. The first number is the port adapter slot number. The second number is the interface port number. Ports on appliances are numbered sequentially starting with 1.

The following figure shows the back panel of all 12000 models.

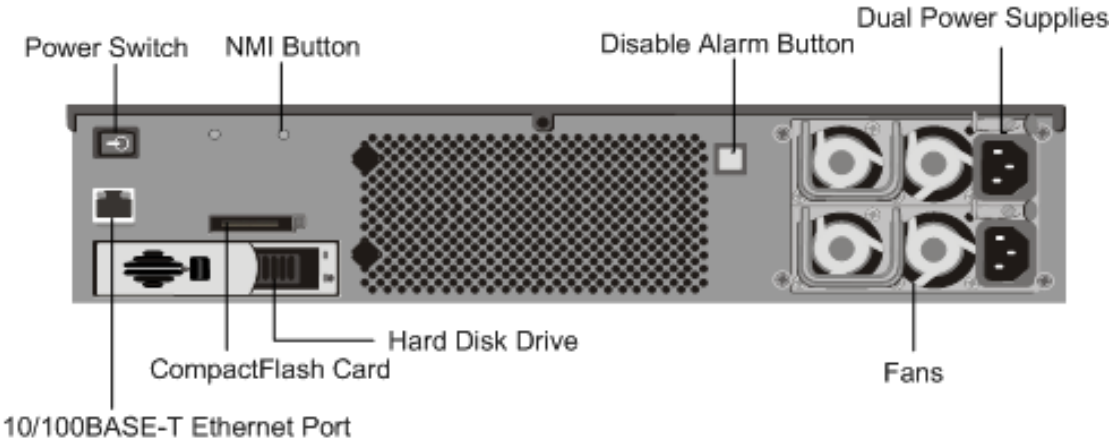

Figure 3. Citrix NetScaler 12000, back panel

The following components are visible on the back panel of the 12000:

- Power switch, which turns off power to the 12000, just as if you were to unplug both power supplies.
- Non-maskable interrupt (NMI) button, which signals the 12000 to perform an orderly shutdown after saving all files. You must use a pen, pencil, or other pointed object to press this button, which is located inside a small hole to prevent it being pressed accidentally.
- Disable Alarm Button, which silences the alarm that the 12000 sounds when it is receiving power from only one of its power supplies. Press this button to prevent the power alarm from sounding when you have plugged the 12000 into only one power outlet or when one power supply is malfunctioning and you wish to continue operating the 12000 until it is repaired.

- Dual Power Supplies, each rated at 500 watts, 110-220 volts. You plug separate power cords into the power supplies and connect them to separate wall sockets. The 12000 functions properly with a single power supply; the extra power supply serves as a backup.
- 10/100BASE-T copper Ethernet port, numbered 0/1.
- Removable CompactFlash Card that is used to store the operating system.
- Removable Hard Disk Drive that is used to store user data.

Citrix NetScaler MPX 5500

The Citrix NetScaler MPX 5500 is a 1U appliance, with 1 dual-core processor, and 4 gigabytes (GB) of memory.

The following figure shows the front panel of the MPX 5500.

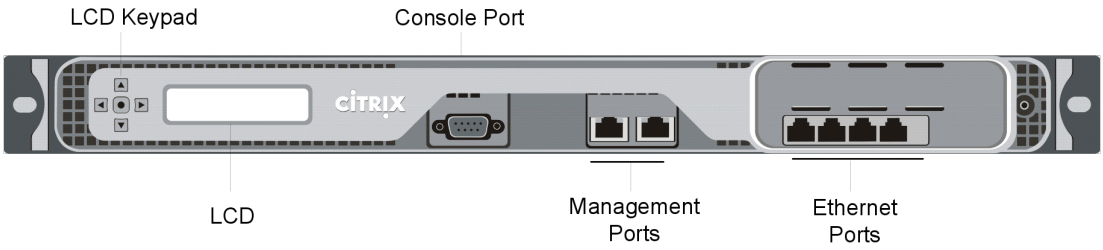

Figure 1. Citrix NetScaler MPX 5500, front panel

The MPX 5500 has the following ports:

- RS232 serial Console Port.
- Two 10/100/1000Base-T copper Ethernet Management Ports, numbered 0/1 and 0/2 from left to right. You can use these ports to connect directly to the appliance for system administration functions.
- Four 10/100/1000Base-T copper Ethernet ports numbered 1/1, 1/2, 1/3, and 1/4 from left to right.

Note: The network port numbers on all appliances consist of two numbers separated by a forward slash. The first number is the port adapter slot number. The second number is the interface port number. Ports on appliances are numbered sequentially starting with 1.

The following figure shows the back panel of the MPX 5500.

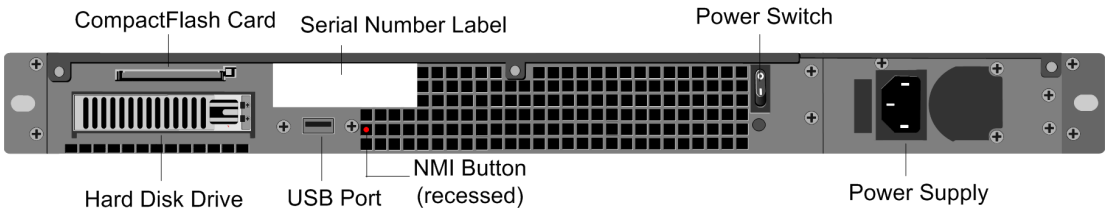

Figure 2. Citrix NetScaler MPX 5500, back panel

The following components are visible on the back panel of the MPX 5500:

- Four GB removable CompactFlash Card that is used to store the operating system.

- Power Switch, which turns off power to the MPX 5500, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- Removable Hard Disk Drive that is used to store user data.
- USB port (reserved for a future release).
- Non-maskable interrupt (NMI) Button that is used at the request of Technical Support and produces a core dump on the NetScaler. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Power supply rated at 300 watts, 110-220 volts. The power-supply fan is designed to turn on only when the internal temperature of the power supply reaches a certain value. You cannot see the fan turning on the back panel. What you can see is the fixed part of the fan that holds the spinning motor.

Citrix NetScaler MPX 7500 and MPX 9500

The Citrix NetScaler MPX 7500/9500 are 1U appliances, each with 1 quad-core processor, and 8 gigabytes (GB) of memory. The MPX 7500/9500 appliances are available in two port configurations: 8xCopper Ethernet (Cu) and 4xSFP+4xCu.

The following figure shows the front panel of the MPX 7500/9500 (8xCu) appliances.

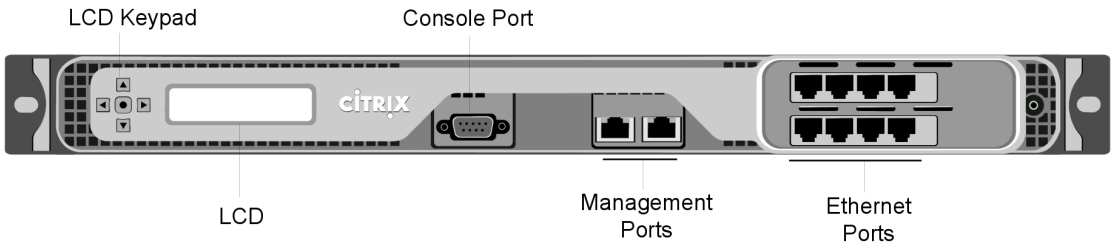

Figure 1. Citrix NetScaler MPX 7500/9500 (8xCu), front panel

The following figure shows the front panel of the MPX 7500/9500 (4xSFP+4xCu) appliances.

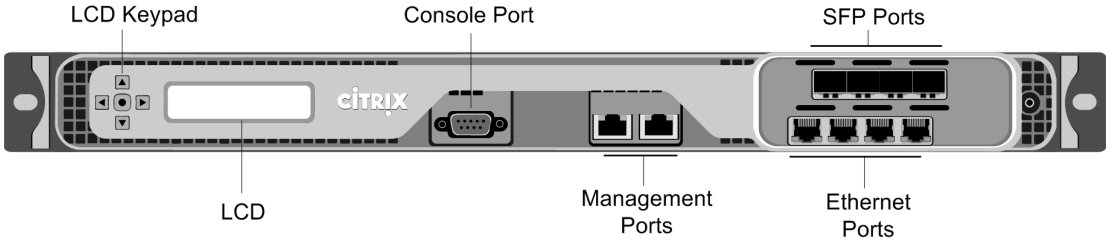

Figure 2. Citrix NetScaler MPX 7500/9500 (4xSFP+4xCu), front panel

Depending on the model, the appliance has the following ports:

- RS232 serial Console Port.
- Two 10/100/1000Base-T copper Ethernet management ports, numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Network Ports
    - MPX 7500/9500 (8xCu). Eight 10/100/1000Base-T copper Ethernet ports numbered 1/1, 1/2, 1/3, and 1/4 on the top row from left to right, and 1/5, 1/6, 1/7, and 1/8 on the bottom row from left to right.

- MPX 7500/9500 (4xSFP+4xCu). Four 1-gigabit copper or fiber SFP ports numbered 1/1, 1/2, 1/3, and 1/4 on the top row from left to right, and four 10/100/1000BASE-T copper Ethernet Ports (RJ45) numbered 1/5, 1/6, 1/7, and 1/8 on the bottom row from left to right.

The following figure shows the back panel of the MPX 7500/9500appliance.

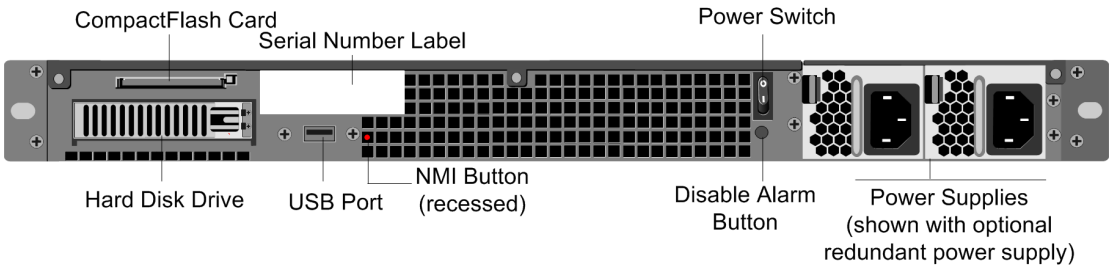

Figure 3. Citrix NetScaler MPX 7500/9500, back panel

The following components are visible on the back panel of the MPX 7500/9500:

- Four-gigabyte removable compact flash that is used to store the operating system.
- Power Switch, which turns off power to the MPX 7500/9500, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- Removable Hard Disk Drive that is used to store user data.
- USB port (reserved for a future release).
- Non-maskable interrupt (NMI) Button that is used at the request of Technical Support and produces a core dump on the appliance. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Disable Alarm Button. This button is functional only when the appliance has two power supplies.

  Press this button to stop the power alarm from sounding when you have plugged the MPX 7500/9500 into only one power outlet or when one power supply is malfunctioning and you want to continue operating the MPX 7500/9500 until it is repaired.

Citrix NetScaler MPX 9700, MPX 10500, MPX 12500, and MPX 15500

The Citrix NetScaler MPX 9700/10500/12500/15500 are 2U appliances, each with 2 quad-core processors, and 16 gigabytes (GB) of memory. All these appliances are also available in a 10G model and a FIPS model.

The following figure shows the front panel of the MPX 9700/10500/12500/15500.

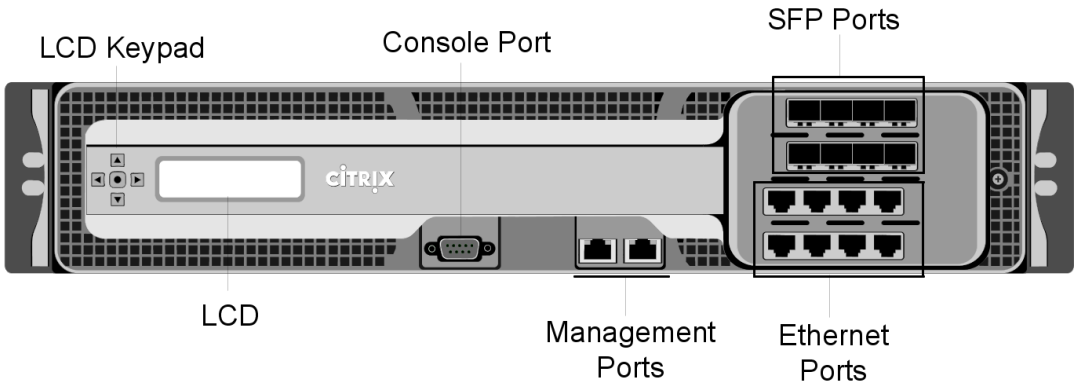

Figure 1. Citrix NetScaler MPX 9700/10500/12500/15500, front panel

The following figure shows the front panel of the MPX 9700/10500/12500/15500 10G.

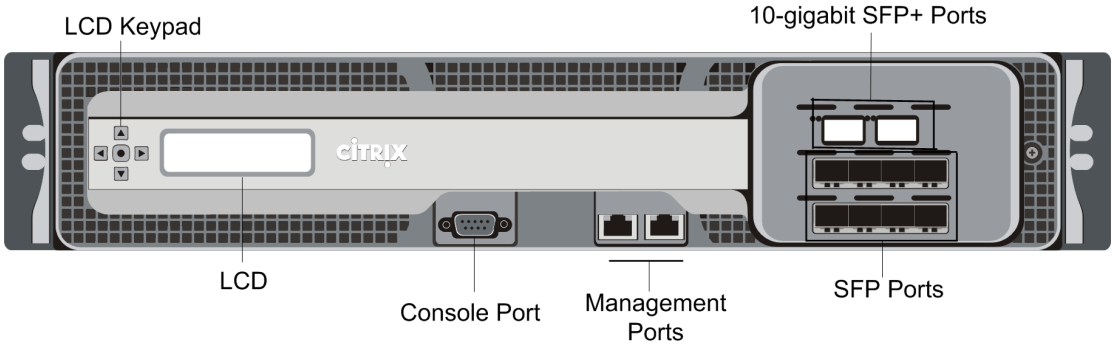

Figure 2. Citrix NetScaler MPX 9700/10500/12500/15500 10G, front panel

The following figure shows the front panel of the MPX 9700/10500/12500/15500 FIPS.

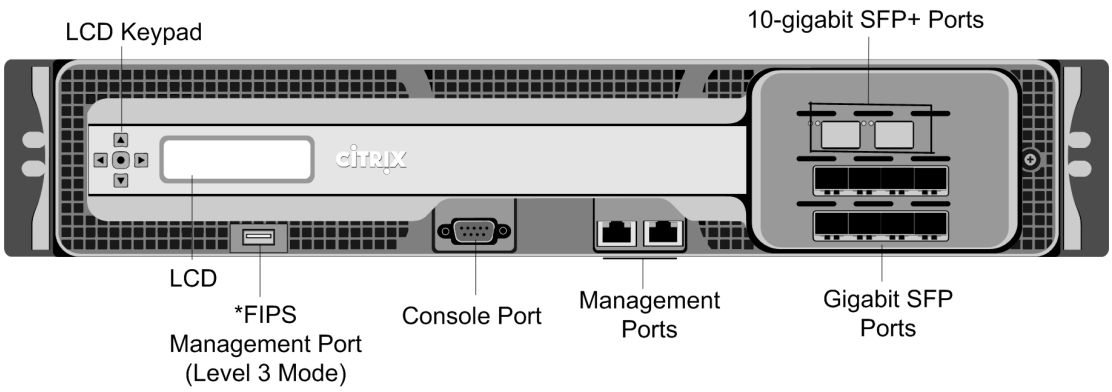

Figure 3. Citrix NetScaler MPX 9700/10500/12500/15500 FIPS, front panel

*The FIPS Management Port (Level 3 Mode) is reserved for a future release.

Caution: Do not insert a USB device into the FIPS Management Port. This will cause the FIPS card to fail.

Depending on the model, the appliance has the following ports:

- FIPS Management Port (reserved for a future release).
- RS232 serial Console Port.
- Two 10/100/1000Base-T copper Ethernet Management Ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Network Ports
  - MPX 9700/10500/12500/15500. Eight 1-gigabit copper or fiber SFP ports numbered 1/1, 1/2, 1/3, and 1/4 on the first row from left to right, and 1/5, 1/6, 1/7, and 1/8 on the second row from left to right. Eight 10/100/1000BASE-T copper Ethernet Ports (RJ45) numbered 1/9, 1/10, 1/11, and 1/12 on the third row from left to right, and 1/13, 1/14, 1/15, and 1/16 on the fourth row from left to right.
  - MPX 9700/10500/12500/15500 10G and MPX 9700/10500/12500/15000 FIPS. Two 10-gigabit SFP+ Ports numbered 10/1 and 10/2 on the top row, eight 1-gigabit copper or fiber SFP Ports numbered 1/1, 1/2, 1/3, and 1/4 on the middle row from left to right, and 1/5, 1/6, 1/7, and 1/8 on the bottom row from left to right.

Important: The 10-gigabit ports on this appliance are labeled 10/1 and 10/2.

The following figure shows the back panel of the MPX 9700/10500/12500/15500 appliances, including the 10G model and FIPS model.

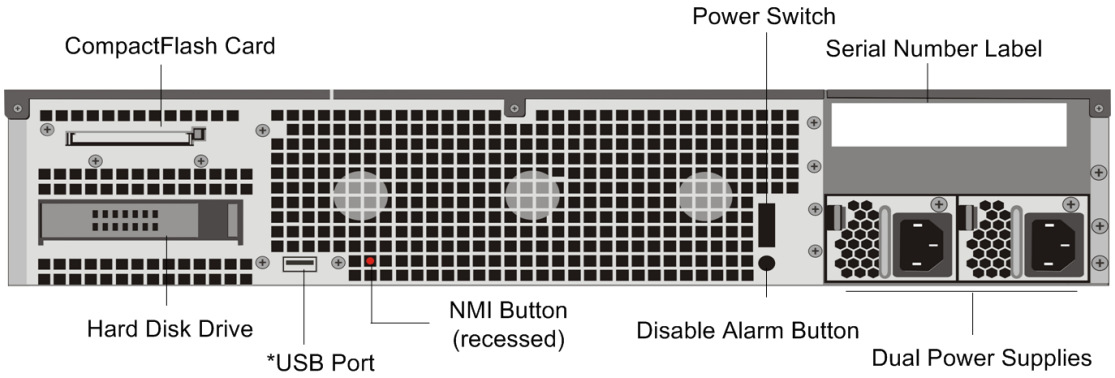

Figure 4. Citrix NetScaler MPX 9700/10500/12500/15500, MPX 9700/10500/12500/15500 FIPS, and MPX 9700/10500/12500/15500 10G, back panel

*The USB Port is reserved for a future release.

The following components are visible on the back panel of the MPX 9700/10500/12500/15500, including the 10G model and FIPS model:

- Four GB removable CompactFlash Card that is used to store the operating system.
- Power Switch, which turns off power to the appliance, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- Removable Hard Disk Drive that is used to store user data.
- USB Port (reserved for a future release).
- Non-maskable interrupt (NMI) Button that is used at the request of Technical Support and produces a core dump on the NetScaler. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Disable Alarm Button. This button is functional only when the appliance has two power supplies.

  Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet or when one power supply is malfunctioning and you want to continue operating the appliance until it is repaired.
- Dual Power Supplies, each rated at 450 watts, 110-220 volts.

Citrix NetScaler MPX 11500, MPX 13500, MPX 14500, MPX 16500, MPX 18500, and MPX 20500

The Citrix NetScaler models MPX 11500/13500/14500/16500/18500/20500 are 2U appliances. Each model has two 6-core processors for a total of 12 physical cores (24 cores with hyper-threading), and 48 gigabytes (GB) of memory.

The following figure shows the front panel of the MPX 11500/13500/14500/16500/18500/20500.

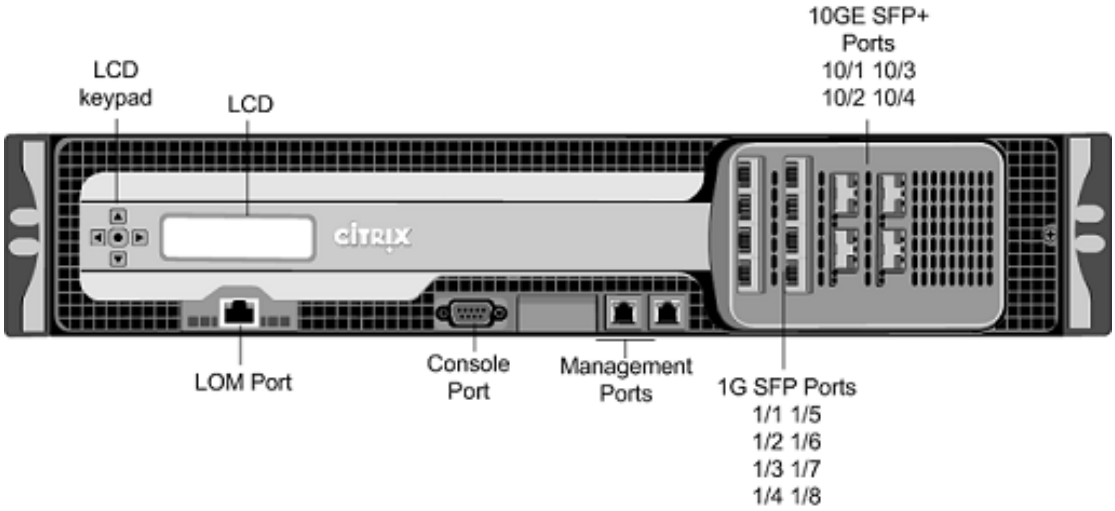

Figure 1. Citrix NetScaler MPX 11500/13500/14500/16500/18500/20500, front panel

The MPX 11500/13500/14500/16500/18500/20500 appliances have the following ports:

- 10/100Base-T copper Ethernet Port (RJ45), also called LOM Port. You can use this port to remotely monitor and manage the appliance independently of the operating system.

  Note: The LEDs on the LOM port are not operational by design.

- RS232 serial Console Port.

- Two 10/100/1000Base-T copper Ethernet Management Ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.

- Eight 1-gigabit SFP ports numbered 1/1, 1/2, 1/3, 1/4 from top to bottom in the first column, and 1/5, 1/6, 1/7, and 1/8 from top to bottom in the second column.

- Four 10-gigabit SFP+ Ports numbered 10/1 and 10/2 from top to bottom in the first column, and 10/3 and 10/4 from top to bottom in the second column.

The following figure shows the back panel of the MPX 11500/13500/14500/16500/18500/20500.

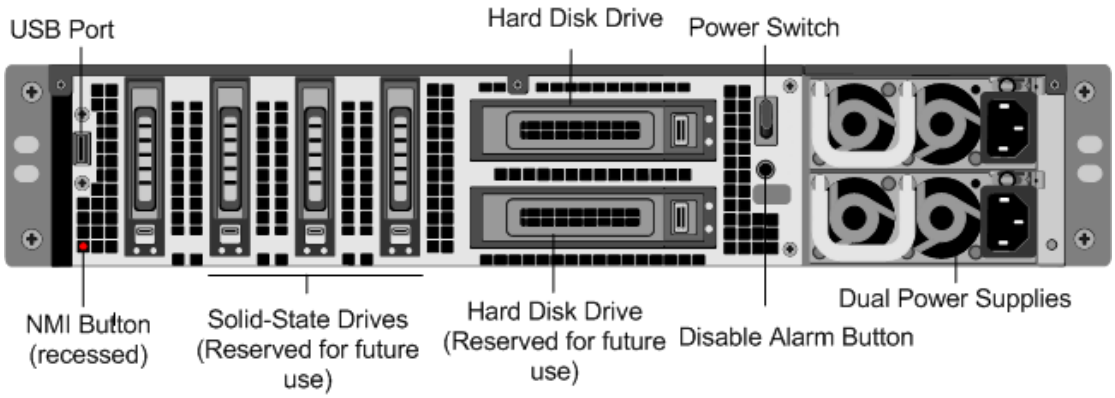

Figure 2. Citrix NetScaler MPX 11500/13500/14500/16500/18500/20500, back panel

The following components are visible on the back panel of the MPX 11500/13500/14500/16500/18500/20500:

- 160 GB removable Solid-State Drive that is used to store the operating system.
- USB port (reserved for a future release).
- Power Switch, which turns off power to the appliance, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- Non-maskable interrupt (NMI) Button that is used at the request of Technical Support and produces a core dump on the NetScaler. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Two removable Hard Disk Drives that are used to store user data.
- Disable Alarm Button. This button is functional only when the appliance has two power supplies.

  Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet or when one power supply is malfunctioning and you want to continue operating the appliance until it is repaired.
- Dual Power Supplies, each rated at 650 watts, 110-220 volts.

Citrix NetScaler MPX 15000

The Citrix NetScaler MPX 15000 appliance is a 2U appliance, with 2 dual-core processors, and 16 GB of memory. The MPX 15000 is a high-capacity, fault-tolerant hardware platform intended for heavy use in enterprise and service provider environments. The following figure shows the front panel of the MPX 15000.

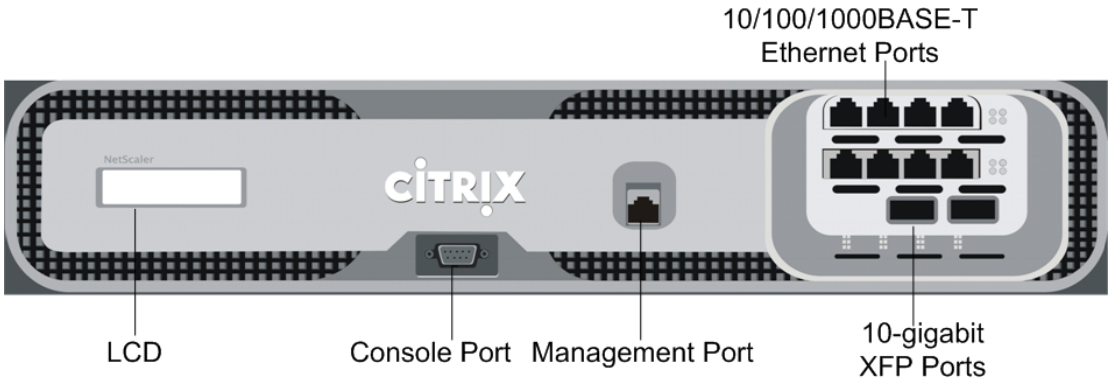

Figure 1. Citrix NetScaler MPX 15000, front panel

The appliance has the following ports:

- RS232 serial Console Port.
- 10/100/1000BASE-T copper Ethernet Management Port, numbered 0/1.
- Two XFP (10-Gigabit Small Form Factor Pluggable) fiberoptic ports, numbered from left to right 1/1 and 1/2.
- Eight 10/100/1000BASE-T copper Ethernet ports, numbered from upper left to bottom right 1/3, 1/4, 1/5, 1/6, 1/7, 1/8, 1/9, and 1/10.

When facing the bezel, the upper LEDs to the left of each port represent connectivity. They are lit and amber in color when active. The lower LEDs represent throughput. They are lit and green when active.

Note: The network port numbers on all appliances consist of two numbers separated by a forward slash. The first number is the port adapter slot number and will always be either 0 or 1. The second number is the interface port number. Ports on appliances are numbered sequentially starting with 1.

The following figure shows the back panel of the MPX 15000.

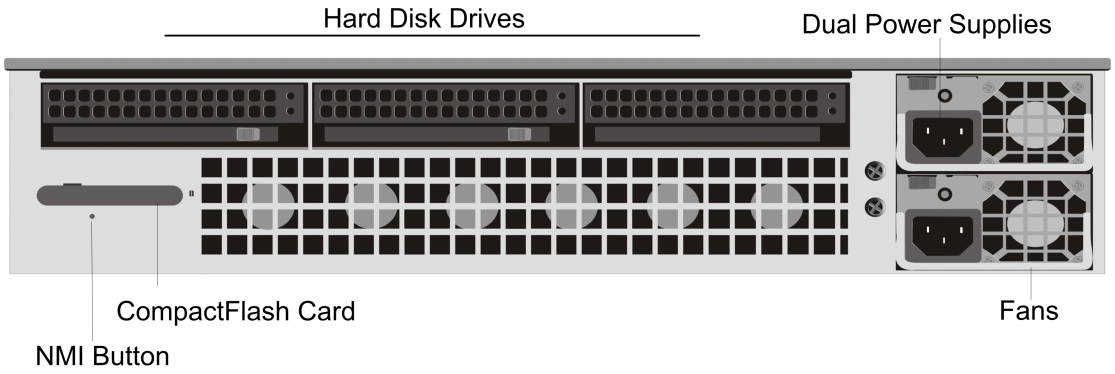

Figure 2. Citrix NetScaler MPX 15000, back panel

The following components are visible on the back panel of the MPX 15000:

- Removable Hard Disk Drive that is used to store user data.
- Dual Power supplies, each rated at 500 watts, 110-220 volts.

  You plug separate power cords into the power supplies and connect them to separate wall sockets. The MPX 15000 functions properly with a single power supply; the extra power supply serves as a backup.
- Non-maskable interrupt (NMI) button, which signals the MPX 15000 to perform an orderly shutdown after saving all files. You must use a pen, pencil, or other pointed object to press this button, which is located inside a small hole to prevent it being pressed accidentally.
- Removable CompactFlash Card that is used to store the operating system.

Citrix NetScaler MPX 17000

The Citrix NetScaler MPX 17000 appliance is a 2U appliance, with 2 quad-core processors, and 32 GB of memory. The MPX 17000 is a high-capacity, fault-tolerant hardware platform intended for any high traffic, intensive processing data center environment. There are two MPX 17000 models: the four network-port model and the ten network-port model. The following figure shows the front panel of the MPX 17000, four network-port model.

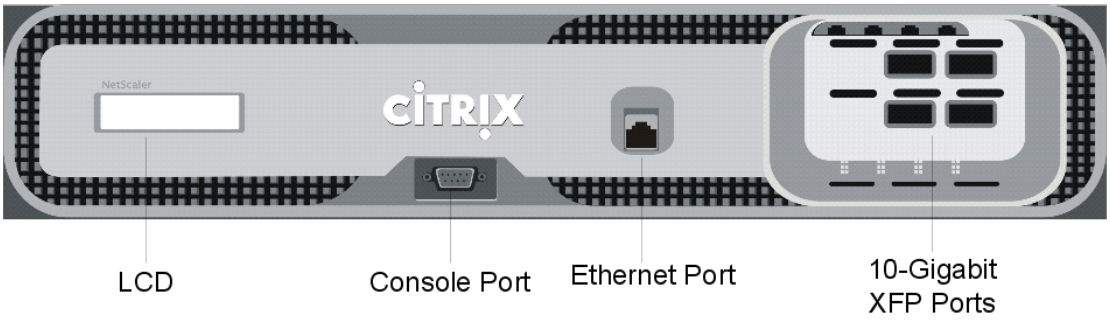

Figure 1. Citrix NetScaler MPX 17000 four network-port model, front panel

Depending on the model, the appliance has the following ports:

- RS232 serial Console Port.
- 10/100/1000BASE-T copper Ethernet Management Port, numbered 0/1.
- Network Ports
    - MPX 17000 four network-port model. Four XFP (10-Gigabit Small Form Factor Pluggable) ports, numbered from upper left to bottom right 1/1, 1/2, 1/3, and 1/4.
    - MPX 17000 ten network-port model. Two XFP ports, numbered from left to right 1/1 and 1/2 and eight 10/100/1000BASE-T Ethernet ports, numbered from upper left to bottom right 1/3, 1/4, 1/5, 1/6, 1/7, 1/8, 1/9 and 1/10.

    Note: The network port numbers on all appliances consist of two numbers separated by a forward slash. The first number is the port adapter slot number and will always be either 0 or 1. The second number is the interface port number. Ports on appliances are numbered sequentially starting with 1.

When facing the bezel, the upper LEDs to the left of each port represent connectivity. They are lit and amber in color when active. The lower LEDs represent throughput. They are lit and green when active.

The following figure shows the back panel of the MPX 17000.

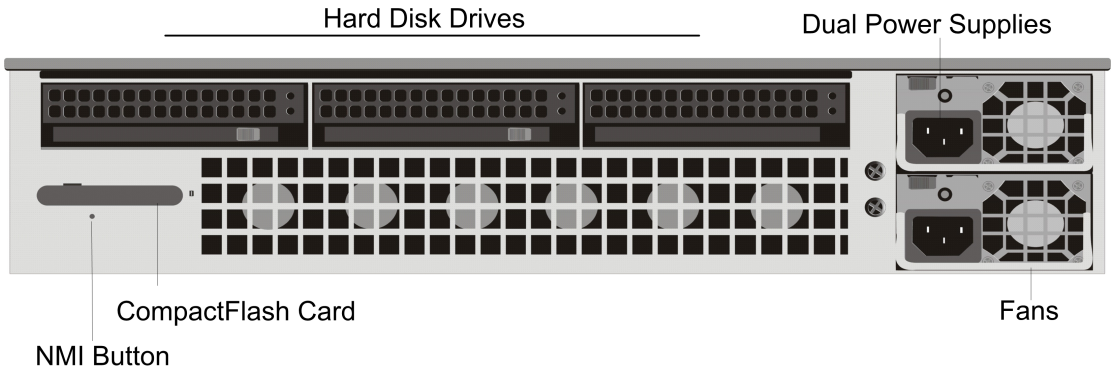

Figure 2. Citrix NetScaler MPX 17000, back panel

The following components are visible on the back of the MPX 17000:

- Removable Hard Disk Drive that is used to store user data.
- Dual Power supplies, each rated at 500 watts, 110-220 volts.

  You plug separate power cords into the power supplies and connect them to separate wall sockets. The MPX 17000 functions properly with a single power supply; the extra power supply serves as a backup.
- Non-maskable interrupt (NMI) button, which signals the MPX 17000 to perform an orderly shutdown after saving all files. You must use a pen, pencil, or other pointed object to press this button, which is located inside a small hole to prevent it being pressed accidentally.
- Removable CompactFlash Card that is used to store the operating system.

Citrix NetScaler MPX 17500, MPX 19500, and MPX 21500

The Citrix NetScaler models MPX 17500/19500/21500 are 2U appliances. Each model has two 6-core processors and 48 gigabytes (GB) of memory.

The following figure shows the front panel of the MPX 17500/19500/21500.

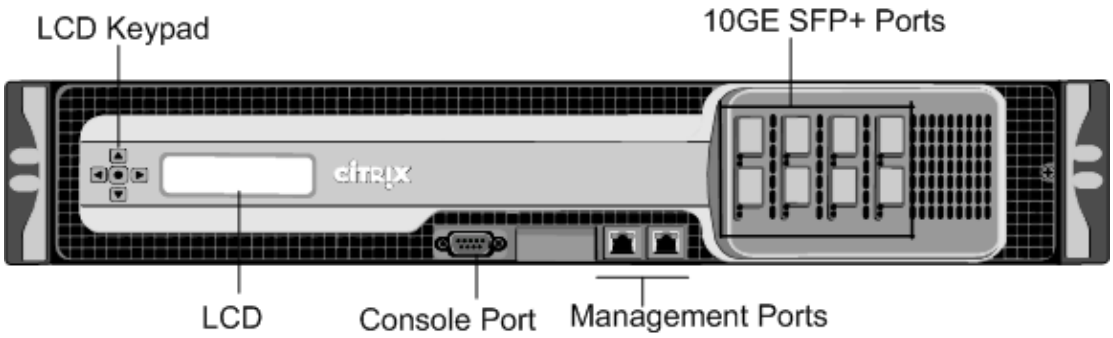

Figure 1. Citrix NetScaler MPX 17500/19500/21500, front panel

The MPX 17500/19500/21500 appliances have the following ports:

- RS232 serial Console Port.
- Two 10/100/1000Base-T copper Ethernet Management Ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Eight 10-gigabit SFP+ Ports numbered 10/1, 10/2, 10/3, and 10/4 on the top row from left to right, and 10/5, 10/6, 10/7, and 10/8 on the bottom row from left to right.

The following figure shows the back panel of the MPX 17500/19500/21500.

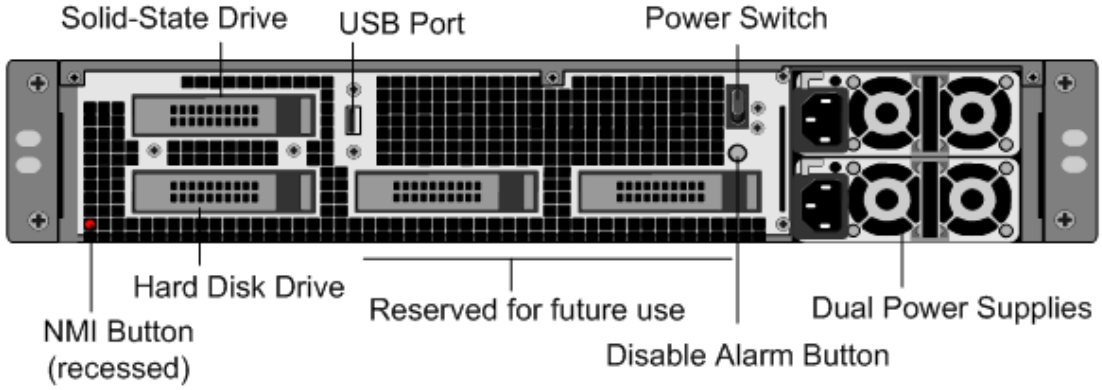

Figure 2. Citrix NetScaler MPX 17500/19500/21500, back panel

The following components are visible on the back panel of the MPX 17500/19500/21500:

- 160 GB removable Solid-State Drive that is used to store the operating system.
- USB port (reserved for a future release).
- Power Switch, which turns off power to the appliance, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- Non-maskable interrupt (NMI) Button that is used at the request of Technical Support and produces a core dump on the NetScaler. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Removable Hard Disk Drive that is used to store user data.
- Disable Alarm Button. This button is functional only when the appliance has two power supplies.

  Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet or when one power supply is malfunctioning and you want to continue operating the appliance until it is repaired.
- Dual Power Supplies, each rated at 650 watts, 110-220 volts.

Citrix NetScaler MPX 17550, MPX 19550, MPX 20550, and MPX 21550

The Citrix NetScaler models MPX 17550, MPX 19550, MPX 20550, and MPX 21550 are 2U appliances. Each model has two 6-core processors for a total of 12 physical cores (24 cores with hyper-threading), and 96 gigabytes (GB) of memory.

The following figure shows the front panel of the MPX 17550/19550/20550/21550 appliance.

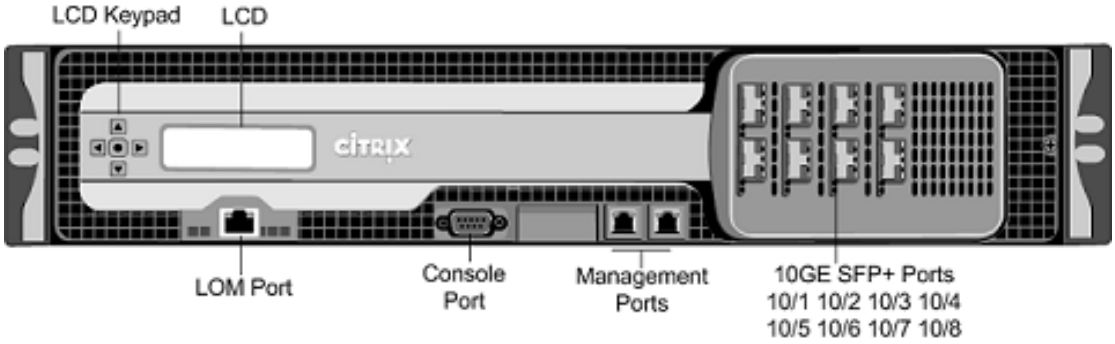

Figure 1. Citrix NetScaler MPX 17550/19550/20550/21550 appliance, front panel

The MPX 17550/19550/20550/21550 appliance has the following ports:

- 10/100Base-T copper Ethernet Port (RJ45), also called LOM Port. You can use this port to remotely monitor and manage the appliance independently of the operating system.

  Note: The LEDs on the LOM port are not operational by design.

- RS232 serial Console Port.
- Two 10/100/1000Base-T copper Ethernet Management Ports (RJ45), numbered 0/1 and 0/2 from left to right. These ports are used to connect directly to the appliance for system administration functions.
- Eight 10-gigabit SFP+ Ports numbered 10/1, 10/2, 10/3, and 10/4 on the top row from left to right, and 10/5, 10/6, 10/7, and 10/8 on the bottom row from left to right.

The following figure shows the back panel of the MPX 17550/19550/20550/21550 appliance.

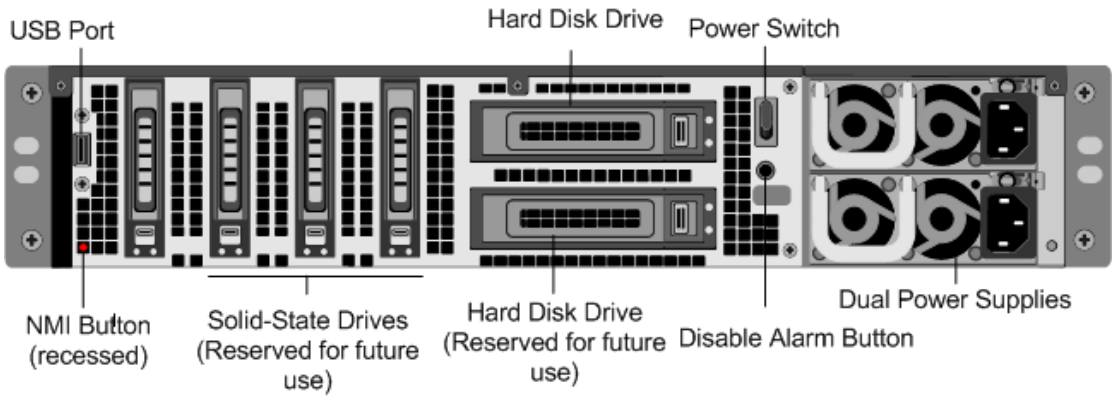

Figure 2. Citrix NetScaler MPX 17550/19550/20550/21550 appliance, back panel

The following components are visible on the back panel of the MPX 17550/19550/20550/21550 appliance:

- 160 GB removable Solid-State Drive that is used to store the operating system.
- USB port (reserved for a future release).
- Power Switch, which turns off power to the appliance, just as if you were to unplug the power supply. Press the switch for five seconds to turn off the power.
- Non-maskable interrupt (NMI) Button that is used at the request of Technical Support and produces a core dump on the NetScaler. You must use a pen, pencil, or other pointed object to press this red button, which is recessed to prevent unintentional activation.
- Two removable Hard Disk Drives that are used to store user data.
- Disable Alarm Button. This button is functional only when the appliance has two power supplies.

  Press this button to stop the power alarm from sounding when you have plugged the appliance into only one power outlet or when one power supply is malfunctioning and you want to continue operating the appliance until it is repaired.
- Dual Power Supplies, each rated at 850 watts, 110-220 volts.

Summary of Hardware Specifications

The following tables summarize the specifications of the hardware platforms.

Table 1. Standard Platform Summary

	7000	9010	10010	12000
Processor	1 single-core	1 single-core	1 single-core	2 single-cores
Memory	1 GB	2 GB	4 GB	4 GB
Number of Power Supplies	1	2	2	2
Power Supply input voltage & frequency	100-240 VAC 47-63 Hz	100-240 VAC 47-63 Hz	100-240 VAC 47-63 Hz	100-240 VAC 47-63 Hz
Maximum Power Consumption	250 W	500 W	500 W	500 W
Weight	28 lbs	52 lbs	52 lbs	52 lbs
Height	1U	2U	2U	2U
Width	EIA 310-D EIA	EIA 310-D	EIA 310-D	EIA 310-D

Compliance	RoHS, WEEE	RoHS, SVHC, WEEE	RoHS, WEEE	RoHS, WEEE

Preparing for Installation

Before you install your new NetScaler appliance, carefully unpack your appliance and make sure that all parts were delivered. Once you are satisfied that your appliance has been delivered to your expectations, verify that the location where the appliance will be installed meets temperature and power requirements and that the server cabinet or floor-to-ceiling cabinet is securely bolted to the floor and has sufficient airflow.

Only trained and qualified personnel should install, maintain, or replace the appliance and efforts should be taken to ensure that all cautions and warnings are followed.

Unpacking the NetScaler Appliance

The hardware accessories for your particular appliance, such as cables, adapters, and rail kit, will vary depending on the hardware platform you ordered. Unpack the box that contains your new appliance on a sturdy table with plenty of space and inspect the contents.

Use the following list to verify that you received everything that should have been included in the box.

- The appliance you ordered For a description and illustration of your particular model, see Hardware Platforms.
- One RJ-45 to DB-9 adapter
- One 6 ft RJ-45/DB-9 cable
- The following list specifies the number of power cables included for each appliance model:
  - One power cable for the 7000, MPX 5500, and MPX 7500/9500 appliances
  - Two power cables for the 9010, 10010, 12000, MPX 15000, MPX 17000, MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 17500/19500/21500, and MPX 17550/19550/20550/21550 appliances

    Note: Make sure that a power outlet is available for each cable.
- One mounting rail kit with all the models

In addition to the items included in the box with your new appliance, you will need the following items to complete the installation and initial configuration process.

- Ethernet cables for each additional Ethernet port that you will connect to your network
- One available Ethernet port on your network switch or hub for each NetScaler Ethernet port you want to connect to your network

  Note: Transceiver modules are sold separately. Please contact your Citrix sales representative to order transceiver modules for your appliance. Only transceivers supplied by Citrix are supported on the appliance.
- A computer to serve as a management workstation

Preparing the Site and Rack

There are specific site and rack requirements for the NetScaler appliance. You must make sure that adequate environmental control and power density are available. Racks must be bolted to the ground, have sufficient airflow, and have adequate power and network connections. Preparing the site and rack are important steps in the installation process and will help ensure a smooth installation.

Site Requirements

The appliance should be installed in a server room or server cabinet with the following features:

Environment control

An air conditioner, preferably a dedicated computer room air conditioner (CRAC), capable of maintaining the cabinet or server room at a temperature of no more than 21 degrees C/70 degrees F at altitudes up to 2100 m/7000 ft, or 15 degrees C/60 degrees F at higher altitudes, a humidity level no greater than 45 percent, and a dust-free environment.

Power density

Wiring capable of handling at least 4,000 watts per rack unit in addition to power needs for the CRAC.

Rack Requirements

The rack on which you install your appliance should meet the following criteria:

Rack characteristics

Racks should be either integrated into a purpose-designed server cabinet or be the floor-to-ceiling type, bolted down at both top and bottom to ensure stability. If you have a cabinet, it should be installed perpendicular to a load-bearing wall for stability and sufficient airflow. If you have a server room, your racks should be installed in rows spaced at least 1 meter/3 feet apart for sufficient airflow. Your rack must allow your IT personnel unfettered access to the front and back of each server and to all power and network connections.

Power connections

At minimum, two standard power outlets per unit.

Network connections

At minimum, four Ethernet connections per rack unit.

Space requirements

One empty rack unit for the Citrix NetScaler 7000, MPX 5500, and MPX 7500/MPX 9500, and two consecutive empty rack units for all oter appliance models.

Cautions and Warnings

Electrical Safety Precautions

Basic electrical safety precautions should be followed to protect yourself from harm and the appliance from damage.

- Be aware of the location of the emergency power off (EPO) switch so that if an electrical accident occurs, you can quickly remove power to the appliance.
- Remove all jewelry and other metal objects that might come into contact with power sources or wires before installing or repairing the appliance. When you touch both a live power source or wire and ground, any metal objects can heat up rapidly, and may cause burns, set clothing on fire, or fuse the metal object to an exposed terminal.
- Use a regulating uninterruptible power supply (UPS) to protect the appliance from power surges and voltage spikes, and to keep the appliance operating in case of power failure.
- Never stack the appliance on top of any other server or electronic equipment.
- All appliances are designed to be installed on power systems that use TN earthing. Do not install your device on a power system that uses either TT or IT earthing.
- Make sure that the appliance has a direct physical connection to the earth during normal use. When installing or repairing an appliance, always make sure that the ground circuit is connected first and disconnected last.
- Make sure that a fuse or circuit breaker no larger than 120 VAC, 15 A U.S. (240 VAC, 16 A international) is used on all current-carrying conductors on the power system to which your appliances are connected.
- Do not work alone when working with high voltage components.
- Always disconnect the appliance from power before removing or installing any component. When disconnecting power, you should first shut down the appliance and then unplug the power cords of all the power supply units connected to the appliance. As long as the power cord is plugged in, line voltages may be present in the power supply, even when the power switch is OFF.
- Do not use mats designed to decrease static electrical discharge as protection from electrical shock. Instead, use rubber mats that have been specifically designed as electrical insulators.
- Make sure that the power source can handle the appliance's maximum power consumption rating with no danger of an overload. Always unplug any appliance before performing repairs or upgrades.
- Do not overload the wiring in your server cabinet or on your server room rack.

- During thunderstorms, or anticipated thunderstorms, avoid performing any hardware repairs or upgrades until the danger of lightning has passed.
- When you dispose of an old appliance or any components, follow any local and national laws on disposal of electronic waste.
- To prevent possible explosions, replace expired batteries with the same model or a manufacturer-recommended substitute and follow the manufacturer's instructions on battery replacement.
- 
Never remove a power supply cover or any sealed part that has the following label:

Appliance Precautions

- Determine the placement of each component in the rack before you install the rail.
- Install the heaviest appliance first at the bottom of the rack, and then work upward. Distribute the load on the rack evenly. An unbalanced rack is hazardous.
- Allow the power supply units and hard drives to cool before touching them.
- Install the equipment near a socket outlet for easy access.
- Mount equipment into a rack with sufficient airflow for safe operation.
- For a closed or multi-unit rack assembly, the ambient operating temperature of the rack environment may be greater than the ambient temperature of the room. Therefore, consider the lowest and highest operating temperatures of the equipment when making a decision about where to install the appliance in the rack.

Rack Precautions

- Make sure that the leveling jacks on the bottom of the rack are fully extended to the floor, with the full weight of the rack resting on them.
- For a single-rack installation, attach a stabilizer to the rack.
- For a multiple-rack installation, couple (attach) the racks together.
- Always make sure that the rack is stable before extending a component from the rack.
- Extend only one component at a time. Extending two or more simultaneously may cause the rack to become unstable.

- The handles on the left and right of the front panel of the appliance should only be used for extending the appliance out of the rack. These handles should not be used for mounting the appliance on the rack. Rack-rail hardware described later should be used instead.

Installing the Hardware

After you have determined that the location where you will install your appliance meets the environmental standards and the server rack is in place according to the instructions, you are ready to install the hardware. After you mount the appliance, you are ready to connect it to the network, to a power source, and to the console terminal that you will use for initial configuration. To complete the installation, you turn on the appliance. Be sure to observe the cautions and warnings listed with the installation instructions.

Rack Mounting the Appliance

Most appliances can be installed in standard server racks that conform to EIA-310-D specification. The appliances ship with a set of rails, which you must install before you mount the appliance. The only tools that you need for installing an appliance are a Phillips screwdriver and a flathead screwdriver.

Caution: If you are installing the appliance as the only unit in the rack, mount it at the bottom. If the rack contains other units, make sure that the heaviest unit is at the bottom. If the rack has stabilizing devices available, install them before mounting the appliance.

The following table lists the different hardware platforms and the rack units required for each platform.

Table 1. *Height Requirements For Each Platform*

Platform	Number of rack units
7000	One rack unit
9010, 10010, 12000	Two rack units
MPX 5500	One rack unit
MPX 7500/9500	One rack unit
MPX 9700/10500/12500/15500	Two rack units
MPX 15000, MPX 17000	Two rack units
MPX 11500/13500/14500/16500/18500/20500	Two rack units
MPX 17500/19500/21500	Two rack units
MPX 17550/19550/20550/21550	Two rack units

Each appliance ships with a mounting rail kit that contains two rail assemblies, one for the left side and the other for the right side of the appliance, and screws to attach the rails. An assembly consists of an inner rail and a rack rail.

Note: The same rail kit is used for both square-hole and round-hole racks. See Figure 4 for specific instructions for threaded, round-hole racks.

To mount the appliance, you must first install the rails and then install the appliance in the rack.

Perform the following tasks to mount the appliance:

- Remove the inner rails from the rail assembly.
- Attach the inner rails to the appliance.
- Install the rack rails on the rack.

- Install the appliance in the rack.

To remove the inner rails from the rail assembly

1. Place the rail assembly on a flat surface.
2. Slide out the inner rail toward the front of the assembly.
3. Depress the latch until the inner rail comes all the way out of the rail assembly.
4. Repeat steps 1 through 3 to remove the second inner rail.

To attach the inner rails to the appliance

1. Position the right inner rail behind the handle on the right side of the appliance.
2. Align the holes on the rail with the corresponding holes on the side of the appliance.
3. Attach the rail to the appliance with the provided screws: 4 per side for a 1U appliance and 5 per side for a 2U appliance, as shown in the following figure.

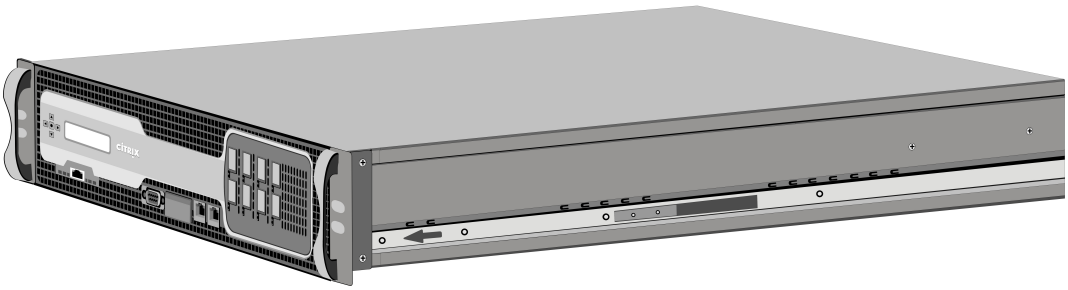

Figure 1. Attaching inner rails

4. Repeat steps 1 through 3 to install the left inner rail on the other side of the appliance.

To install the rack rails on the rack

1. If you have a round-hole, threaded rack, skip to step 3.

2. Install square nut retainers into the front post and back post of the rack as shown in the following figures. Before inserting a screw, be sure to align the square nut with the correct hole for your 1U or 2U appliance. The three holes are not evenly spaced.

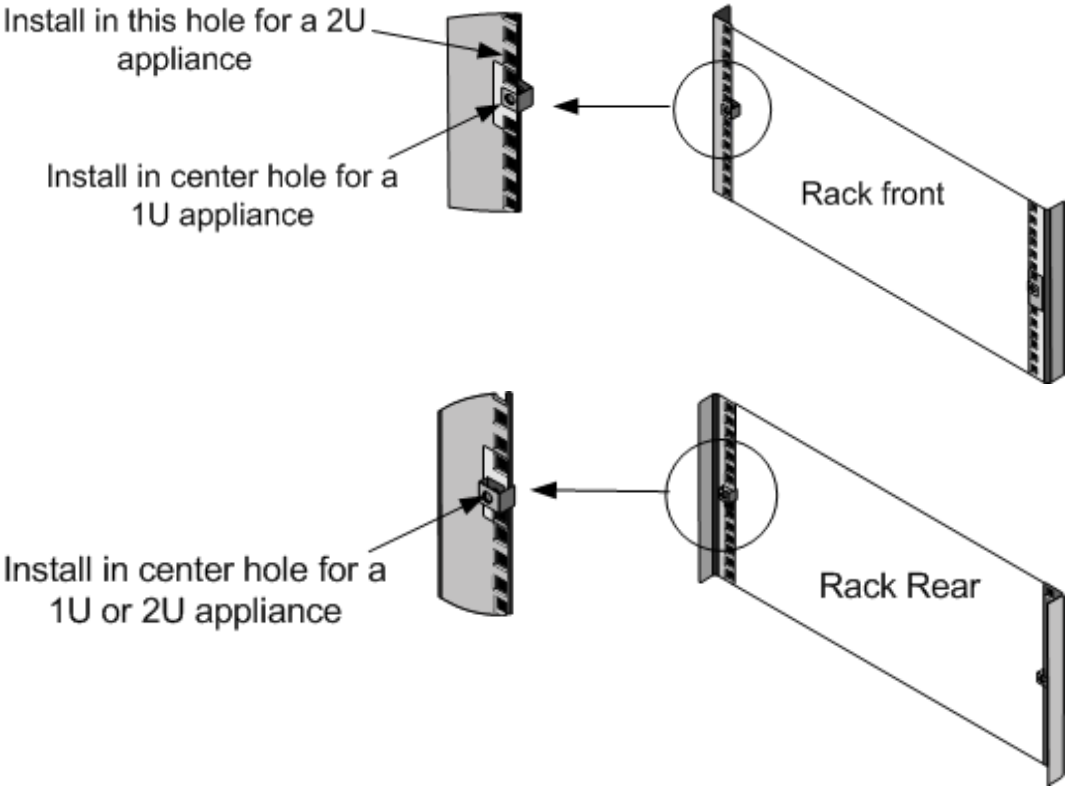

Figure 2. Installing Retainers into the Front Rack Posts Figure 3. Installing Retainers into the Rear Rack Posts

3. Install the adjustable rail assembly into the rack as shown in the following figures. Use a screw to lock the rear rail flange into the rack. With the screw securing the rail in place, you can optionally remove the latching spring.

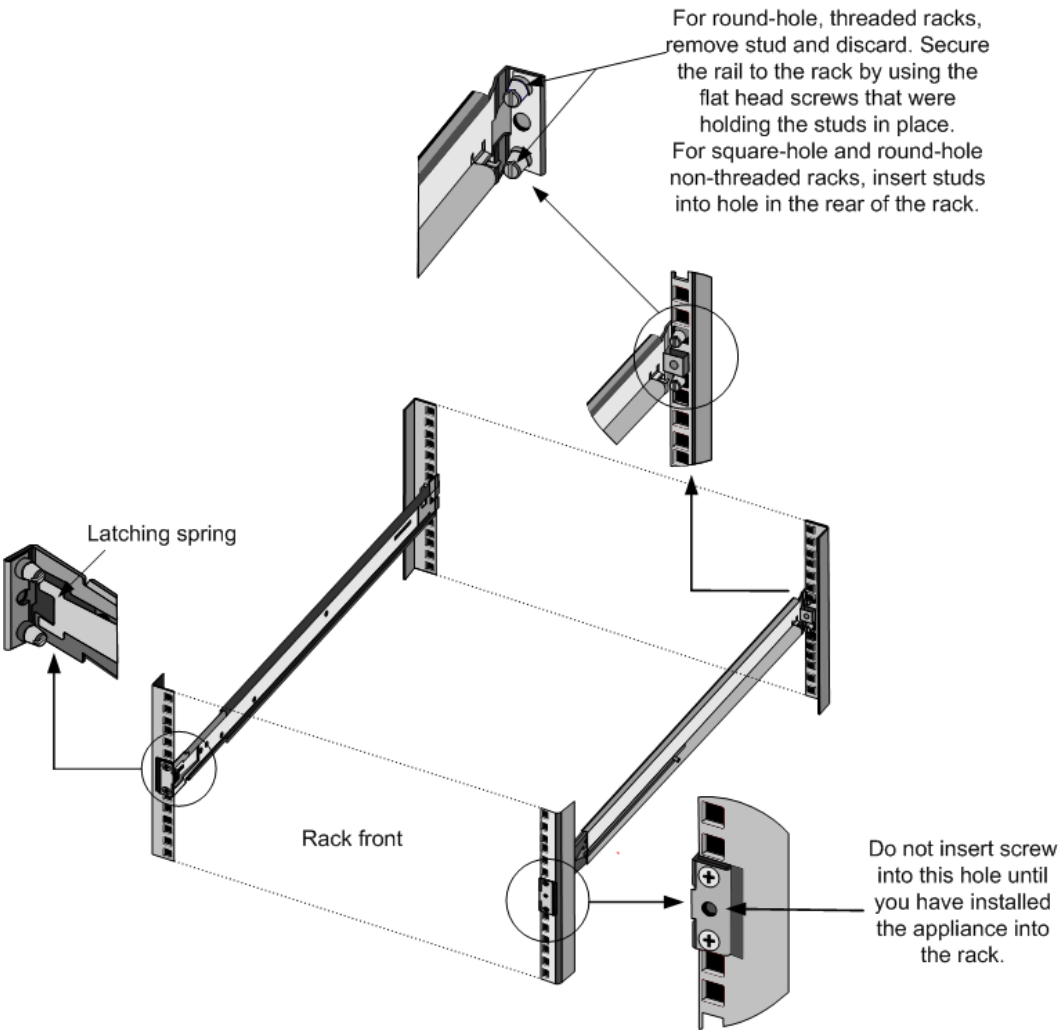

Figure 4. Installing the Rail Assembly to the Rack

To install the appliance in the rack

1. Align the inner rails, attached to the appliance, with the rack rails.
2. Slide the appliance into the rack rails, keeping the pressure even on both sides.
3. Verify that the appliance is locked in place by pulling it all the way out from the rack.

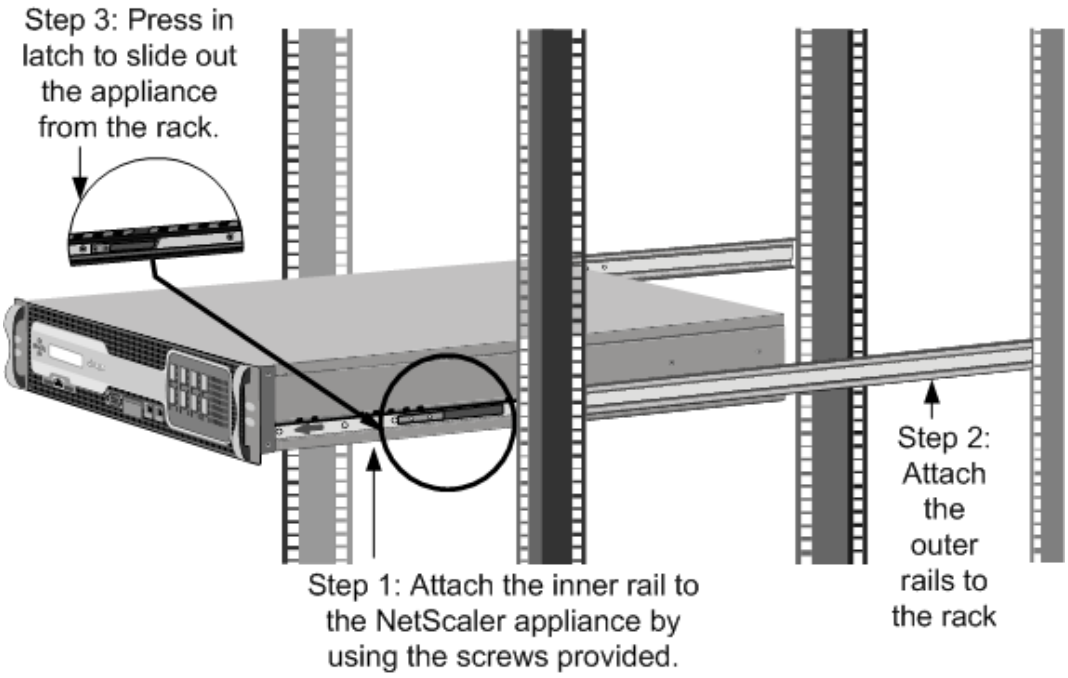

Figure 5. Rack Mounting the Appliance

Installing and Removing SFP Transceivers

Note: This section applies to the 9010, 10010, 12000, MPX 9700/10500/12500/15500, and MPX 11500/13500/14500/16500/18500/20500 appliances.

A Small Form Factor Pluggable (SFP) is a compact transceiver that can operate at speeds of up to 1 gigabit per second and is available in both copper and fiber types. Inserting an SFP copper transceiver converts the SFP port to a 1000BASE-T port. Inserting an SFP fiber transceiver converts the SFP port to a 1000BASE-X port. Auto-negotiation is enabled by default on the SFP port into which you insert your SFP transceiver. As soon as a link between the port and the network is established, the speed and mode are matched on both ends of the cable.

Caution: Only SFP transceivers provided by Citrix Systems are supported on NetScaler appliances. Attempting to install third-party SFP transceivers on your NetScaler appliance voids the warranty.

Insert SFP transceivers into the SFP ports on the front panel of the appliance. Frequent installation and removal of transceivers shortens their life span. Follow the removal procedure carefully to avoid damaging the SFP transceiver or the appliance.

Caution: Do not install the transceivers with the cables attached. Doing so can damage the cable, the connector, or the optical interface of the transceiver.

To install an SFP transceiver

1. Remove the SFP transceiver carefully from its box. DANGERDo not look directly into fiberoptic transceivers or cables. They emit laser beams that can damage your eyes.

2. Align the SFP transceiver to the front of the SFP transceiver port on the front panel of the appliance, as shown in the following figure.

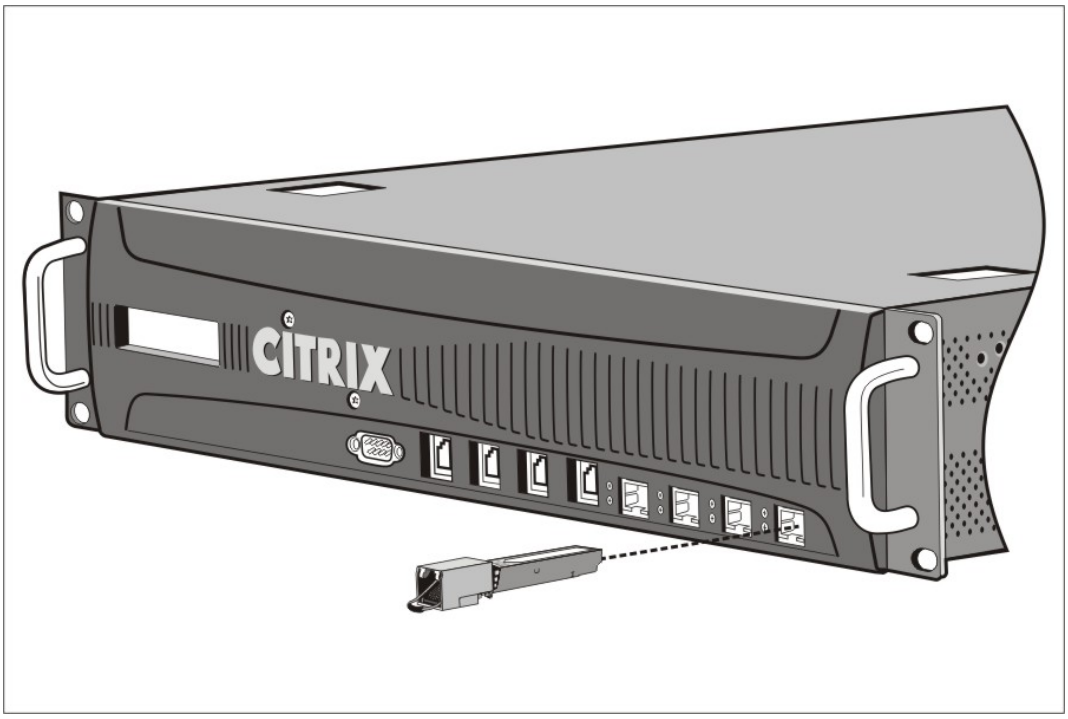

Figure 1. Installing an SFP transceiver

3. Hold the SFP transceiver between your thumb and index finger and insert it into the SFP transceiver port, pressing it in until you hear the transceiver snap into place.

4. Lock the transceiver.

5. Verify that the LED is green and blinks twice, which indicates that the transceiver is functioning correctly.

6. If you are using a fiber SFP transceiver, remove the dust caps attached to the transceiver and the cable only when you are ready to insert the cable.

To remove an SFP transceiver

1. Disconnect the cable from the SFP transceiver. If you are using a fiberoptic cable, replace the dust cap on the cable before putting it away. DANGERDo not look directly into fiberoptic transceivers or cables. They emit laser beams that can damage your eyes.

2. Unlock the SFP transceiver.

3. Hold the SFP transceiver between your thumb and index finger and slowly pull it out of the port.

4. If you are removing a fiber SFP transceiver, replace the dust cap before putting it away.

5. Put the SFP transceiver into its original box or another appropriate container.

Installing and Removing XFP and SFP+ Transceivers

Note: This section applies to the 12000 10G, MPX 9700/10500/12500/15500, MPX 15000, MPX 17000, MPX 11500/13500/14500/16500/18500/20500, MPX 17500/19500/21500, and MPX 17550/19550/20550/21550 appliances.

A 10-Gigabit Small Form Factor Pluggable (XFP or SFP+) is a compact optical transceiver that can operate at speeds of up to 10 gigabits per second. The 12000 10G, MPX 15000, and MPX 17000 appliances use XFP transceivers and the MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 17500/19500/21500, and MPX 17550/19550/20550/21550 appliances use SFP+ transceivers. Auto-negotiation is enabled by default on the XFP/SFP+ ports into which you insert your XFP/SFP+ transceiver. As soon as a link between the port and the network is established, the mode is matched on both ends of the cable and for SFP+ transceivers, the speed is also autonegotiated.

Note: XFP and SFP+ transceivers are **not hot-swappable** on the NetScaler appliances. You must restart a NetScaler appliance after you insert a 10 GE XFP or SFP+ transceiver.

Caution: Only XFP/SFP+ transceivers provided by Citrix Systems are supported on NetScaler appliances. Attempting to install third-party XFP/SFP+ transceivers on your NetScaler appliance voids the warranty.

Insert the XFP/SFP+ transceivers into the XFP/SFP+ ports on the front panel of the appliance. Frequent installation and removal of transceivers shortens their life span. Follow the removal procedure carefully to avoid damaging the transceiver or the appliance.

Caution: Do not install the transceivers with the cables attached. Doing so can damage the cable, the connector, or the optical interface of the transceiver.

To install an XFP/SFP+ transceiver

1. Remove the XFP/SFP+ transceiver carefully from its box. DANGERDo not look directly into fiberoptic transceivers and cables. They emit laser beams that can damage your eyes.

2. Align the XFP/SFP+ transceiver to the front of the XFP/SFP+ transceiver port on the front panel of the appliance.

3. Hold the XFP/SFP+ transceiver between your thumb and index finger and insert it into the XFP/SFP+ transceiver port, pressing it in until you hear the transceiver snap into place.

4. Move the locking hinge to the DOWN position as shown in the following figure.

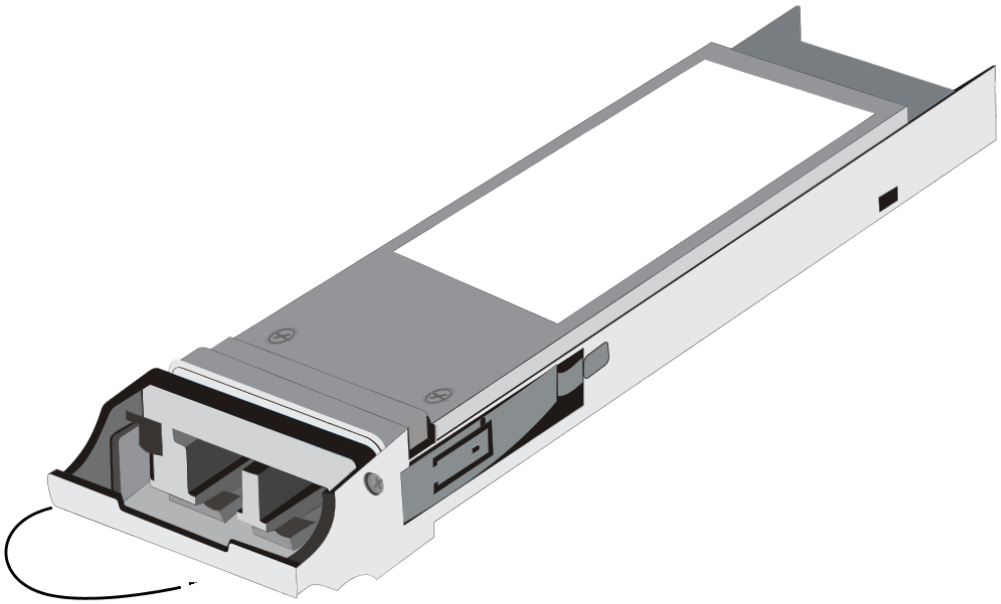

Figure 1. Locking an XFP transceiver

5. Verify that the LED is green and blinks twice, which indicates that the transceiver is functioning correctly.

6. Remove the dust caps attached to the transceiver and cable only when you are ready to insert the cable.

To remove an XFP/SFP+ transceiver

1. Disconnect the cable from the XFP/SFP+ transceiver. Replace the dust cap on the cable before putting it away. DANGERDo not look directly into fiberoptic transceivers or cables. They emit laser beams that can damage your eyes.

2. Unlock the XFP/SFP+ transceiver by moving the locking hinge to the UP position.

3. Hold the XFP/SFP+ transceiver between your thumb and index finger and slowly pull it out of the port.

4. Replace the dust cap on the transceiver before putting it away.

5. Put the XFP/SFP+ transceiver into its original box or another appropriate container.

Connecting the Cables

When the appliance is securely mounted on the rack, you are ready to connect the cables. Ethernet cables and the optional console cable are connected first. Connect the power cable last.

DANGERRemove all jewelry and other metal objects that might come in contact with power sources or wires before installing or repairing the appliance. When you touch both a live power source or wire and ground, any metal objects can heat up rapidly, and may cause burns, set clothing on fire, or fuse the metal object to an exposed terminal.

Connecting the Ethernet Cables

Ethernet cables connect your appliance to the network. The type of cable you need depends on the type of port used to connect to the network. Use a category 5e or category 6 Ethernet cable with a standard RJ-45 connector on a 10/100/1000BASE-T port or 1-gigabit SFP copper transceiver. Use a fiber optic cable with an LC duplex connector with an SFP fiber transceiver, SFP+, or XFP transceiver. The type of connector at the other end of the fiber optic cable depends on the port of the device that you are connecting to.

To connect an Ethernet cable to a 10/100/1000BASE-T port or 1-gigabit SFP copper transceiver

1. Insert the RJ-45 connector on one end of your Ethernet cable into an appropriate port on the front panel of the appliance, as shown in the following figure.

Figure 1. Inserting an Ethernet cable

2. Insert the RJ-45 connector on the other end into the target device, such as a router or switch.

3. Verify that the LED glows amber when the connection is established.

To connect the Ethernet cable to an SFP fiber, SFP+, or XFP transceiver

1. Remove the dust caps from the transceiver and cable.
2. Insert the LC connector on one end of the fiber optic cable into the appropriate port on the front panel of the appliance.
3. Insert the connector on the other end into the target device, such as a router or switch.
4. Verify that the LED glows amber when the connection is established.

Connecting the Console Cable

You can use the console cable to connect your appliance to a computer or terminal, from which you can configure the appliance. Alternatively, you can use a computer connected to the network. Before connecting the console cable, configure the computer or terminal to support VT100 terminal emulation, 9600 baud, 8 data bits, 1 stop bit, parity, and flow control set to NONE. Then connect one end of the console cable to the RS232 serial port on the appliance and the other end to the computer or terminal.

To connect the console cable to a computer or terminal

1. Insert the DB-9 connector at the end of the cable into the console port that is located on the front panel of the appliance as shown in the following figure.

   Figure 2. Inserting a console cable

   Note: To use a cable with an RJ-45 converter, insert the optional converter provided into the console port and attach the cable to it.

2. Insert the RJ-45 connector at the other end of the cable into the serial port of the computer or terminal.

Connecting the Power Cable

An MPX 5500, MPX 7500/9500, and 7000 appliance has one power cable. All the other appliances come with two power cables, but they can also operate if only one power cable is connected. A separate ground cable is not required, because the three-prong plug provides grounding.

To connect the appliance to the power source

1. Connect one end of the power cable to the power outlet on the back panel of the appliance, next to the power supply, as shown in the following figure.

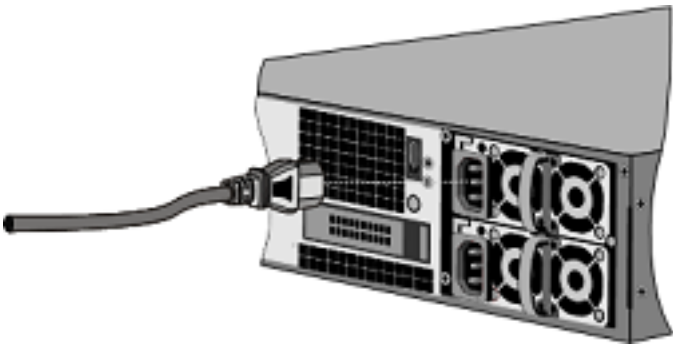

Figure 3. Inserting a power cable

2. Connect the other end of the power cable to a standard 110V/220V power outlet.

3. If a second power supply is provided, repeat steps 1 and 2 to connect the second power supply.

Note: The 9010, 10010, 12000, MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 17500/19500/21500, and MPX 17550/19550/20550/21550 appliances emit a high-pitched alert if one power supply fails or if you connect only one power cable to the appliance. To silence the alarm, you can press the small red button located on the back panel of the appliance.

Turning on the Appliance

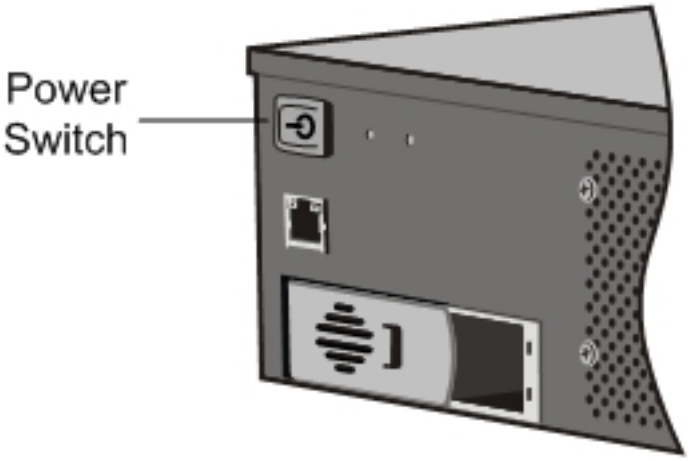
After you have installed the appliance in a rack and connected the cables, verify that the power cable is properly connected. When two power supplies are present, make sure the second cable is connected to an outlet for a different circuit than the first. After verifying the connections, you are ready to turn on the appliance.

To turn on the appliance

1. Verify that the appliance is connected through a console or Ethernet port. This will ensure that you can configure the appliance after it is turned on.

2. Press the ON/OFF toggle power switch on the back panel of the appliance.

Figure 1. Power switch on back panel



3. Verify that the LCD on the front panel is backlit and the start message appears, as shown in the following figure.

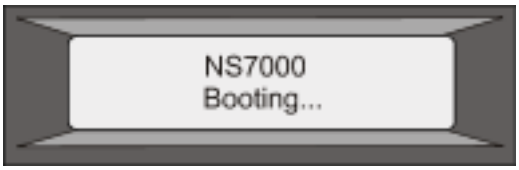


Figure 2. LCD startup screen

Caution: Be aware of the location of the emergency power off (EPO) switch. If an electrical accident occurs, you can quickly remove power from the appliance.

Initial Configuration

After you have installed your appliance in a rack, you are ready to perform the initial configuration. Once initial configuration is complete, you need to refer to the specific configuration guides for the features you will be using.

Initial configuration is the same for the multifunction Citrix NetScaler, the dedicated Citrix Access Gateway Enterprise Edition, and the dedicated Citrix Application Firewall appliances. To perform the initial configuration on the MPX 5500, MPX 7500/9500, MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 17500/19500/21500, and MPX 17550/19550/20550/21550 appliances, you can also use the LCD keypad on the front panel of the appliance.To perform the initial configuration, you can use the serial console or the setup wizard. You can access the setup wizard from any computer that is on the same network as the new NetScaler. However, because this method uses the NetScaler default IP address, you must install and configure one NetScaler appliance at a time. If you want to configure a new NetScaler from a remote network, or if you want to install multiple NetScalers and then configure them without using the console port, you can use Dynamic Host Configuration Protocol (DHCP) to assign each new NetScaler an IP address at which you can access the appliance for remote configuration.

After you complete the initial configuration of the appliance, you can configure secure access to your appliance. As a result, you are no longer prompted for a password when logging on. This is especially helpful in environments for which you would otherwise have to keep track of a large number of passwords.

Using the LCD Keypad

Note: The following section is applicable to MPX 5500, MPX 7500/9500, MPX 9700/10500/12500/15500, MPX 11500/13500/14500/16500/18500/20500, MPX 17500/19500/21500, and MPX 17550/19550/20550/21550 appliances only.

When you first install the appliance, you can configure the initial settings by using the LCD keypad on the front panel of the appliance. The keypad interacts with the LCD display module, which is also on the front panel of these appliances.

Note: You can use the LCD keypad for initial configuration on a new appliance with the default configuration. The configuration file (ns.conf) should contain the following command and default values.

set ns config -**IPAddress** 192.168.100.1 **-netmask** 255.255.0.0

The functions of the different keys are explained in the following table.

Table 1. LCD Key Functions

Key	Function
<	Moves the cursor one digit to the left.
>	Moves the cursor one digit to the right.
^	Increments the digit under the cursor.
v	Decrements the digit under the cursor.
.	Processes the information, or terminates the configuration, if none of the values are changed. This key is also known as the ENTER key.

You are prompted to enter the subnet mask, NetScaler IP address (NSIP), and gateway in that order respectively. The subnet mask is associated with both the NSIP and default gateway IP address. The NSIP is the IPv4 address of the NetScaler appliance. The default gateway is the IPv4 address for the router, which will handle external IP traffic that the NetScaler cannot otherwise route. The NSIP and the default gateway should be on the same subnet.

If you enter a valid value for the subnet mask, such as 255.255.255.224, you are prompted to enter the IP address. Similarly, if you enter a valid value for the IP address, you are prompted to enter the gateway address. If the value you entered is invalid, the following error message appears for three seconds, where xxx.xxx.xxx.xxx is the IP address you entered, followed by a request to re-enter the value.

Invalid addr!
xxx.xxx.xxx.xxx

If you press the ENTER (.) key without changing any of the digits, the software interprets this as a user exit request.The following message will be displayed for three seconds.

Exiting menu...
xxx.xxx.xxx.xxx

If all the values entered are valid, when you press the ENTER key, the following message appears.

Values accepted,
Rebooting...

The subnet mask, NSIP, and gateway values are saved in the configuration file.

Using the NetScaler Serial Console

When you first install the appliance, you can configure the initial settings by using the serial console. With the serial console, you can change the system IP address, create a subnet or mapped IP address, configure advanced network settings, and change the time zone.

Note: To locate the serial console port on your appliance, see "RS232 Serial Console Port" in Ports.

To configure initial settings by using a serial console

1. Connect the console cable into your appliance. For more information, see "Connecting the Console Cable" in Connecting the Cables.

2. Run the vt100 terminal emulation program of your choice on your computer to connect to the appliance.

   - For Microsoft Windows, you can use HyperTerminal, which is installed with all current versions of Windows.

   - For Apple Macintosh OSX, you can use the GUI-based Terminal program or the shell-based telnet client.

     Note: OSX is based on the FreeBSD UNIX platform. Most standard UNIX shell programs are available from the OSX command line.

   - For UNIX-based workstations, you can use the shell-based telnet client or any supported terminal emulation program.

3. Press ENTER. The terminal screen displays the Logon prompt.

   Note: You might have to press ENTER two or three times, depending on which terminal program you are using.

4. Log on to the appliance with the administrator credentials. Your sales representative or Citrix Customer Service can provide you with the administrator credentials.

5. At the prompt, type config nsto run the NetScaler configuration script.

6. To complete the initial configuration of your appliance, follow the prompts.

   Note: To prevent an attacker from breaching your ability to send packets to the appliance, choose a non-routable IP address on your organization's LAN as your appliance IP address.

   You can replace steps 5 and 6 with the following NetScaler commands. At the NetScaler command prompt, type:

   set ns config **-ipaddress**<IPAddress> **-netmask**<subnetMask>

   add ns ip<IPAddress> <subnetMask> **-type**<type>

   add route<network> <subnetMask> <gateway>

   set system user<userName> <password>

   save ns config

   reboot

   Example

set ns config -ipaddress 10.102.29.60 -netmask 255.255.255.0 add ns ip 10.102.29.61 255.255.255.0 -typ

You have now completed initial configuration of your appliance. To continue configuring the appliance, choose one of the following options:

Citrix NetScaler.

If you are configuring your appliance as a standard NetScaler with other licensed features, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Citrix Application Firewall.

If you are configuring your appliance as a standalone application firewall, see the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

Citrix Access Gateway.

If you are configuring your appliance as an Access Gateway, see Access Gateway 9.3, Enterprise Edition.

Note: For information about deploying a high availability (HA) pair, see the *Citrix NetScaler Networking Guide* at http://support.citrix.com/article/CTX128671. For information about configuring a Federal Information Processing Standards (FIPS) appliance, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Using the Setup Wizard

To configure the appliance by using the Setup Wizard in the configuration utility, you need an administrative computer configured on the same network as the appliance. To run the configuration utility, the Java RunTime Environment (JRE) version 1.4.2_04 or later must be installed on the workstation or laptop. You can use the Setup Wizard to configure the following initial settings on the appliance:

- System IP address and subnet mask
- Subnet or Mapped IP address and subnet mask
- Host name
- Default gateway
- Time zone
- Licenses
- Administrator password

Important: Before running the Setup Wizard, you should download your licenses from the Citrix Web site and put them in a location on your computer or another device where you can access them from your Web browser during configuration.

Note: If the appliance is configured with the default IP address, licenses are not installed on the appliance, or the mapped or subnet IP address is not configured, the configuration utility automatically opens the Setup Wizard when you log on to the appliance.

To configure initial settings by using the Setup Wizard

1. In a Web browser, type: `http://192.168.100.1`

   Note: The operating system is preconfigured with a default IP address and associated netmask. The default IP address is 192.168.100.1 and the default netmask is 255.255.0.0.

2. In **User Name** and **Password**, type the administrator credentials. You can obtain the initial user name and password from your sales representative or from Citrix Customer Service.

3. In **Start in**, select **Configuration**, and then click **Login**.

4. In the **Setup Wizard**, click **Next**, and then follow the instructions in the wizard.

   Note: To prevent an attacker from breaching your ability to send packets to the appliance, choose a non-routable IP address on your organization's LAN as your appliance IP address.

   You have now completed initial configuration of your appliance. To continue configuring the appliance, choose one of the following options:

   Citrix NetScaler.

   If you are configuring your appliance as a standard NetScaler with other licensed features, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

   Citrix Application Firewall.

   If you are configuring your appliance as a standalone application firewall, see the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX128677.

   Citrix Access Gateway.

   If you are configuring your appliance as an Access Gateway, see Access Gateway 9.3, Enterprise Edition.

   Note: For information about deploying a high availability (HA) pair, see the *Citrix NetScaler Networking Guide* at http://support.citrix.com/article/CTX128671. For information about configuring a Federal Information Processing Standards (FIPS) appliance, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Using DHCP for Initial Access

For initial configuration of a Citrix NetScaler appliance, Dynamic Host Configuration Protocol (DHCP) can eliminate dependency on the console by providing an IP address at which you can access the appliance to configure it remotely. You can also use DHCP after initial configuration if, for example, you want to move a NetScaler to a different subnet.

To use DHCP, you must first specify the NetScaler vendor class identifier on a DHCP server. Optionally, you can also specify the pool of IP addresses from which your NetScaler appliance can acquire an IP address. If a pool is not specified, the address is acquired from the general pool.

A new NetScaler does not have a configuration file. When you connect a NetScaler without a configuration file to the network, its DHCP client automatically polls the DHCP server for an IP address. If you have specified the NetScaler vendor class identifier on the DHCP server, the server returns an address. You can also enable the DHCP client on a previously configured NetScaler.

Prerequisites

To use DHCP, you must:

1. Note the system ID (sysid) on the serial number sticker on the back panel of the appliance. On an older NetScaler, the system ID may not be available. In this case, use the MAC address instead of the system ID.

2. Set up a DHCP server and configure it with the NetScaler vendor class identifier.

To configure a Linux/UNIX DHCP server for the NetScaler

1. Specify "citrix-NS" as the vendor class identifier for the NetScaler by adding the following configuration to the server's dhcpd.conf file:

   ```
   subclass "citrix-1" "citrix-NS"{
   vendor-option-space auto;
   option auto.key "citrix-NS";
   ```

   Note: The location of the dhcpd.conf file can be different in different versions and flavors of the Linux/UNIX-based operating system (for example, in FreeBSD 6.3 the file is present in the /etc/ folder). For the location, see the `dhcpd` man page of the DHCP server.

2. If you do not want NetScaler appliances to use IP addresses from the general pool, specify a pool of addresses for the NetScaler. For example, adding the following configuration to the dhcpd.conf file specifies a pool of IP addresses ranging from 10.102.33.246 to 10.102.33.249.

   ```
   pool {
   allow members of "citrix-1";
   range 10.102.33.246 10.102.33.249;
   option subnet-mask 255.255.255.0;
   }
   ```

3. Terminate the DHCP process and restart it to reflect the change to the configuration file. At the shell prompt, type:

   ```
   killall dhcpd

   dhcpd&
   ```

Implementing an Initial NetScaler Configuration from a Remote Computer

When a new NetScaler (or any NetScaler that does not have a configuration file) starts, it automatically polls the DHCP server for an IP address and provides the DHCP server with its sysid. The DHCP server includes this sysid with the IP address that it assigns to the NetScaler in the server's dhcpd.leases file. To find the IP address currently assigned to your NetScaler, look in the dhcpd.leases file for the last entry with the sysid of your NetScaler in the uid or client-hostname field. Verify that the binding state in this entry is active. If the binding state is not active but free, the IP address is not yet associated with the NetScaler.

You can use this address to connect to the NetScaler and remotely configure the initial settings. For example, you can change the IP address, subnet mask, and gateway settings that were fetched from the DHCP server. After completing the initial configuration, you can manually return the DHCP IP address to the server pool. Alternatively, restarting the NetScaler automatically releases the DHCP IP address back to the server pool. A restart also saves the NetScaler configuration file.

Example

The following code is an example of an entry in a DHCP server's dhcpd.leases file. This entry verifies the binding state of the NetScaler whose sysid is 45eae1a8157e89b9314f.

```
lease 10.102.33.248 {
  starts 3 2009/08/19 00:40:37;
  ends 3 2009/08/19 06:40:37;
  cltt 3 2009/08/19 00:40:37;
  binding state active;
  next binding state free;
  hardware ethernet 00:d0:68:11:f4:d6;
  uid "45eae1a8157e89b9314f";
  client-hostname "45eae1a8157e89b9314f";
```

In the above example, the binding state is ACTIVE and the IP address assigned to the NetScaler is 10.102.33.248.

The following table describes DHCP-related CLI commands that you might want to use when configuring a new NetScaler.

Table 1. NetScaler CLI commands for using DHCP with a new NetScaler

Task	At the NetScaler command prompt, type:
To verify the DHCP fetched details, such as IP address, subnet mask, and gateway on the NetScaler	`> sh dhcpParams`
To release the DHCP IP address and return it to the IP address pool on the DHCP server when the NetScaler configuration is complete	`> release dhcpIP`

Using DHCP When a Configuration File is Present

If you need to move a NetScaler to a different subnet, such as from a testing environment to a production environment, you can use DHCP to access a NetScaler that already has a configuration file. Before moving the NetScaler, enable its DHCP client and save the configuration. As a result, when the NetScaler restarts, it automatically polls the DHCP server for an IP address. If you did not enable the DHCP client and save the configuration before shutting down the NetScaler, you will need to connect to the NetScaler through the console and dynamically run the DHCP client on the NetScaler. The DHCP server will then provide an IP address, a gateway, and a subnet mask. You can use the IP address to access the NetScaler and configure the other settings remotely.

If the DHCP client is enabled in the configuration file, you should disable it and then save the configuration file. If the DHCP client is enabled, the NetScaler will poll the DHCP server again for an IP address when it restarts.

The following table lists the NetScaler CLI commands associated with each task.

Table 2. NetScaler CLI commands for using DHCP with a previously configured NetScaler

Task	At the NetScaler command prompt, type:
To dynamically run the DHCP client to fetch an IP address from the DHCP server	`> set dhcpParams dhcpClient on`

To configure the DHCP client to run when the NetScaler restarts	`> set dhcpParams dhcpClient on`
	
	`> save config`

To prevent the DHCP client from running when the NetScaler restarts	`> set dhcpParams dhcpClient off`
	
	`> save config`
	
	Note: This is required only if the ON setting was saved.

To save the DHCP acquired route so that it is available when the NetScaler restarts	`> set dhcpParams -dhcpclient on -saveroute on`
	
	`> save config`

To prevent saving the DHCP acquired route (default behavior)	`> set dhcpParams -dhcpclient on -saveroute off`
	
	`> save config`
	
	Note: This is required only if the ON setting was saved.

Accessing a NetScaler by Using SSH Keys and No Password

In a setup with a large number of NetScaler appliances, you will have to store and look up passwords for each appliance before you can log on to the appliance. To avoid this, you can set up secure shell access with public key encryption on the appliance so that you are not prompted for the password. To do this, you will need to first generate the public/private key on the client and then copy the public key to the NetScaler.

To generate the public/private key on a Linux client

1. Change directory to /root/.ssh
2. Generate the public and private key pair. At the prompt, type:

   [root@localhost .ssh]# ssh-keygen **-t** rsa
3. Press ENTER when prompted for a file name to save the key.
4. Press ENTER when prompted for a passphrase.

To copy the public key to the remote NetScaler

1. Log on to the remote NetScaler from the Linux client.
2. Change directory to /nsconfig/ssh. At the prompt, type:

   cd /nsconfig/ssh
3. Change to binary mode and copy the public key to this directory. At the prompt, type:

   bin

   put id_rsa.pub

To set up secure shell access with public key encryption on the NetScaler

1. Open a connection to the NetScaler using an SSH client, such as PuTTY.
2. Log on to the NetScaler with the administrator credentials.
3. At the shell prompt, change the directory to /nsconfig/ssh.
4. Append the public key to the authorized_keys file and change permissions. At the prompt, type:

   ```
   cat id_rsa.pub >> authorized_keys

   chmod 755 authorized_keys
   ```

5. Remove the public key (optional). At the prompt, type:

   ```
   rm id_rsa.pub
   ```

6. At the prompt type the following command to complete the configuration:

   cp authorized_keys /root/.ssh/authorized_keys2

7. Change the directory to /nsconfig. At the prompt type:

   ```
   cd /nsconfig
   ```

8. To prevent your changes from being lost if the NetScaler is restarted add the following line to the rc.netscaler file:

   ```
   cp /nsconfig/ssh/authorized_keys /root/.ssh/authorized_keys2
   ```

   Important: If the /nsconfig directory contains no rc.netscaler file, you must create one.

To verify secure shell access with public key encryption on the NetScaler

On the client, verify that you can connect to the remote NetScaler by using SSH, without entering the password. At the prompt, type:

ssh nsroot@<NSIPaddress>

You should not be prompted for a password.

Example

```
ssh nsroot@10.102.96.50
```

Lights Out Management on the NetScaler Appliance

The MPX 11500/13500/14500/16500/18500/20500 and MPX 17550/19550/20550/21550 appliances have an Intelligent Platform Management Interface (IPMI) also known as the Lights out Management (LOM) port on the front panel of the appliance. Using LOM, you can remotely monitor and manage the appliance independently of the operating system. You can remotely change the IP address, power cycle the appliance, and perform a code dump by connecting to the appliance through the LOM port.

By connecting the LOM port over a dedicated channel that is separate from the data channel, you can make sure that connectivity to the appliance is maintained even if the data network is down.

Configuring the LOM Port

For initial configuration of the LOM port, connect to the port's default IP address and change it to the address that you want to use for remote monitoring and management. Also specify the administrator credentials and the network settings.

Note: The LEDs on the LOM port are unoperational by design.

To configure the LOM port

1. In a Web browser, type the IP address of the LOM port. For initial configuration, type the port's default address: `http://192.168.1.3`
2. In the **User Name** and **Password** boxes, type the administrator credentials. You can obtain the initial user name and password from your sales representative or from Citrix Customer Service.
3. In the Menu bar, click **Configuration.**
4. Under **Options**, click **Network** and type values for the following parameters:
   - IP Address—The IP address of the LOM port.
   - Subnet Mask—The mask used to define the subnet of the LOM port.
   - Default Gateway—The IP address of the router that connects the appliance to the network.
5. Click **Save.**

Power Cycling the Appliance

You can remotely turn off the appliance and turn it back on. The result is similar to pressing the power button on the back panel of the appliance for less than four seconds. The operating system performs a graceful shutdown. All operations on the appliance are stopped, no new connections to the client or server are accepted, and all the existing connections are closed.

To power cycle the appliance

1. In a Web browser, type the IP address of the LOM port.
2. In the **User Name** and **Password** boxes, type the administrator credentials.
3. In the **Menu** bar, click **Remote Control**.
4. Under **Options**, click **Power Control**, and then click **Power Cycle Server**.
5. Click **Perform Action**.

Performing a Core Dump

If the appliance fails or becomes unresponsive, you can remotely perform a core dump. This procedure has the same effect as pressing the NMI button on the back panel of the appliance.

To perform a core dump

1. In a Web browser, type the IP address of the LOM port.
2. In the **User Name** and **Password** boxes, type the administrator credentials.
3. In the **Menu** bar, click **Remote Control**.
4. Under **Options**, click **Power Control**, and then click **NMI Dump**.
5. Click **Perform Action**.

Administration

The following topics provide a conceptual reference and instructions for managing and monitoring the Citrix® NetScaler® appliance by using built-in features, such as command policies, Simple Network Management (SNMP), audit server logging, web server logging, Network Time Protocol (NTP), and the Reporting tool.

Citrix NetScaler Authentication and Authorization	Configure authentication and authorization to manage access to the NetScaler and different parts of the NetScaler configuration.
SNMP	Learn how SNMP works with NetScaler and how to configure SNMP V1, V2, and V3 on NetScaler.
Audit Server Logging	Configure the NetScaler audit server log to log and monitor the NetScaler states and status information. Also, learn how to configure audit server logging on a server system and for a deployment scenario.
Web Server Logging	Configure web server log to maintain a history of the page requests that originate from the NetScaler.
Advanced Configurations	Learn how to set advanced configurations, such as NTP, PMTU, and autodetected services, on the NetScaler.
Web Interface	Learn how to configure Web Interface on the NetScaler appliance for providing access to Citrix® XenApp™ and Citrix® XenDesktop® applications.
Enhanced Application Visibility Using AppFlow	Learn how to configure AppFlow for collecting network flow information.
Reporting Tool	Learn how to use the Reporting tool to view performance statistics as reports with graphs that are based on statistics collected by the nscollect utility.

Authentication and Authorization

To configure Citrix® NetScaler® authentication and authorization, you must first define the users who have access to the NetScaler appliance, and then you can organize these users into groups. After configuring users and groups, you need to configure command policies to define types of access, and assign the policies to users and/or groups.

You must log on as an administrator to configure users, groups, and command policies. The default NetScaler administrator user name is *nsroot*. After logging on as the default administrator, you should change the password for the nsroot account. Once you have changed the password, no user can access the NetScaler appliance until you create an account for that user. If you forget the administrator password after changing it from the default, you can reset it to nsroot.

Authentication and Authorization

To configure Citrix® NetScaler® authentication and authorization, you must first define the users who have access to the NetScaler appliance, and then you can organize these users into groups. After configuring users and groups, you need to configure command policies to define types of access, and assign the policies to users and/or groups.

You must log on as an administrator to configure users, groups, and command policies. The default NetScaler administrator user name is *nsroot*. After logging on as the default administrator, you should change the password for the nsroot account. Once you have changed the password, no user can access the NetScaler appliance until you create an account for that user. If you forget the administrator password after changing it from the default, you can reset it to nsroot.

Configuring Users and Groups

You must define your users by configuring accounts for them. To simplify the management of user accounts, you can organize them into groups.

You can also customize the NetScaler command-line prompt for a user. Prompts can be defined in a user's configuration, in a user-group configuration, and in the global configuration. The prompt displayed for a given user is determined by the following order of precedence:

1. Display the prompt as defined in the user's configuration.
2. Display the prompt as defined in the group configuration for the user's group.
3. Display the prompt as defined in the system global configuration.

Configuring User Accounts

To configure user accounts, you simply specify user names and passwords. You can change passwords and remove user accounts at any time.

To create a user account by using the NetScaler command line

At the NetScaler command prompt, type the following command to create a user account and verify the configuration:

- add system user <userName> [-**promptString** <string>]
- show system user

Example

```
> add system user user1
Enter password:
Confirm password:
 Done

> add system user johnd -promptString user-%u-at-%T
Enter password:
Confirm password:
 Done
```

```
> show system user
1)      User name: nsroot
2)      User name: user1
3)      User name: johnd  Prompt String: user-%u-at-%T  Prompt Inherited From: User
 Done
```

To modify or remove a user account by using the NetScaler command line

- To modify a user's password, type the set system user <userName> command and the parameters to be changed, with their new values.
- To remove a user account, type the rm system user <userName> command.

Parameters for configuring a user account

userName

A name for the user. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.

password

A password that the user uses to log on.

promptString

A name for the user’s NetScaler command-line prompt. The name can consist of letters, numbers, the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), underscore (_) symbols, and the following variables:

- **%u**—Will be replaced by the user name.
- **%h**—Will be replaced by the host name of the NetScaler appliance.
- **%t**—Will be replaced by the current time in 12-hour format.
- **%T**—Will be replaced by the current time in 24-hour format.
- **%d**—Will be replaced by the current date.
- **%s**—Will be replaced by the state of the NetScaler appliance.

A maximum of 63 characters are allowed for this parameter. A variable (for example, %u) is counted as two characters. The resulting prompt can be longer than 63 characters.

To configure a user account by using the configuration utility

1. In the navigation pane, expand **System** and click **Users**.
2. In the details pane, do one of the following:
   - To create a user account, click **Add**.
   - To modify an existing user account, select the user, and then click **Open**.
3. In the **Create System User** or **Configure System User** dialog box, specify values for the parameters, which correspond to parameters described in "Parameters for configuring a user account" as shown:
   - **User Name*** —userName (Cannot be changed for an existing user.)
   - **Password*** —password
   - **Confirm Password*** —password
   - **CLI Prompt**—promptString (Optional)

   * A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the user has been configured successfully.

Configuring User Groups

After configuring a user group, you can easily grant the same access rights to everyone in the group. To configure a group, you create the group and bind users to the group. You can bind each user account to more than one group. Binding user accounts to multiple groups may allow more flexibility when applying command policies.

To create a user group by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create a user group and verify the configuration:

- add system group <groupName> [-**promptString** <string>]
- show system group

Example

```
> add system group Managers -promptString Group-Managers-at-%h
 Done
> show system group
1)      Group name: group1
2)      Group name: Managers  Prompt String: Group-Managers-at-%h
 Done
```

To modify or remove a user group by using the NetScaler command line

- To modify a user group, type the set system group <groupName> command and the parameters to be changed, with their new values.
- To remove a user group, type rm system group <groupName>.

To bind a user to a group by using the NetScaler command line

At the NetScaler command prompt, type the following commands to bind a user account to a group and verify the configuration:

- bind system group <groupName> **-userName** <userName>
- show system group <groupName>

Example

```
> bind system group Managers -userName user1
 Done

> bind system group Managers -userName johnd
 Done

> show system group Managers
      Group name: Managers  Prompt String: Group-Managers-at-%h
      User name: user1
      User name: johnd
Done

> show system user user1
User name: user1  Prompt String: Group-Managers-at-%h  Prompt Inherited From: Group

      Group name: Managers
 Done

> show system user johnd
User name: johnd  Prompt String: user-%u-at-%T  Prompt Inherited From: User

      Group name: Managers
 Done
```

To unbind a user from a group by using the NetScaler command line

At the NetScaler command prompt, type the following commands to unbind a user account and verify the configuration:

- unbind system group <groupName> **-userName** <userName>
- show system group <groupName>

Parameters for configuring a user group

groupName

A name for the group you are creating. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing groups.)

userName

The name that was assigned to a previously configured user.

promptString

A name for the NetScaler command-line prompt for all the users that are part of this group. The name can consist of letters, numbers, the hyphen (-), period (.), pound (#), space ( ), at sign (@), equals (=), colon (:), underscore (_) symbols, and the following variables:

- **%u**—Will be replaced by the user name.
- **%h**—Will be replaced by the host name of the NetScaler appliance.
- **%t**—Will be replaced by the current time in 12-hour format.
- **%T**—Will be replaced by the current time in 24-hour format.
- **%d**—Will be replaced by the current date.
- **%s**—Will be replaced by the state of the NetScaler appliance.

A maximum of 63 characters are allowed for this parameter. A variable (for example, %u) is counted as two characters. The resulting prompt can be longer than 63 characters.

To configure a user group by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Groups**.

2. In the details pane, do one of the following:

   - To create a new user group, click **Add**.

   - To modify an existing user group, select the group, and then click **Open**.

3. In the **Create System Group** or **Configure System Group** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring a user group" as shown:

   - **Group Name*****—groupName (Required for a new group. Cannot be changed for an existing group.)

   - **CLI Prompt**—promptString (Optional)

   * A required parameter

4. Under **Members**, select users from the **Available Users** list and click **Add** to move them to the **Configured Users** list.

5. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the group has been configured successfully.

Configuring Command Policies

Command policies regulate which commands, command groups, vservers, and other entities that users and user groups are permitted to use.

The Citrix® NetScaler® appliance provides a set of built-in command policies, and you can configure custom policies. To apply the policies, you bind them to users and/or groups.

Here are the key points to keep in mind when defining and applying command policies.

- You cannot create global command policies. Command policies must be bound directly to NetScaler users and groups.
- Users or groups with no associated command policies are subject to the default (DENY-ALL) command policy, and are therefore unable to execute any configuration commands until the proper command policies are bound to their accounts.
- All users inherit the policies of the groups to which they belong.
- You must assign a priority to a command policy when you bind it to a user account or group account. This enables the NetScaler to determine which policy has priority when two or more conflicting policies apply to the same user or group.
- The following commands are available by default to any user and are unaffected by any command you specify:

  help cli, show cli attribute, clear cli prompt, alias, unalias, help, history, quit, exit, whoami, config, set cli mode, unset cli mode, show cli mode, set cli prompt, and show cli prompt.

Built-in Command Policies

The following table describes the built-in policies.

Table 1. Built-in Command Policies

Policy name	Allows
read-only	Read-only access to all show commands except show runningconfig, show ns.conf, and the show commands for the NetScaler command group.
operator	Read-only access and access to commands to enable and disable services and servers or place them in ACCESSDOWN mode.

network	Full access, except to the set and unset SSL commands, sh ns.conf, sh runningconfig, and sh gslb runningconfig commands.
superuser	Full access. Same privileges as the nsroot user.

Creating Custom Command Policies

Regular expression support is offered for users with the resources to maintain more customized expressions, and for those deployments that require the flexibility that regular expressions offer. For most users, the built-in command policies are sufficient. Users who need additional levels of control but are unfamiliar with regular expressions may want to use only simple expressions, such as those in the examples provided in this section, to maintain policy readability.

When you use a regular expression to create a command policy, keep the following in mind.

- When you use regular expressions to define commands that will be affected by a command policy, you must enclose the commands in double quotation marks. For example, to create a command policy that includes all commands that begin with show, type the following:

  ```
  "^show .*$"
  ```

  To create a command policy that includes all commands that begin with rm, type the following:

  ```
  "^rm .*$"
  ```

- Regular expressions used in command policies are not case sensitive.

The following table lists examples of regular expressions:

Table 2. Examples of Regular Expressions for Command Policies

Command specification	Matches these commands
"^rm\s+.*$"	All remove actions, because all remove actions begin with the rm string, followed by a space and additional parameters and flags.
"^show\s+.*$"	All show commands, because all show actions begin with the show string, followed by a space and additional parameters and flags.
"^shell$"	The shell command alone, but not combined with any other parameters or flags.

"^add\s+vserver\s+.*$"	All create vserver actions, which consist of the add vserver command followed by a space and additional parameters and flags.
"^add\s+(lb\s+vserver)\s+.*"	All create lb vserver actions, which consist of the add lb vserver command followed by a space and additional parameters and flags.

The following table shows the command specifications for each of the built-in command policies.

Table 3. Expressions Used in the Built-in Command Policies

Policy name	Command specification regular expression
read-only	(^man.*)|(^show\s+(?!system)(?!ns ns.conf)(?!ns runningConfig).*)|(^stat.*)
operator	(^man.*)|(^show\s+(?!system)(?!ns ns.conf)(?!ns runningConfig).*)|(^stat.*)|(^set.*-accessdown.*)|(^(enable|disable) (server|service).*)
network	^(?!shell)\S+\s+(?!system)(?!ns ns.conf)(?!ns runningConfig).*
superuser	.*

To create a command policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create a command policy and verify the configuration:

- add system cmdPolicy <policyname> <action> <cmdspec>
- sh system cmdPolicy

Example

```
> add system cmdPolicy read_all ALLOW (^show\s+(!system)(!ns ns.conf)(!ns runningConfig).*)|(^stat.*)
 Done
> sh system cmdPolicy
1)      Command policy: operator
2)      Command policy: read-only
3)      Command policy: network
4)      Command policy: superuser
5)      Command policy: allow_portaladmin
6)      Command policy: read_all
 Done
```

To modify or remove a command policy by using the NetScaler command line

- To modify a command policy, type the set system cmdPolicy <PolicyName> command and the parameters to be changed, with their new values.
- To remove a command policy, type rm system cmdPolicy <PolicyName>.

  Note: The built-in command policies cannot be removed.

Parameters for configuring a command policy

policyname

A name for the command policy you are creating. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing policies.)

action

The action the policy applies when the command specification pattern matches. Possible values: ALLOW, DENY

cmdspec

Rule (expression) that the policy uses for pattern matching.

To configure a command policy by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Command Policies**.
2. In the details pane, do one of the following:
   - To create a command policy, click **Add**.
   - To modify an existing command policy, select the command policy, and then click **Open**.
3. In the **Create Command Policy** or **Configure Command Policy** dialog box, specify values for the parameters, which correspond to the parameters described in "Parameters for configuring a command policy" as shown:
   - Policy Name*—policyname (Cannot be changed for an existing policy.)
   - Action—action
   - Command Spec*—cmdspec (You can type a complete expression directly into the text area, or you can click **Add** or **Regex Tokens** for assistance.The **Add** icon opens the **Add Command** dialog box, in which you can select a NetScaler entity and then select an operation to perform on the entity. The **Regex Tokens** icon displays regular expression tokens, which you can add to your expression by selecting them.)

   * A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the command policy has been configured successfully.

Binding Command Policies to Users and Groups

Once you have defined your command policies, you must bind them to the appropriate user accounts and groups.

When you bind a policy, you must assign it a priority so that the NetScaler appliance can determine which command policy to follow when two or more applicable command policies are in conflict.

Command policies are evaluated in the following order:

- Command policies bound directly to users and the corresponding groups are evaluated according to priority number. A command policy with a lower priority number is evaluated before one with a higher priority number. Therefore, any privileges the lower-numbered command policy explicitly grants or denies are not overridden by a higher-numbered command policy.
- When two command policies, one bound to a user account and other to a group, have the same priority number, the command policy bound directly to the user account is evaluated first.

To bind command policies to a user by using the NetScaler command line

At the NetScaler command prompt, type the following commands to bind a command policy to a user and verify the configuration:

- bind system user <userName> -**policyName** <policyName> <priority>
- sh system user <userName>

Example

```
> bind system user user1 -policyName read_all 1
Done
> sh system user user1
User name: user1

      Command Policy: read_all       Priority:1
 Done
```

To unbind command policies from a user by using the NetScaler command line

At the NetScaler command prompt, type the following commands to unbind a command policy from a user and verify the configuration:

- unbind system user <userName> **-policyName** <policyName>
- sh system user <userName>

Parameters for binding a command policy to a user

userName

The name of an existing user account.

policyName

The name of an existing command policy.

priority

The priority assigned to this policy.

To bind command policies to a user by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Users**.
2. In the details pane, select the user to which you want to bind a command policy, and then click **Open**.
3. In the **Configure System User** dialog box, under **Command Policies**, all of the command policies configured on your NetScaler appear on the list. Select the check box next to the name of the policy you want to bind to this user.
4. In the **Priority** column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
5. Click **OK**. A message appears in the status bar, stating that the user has been configured successfully.

To bind command policies to a group by using the NetScaler command line

At the NetScaler command prompt, type the following commands to bind a command policy to a user group and verify the configuration:

- bind system group <groupName> -**policyName** <policyName> <priority>
- sh system group <groupName>

Example

```
> bind system group Managers -policyName read_all 1
Done
> sh system group Managers
      Group name: Managers

      User name: johnd

      Command policy: read_all       Priority:1
 Done
```

To unbind command policies from a group by using the NetScaler command line

At the NetScaler command prompt, type the following commands to unbind a command policy from a user group and verify the configuration:

- unbind system group <groupName> -**policyName** <policyName>
- sh system group <groupName>

Parameters for binding a command policy to a group

groupName

The name of an existing user group.

policyName

The name of an existing command policy.

priority

The priority assigned to this command policy.

To bind command policies to a group by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Groups**.
2. In the details pane, select the group to which you want to bind a command policy, and then click **Open**.
3. In the **Configure System Group** dialog box, under **Command Policies**, all the command policies configured on your NetScaler appear on the list. Select the check box next to the name of the policy you want to bind to this group.
4. In the **Priority** column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
5. Click **OK**. A message appears in the status bar, stating that the group has been configured successfully.

Resetting the Default Administrator (nsroot) Password

The nsroot account provides complete access to all features of the Citrix® NetScaler® appliance. Therefore, to preserve security, the nsroot account should be used only when necessary, and only individuals whose duties require full access should know the password for the nsroot account. Frequently changing the nsroot password is advisable. If you lose the password, you can reset it to the default and then change it.

To reset the nsroot password, you must boot the NetScaler into single user mode, mount the file systems in read/write mode, and remove the set NetScaler user nsroot entry from the ns.conf file. You can then reboot, log on with the default password (nsroot), and choose a new password.

To reset the nsroot password

1. Connect a computer to the NetScaler serial port and log on.

   Note: You cannot log on by using ssh to perform this procedure; you must connect directly to the NetScaler.

   As the operating system starts, it displays the following message:

   ```
   Hit [Enter] to boot immediately, or any other key for command
   prompt.

   Booting [kernel] in # seconds.
   ```

2. Press CTRL+C.

   The following message appears:

   Type '?' for a list of commands, 'help' for more detailed help.

   ok

3. Type **boot -s** and press the ENTER key to start the NetScaler in single user mode.

   After the NetScaler boots, it displays the following message:

   Enter full path name of shell or RETURN for /bin/sh:

4. Press the ENTER key to display the # prompt, and type the following commands to mount the file systems:

   fsck /dev/ad0s1a

   mount /dev/ad0s1a /flash

5. Using a text editor of your choice, edit the /flash/nsconfig/ns.conf file and remove the set system user nsroot entry.

6. Save the file and exit the text editor.

7. Type **reboot** and press the ENTER key to reboot the NetScaler.

   When the NetScaler completes rebooting, it prompts for the user name and password.

8. Log on as nsroot, with the password nsroot.

   Once logged on to the NetScaler, you will be required to enter a new nsroot user password.

9. Follow the prompts to change the password.

10. Exit the **config ns** menu.

Example of a User Scenario

The following example shows how to create a complete set of user accounts, groups, and command policies and bind each policy to the appropriate groups and users. The company, Example Manufacturing, Inc., has three users who will access the Citrix® NetScaler® appliance:

John Doe. The IT manager. John needs to be able to see all parts of the NetScaler configuration but does not need to modify anything.

- **Maria Ramiez.** The lead IT administrator. Maria needs to be able to see and modify all parts of the NetScaler configuration except for NetScaler commands (which local policy dictates must be performed while logged on as nsroot).
- **Michael Baldrock.** The IT administrator in charge of load balancing. Michael needs to be able to see all parts of the NetScaler configuration, but needs to modify only the load balancing functions.

The following table shows the breakdown of network information, user account names, group names, and command policies for the sample company.

Table 1. Sample Values for Creating Entities

Field	Value	Note
NetScaler host name	ns01.example.net	N/A
User accounts	johnd, mariar, and michaelb	John Doe, IT manager, Maria Ramirez, IT administrator and Michael Baldrock, IT administrator.
Groups	Managers and SysOps	All managers and all IT administrators.
Command Policies	read_all, modify_lb, and modify_all	Allow complete read-only access, Allow modify access to load balancing, and Allow complete modify access.

The following description walks you through the process of creating a complete set of user accounts, groups, and command policies on the NetScaler appliance named ns01.example.net.

The description includes procedures for binding the appropriate user accounts and groups to one another, and binding appropriate command policies to the user accounts and groups.

This example illustrates how you can use prioritization to grant precise access and privileges to each user in the IT department.

The example assumes that initial installation and configuration have already been performed on the NetScaler.

Configuration steps

1. Use the procedure described in Configuring User Accounts to create user accounts **johnd**, **mariar**, and **michaelb**.
2. Use the procedure described in Configuring User Groups to create user groups **Managers** and **SysOps**, and then bind the users **mariar** and **michaelb** to the **SysOps** group and the user **johnd** to the **Managers** group.
3. Use the procedure described in Creating Custom Command Policies to create the following command policies:
   - **read_all** with action **Allow** and command spec "(^show\s+(?!system)(?!ns ns.conf)(?!ns runningConfig).*)|(^stat.*)"
   - **modify_lb** with action as **Allow** and the command spec **"^set\s+lb\s+.*$"**
   - **modify_all** with action as **Allow** and the command spec **"^\S+\s+(?!system).*"**
4. Use the procedure described in Binding Command Policies to Users and Groups to bind the **read_all** command policy to the **SysOps** group, with priority value **1**.
5. Use the procedure described in Binding Command Policies to Users and Groups to bind the **modify_lb** command policy to user **michaelb**, with priority value **5**.

The configuration you just created results in the following:

- John Doe, the IT manager, has read-only access to the entire NetScaler configuration, but he cannot make modifications.
- Maria Ramirez, the IT lead, has near-complete access to all areas of the NetScaler configuration, having to log on only to perform NetScaler-level commands.
- Michael Baldrock, the IT administrator responsible for load balancing, has read-only access to the NetScaler configuration, and can modify the configuration options for load balancing.

The set of command policies that applies to a specific user is a combination of command policies applied directly to the user's account and command policies applied to the group(s) of which the user is a member.

Each time a user enters a command, the operating system searches the command policies for that user until it finds a policy with an ALLOW or DENY action that matches the command. When it finds a match, the operating system stops its command policy search and allows or denies access to the command.

If the operating system finds no matching command policy, it denies the user access to the command, in accordance with the NetScaler appliance's default deny policy.

Note: When placing a user into multiple groups, take care not to cause unintended user command restrictions or privileges. To avoid these conflicts, when organizing your users in groups, bear in mind the NetScaler command policy search procedure and policy ordering rules.

Configuring External User Authentication

External user authentication is the process of authenticating the users of the Citrix® NetScaler® appliance by using an external authentication server. The NetScaler supports LDAP, RADIUS, TACACS+, and NT4 authentication servers. To configure external user authentication, you must create authentication policies. You can configure one or many authentication policies, depending on your authentication needs. An authentication policy consists of an expression and an action. Authentication policies use NetScaler classic expressions, which are described in detail in the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/ctx128673.

After creating an authentication policy, you bind it to the system global entity and assign a priority to it. You can create simple server configurations by binding a single authentication policy to the system global entity. Or, you can configure a cascade of authentication servers by binding multiple policies to the system global entity. If no authentication policies are bound to the system, users are authenticated by the onboard system.

Note: User accounts must be configured on the NetScaler appliance before users can be externally authenticated. You must first create an onboard system user for all users who will access the appliance, so that you can bind command policies to the user accounts. Regardless of the authentication source, users cannot log on if they are not granted sufficient command authorization through command policies bound to their user accounts or to a group of which they are a member.

Configuring LDAP Authentication

You can configure the NetScaler to authenticate user access with one or more LDAP servers. LDAP authorization requires identical group names in Active Directory, on the LDAP server, and on the NetScaler. The characters and case must also be the same.

By default, LDAP authentication is secured by using SSL/TLS protocol. There are two types of secure LDAP connections. In the first type, the LDAP server accepts the SSL/TLS connection on a port separate from the port used to accept clear LDAP connections. After users establish the SSL/TLS connection, LDAP traffic can be sent over the connection. The second type allows both unsecure and secure LDAP connections and is handled by a single port on the server. In this scenario, to create a secure connection, the client first establishes a clear LDAP connection. Then the LDAP command StartTLS is sent to the server over the connection. If the LDAP server supports StartTLS, the connection is converted to a secure LDAP connection by using TLS.

The port numbers for LDAP connections are:

- 389 for unsecured LDAP connections
- 636 for secure LDAP connections
- 3268 for Microsoft unsecure LDAP connections
- 3269 for Microsoft secure LDAP connections

LDAP connections that use the StartTLS command use port number 389. If port numbers 389 or 3268 are configured on the NetScaler, it tries to use StartTLS to make the connection. If any other port number is used, connection attempts use SSL/TLS. If StartTLS or SSL/TLS cannot be used, the connection fails.

When configuring the LDAP server, the case of the alphabetic characters must match that on the server and on the NetScaler. If the root directory of the LDAP server is specified, all of the subdirectories are also searched to find the user attribute. In large directories, this can affect performance. For this reason, Citrix recommends that you use a specific organizational unit (OU).

The following table lists examples of user attribute fields for LDAP servers.

Table 1. User Attribute Fields for LDAP Servers

LDAP server	User attribute	Case sensitive?
Microsoft Active Directory	Server sAMAccountName	No
Novell eDirectory	cn	Yes
IBM Directory Server	uid	Yes
Lotus Domino	CN	Yes

Sun ONE directory (formerly iPlanet)	uid or cn	Yes

The following table lists examples of the base distinguished name (DN).

Table 2. Examples of Base Distinguished Name

LDAP server	Base DN
Microsoft Active Directory	DC=citrix, DC=local
Novell eDirectory	dc=citrix, dc=net
IBM Directory Server	cn=users
Lotus Domino	OU=City, O=Citrix, C=US
Sun ONE directory (formerly iPlanet)	ou=People, dc=citrix, dc=com

The following table lists examples of the bind distinguished name (DN).

Table 3. Examples of Bind Distinguished Name

LDAP server	Bind DN
Microsoft Active Directory	CN=Administrator, CN=Users, DC=citrix, DC=local
Novell eDirectory	cn=admin, dc=citrix, dc=net
IBM Directory Server	LDAP_dn
Lotus Domino	CN=Notes Administrator, O=Citrix, C=US
Sun ONE directory (formerly iPlanet)	uid=admin, ou=Administrators, ou=TopologyManagement, o=NetscapeRoot

To configure LDAP authentication by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Authentication**.
2. On the **Policies** tab, click **Add**.
3. In **Name**, type a name for the policy.
4. In **Authentication Type**, select **LDAP**. Next to **Server**, click **New**.
5. In **Name**, type the name of the server.
6. Under **Server**, in **IP Address** and **Port**, type the IP address and port number of the LDAP server.
7. Under **Connection Settings**, provide the following information:

   - In **Base DN (location of users)**, type the base DN under which users are located.

     Base DN is usually derived from the Bind DN by removing the user name and specifying the group where in which are located. Examples of syntax for base DN are:

     ou=users, dc=ace, dc=com
     cn=Users, dc=ace, dc=com

   - In **Administrator Bind DN**, type the administrator bind DN for queries to the LDAP directory. Examples for syntax of bind DN are:

     domain/user name
     ou=administrator, dc=ace, dc=com
     user@domain.name (for Active Directory)
     cn=Administrator, cn=Users, dc=ace, dc=com

     For Active Directory, the group name specified as cn=groupname is required. The group name that is defined in the NetScaler must be identical to the group name that is defined on the LDAP server. For other LDAP directories, the group name either is not required or, if required, is specified as ou=groupname.

     The NetScaler binds to the LDAP server, using the administrator credentials, and then searches for the user. After locating the user, the NetScaler unbinds the administrator credentials and rebinds with the user credentials.

   - In **Administrator Password** and **Confirm Administrator Password**, type the administrator password for the LDAP server.
8. To retrieve additional LDAP settings automatically, click **Retrieve Attributes**. The fields under **Other Settings** then populate automatically. If you do not want to do this, skip to Step 12.
9. Under **Other Settings**, in **Server Logon Name Attribute**, type the attribute under which the NetScaler should look for user logon names for the LDAP server that you are

configuring. The default is `samAccountName`.

10. In **Group Attribute**, leave the default memberOf for Active Directory or change it to that of the LDAP server type you are using. This attribute enables the NetScaler to obtain the groups associated with a user during authorization.

11. In **Security Type**, select the security type. If you select **PLAINTEXT** or **TLS** for security, use port number 389. If you select SSL, use port number 636.

12. To allow users to change their LDAP password, select **Allow Password Change**. If you select **PLAINTEXT** as the security type, allowing users to change their passwords is not supported.

13. Click **Create**.

14. In the **Create Authentication Policy** dialog box, next to **Named Expressions**, select the expression, click **Add Expression**, click **Create**, and click **Close**.

After the LDAP server settings are configured on the NetScaler, bind the policy to the system global entity. For more information about binding authentication policies globally, see Binding the Authentication Policies to the System Global Entity.

Determining attributes in the LDAP directory

If you need help determining your LDAP directory attributes, you can easily look them up with the free LDAP browser from Softerra.

You can download the LDAP browser from the Softerra LDAP Administrator Web site at http://www.ldapbrowser.com. After the browser is installed, set the following attributes:

- The host name or IP address of your LDAP server.
- The port of your LDAP server. The default is 389.
- The base DN field can be left blank.
- The information provided by the LDAP browser can help you determine the base DN needed for the Authentication tab.
- The Anonymous Bind check determines whether the LDAP server requires user credentials for the the browser to connect to it. If the LDAP server requires credentials, leave the check box cleared.

After completing the settings, the LDAP browser displays the profile name in the left pane and connects to the LDAP server.

Configuring RADIUS Authentication

You can configure the NetScaler appliance to authenticate user access with one or more RADIUS servers. If you are using RSA SecurID, SafeWord, or Gemalto Protiva products, use a RADIUS server.

Your configuration might require using a network access server IP address (NAS IP) or a network access server identifier (NAS ID). When configuring your NetScaler to use a RADIUS authentication server, use the following guidelines:

- If you enable use of the NAS IP, the appliance sends its configured IP address to the RADIUS server, rather than the source IP address used in establishing the RADIUS connection.
- If you configure the NAS ID, the appliance sends the identifier to the RADIUS server. If you do not configure the NAS ID, the appliance sends its host name to the RADIUS server.
- When the NAS IP is enabled, the appliance ignores any NAS ID that was configured by using the NAS IP to communicate with the RADIUS server.

To configure RADIUS authentication by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Authentication**.
2. On the **Policies** tab, click **Add**.
3. In **Name**, type a name for the policy.
4. In **Authentication Type**, select **RADIUS**.
5. Next to **Server**, click **New**.
6. In **Name**, type a name for the server.
7. Under **Server**, in **IP Address**, type the IP address of the RADIUS server.
8. In **Port**, type the port. The default is 1812.
9. Under **Details**, in **Secret Key** and **Confirm Secret Key**, type the RADIUS server secret.
10. In **NAS ID**, type the identifier number, and then click **Create**.
11. In the **Create Authentication Policy** dialog box, next to **Named Expressions**, select the expression, click **Add Expression**, click **Create**, and click **Close**.

After the RADIUS server settings are configured on the NetScaler, bind the policy to the system global entity. For more information about binding authentication policies globally, see Binding the Authentication Policies to the System Global Entity.

Choosing RADIUS authentication protocols

The NetScaler appliance supports implementations of RADIUS that are configured to use any of several protocols for user authentication, including:

- Password Authentication Protocol
- Challenge-Handshake Authentication Protocol (CHAP)
- Microsoft Challenge-Handshake Authentication Protocol (MS-CHAP Version 1 and Version 2)

If your deployment of the NetScaler is configured to use RADIUS authentication and your RADIUS server is configured to use Password Authentication Protocol, you can strengthen user authentication by assigning a strong shared secret to the RADIUS server. Strong RADIUS shared secrets consist of random sequences of uppercase and lowercase letters, numbers, and punctuation, and are at least 22 characters long. If possible, use a random character generation program to determine RADIUS shared secrets.

To further protect RADIUS traffic, assign a different shared secret to each NetScaler appliance or virtual server. When you define clients on the RADIUS server, you can also assign a separate shared secret to each client. If you do this, you must configure separately each NetScaler policy that uses RADIUS authentication.

Shared secrets are configured on the NetScaler when a RADIUS policy is created.

Configuring IP address extraction

You can configure the NetScaler to extract the IP address from a RADIUS server. When a user authenticates with the RADIUS server, the server returns a framed IP address that is assigned to the user. The following are attributes for IP address extraction:

- Allows a remote RADIUS server to supply an IP address from the internal network for a user logged on to the NetScaler.
- Allows configuration for any RADIUS attribute using the type ipaddress, including those that are vendor encoded.

When configuring the RADIUS server for IP address extraction, you configure the vendor identifier and the attribute type.

The vendor identifier enables the RADIUS server to assign an IP address to the client from a pool of IP addresses that are configured on the RADIUS server. The vendor ID and attributes are used to make the association between the RADIUS client and the RADIUS server. The vendor ID is the attribute in the RADIUS response that provides the IP address of the internal network. A value of zero indicates that the attribute is not vendor encoded. The

attribute type is the remote IP address attribute in a RADIUS response. The minimum value is one and the maximum value is 255.

A common configuration is to extract the RADIUS attribute *framed IP address*. The vendor ID is set to zero or is not specified. The attribute type is set to eight.

To configure IP address extraction by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Authentication**.
2. On the **Policies** tab, click **Open**.
3. In the **Configure Authentication Policy** dialog box, next to **Server**, click **Modify**.
4. Under **Details**, in **Group Vendor Identifier**, type the value.
5. In **Group Attribute Type**, type the value, and click **OK** twice.

Configuring TACACS+ Authentication

You can configure a TACACS+ server for authentication. Similar to RADIUS authentication, TACACS+ uses a secret key, an IP address, and the port number. The default port number is 49. To configure the NetScaler to use a TACACS+ server, provide the server IP address and the TACACS+ secret. The port needs to be specified only when the server port number in use is something other than the default port number of 49.

To configure TACACS+ authentication by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Authentication**.
2. On the **Policies** tab, click **Add**.
3. In **Name**, type a name for the policy.
4. In **Authentication Type**, select **TACACS**.
5. Next to **Server**, click **New**.
6. In **Name**, type a name for the server.
7. Under **Server**, type the IP address and port number of the TACACS+ server.
8. Under **TACACS server information**, in **TACACS Key** and **Confirm TACACS key**, type the key.
9. In **Authorization**, select **ON** and click **Create**.
10. In the **Create Authentication Policy** dialog box, next to **Named Expressions**, select the expression, click **Add Expression**, click **Create**, and click **Close**.

After the TACACS+ server settings are configured on the NetScaler, bind the policy to the system global entity. For more information about binding authentication policies globally, see Binding the Authentication Policies to the System Global Entity.

Configuring NT4 Authentication

You can configure the NetScaler appliance to use Windows NT LAN Manager (NTLM) authentication to authenticate users against the user database on a Windows NT 4.0 domain controller. A Windows NT 4.0 domain controller maintains domain user accounts in a database on the Windows NT 4.0 server. A domain user account includes a user name and password and other information about the user.

When a user logs on to the NetScaler, the user enters the user name and password maintained in the domain user account on the Windows NT 4.0 server. The NetScaler connects to the Windows NT 4.0 server and passes these credentials to the server. The server authenticates the user. If you need to configure the NetScaler to authenticate clients against a Windows NT 4.0 primary or backup domain controller, you need to specify the server IP address, the domain name, and the domain administrator user name and password of the person who is authorized to administer the domain. These parameters are necessary because the NetScaler joins the domain to communicate authentication data.

NT4 authentication supports NTLMv1 and NTLMv2 authentication protocols only.

To configure NT4 authentication by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Authentication**.
2. On the **Policies** tab, click **Add**.
3. In **Name**, type a name for the policy.
4. In **Authentication Type**, select **NT4**.
5. Next to **Server**, click **New**.
6. In **Server**, type the name of the server.
7. Complete the settings as they are configured on your Windows NT 4.0 server and click **Create**.
8. In the **Create Authentication Policy** dialog box, next to **Named Expressions**, select the expression, click **Add Expression**, click **Create**, and click **Close**.

When the settings for Windows NT 4.0 authentication are configured, bind the policy to the system global entity. For more information about binding authentication policies globally, see Binding the Authentication Policies to the System Global Entity.

Binding the Authentication Policies to the System Global Entity

When the authentication policies are configured, bind the policies to the system global entity.

To bind an authentication policy globally by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Authentication**.
2. On the **Policies** tab, click **Global Bindings**.
3. Under **Details**, click **Insert Policy**.
4. Under **Policy Name**, select the policy and click **OK**.

To unbind a global authentication policy by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Authentication**.
2. On the **Policies** tab, click **Global Bindings**.
3. In the **Bind/Unbind Authentication Policies** dialog box, in **Policy Name**, select the policy, click **Unbind Policy** and then click **OK**.

SNMP

You can use Simple Network Management Protocol (SNMP) to configure the SNMP agent on the Citrix® NetScaler® appliance to generate asynchronous events, which are called *traps*. The traps are generated whenever there are abnormal conditions on the NetScaler. The traps are then sent to a remote device called a *trap listener*, which signals the abnormal condition on the NetScaler appliance. Or, you can query the SNMP agent for System-specific information from a remote device called an *SNMP manager*. The agent then searches the management information base (MIB) for the data requested and sends the data to the SNMP manager.

The SNMP agent on the NetScaler can generate traps compliant with SNMPv1 and SNMPv2 only. For querying, the SNMP agent supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3).

The following figure illustrates a network with a NetScaler that has SNMP enabled and configured. In the figure, each SNMP network management application uses SNMP to communicate with the SNMP agent on the NetScaler. The SNMP agent searches its management information base (MIB) to collect the data requested by the SNMP Manager and provides the information to the application.

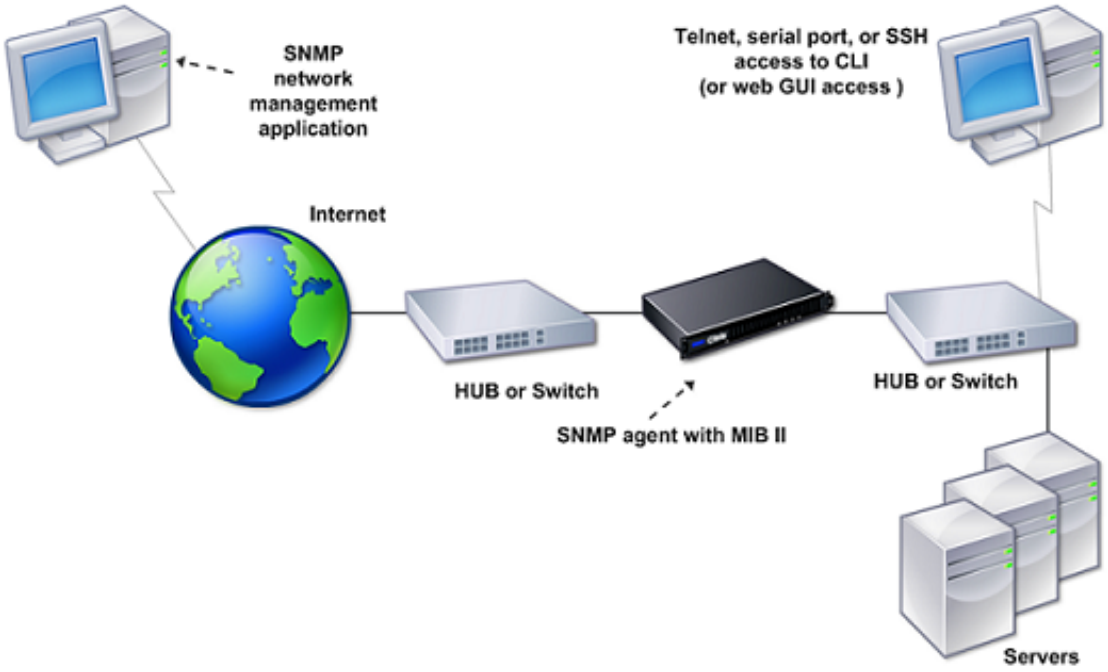

Figure 1. *NetScaler Supporting SNMP*

Importing MIB Files to the SNMP Manager and Trap Listener

You must download the following files to SNMP managers and trap listeners before you start monitoring a NetScaler appliance.

- **NS-MIB-smiv1.mib.** This file is used by SNMPv1 managers and trap listeners.
- **NS-MIB-smiv2.mib.** This file is used by SNMPv2 and SNMPv3 managers and SNMPv2 trap listeners.

The MIB files include the following:

- **A subset of standard MIB-2 groups.** Provides the MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.
- **A NetScaler enterprise MIB.** Provides NetScaler-specific configuration and statistics.

To import the MIB files to the SNMP manager and trap listener

- Logon to the **Downloads** page of NetScaler appliance GUI.
- Under **SNMP Files**, do one of the following:
  1. If your SNMP management application is other than WhatsUpGold, download the following files to your SNMP management application:
     - NS-MIB-smiv2.mib
     - NS-MIB-smiv1.mib
  2. If you are using the WhatsUpGold SNMP management application, download only the following files to the SNMP management application:
     - mib.txt
     - traps.txt

Configuring the NetScaler to Generate SNMPv1 and SNMPv2 Traps

You can configure the NetScaler to generate asynchronous events, which are called *traps*. The traps are generated whenever there are abnormal conditions on the NetScaler. The traps are sent to a remote device called a *trap listener*. This helps administrators monitor the NetScaler and respond promptly to any issues.

The NetScaler provides a set of condition entities called *SNMP alarms*. When the condition in any SNMP alarm is met, the NetScaler generates SNMP trap messages that are sent to the configured trap listeners. For example, when the LOGIN-FAILURE alarm is enabled, a trap message is generated and sent to the trap listener whenever there is a login failure on the NetScaler appliance.

To configure the NetScaler to generate traps, you need to enable and configure alarms. Then, you specify trap listeners to which the NetScaler will send the generated trap messages.

Enabling or Disabling an SNMP Alarm

The NetScaler generates traps only for SNMP alarms that are enabled. Some alarms are enabled by default, but you can disable them.

When you enable an SNMP alarm, the NetScaler generates corresponding trap messages when some events occur. Some NetScaler alarms are enabled by default.

To enable or disable an SNMP alarm by using the command line

At the NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- enable snmp alarm <alarm name>
- sh snmp alarm <alarm name>

Example

```
 > enable snmp alarm LOGIN-FAILURE
 Done
 > show snmp alarm LOGIN-FAILURE
 Alarm Alarm Threshold Normal Threshold Time State Severity Logging
----- --------------- ---------------- ---- -------- ------------- --------
 1) LOGIN-FAILURE N/A N/A N/A ENABLED - ENABLED
Done
```

To enable or disable an SNMP alarm by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Alarms**.
2. In the details pane, select an alarm (for example, **Login-Failure**), and do one of the following:
   - To enable an alarm, click **Enable**.
   - To disable an alarm, click **Disable**.

   A message appears in the status bar, stating that the alarm is enabled or disabled successfully.

Configuring Alarms

The NetScaler provides a set of condition entities called *SNMP alarms*. When the condition set for an SNMP alarm is met, the NetScaler generates SNMP traps messages that are sent to the configured trap listeners. For example, when the LOGIN-FAILURE alarm is enabled, a trap message is generated and sent to the trap listener whenever there is a login failure on the NetScaler appliance.

You can assign an SNMP alarm with a severity level. When you do this, the corresponding trap messages are assigned that severity level.

The following are the severity levels, defined in the NetScaler, in decreasing order of severity.

- Critical
- Major
- Minor
- Warning
- Informational

For example, if you set a Warning severity level for the SNMP alarm named LOGIN-FAILURE, the trap messages generated when there is a login failure will be assigned with the Warning severity level.

You can also configure an SNMP alarm to log the corresponding trap messages generated whenever the condition on that alarm is met.

To configure an SNMP alarm by using the command line

At the NetScaler command prompt, type the following commands to configure an SNMP alarm and verify the configuration:

- set snmp alarm <alarm Name> [**-thresholdValue** <positive_integer> [**-normalValue** <positive_integer>]] [**-time** <secs>] [**-state** (ENABLED | DISABLED)] [**-severity** <severity>] [**-logging** (ENABLED | DISABLED)]
- sh snmp alarm <alarm Name>

Parameters for configuring SNMP alarms

severity

Severity level of this alarm. Possible values: Critical, Major, Minor, Warning, Informational. Default: Informational.

logging

Enable logging of SNMP trap messages by Syslog. Possible values: ENABLED and DISABLED.

To configure SNMP alarms by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Alarms**.
2. In the details pane, select an alarm (for example, **Login-Failure**), and then click **Open**.
3. In the **Configure SNMP Alarm** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring SNMP alarms" as shown:
   - **Severity**—severity
   - **Logging**—logging
4. Click **OK**. A message appears in the status bar, stating that the alarm has been configured successfully.

Configuring Traps

After configuring the alarms, you need to specify the trap listener to which the NetScaler will send the trap messages. Apart from specifying parameters like IP address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

You can also configure the NetScaler to send SNMP trap messages with a source IP, other than the NetScaler IP address (NSIP), to a particular trap listener. You can set the source IP to either a mapped IP address (MIP) or a subnet IP address (SNIP) configured on the NetScaler appliance.

You can also configure the NetScaler to send trap messages based on a severity level to a trap listener. For example, if you set the severity level as Minor for a trap listener, all

the trap messages of the severity level equal to or greater than Minor (Minor, Major, and Critical) will be sent to the trap listener.

Also, you need to specify a community string if you have defined the same in the trap listener. This string is sent in the trap messages to the specified trap listener. The trap listener will accept a trap message only when the community string defined in the trap message matches the community string defined in the trap listener; otherwise, the trap message is dropped.

To add an SNMP trap by using the NetScaler command line

At the NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp trap <trapClass> <trapDestination> **-version** (V1 | V2) **-destPort** <port> **-communityName** <string> **-srcIP** <ip_addr> **-severity** <severity>
- show snmp trap

Example

```
 add snmp trap specific 10.102.29.3 -version V2 -destPort 80 -communityName com1 -severity Major
 Done
> show snmp trap
Type       DestinationIP    DestinationPort  Version     SourceIP        Min-Severity   Community
```

```
----      -------------   ---------------  -------   --------      ------------  ---------
generic    10.102.29.9     162             V2        NetScaler IP   N/A           public
specific   10.102.29.9     162             V2        NetScaler IP   -             public
specific   10.102.29.3     80              V2        NetScaler IP   Major         com1
 Done
```

Parameters for configuring SNMP traps

trapClass

The trap type. Possible values: generic and specific.

version

SNMP version of the trap PDU to be sent.

trapDestination

IP address of the trap destination.

destPort

Destination port of the trap. Default: 162. Minimum value: 1

scrIP

Source IP of the traps. Default: NetScaler IP (NSIP)

severity

Specify the severity level of trap messages. All generated trap mesages of the severity level up to the specified severity level will be sent to the trap listener.

Possible values: Critical, Major, Minor, Warning, and Informational.

Default: Informational.

communityName

The community string. Default: public.

To configure SNMP Traps by using the configuration utility

1. In the navigation pane, expand **System,** expand **SNMP,** and then click **Traps**.
2. In the details pane, do one of the following:
   - To create a new trap, click **Add**.
   - To modify an existing trap, select the trap, and then click **Open**.
3. In the **Create SNMP Trap Destination** or **Configure SNMP Trap** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring SNMP traps" as shown:
   - **Type*****—trapClass
   - **Version**—version
   - **Destination IP Address*****—trapDestination
   - **Destination Port**—destPort
   - **Source IP Address**—srcIP
   - **Minimum Severity**—severity
   - **Community Name**—communityName

   *A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the trap has been configured successfully.

Configuring the NetScaler for SNMP v1 and v2 Queries

You can query the NetScaler SNMP agent for system-specific information from a remote device called *SNMP managers*. The agent then searches the management information base (MIB) for the data requested and sends the data to the SNMP manager.

The following types of SNMP v1 and v2 queries are suppoted by the SNMP agent:

- GET
- GET NEXT
- ALL
- GET BULK

You can create strings called *community strings* and associate each of these to query types. You can associate one or more community strings to each query type. Community string are passwords and used to authenticate SNMP queries from SNMP managers.

For example, if you associate two community strings, such as **abc** and **bcd**, to the query type GET NEXT, the SNMP agent on the NetScaler appliance considers only those GET NEXT SNMP query packets that contain **abc** or **bcd** as the community string.

Specifying an SNMP Manager

You must configure the NetScaler appliance to allow the appropriate SNMP managers to query it. You must also provide the SNMP manager with the required NetScaler-specific information. You can add up to a maximum of 100 SNMP managers or networks.

You can also specify an associated host name of an SNMP manager. To do so, you need to add a DNS name server that resolves the host name of the SNMP manager to its IP address. You can add up to a maximum of five host name-based SNMP managers.

If you do not configure at least one SNMP manager, the NetScaler appliance accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the appliance accepts and responds only to SNMP queries from those specific IP addresses.

If you remove an SNMP manager from the NetScaler configuration, that manager can no longer query the NetScaler.

To add an SNMP manager by using the NetScaler command line

At the NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp manager <IPAddress> ... [**-netmask** <netmask>]
- show snmp manager

Example

```
> add snmp manager 10.102.29.10
 Done
> show snmp manager
1)      10.102.29.5         255.255.255.255
Done
```

To add an SNMP manager by specifying its IP address, using the NetScaler command line

At the NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp manager <IPAddress> ... [**-netmask** <netmask>]
- show snmp manager

Example

```
> add snmp manager 10.102.29.10
 Done
> show snmp manager
1)      10.102.29.5         255.255.255.0
Done

> add snmp manager 10.102.29.15  10.102.29.30
 Done
> show snmp manager
1)      IP Address:     10.102.29.10
        Netmask:        255.255.255.255
2)      IP Address:     10.102.29.15
        Netmask:        255.255.255.255
3)      IP Address:     10.102.29.30
        Netmask:        255.255.255.255
 Done
```

To add an SNMP manager by specifying its host name, using the NetScaler command line

Important: If you specify the SNMP manager's host name instead of its IP address, you must configure a DNS name server to resolve the host name to the SNMP manager's IP address. For more information, see Adding a Name Server.

At the NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp manager <IPAddress> [**-domainResolveRetry** <integer>]
- show snmp manager

Example

```
> add nameserver 10.103.128.15
Done
> show nameserver
1)      10.103.128.15  -  State: UP
```

```
 Done

> add snmp manager engwiki.eng.company.net –domainResolveRetry 10
 Done
> show snmp manager
1)      Hostname:       abc.com (Unresolved IP)
        Resolve Retry:  7
2)      Hostname:       engwiki.eng.company.net (10.217.3.249)
        Resolve Retry:  10
 Done
```

Parameters for configuring an SNMP manager

IPAddress

IP or network address of the SNMP manager. You can also specify an associated host name of an SNMP manager. If you specify a host name, you must add a DNS name server that will resolve the host name of the SNMP manager to its IP address.

netmask

Subnet of management stations. Used to grant access from entire subnets to the NetScaler appliance.

domainResolveRetry

The duration, in seconds, for which the NetScaler appliance waits to send the next DNS query to resolve the host name of the SNMP manager if the last query failed. If last query succeeds, the NetScaler waits for the TTL time. Minimum value: 5. Maximum value: 20940. Default value: 5.

To add an SNMP manager by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Managers**.
2. In the details pane, click **Add**.
3. In the **Create SNMP Manager** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring an SNMP manager" as shown:
   - **IP Address***—IPAddress
   - **Netmask**—netmask

   *A required parameter
4. In the **Create SNMP Manager** dialog box, do one of the following:
   - To specify the host name of an SNMP manager, select Management Host and specify values for the following parameters, which correspond to parameters described in "Parameters for configuring an SNMP manager" as shown:
     - **Host Name***—IPAddress
     - **Resolve Retry (secs)***—domainResolveRetry

     Important: If you specify the SNMP manager's host name instead of its IP address, you must configure a DNS name server to resolve the host name to the SNMP manager's IP address. For more information, see Adding a Name Server.
   - To specify the IP address of an SNMP manager, select Management Network and specify values for the following parameters, which correspond to parameters described in "Parameters for configuring an SNMP manager" as shown:
     - **IP Address***—IPAddress
     - **Netmask**—netmask
5. Click **Create**, and then click **Close**. A message appears in the status bar, stating that the SNMP manager has been configured successfully.

Specifying an SNMP Community

You can create strings called *community strings* and associate them with the following SNMP query types on the NetScaler:

- GET
- GET NEXT
- ALL
- GET BULK

You can associate one or more community strings to each query types. For example, when you associate two community strings, such as **abc** and **bcd**, to the query type GET NEXT, the SNMP agent on the NetScaler appliance considers only those GET NEXT SNMP query packets that contain **abc** or **bcd** as the community string.

If you don't associate any community string to a query type then the SNMP agent responds to all SNMP queries of that type.

To specify an SNMP community by using the NetScaler command line

At the NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp community <communityName> <permissions>
- sh snmp community

Example

```
> add snmp community com all
 Done
> show snmp community com
Community: com  Permissions: ALL
 Done
```

Parameters for configuring an SNMP community string

communityName

SNMP community string.

permissions

Access privileges. Possible values: GET, GET NEXT, GET BULK, ALL.

To configure an SNMP community string by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Community**.
2. In the details pane, click **Add**.
3. In the **Create SNMP Community** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring an SNMP community string" as shown:
   - **Community String***—communityName
   - **Permission***—permissions

   *A required parameter
4. Click **Create**, and then click **Close**. A message appears in the status bar, stating that the SNMP community string has been configured successfully.

To remove an SNMP community string by using the configuration utility

1. In the navigation pane, expand **System**, click **SNMP**, and then click **Community**.
2. In the details pane, select the community that you want to remove (for example, **Com_All**), and then click **Remove**.

Configuring SNMP Alarms for Rate Limiting

Citrix® NetScaler® appliances such as the NetScaler MPX 10500, 12500, and 15500 are rate limited. The maximum throughput (Mbps) and packets per second (PPS) are determined by the license purchased for the appliance. For rate-limited platforms, you can configure SNMP traps to send notifications when throughput and PPS approach their limits and when they return to normal.

Throughput and PPS are monitored every seven seconds. You can configure traps with high-threshold and normal-threshold values, which are expressed as a percentage of the licensed limits. The appliance then generates a trap when throughput or PPS exceeds the high threshold, and a second trap when the monitored parameter falls to the normal threshold. In addition to sending the traps to the configured destination device, the NetScaler logs the events associated with the traps in the /var/log/ns.log file as EVENT ALERTSTARTED and EVENT ALERTENDED.

Exceeding the throughput limit can result in packet loss. You can configure SNMP alarms to report packet loss.

For more information about SNMP alarms and traps, see Configuring the NetScaler to generate SNMP v1 and v2 Traps.

Configuring an SNMP Alarm for Throughput or PPS

To monitor both throughput and PPS, you must configure separate alarms.

To configure an SNMP alarm for the throughput rate by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure the SNMP alarm and verify the configuration:

- set snmp alarm PF-RL-RATE-THRESHOLD [**-thresholdValue** <positive_integer> [**-normalValue** <positive_integer>]] [**-state** (**ENABLED** | **DISABLED**)] [**-severity** <severity>] [**-logging** (**ENABLED** | **DISABLED**)]
- show snmp alarm PF-RL-RATE-THRESHOLD

Example

```
> set snmp alarm PF-RL-RATE-THRESHOLD -thresholdValue 70 -normalValue 50
   Done

> show snmp alarm PF-RL-RATE-THRESHOLD
  Alarm                 Alarm Threshold    Normal Threshold Time State     Severity     Logging
  -----                 ---------------    ---------------- ---- --------  ------------ --------
 1) PF-RL-RATE-THRESHOLD    70                 50              N/A  DISABLED  -          ENABLED
Done
```

To modify or remove the threshold values by using the NetScaler command line

- To modify the threshold values, type the set snmp alarm PF-RL-RATE-THRESHOLD command and the parameters to be changed, with their new values.
- To remove the threshold values, type the unset snmp alarm PF-RL-RATE-THRESHOLD command, followed by the **-thresholdValue** parameter, but do not specify any value for the parameter.

Note: The normal-threshold value is automatically unset when you unset the high-threshold value.

To configure an SNMP alarm for PPS by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure the SNMP alarm for PPS and verify the configuration:

- set snmp alarm PF-RL-PPS-THRESHOLD [**-thresholdValue** <positive_integer> [**-normalValue** <positive_integer>]] [**-state** (**ENABLED** | **DISABLED**)] [**-severity** <severity>] [**-logging** (**ENABLED** | **DISABLED**)]
- show snmp alarm PF-RL-PPS-THRESHOLD

Example

```
> set snmp alarm PF-RL-PPS-THRESHOLD -thresholdValue 70 -normalValue 50
Done

> show snmp alarm PF-RL-PPS-THRESHOLD
Alarm                                 Alarm Threshold     Normal Threshold    Time       State      S
-----                                 ---------------     ----------------    ----       -----      -
1) PF-RL-PPS-THRESHOLD 70                                 50
Done
```

To modify or remove the threshold values by using the NetScaler command line

- To modify the threshold values, type the set snmp alarm PF-RL-PPS-THRESHOLD command and the parameters to be changed, with their new values.
- To remove the threshold values, type the unset snmp alarm PF-RL-PPS-THRESHOLD command, followed by the **-thresholdValue** parameter, but do not specify any value for the parameter.

Note: The normal-threshold value is automatically unset when you unset the high-threshold value.

Parameters for configuring an SNMP alarm for throughput or PPS

thresholdValue

The high threshold value, which triggers EVENT ALERTSTARTED. Minimum value: 1.

normalValue

The normal threshold value, which triggers EVENT ALERTENDED.

state

The current state of the alarm. Possible values: ENABLED, DISABLED. Default: ENABLED.

severity

The severity level of the alarm. Possible values: Critical, Major, Minor, Warning, Informational. Default: SNMP_SEV_UNKNOWN.

logging

Log the alarm. Possible values: ENABLED, DISABLED. Default value: ENABLED.

To configure an SNMP alarm for throughput or PPS by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Alarms**.
2. In the details pane, do one of the following:
   - Select **PF-RL-RATE-THRESHOLD** to configure the SNMP alarm for throughput rate.
   - Select **PF-RL-PPS-THRESHOLD** to configure the SNMP alarm for packets per second.
3. Click **Open**.
4. In the **Configure SNMP Alarm** dialog box, specify values for the following parameters, which correspond to parameters described in “Parameters for configuring an SNMP alarm for throughput or PPS” as shown:
   - **Alarm Threshold**—thresholdValue
   - **Alarm Threshold**—thresholdValue
   - **Normal Threshold**—normalValue
   - **Severity**—severity
   - **Logging**—logging
5. Select the **Enable** check box to enable the alarm.
6. Click **OK**, and then click **Close**.

Configuring SNMP Alarm for Dropped Packets

You can configure an alarm for packets dropped as a result of exceeding the throughput limit and an alarm for packets dropped as a result of exceeding the PPS limit.

To configure an SNMP alarm for packets dropped because of excessive throughput, by using the NetScaler command line

At the NetScaler command prompt, type:

set snmp alarm PF-RL-RATE-PKTS-DROPPED [**-state** (**ENABLED** | **DISABLED**)] [**-severity** <severity>] [**-logging** (**ENABLED** | **DISABLED**)]

To configure an SNMP alarm for packets dropped because of excessive PPS, by using the NetScaler command line

At the NetScaler command prompt, type:

set snmp alarm PF-RL-PPS-PKTS-DROPPED [**-state** (**ENABLED** | **DISABLED**)] [**-severity** <severity>] [**-logging** (**ENABLED** | **DISABLED**)]

Parameters for configuring an SNMP alarm for dropped packets

state

The current state of the alarm. Possible values: ENABLED, DISABLED. Default: ENABLED.

severity

The severity level of the alarm. Possible values: Critical, Major, Minor, Warning, Informational. Default: SNMP_SEV_UNKNOWN.

logging

Log the alarm. Possible values: ENABLED, DISABLED. Default value: ENABLED.

To configure an SNMP alarm for dropped packets by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Alarms**.
2. In the details pane, do one of the following:
   - Select **PF-RL-RATE-PKTS-DROPPED** to configure an SNMP alarm for packets dropped because of excessive throughput.
   - Select **PF-RL-PPS-PKTS-DROPPED** to configure an SNMP alarm for packets dropped because of excessive PPS.
3. Click **Open**.
4. In the Configure SNMP Alarm dialog box, specify values for the following parameters, which correspond to parameters described in “Parameters for configuring an SNMP alarm for dropped packets” as shown:
   - **Severity**—severity
   - **Logging**—logging
5. Select the **Enable** check box to enable the alarm.
6. Click **OK**, and then click **Close**.

Configuring the NetScaler for SNMPv3 Queries

Simple Network Management Protocol Version 3 (SNMPv3) is based on the basic structure and architecture of SNMPv1 and SNMPv2. However, SNMPv3 enhances the basic architecture to incorporate administration and security capabilities, such as authentication, access control, data integrity check, data origin verification, message timeliness check, and data confidentiality.

To implement message level security and access control, SNMPv3 introduces the user-based security model (USM) and the view-based access control model (VACM).

- **User-Based Security Model.** The user-based security model (USM) provides message-level security. It enables you to configure users and security parameters for the SNMP agent and the SNMP manager. USM offers the following features:
  - **Data integrity:** To protect messages from being modified during transmission through the network.
  - **Data origin verification:** To authenticate the user who sent the message request.
  - **Message timeliness:** To protect against message delays or replays.
  - **Data confidentiality:** To protect the content of messages from being disclosed to unauthorized entities or individuals.
- **View-Based Access Control Model.** The view-based access control model (VACM) enables you to configure access rights to a specific subtree of the MIB based on various parameters, such as security level, security model, user name, and view type. It enables you to configure agents to provide different levels of access to the MIB to different managers.

The Citrix NetScaler supports the following entities that enable you to implement the security features of SNMPv3:

- SNMP Engines
- SNMP Views
- SNMP Groups
- SNMP Users

These entities function together to implement the SNMPv3 security features. Views are created to allow access to subtrees of the MIB. Then, groups are created with the required security level and access to the defined views. Finally, users are created and assigned to the groups.

Note: The view, group, and user configuration are synchronized and propagated to the secondary node in a high availability (HA) pair. However, the engine ID is neither

propagated nor synchronized as it is unique to each NetScaler appliance.

To implement message authentication and access control, you need to:

- Set the Engine ID
- Configure Views
- Configure Groups
- Configure Users

Setting the Engine ID

SNMP engines are service providers that reside in the SNMP agent. They provide services such as sending, receiving, and authenticating messages. SNMP engines are uniquely identified using engine IDs.

The NetScaler has a unique engineID based on the MAC address of one of its interfaces. It is not necessary to override the engineID. However, if you want to change the engine ID, you can reset it.

To set the engine ID by using the NetScaler command line

At a NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- set snmp engineId <engineID>
- show snmp engineId

Example

```
> set snmp engineId 8000173f0300c095f80c68
 Done
> show snmp engineId
       EngineID:   8000173f0300c095f80c68
 Done
```

Parameters for setting the engine ID

EngineID

Engine ID of the SNMP agent.

To set the engine ID by using configuration utility

1. In the navigation pane, expand **System,** expand **SNMP,** and then click **Users**.
2. In the details pane, click **Configure Engine ID**.
3. In the **Configure Engine ID** dialog box, in the **Engine ID** text box, type an engine ID (for example, 8000173f0300c095f80c68).
4. Click **OK**. A message appears in the status bar, stating that the engine ID has been modified successfully.

Configuring a View

SNMP views restrict user access to specific portions of the MIB. SNMP views are used to implement access control.

To add an SNMP view by using the NetScaler command line

At a NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp view <name> <subtree> **-type** (included | excluded)
- sh snmp view <name>

Example

add snmp view View1 -type included

Parameters for configuring an SNMP view

name

Name of the SNMP view.

subtree

Subtree of the MIB.

type

Whether the subtree needs to be included or excluded.

To configure an SNMP view by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Views**.
2. In the details pane, click **Add**.
3. In the **Create SNMP View** or **Configure SNMP View** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring an SNMP view" as shown:
   - **Name***—name
   - **Subtree***—subtree
   - **Type**—type

   *A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the SNMP view has been configured successfully.

Configuring a Group

SNMP groups are logical aggregations of SNMP users. They are used to implement access control and to define the security levels. You can configure an SNMP group to set access rights for users assigned to that group, thereby restricting the users to specific views.

You need to configure an SNMP group to set access rights for users assigned to that group.

To add an SNMP group by using the NetScaler command line

At a NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp group <name> <securityLevel> **-readViewName** <string>
- show snmp group <name> <securityLevel>

Example

```
add snmp group edocs_group2 authPriv -readViewName edocs_read_view
 Done
> show snmp group edocs_group2 authPriv
1)      Name:  edocs_group2      SecurityLevel:  authPriv
       ReadViewName:  edocs_read_view StorageType:  volatile
       Status:  active
 Done
```

Parameters for configuring an SNMP group

name

Name of the SNMP view.

securityLevel

The security level of the group. Possible values: noAuthNoPriv, authNoPriv, authPriv

readViewName

SNMP view to be associated with this group.

To configure an SNMP group by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Groups**.
2. In the details pane, click **Add**.
3. In the **Create SNMP Group** or **Configure SNMP Group** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring an SNMP group" as shown:
   - **Name***—name
   - **Security Level***—securityLevel
   - **Read View Name***—readViewName

   *A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the SNMP group has been configured successfully.

Configuring a User

SNMP users are the SNMP managers that the agents allow to access the MIBs. Each SNMP user is assigned to an SNMP group.

You need to configure users at the agent and assign each user to a group.

To configure a user by using the NetScaler command line

At a NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- add snmp user <name> **-group** <string> [**-authType** (MD5 | SHA) {**-authPasswd** } [**-privType** (DES | AES) {**-privPasswd** }]]
- show snmp user <name>

Example

```
> add snmp user edocs_user -group edocs_group
 Done
> show snmp user edocs_user
1)      Name:  edocs_user       Group:  edocs_group
       EngineID:  123abc456abc788 StorageType:  volatile
       Status:  active
 Done
>
```

Parameters for configuring an SNMP user

name

The name of the SNMP user.

group

Specifyes the SNMP group name to which the SNMP user will belong.

authType

The authentication type. Possible values: MD5, SHA.

authPasswd

Enter an authentication password.

privType

The encryption type. Possible values: DES, AES.

privPasswd

The encryption password. Maximum Length: 31

To configure an SNMP user by using the configuration utility

1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Users**.
2. In the details pane, click **Add**.
3. In the **Create SNMP User**or **Configure SNMP User** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring an SNMP user" as shown:
   - **Name***—name
   - **Group Name***—group
   - **Authentication Type**—authType
   - **Authentication Password**—authPasswd
   - **Privacy Type**—privType
   - **Privacy password**—privPasswd

   *A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the SNMP user has been configured successfully.

Audit Logging

Auditing is a methodical examination or review of a condition or situation. The Audit Logging feature enables you to log the Citrix® NetScaler® states and status information collected by various modules in the kernel and in the user-level daemons. For audit logging, you have the options to configure SYSLOG, the native NSLOG protocol, or both.

SYSLOG is a standard protocol for logging. It has two components□ the SYSLOG auditing module, which runs on the NetScaler appliance, and the SYSLOG server, which can run on the underlying FreeBSD operating system (OS) of the NetScaler appliance or on a remote system. SYSLOG uses user data protocol (UDP) for the transfer of data.

Similarly, the native NSLOG protocol has two components□ the NSLOG auditing module, which runs on the NetScaler appliance, and the NSLOG server, which can run on the underlying FreeBSD OS of the NetScaler appliance or on a remote system. NSLOG uses transmission control protocol (TCP) for transfer of data.

When you run NSLOG or a SYSLOG server, it connects to the NetScaler appliance. The NetScaler appliance then starts sending all the log information to the SYSLOG or NSLOG server, and the server can filter the log entries before storing them in a log file. An NSLOG or SYSLOG server can receive log information from more than one NetScaler appliance and a NetScaler appliance can send log information to more than one SYSLOG server or NSLOG server.

The log information that a SYSLOG or NSLOG server collects from a NetScaler appliance is stored in a log file in the form of messages. These messages typically contain the following information:

- The IP address of a NetScaler appliance that generated the log message
- A time stamp
- The message type
- The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency)
- The message information

To configure audit logging, you first configure the audit modules on the NetScaler that involves creating audit policies and specifying the NSLOG server or SYSLOG server information. You then install and configure the SYSLOG or the NSLOG server on the underlying FreeBSD OS of the NetScaler appliance or on a remote system.

Note: Because SYSLOG is an industry standard for logging program messages and because various vendors provide support, this documentation does not include SYSLOG server configuration information.

The NSLOG server has it own configuration file (auditlog.conf). You can customize logging on the NSLOG server system by making additional modifications to the configuration file (auditlog.conf).

Configuring the NetScaler Appliance for Audit Logging

Policies define the SYSLOG or NSLOG protocol, and server actions define what logs are sent where. For server actions, you specify the system information, which runs the SYSLOG or the NSLOG server.

The Citrix NetScaler logs the following information related to TCP connections:

- Source port
- Destination port
- Source IP
- Destination IP
- Number of bytes transmitted and received
- Time period for which the connection is open

Note: You can enable TCP logging on individual load balancing vservers. You must bind the audit log policy to a specific load balancing vserver that you want to log.

Configuring Audit Servers

You can configure audit server actions for different servers and for different log levels.

To configure a SYSLOG server action by using the command line

At the NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- add audit syslogAction <name> <serverIP> [**-serverPort** <port>] **-logLevel** <logLevel> [**-dateFormat** (MMDDYYYY | DDMMYYYY)]
- show audit syslogAction [<name>]

Example

```
> add audit syslogaction audit-action1 10.102.1.1 -loglevel INFORMATIONAL -dateformat MMDDYYYY
 Done
> show audit syslogaction audit-action1
1)      Name: audit-action1
        Server IP: 10.102.1.1   Port: 514
        Loglevel : INFORMATIONAL
        Date Format: MMDDYYYY
        Time Zone: GMT_TIME
        Facility: LOCAL0
        Tcp Logging: NONE
        ACL Logging: DISABLED
        UserDefinedLogging: No
           AppFlow export: DISABLED
 Done
```

To configure an NSLOG server action by using the command line

At the NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- add audit nslogAction <name> <serverIP> [**-serverPort** <port>] **-logLevel** <logLevel> [**-dateFormat** (MMDDYYYY | DDMMYYYY)]
- show audit nslogAction [<name>]

Example

```
 > add audit nslogAction nslog-action1 10.102.1.3 -serverport 520 -loglevel INFORMATIONAL -dateFormat MMI
 Done
> show nslogAction nslog-action1
1)      Name: nslog-action1
        Server IP: 10.102.1.3   Port: 520
        Loglevel : INFORMATIONAL
        Date Format: MMDDYYYY
        Time Zone: GMT_TIME
        Facility: LOCAL0
        Tcp Logging: NONE
        ACL Logging: DISABLED
               UserDefinedLogging: No
           AppFlow export: DISABLED
 Done
```

Parameters for configuring auditing servers

name

The name of the SYSLOG server action or NSLOG server action.

serverIP

IP address of the auditing server.

serverPort

Port through which to communicate.

logLevel

Severity levels of messages to be logged. Possible values: ALL, NONE, or one or more of the following:

- EMERGENCY
- ALERT
- CRITICAL

- ERROR
- WARNING
- NOTICE
- INFORMATION
- DEBUG

dateFormat

Format of the date stamp. Possible values: MMDDYYYY, DDMMYYYY.

logFacility

The Facility value (RFC 3164) assigned to the log message. Uses numerical codes 0 to 7 to indicate the type of message originating from the NetScaler (for example, NS and VPN). Possible values: LOCAL0 to LOCAL7. Default: LOCAL0.

timeZone

Time zone for the time stamp. Possible values: GMT and Local. Default: Local.

tcp

Log TCP events. Possible values: NONE, ALL.

acl

Log ACL events. Possible values: ENABLED, DISABLED.

userDefinedAuditlog

Enable user-configurable log messages. Possible values: YES, NO.

appflowExport

Export log messages to the AppFlow collectors. Possible values: ENABLED, DISABLED. Default: DISABLED.

Log levels defined

EMERGENCY

Log errors indicating that the NetScaler is experiencing a critical problem that may make it unusable.

ALERT

Log problems that are not critical to current operations but that indicate a need for immediate corrective action to prevent a critical problem.

CRITICAL

Log critical conditions, which do not restrict current operations but may escalate to a larger problem.

ERROR

Log messages related to failed NetScaler operations.

WARNING

Log issues that may result in critical errors.

NOTICE

Log events specified by the INFORMATION setting, but in greater detail.

INFORMATION

Log actions taken by the NetScaler. This level is useful for troubleshooting problems.

DEBUG

Log extensive, detailed information to help developers troubleshoot problems.

To configure an auditing server action

1. In the navigation pane, expand **System**, expand **Auditing**, and then click **Policies**.
2. In the details pane, on the **Servers** tab, do one of the following:
   - To create a new server action, click **Add**.
   - To modify an existing server action, select the server, and then click **Open**.
3. In the **Create Auditing Server** or **Configure Auditing Server** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring auditing servers" as shown:
   - **Name***—name
   - **IP Address***—serverIP
   - **Port**—serverPort
   - **Log Levels**—logLevel
   - **Log Facility**—logFacility
   - **Date format**—dateFormat
   - **Time Zone**—timeZone
   - **TCP Logging**—tcp
   - **ACL Logging**—acl
   - **User Configurable Log Messages**—userDefinedAuditlog
   - **AppFlow Export**—appflowExport

   *A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the auditing server has been configured successfully.

Configuring Audit Policies

The audit policies define the SYSLOG or NSLOG protocol.

To configure a SYSLOG policy by using the command line

At the NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- add audit syslogPolicy <name> <rule> <action>
- show audit syslogPolicy [<name>]

Example

```
> add audit syslogpolicy syslog-pol1 ns_true audit-action1
Done
> show audit syslogpolicy syslog-pol1
1)      Name: syslog-pol1       Rule: ns_true
       Action: audit-action1
 Done
```

To configure an NSLOG policy by using the command line

At the NetScaler command prompt, type the following commands to set the parameters and verify the configuration:

- add audit nslogPolicy <name> <rule> <action>
- show audit nslogPolicy [<name>]

Example

```
> add audit nslogPolicy nslog-pol1 ns_true nslog-action1
 Done
> show audit nslogPolicy nslog-pol1
1)      Name: nslog-pol1        Rule: ns_true
        Action: nslog-action1
 Done
```

Parameters for configuring audit policies

name

The name of NSLOG policy or SYSLOG policy.

rule

The name of the rule or expression that the policy will use. It currently supports only the rule "ns_true."

This parameter is only for the command line.

In the configuration utility ns_true is internally assigned as a rule for the SYSLOG or the NSLOG policy.

action

SYSLOG server action or the NSLOG server action. NSLOG server action is bind to a NSLOG audit policy and SYSLOG server action is bind to a SYSLOG audit policy.

To configure an audit server policy

1. In the navigation pane, expand **System**, expand **Auditing**, and then click **Policies**.
2. In the details pane, on the **Policies** tab, do one of the following:
   - To create a new policy, click **Add**.
   - To modify an existing policy, select the policy, and then click **Open**.
3. In the **Create Auditing Policy** or **Configure Auditing Policy** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring auditing policies" as shown:
   - **Name*** ▫ name
   - **Server*** ▫ action

   *A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the auditing policy has been configured successfully.

Binding the Audit Policies Globally

You must globally bind the audit log policies to enable logging of all Citrix® NetScaler® system events. By defining the priority level, you can set the evaluation order of the audit server logging. Priority 0 is the highest and is evaluated first. The higher the priority number, the lower is the priority of evaluation.

To configure a SYSLOG policy by using the command line

- bind system global [<policyName> [**-priority** <positive_integer>]]
- sh system global

Example

```
> bind system global nslog-pol1 -priority 20
  Done

> sh system global
1)      Policy Name: nslog-pol1 Priority: 20
2)      Policy Name: syslog-pol1 Priority: 50
3)      Policy Name: nslogpol9   Priority: 100
 Done
```

Parameters for binding the audit policies globally

policyName

The name of the NSLOG or SYSLOG policy.

priority

A numeric value that indicates when this policy is evaluated relative to others. A lower priority is evaluated before a higher one.

To globally bind the audit policy

1. In the navigation pane, expand **System**, expand **Auditing**, and then click **Policies**.
2. In the details pane, on the **Policies** tab, click **Global Bindings**.
3. In the **Bind/Unbind Auditing Global Policies** dialog box, click **Insert Policy**.
4. Select the policy from the drop-down list that appears under **Policy Name**, and then click **OK**. A message appears in the status bar, stating that the auditing policy has been globally bound.

Configuring Policy-Based Logging

You can configure policy-based logging for rewrite and responder policies. Audit messages are then logged in a defined format when the rule in a policy evaluates to TRUE. To configure policy-based logging, you configure an audit-message action that uses default syntax expressions to specify the format of the audit messages, and associate the action with a policy. The policy can be bound either globally or to a load balancing or content switching virtual server. You can use audit-message actions to log messages at various log levels, either in syslog format only or in both syslog and newnslog formats.

Pre Requisites

User Configurable Log Messages (userDefinedAuditlog) option is enabled for when configuring the audit action server to which you want to send the logs in a defined format. For more information about enabling policy-based logging on a audit action server, see http://support.citrix.com/proddocs/topic/netscaler-admin-guide-93/ns-ag-bind-adt-pol-tsk.html.

- The related audit policy is bound to system global. For more information about binding audit policies to system global, see http://support.citrix.com/proddocs/topic/netscaler-admin-guide-93/ns-ag-bind-adt-pol-tsk.html.

Configuring an Audit Message Action

You can configure audit message actions to log messages at various log levels, either in syslog format only or in both syslog and newnslog formats. Audit-message actions use expressions to specify the format of the audit messages.

To create an audit message action by using the NetScaler command line

At the NetScaler command prompt, type:

add audit messageaction <name> <logLevel> <stringBuilderExpr> [-**logtoNewnslog** (YES|NO)] [-**bypassSafetyCheck** (YES|NO)]

To modify or remove an audit message action by using the NetScaler command line

- To modify an audit message action, type the set audit messageaction command, the name of the action, and the parameters to be changed, with their new values.
- To remove an audit message action, type the rm audit messageaction command and the name of the action.

Example

```
> add audit messageaction log-act1 CRITICAL "'Client:"+CLIENT.IP.SRC+" accessed "+H
TTP.REQ.URL' -bypassSafetyCheck YES
 Done

> show audit messageaction log-act1

1)     Name: log-act1
       LogMsgStr: "Client:"+CLIENT.IP.SRC+" accessed "+HTTP.REQ.URL
       Loglevel:CRITICAL
       Log2Newnslog:NO
       BypassSafetyCheck : YES
       Hits: 0
       Undef Hits: 0
       Action Reference Count: 0
 Done
```

Parameters for configuring an audit message action

name

The name of the audit message action. The name can begin with a letter, number, or the underscore symbol, and can consist of up to 127 characters including letters, numbers, and hyphen (-), period (.) pound (#), space ( ), at sign (@), equal sign (=), colon (:), and underscore (_) symbols.

logLevel

The log level for the message action. Possible values: EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG, NONE.

stringBuilderExpr

The expression that defines the format of the log message. For a complete description of NetScaler expressions, see Policy Configuration and Reference.

bypassSafetyCheck

Bypass the safety check and allow unsafe expressions. Possible values: YES, NO. Default: NO.

logtoNewnslog

Log messages in newnslog format in addition to logging them in syslog format. Possible values: YES, NO. Default: NO.

To configure an audit message action by using the configuration utility

1. In the navigation pane, expand **System**, expand **Auditing**, and then click **Message Actions**.
2. In the details pane, do one of the following:
   - To create a new audit message action, click **Add**.
   - To modify an existing audit message action, select the action, and then click **Open**.
3. In the **Create Message Action** or **Configure Message Action** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring an audit message action" as shown:
   - **Name***—name
   - **Log Level***—logLevel
   - **Log Message**—stringBuilderExpr
   - **Bypass Safety Check**—bypassSafetyCheck (To specify **YES**, select the check box.)
   - **Log in newnslog**—logtoNewnslog (To specify **YES**, select the check box.)

   *A required parameter
4. Click **Create** or **OK**, and then click **Close**. The audit message action that you configured appears in the details pane.

Binding Audit Message Action to a Policy

After you have created an audit message action, you must bind it to a rewrite or responder policy. For more information about binding log message actions to a rewrite or responder policy, see Rewrite or Responder.

Installing and Configuring the NSLOG Server

During installation, the NSLOG server executable file (auditserver) is installed along with other files. The auditserver executable file includes options for performing several actions on the NSLOG server, including running and stopping the NSLOG server. In addition, you use the auditserver executable to configure the NSLOG server with the IP addresses of the NetScaler appliances from which the NSLOG server will start collecting logs. Configuration settings are applied in the NSLOG server configuration file (auditlog.conf).

Then, you start the NSLOG server by executing the auditserver executable. The NSLOG server configuration is based on the settings in the configuration file. You can further customize logging on the NSLOG server system by making additional modifications to the NSLOG server configuration file (auditlog.conf).

The following table lists the operating systems on which the NSLOG server is supported.

Table 1. Supported Platforms for the NSLOG Server

Operating system	Software requirements
Windows	• Windows XP Professional • Windows Server 2003 • Windows 2000/NT
Linux	• Red Hat Enterprise Linux AS release 4 (Nahant) - Linux version 2.6.9-5.EL • Red Hat 3.4.3-9.EL4 - Linux version 2.6.9-5.ELsmp • Red Hat Linux 3.2.2-5 - Linux version 2.4.20-8
FreeBSD	FreeBSD 4.9

The minimum hardware specifications for the platform running the NSLOG server are as follows:

- Processor- Intel x86 ~501 megahertz (MHz)
- RAM - 512 megabytes (MB)
- Controller - SCSI

Installing NSLOG Server on the Linux Operating System

Copy the installation files from the NetScaler product CD or download them from ftp.netscaler.com. Log on to the Linux system as an adminstrator. Use the following procedure to install the NSLOG server executable files on the system.

To install the NSLOG server package on a Linux operating system

1. At a Linux command prompt, type the following command to copy the NSauditserver.rpm file to a temporary directory:

   cp <path_to_cd>**/Utilities/auditserver/Linux/NSauditserver.rpm /tmp**

2. Type the following command to install the NSauditserver.rpm file:

   rpm **-i NSauditserver.rpm**

   This command extracts the files and installs them in the following directories:

   - /usr/local/netscaler/etc
   - /usr/local/netscaler/bin
   - /usr/local/netscaler/samples

To uninstall the NSLOG server package on a Linux operating system

1. At a command prompt, type the following command to uninstall the audit server logging feature:

   rpm **-e NSauditserver**

2. For more information about the NSauditserver RPM file, use the following command:

   rpm **-qpi *.rpm**

3. To view the installed audit server files use the following command:

   rpm **-qpl *.rpm**

   *.rpm: Specifies the file name.

Installing NSLOG Server on the FreeBSD Operating System

Copy the installation files from the NetScaler product CD or download them from ftp.netscaler.com. Log on to the FreeBSD operating system as an adminstrator. Use the following procedure to install the NSLOG server executable files on the system.

Note: If you want to install the NSLOG server on the underlying FreeBSD OS of the NetScaler appliance, then log on to the NetScaler appliance's command line and then switch to the shell prompt and then use the following procedure.

To install the NSLOG server package on a FreeBSD operating system

1. Copy the NSauditserver.tgz file to a target directory by using the following command:

   cp <path_to_cd>**/Utilities/auditserver/Freebsd/NSauditserver.tgz /<targetdirectory>**

2. Change to the target directory:

   cd / <targetdirectory>

3. Use the following command to install the package:

   pkg_add NSauditserver.tgz

   This command extracts the files and installs them in the following directories:

   - /usr/local/netscaler/etc
   - /usr/local/netscaler/bin
   - /usr/local/netscaler/samples

4. At a command prompt, type the following command to check whether the package is installed:

   pkg_info | grep NSauditserver

To uninstall the NSLOG server package on a FreeBSD operating system

At a command prompt, type:

```
pkg_delete NSauditserver
```

Installing NSLOG Server Files on the Windows Operating System

You need to copy the NSLOG package from the NetScaler product CD or download it from www.citrix.com. The NSLOG package has the following name format AuditServer _<release number>-<build number>.zip (for example, AuditServer_9.3-51.5.zip). This package contains NSLOG installation packages for all the supported platforms.

To download NSLOG package from www.Citrix.com

1. From any system, open www.citrix.com in the Web browser.
2. In the menu bar, click **Log In**.
3. Enter your login credentials and then click **Log In**.
4. In the menu bar, click **Downloads**.
5. Search to the page of the desired release number and build.
6. On the desired page, under **Audit Servers**, click **Download** to download a file, having the format `AuditServer_<release number>-<build number>.zip` , to your local system (for example, `AuditServer_9.3-51.5.zip`).
7. Extract `audserver_<release number>-<build number>.zip` (for example, `audserver_win-9.3-51.5.zip`) from the AuditServer_<release number>-<build number>.zip (for example, `AuditServer_9.3-51.5.zip`).
8. Copy the extracted file `audserver_<release number>-<build number>.zip` (for example, `audserver_win-9.3-51.5.zip`) to a Windows system on which you want to install the NSLOG server.

To install NSLOG server on a Windows operating system

1. Log on to the Windows system as an administrator.
2. Unzip the `audserver_<release number>-<build number>.zip` file (for example, `audserver_win-9.3-51.5.zip`).
3. The following directories are extracted:
   a. <root directory extracted from the Windows NSLOG server package zip file>\bin (for example, `C:\audserver_win-9.3-51.5\bin`)
   b. <root directory extracted from the Windows NSLOG server package zip file>\etc (for example, `C:\audserver_win-9.3-51.5\ etc`)
   c. < root directory extracted from the Windows NSLOG server package zip file >\samples (for example, `C:\audserver_win-9.3-51.5\ samples`)
4. At a command prompt, run the following command from the <root directory extracted from the Windows `NSLOG server package zip file>\bin path:`

   audserver **-install -f** <directorypath>**auditlog.conf**

   <directorypath>: Specifies the path to the configuration file (`auditlog.conf`). By default, log.conf is under <root directory extracted from Windows `NSLOG server package zip file>\samples` directory. But you can copy auditlog.conf to your desired directory.

To uninstall the NSLOG server on a Windows operating system

At a command prompt, run the following from the `<root directory extracted from Windows NSLOG server package zip file>\bin path:`

audserver **-remove**

NSLOG Server Command Options

The following table describes the commands that you can use to configure audit server options.

Table 1. Audit Server Options

Audit server commands	Specifies
audserver **-help**	The available Audit Server options.
audserver **-addns -f** <path to configuration file>	The system that gathers the log transaction data. You are prompted to enter the IP address of the NetScaler appliance. Enter the valid user name and password.
audserver **-verify -f** <path to configuration file>	Check for syntax or semantic errors in the configuration file (for example, auditlog.conf).
audserver **-start -f** <path to configuration file>	Start audit server logging based on the settings in the configuration file (auditlog.conf) Linux only: To start the audit server as a background process, type the ampersand sign (&) at the end of the command.
audserver **-stop** (Linux only)	Stops audit server logging when audit server is started as a background process. Alternatively, use the Ctrl+C key to stop audit server logging.
audserver **-install -f** <path to configuration file> (Windows only)	Installs the audit server logging client as a service on Windows.

audserver **-startservice** (Windows Only)	Start the audit server logging service, when you enter this command at a command prompt. You can also start audit server logging from **Start > Control Panel > Services**. **Note:** Audit server logging starts by using the configuration settings in the configuration file, for example, auditlog.conf file specified in the audit server install option.
audserver **-stopservice** (Windows Only)	Stop audit server logging.
audserver **-remove**	Removes the audit server logging service from the registry.

Run the audserver command from the directory in which the audit server executable is present:

- On Windows: \ns\bin
- On Solaris and Linux: \usr\local\netscaler\bin

The audit server configuration files are present in the following directories:

- On Windows: \ns\etc
- On Linux: \usr\local\netscaler\etc

The audit server executable is started as ./auditserver in Linux and FreeBSD.

Adding the NetScaler Appliance IP Addresses on the NSLOG Server

In the configuration file (auditlog.conf), add the IP addresses of the NetScaler appliances whose events must be logged.

To add the IP addresses of the NetScaler appliance

At a command prompt, type the following command:

audserver **-addns -f** <directorypath>**auditlog.conf**

<directorypath>: Specifies the path to the configuration file (auditlog.conf).

You are prompted to enter the information for the following parameters:

NSIP: Specifies the IP address of the NetScaler appliance, for example, 10.102.29.1.

Userid: Specifies the user name, for example, nsroot.

Password: Specifies the password, for example, nsroot.

If you add multiple NetScaler IP addresses (NSIP), and later you do not want to log all of the NetScaler appliance event details, you can delete the NSIPs manually by removing the NSIP statement at the end of the auditlog.conf file. For a high availability (HA) setup, you must add both primary and secondary NetScaler IP addresses to auditlog.conf by using the audserver command. Before adding the IP address, make sure the user name and password exist on the system.

Verifying the NSLOG Server Configuration File

Check the configuration file (audit log.conf) for syntax correctness to enable logging to start and function correctly.

To verify configuration, at a command prompt, type the following command:

audserver **-verify -f** <directorypath>**auditlog.conf**

<directorypath>: Specifies the path to the configuration file (audit log.conf).

Running the NSLOG Server

To start audit server logging

Type the following command at a command prompt:

audserver **-start -f** <directorypath>**auditlog.conf**

<directorypath>: Specifies the path to the configuration file (audit log.conf).

To stop audit server logging that starts as a background process in FreeBSD or Linux

Type the following command:

audserver **-stop**

To stop audit server logging that starts as a service in Windows

Type the following command:

audserver **-stopservice**

Customizing Logging on the NSLOG Server

You can customize logging on the NSLOG server by making additional modifications to the NSLOG server configuration file (log.conf). Use a text editor to modify the log.conf configuration file on the server system.

To customize logging, use the configuration file to define filters and log properties.

- **Log filters.** Filter log information from a NetScaler appliance or a set of NetScaler appliances.
- **Log properties.** Each filter has an associated set of log properties. Log properties define how to store the filtered log information.

Creating Filters

You can use the default filter definition located in the configuration file (audit log.conf), or you can modify the filter or create a new filter. You can create more than one log filter.

Note: For consolidated logging, if a log transaction occurs for which there is no filter definition, the default filter is used (if it is enabled.) The only way you can configure consolidated logging of all the Citrix NetScaler appliances is by defining the default filter.

To create a filter

At the command prompt, type the following command in the configuration file (auditlog.conf) :

filter <filterName> **[IP** <ip>] [**NETMASK** <mask>] [ON | OFF]

<filterName>: Specify the name of the filter (maximum of 64 alphanumeric characters).

<ip>: Specify the IP addresses.

<mask>: Specify the subnet mask to be used on a subnet.

Specify ON to enable the filter to log transactions, or specify OFF to disable the filter. If no argument is specified, the filter is ON

Examples

```
filter F1 IP 192.168.100.151 ON
```

To apply the filter F2 to IP addresses 192.250.100.1 to 192.250.100.254:

```
filter F2 IP 192.250.100.0 NETMASK 255.255.255.0 ON
```

filterName is a required parameter if you are defining a filter with other optional parameters, such as IP address, or the combination of IP address and Netmask.

Specifying Log Properties

Log properties associated with the filter are applied to all the log entries present in the filter. The log property definition starts with the key word BEGIN and ends with END as illustrated in the following example:

```
BEGIN <filtername>
   logFilenameFormat ...
   logDirectory ...
   logInterval ...
   logFileSizeLimit ....
END
```

Entries in the definition can include the following:

- **LogFilenameFormat** specifies the file name format of the log file. The name of the file can be of the following types:
  - Static: A constant string that specifies the absolute path and the file name.
  - Dynamic: An expression that includes the following format specifiers:
    - Date (%{format}t)
    - % creates file name with NSIP

  Example

  LogFileNameFormat Ex%{%m%d%y}t.log

  This creates the first file name as Exmmddyy.log. New files are named: Exmmddyy.log.0, Exmmddyy.log.1, and so on. In the following example, the new files are crated when the file size reaches 100MB.

  Example

  ```
  LogInterval size
  LogFileSize 100
  LogFileNameFormat Ex%{%m%d%y}t
  ```

  Caution: The date format %t specified in the LogFilenameFormat parameter overrides the log interval property for that filter. To prevent a new file being created every day instead of when the specified log file size is reached, do not use %t in the LogFilenameFormat parameter.
- **logDirectory** specifies the directory name format of the log file. The name of the file can be either of the following:

- Static: Is a constant string that specifies the absolute path and file name.
- Dynamic: Is an expression containing the following format specifiers:
  - Date (%{format}t)
  - % creates directory with NSIP

The directory separator depends on the operating system. In Windows, use the directory separator \.

Example:

LogDirectory dir1\dir2\dir3

In the other operating systems (Linux, FreeBsd, Mac, etc.), use the directory separator /.

Example:

LogDirectory dir1/dir2/dir3

In the other operating systems (Linux, FreeBsd, Mac, etc.), use the directory separator /.

Example:

LogDirectory dir1/dir2/dir3

- **LogInterval** specifies the interval at which new log files are created. Use one of the following values:
  - Hourly: A file is created every hour. Default value.
  - Daily: A file is created very day at midnight.
  - Weekly: A file is created every Sunday at midnight.
  - Monthly : A file is created on the first day of the month at midnight.
  - None: A file is created only once, when audit server logging starts.
  - Size: A file is created only when the log file size limit is reached.

Example

LogInterval Hourly

LogFileSizeLimit specifies the maximum size (in MB) of the log file. A new file is created when the limit is reached.

Note that you can override the loginterval property by assigning size as its value.

The default LogFileSizeLimit is 10 MB.

Example

LogFileSizeLimit 35

Default Settings for the Log Properties

The following is an example of the default filter with default settings for the log properties:

```
begin default
 logInterval Hourly
 logFileSizeLimit 10
 logFilenameFormat  auditlog%{%y%m%d}t.log
 end default
```

Following are two examples of defining the default filters:

Example 1

```
Filter f1 IP 192.168.10.1
```

This creates a log file for NSI 192.168.10.1 with the default values of the log in effect.

Example 2

```
Filter f1 IP 192.168.10.1
begin f1
   logFilenameFormat logfiles.log
end f1
```

This creates a log file for NSIP 192.168.10.1. Since the log file name format is specified, the default values of the other log properties are in effect.

Sample Configuration File (audit.conf)

Following is a sample configuration file:

```
################################
# This is the Auditserver configuration file
# Only the default filter is active
# Remove leading # to activate other filters
################################
MYIP <NSAuditserverIP>
MYPORT 3023
#   Filter filter_nsip  IP <Specify the NetScaler IP address to filter on > ON
#   begin filter_nsip
#       logInterval         Hourly
#       logFileSizeLimit    10
#       logDirectory        logdir\%A\
#       logFilenameFormat   nsip%{%d%m%Y}t.log
#   end filter_nsip
Filter default
begin default
   logInterval      Hourly
   logFileSizeLimit    10
   logFilenameFormat   auditlog%{%y%m%d}t.log
end default
```

Web Server Logging

You can use the Web server logging feature to send logs of HTTP and HTTPS requests to a client system for storage and retrieval. This feature has two components: the Web log server, which runs on the Citrix® NetScaler® appliance, and the NetScaler Web Logging (NSWL) client, which runs on the client system. When you run the client, it connects to the NetScaler. The NetScaler buffers the HTTP and HTTPS request log entries before sending them to the NSWL client, and the client can filter the entries before storing them. You can log HTTP and HTTPS requests for all of your Web servers on one NSWL client system.

To configure Web server logging, you first enable the Web logging feature on the NetScaler and configure the size of the buffer for temporarily storing the log entries. Then, you install NSWL on the client system. You then add the NetScaler IP address (NSIP) to the NSWL configuration file. You are now ready to start the NSWL client to begin logging. You can customize Web server logging by making additional modifications to the NSWL configuration file (log.conf).

Configuring the NetScaler Appliance for Web Server Logging

On the NetScaler appliance you need to enable the Web logging feature, and you can modify the size of the buffer that stores the logged information before sending the logged information to the NetScaler Web Logging (NSWL) client.

Enabling or Disabling Web Server Logging

Web server logging is enabled by default.

To enable or disable Web server logging by using the NetScaler command line

At the NetScaler command prompt, type the following relevant commands to add or remove Web server logging and verify the configuration:

- enable ns feature WL
- disable ns feature WL
- sh ns feature

Example

```
> enable ns feature WL
Done
sh ns feature

      Feature           Acronym    Status
      -------           -------    ------
 1)   Web Logging       WL         ON
 2)   Surge Protection  SP         ON
 .
 .
 .
 24)  NetScaler Push     push       OFF
 Done
>
> disable ns feature WL
Done
sh ns feature

      Feature           Acronym    Status
      -------           -------    ------
 1)   Web Logging       WL         OFF
 2)   Surge Protection  SP         ON
 .
 .
```

.
24) NetScaler Push push OFF
Done

To enable or disable Web server logging by using the configuration utility

1. In the navigation pane, expand **System**, and then select **Settings**.
2. In the details pane, under **Modes and Features**, click **Change advanced features**.
3. In the **Configure Advanced Features** dialog box, select the **Web Logging** check box to enable the Web logging feature, or clear the check box to disable the feature.
4. Click **OK**.
5. In the **Enable/Disable Feature(s)** dialog box, click **Yes**. A message appears in the status bar, stating that the feature has been enabled or disabled.

Modifying the Default Buffer Size

You can change the default buffer size of 16 megabytes (MB) for Web server logging to suit your requirements. To activate your modification, you must disable and reenable Web server logging.

To modify the buffer size by using the NetScaler command line

At the NetScaler command prompt, type the following commands to modify the buffer size and and verify the configuration:

- set weblogparam-**bufferSizeMB** <size>
- sh weblogparam

Example

```
> set weblogparam -bufferSizeMB 32

> sh weblogparam
       Web Logging parameters:
        Log buffer size: 32MB
 Done
```

Parameter for modifying the buffer size

Buffer Size

Memory (in megabytes) allocated for buffering the HTTP and HTTPS request log entries before sending them to the NSWL client.

To modify the buffer size by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change global system settings**.
3. In the **Configure Global Settings** dialog box, under **Web Logging**, enter a value in the **Buffer_Size (in MBytes)** text box (for example, **32**).
4. Click **OK**.

Installing and Configuring the Client System for Web Server Logging

During installation, the NSWL client executable file (nswl) is installed along with other files. The nswl executable file includes options for performing several actions on the NSWL client, including running and stopping the NSWL client. In addition, you use the nswl executable to configure the NSWL client with the IP addresses of the NetScaler appliances from which the NSWL client will start collecting logs. Configuration settings are applied in the NSWL client configuration file (log.conf).

Then, you start the NSWL client by executing the nswl executable. The NSWL client configuration is based on the settings in the configuration file. You can further customize logging on the NSWL client system by making additional modifications to the NSLOG server configuration file (auditlog.conf).

The following table lists the operating systems on which the NSWL client is supported.

Table 1. Supported Platforms for the NSWL Client

Operating system	Version
Windows	• Windows XP Professional • Windows Server 2003 • Windows 2000/NT • Windows Server 2008 • Windows Server 2008 R2
Mac OS	Mac OS 8.6 or later
Linux	• RedHat Linux 4 or later • SUSE Linux Enterprise 9.3 or later
Solaris	Solaris Sun OS 5.6 or later
FreeBSD	FreeBSD 6.3 or later

The following table describes the minimum hardware specifications for the platform running the NSWL client.

Table 2. Minimum Hardware Specification for Platforms Running the NSWL Client

Operating system	Hardware requirements

For Windows / Linux / FreeBSD	• Processor- Intel x86 ~501 megahertz (MHz) • RAM - 512 megabytes (MB) • Controller - SCSI
For Solaris 2.6	• Processor - UltraSPARC-IIi 400 MHz • RAM - 512 MB • Controller - SCSI

If the NSWL client system cannot process the log transaction because of a CPU limitation, the Web log buffer overruns and the logging process reinitiates.

Caution: Reinitiation of logging can result in loss of log transactions.

To temporarily solve a NSWL client system bottleneck caused by a CPU limitation, you can tune the Web server logging buffer size on the NetScaler appliance. To solve the problem, you need a client system that can handle the site's throughput.

Installing NSWL Client on a Solaris Operating System

Copy the installation files from the NetScaler product CD or download them from ftp.netscaler.com. Log on to the Solaris system as an adminstrator. Use the following procedure to install the NSWL executable and the other files on the system.

To install the NSWL client package on a Solaris operating system

1. At a command prompt, copy the NSweblog.tar file into a temporary directory using the command:

   cp <path_to_cd>/Utilities/weblog/Solaris/NSweblog.tar /tmp

2. Change to the temporary directory:

   cd /tmp

3. Extract the files from the *.tar file with the following command:

   tar xvf NSweblog.tar

   A directory NSweblog is created in the temporary directory, and the files are extracted to the NSweblog directory.

4. Install the package with the following command:

   pkgadd -d

   The list of available packages appears. In the following example, one NSweblog package is shown:

   ```
    1 NSweblog NetScaler Weblogging
   (SunOS,sparc) 7.0
   ```

5. You are prompted to select the packages. Select the package number of the NSweblog to be installed.

   After you select the package number and press Enter, the files are extracted and installed in the following directories:

   - /usr/local/netscaler/etc
   - /usr/local/netscaler/bin
   - /usr/local/netscaler/samples

6. At a command prompt, type the following command to check whether the package is installed:

   pkginfo | grep NSweblog

To uninstall the NSWL client package on a Solaris operating system

At a command prompt, type:

pkgrm NSweblog

Installing NSWL Client on a Linux Operating System

Copy the installation files from the NetScaler product CD or download them from ftp.netscaler.com. Log on to the Linux system as an administrator. Use the following procedure to install the NSWL executable and the other files on the system.

To install the NSWL client package on a Linux operating system

1. At a command prompt, copy the NSweblog.rpm file into a temporary directory:

   cp <path_to_cd>/Utilities/weblog/Linux/NSweblog.rpm /tmp

2. To install the NSWL executable, use the following command:

   rpm -i NSweblog.rpm

   This command extracts the files and installs them in the following directories.

   - /usr/local/netscaler/etc
   - /usr/local/netscaler/bin
   - /usr/local/netscaler/samples

To uninstall the NSWL client package on a Linux operating system

At a command prompt, type:

rpm -e NSweblog

To get more information about the NSweblog RPM file

At a command prompt, type:

rpm -qpi *.rpm

To view the installed Web server logging files

At a command prompt, type:

rpm -qpl *.rpm

Installing NSWL Client on a FreeBSD Operating System

Copy the installation files from the NetScaler product CD or download them from ftp.netscaler.com. Log on to the FreeBSD system as an administrator. Use the following procedure to install the NSWL executable and the other files on the system.

To install the NSWL client package on a FreeBSD operating system

1. At a command prompt, copy the NSweblog.tgz file into a temporary directory:

   cp <path_to_cd>/Utilities/weblog/Freebsd/NSweblog.tgz /tmp

2. Change to the temporary directory:

   cd /tmp

3. Install the package using the following command:

   pkg_add NSweblog.tgz

   This command extracts the files and installs them in the following directories.

   - /usr/local/netscaler/etc
   - /usr/local/netscaler/bin
   - /usr/local/netscaler/samples

4. To verify that the package is installed, use the following command:

   pkg_info | grep NSweblog

To uninstall the NSWL client package on a FreeBSD operating system

At a command prompt, type:

pkg_delete NSweblog

Installing NSWL Client on a Mac OS Operating System

Copy the installation files from the NetScaler product CD or download them from ftp.netscaler.com. Log on to the Mac OS operating system as an administrator. Use the following procedure to install the NSWL executable and the other files on the system.

To install the NSWL client package on a Mac OS operating system

1. At a command prompt, copy the NSweblog.tgz file into a temporary directory with the following command:

   cp <path_to_cd>/Utilities/weblog/macos/NSweblog.tgz /tmp

2. Change to the temporary directory:

   cd /tmp

3. To install the package, use the pkg_add command:

   pkg_add NSweblog.tgz

   This command extracts the files and installs them in the following directories:

   - /usr/local/netscaler/etc
   - /usr/local/netscaler/bin
   - /usr/local/netscaler/samples

4. To verify that the package is installed, use the following command:

   pkg_info | grep NSweblog

To uninstall the NSWL client package on a Mac OS operating system

At a command prompt, type:

pkg_delete NSweblog

Installing NSWL Client on a Windows Operating System

Before installing the NSWL client, you have to copy the NSWL client package from the NetScaler product CD or download it from www.citrix.com. The NSWL client package has the following name format:

Weblog_<release number>-<build number>.zip (for example, Weblog_9.3-51.5.zip). Within the package are separate installation packages for each supported platforms.

To download NSWL client package from www.Citrix.com

1. From any system, open www.citrix.com in the Web browser.
2. In the menu bar, click **Log In**.
3. Enter your login credentials and then click **Log In**.
4. In the menu bar, click **Downloads** .
5. Search to the page of the desired release number and build.
6. On the desired page, under **Weblog Clients**, click **Download** to download a file, having the format Weblog_<release number>-<build number>.zip , to your local system (for example, Weblog_9.3-51.5.zip).
7. Extract `nswl_<release number>-<build number>.zip` (for example, `nswl_win-9.3-51.5.zip`) from the `Weblog_<release number>-<build number>.zip` (for example, `Weblog_9.3-51.5.zip`).
8. Copy the extracted file `nswl_<release number>-<build number>.zip` (for example, `nswl_win-9.3-51.5.zip`) to a Windows system on which you want to install the NSWL client.

To install the NSWL client on a Windows system

1. Log on to the Windows system as an administrator.

2. Unzip the `nswl_<release number>-<build number>.zip` file (for example , `nswl_win-9.3-51.5.zip`). The following directories are extracted:

   a. `<root directory extracted from the Windows NSWL client package zip file>\bin` (for example, `C:\nswl_win-9.3-51.5\bin`)

   b. `<root directory extracted from the Windows NSWL client package zip file>\etc` (for example, `C:\nswl_win-9.3-51.5\ etc`)

   c. `< root directory extracted from the Windows NSWL client package zip file >\samples` (for example, `C:\nswl_win-9.3-51.5\ samples`)

3. At a command prompt, run the following command from the `<root directory extracted from the Windows NSWL client package zip file>\bin path:`

   nswl **-install -f** <directorypath> \log.conf

   `<directorypath>:` Specifies the path to the configuration file (`log.conf`). By default, `log.conf` is in the `< root directory extracted from the Windows NSWL client package zip file >\samples` directory. But you can copy log.conf to your desired directory.

To uninstall the NSWL client on a Windows system

At a command prompt, run the following from the <root directory extracted from the Windows NSWL client package zip file>\bin path:

nswl -**remove**

Installing NSWL Client on an AIX Operating System

Copy the installation files from the NetScaler product CD or download them from ftp.netscaler.com. Log on to the AIX system as an administrator. Use the following procedure to install the NSWL executable and the other files on the system.

To install the NSWL client package on an AIX operating system

1. Copy the NSweblog.rpm file into a temporary directory:

   cp <path_to_cd>/Utilities/weblog/AIX/NSweblog.rpm /tmp

2. To install the NSWL executable, use the following command:

   rpm -i NSweblog.rpm

   This command extracts the files and installs them in the following directories.

   - /usr/local/netscaler/etc
   - /usr/local/netscaler/bin
   - /usr/local/netscaler/samples

To uninstall the NSWL client package on an AIX operating system

At a command prompt, type:

rpm -e NSweblog

To get more information about the NSweblog RPM file

At a command prompt, type:

rpm -qpi *.rpm

To view the installed Web server logging files

At a command prompt, type:

rpm -qpl *.rpm

NSWL Client Command Options

The following table describes the commands that you can use to configure the NSWL client.

Table 1. NSWL Command Options

NSWL command	Specifies
nswl -help	The available NSWL help options.
nswl -addns -f <path to configuration file>	The system that gathers the log transaction data. You are prompted to enter the IP address of the NetScaler appliance. Enter a valid user name and password.
nswl -verify -f <path to configuration file>	Check for syntax or semantic errors in the configuration file (for example, log.conf).
nswl -start -f <path to configuration file>	Start the NSWL client based on the settings in the configuration file (for example, log.conf). For Solaris and Linux: To start Web server logging as a background process, type the ampersand sign (&) at the end of the command.
nswl -stop (Solaris and Linux only)	Stop the NSWL client if it was started as a background process; otherwise, use CTRL+C to stop Web server logging.
nswl -install -f <path to configuration file> (Windows only)	Install the NSWL client as a service in Windows.
nswl -startservice (Windows only)	Start the NSWL client by using the settings in the configuration file (for example, log.conf) specified in the nswl install option. You can also start NSWL client from **Start** > **Control Panel** > **Services**.
nswl -stopservice (Windows only)	Stops the NSWL client.
nswl -remove	Remove the NSWL client service from the registry.

Run the following commands from the directory in which the NSWL executable is located:

- Windows: \ns\bin
- Solaris and Linux: \usr\local\netscaler\bin

The Web server logging configuration files are located in the following directory path:

- Windows: \ns\etc

- Solaris and Linux: \usr\local\netscaler\etc

The NSWL executable is started as .\nswl in Linux and Solaris.

Adding the IP Addresses of the NetScaler Appliance

In the NSWL client configuration file (log.conf), add the NetScaler IP address (NSIP) from which the NSWL client will start collecting logs.

To add the NSIP address of the NetScaler appliance

1. At the client system command prompt, type:

   nswl -addns -f < directorypath > \log.conf

   < directorypath >: Specifies the path to the configuration file (log.conf).

2. At the next prompt, enter the following information:

   - NSIP: Specify the IP address of the NetScaler appliance.
   - User name: Specify the user name of the NetScaler appliance.
   - Password: Specify the password.

Note: If you add multiple NetScaler IP addresses (NSIP), and later you do not want to log all of NetScaler system log details, you can delete the NSIPs manually by removing the NSIP statement at the end of the log.conf file. During a failover setup, you must add both primary and secondary NetScaler IP addresses to the log.conf by using the command. Before adding the IP address, make sure the user name and password exist on the NetScaler appliances.

Verifying the NSWL Configuration File

To make sure that logging works correctly, check the NSWL configuration file (log.conf) on the client system for syntax errors.

To verify the configuration in the NSWL configuration file

At the client system command prompt, type:

nswl -**verify** -**f** <directorypath>**log.conf**

< directorypath >: Specifies the path to the configuration file (log.conf).

Running the NSWL Client

To start Web server logging

At the client system command prompt, type:

nswl -**start** -**f** <directorypath>\log.conf

<directorypath>: Specifies the path to the configuration file (log.conf).

To stop Web server logging started as a background process on the Solaris or Linux operating systems

At the command prompt, type:

nswl -**stop**

To stop Web server logging started as a service on the Windows operating system

At the command prompt, type:

nswl -**stopservice**

Customizing Logging on the NSWL Client System

You can customize logging on the NSWL client system by making additional modifications to the NSWL client configuration file (log.conf). Use a text editor to modify the log.conf configuration file on the client system.

To customize logging, use the configuration file to define filters and log properties.

- **Log filters.** Filter log information based on the the host IP address, domain name, and host name of the Web servers.
- **Log properties.** Each filter has an associated set of log properties. Log properties define how to store the filtered log information.

Creating Filters

You can use the default filter definition located in the configuration file (log.conf), or you can modify the filter or create a new filter. You can create more than one log filter.

Note: Consolidated logging, which logs transactions for which no filter is defined, uses the default filter if it is enabled. Consolidated logging of all servers can be done by defining only the default filter.

If the server hosts multiple Web sites and each Web site has its own domain name, and each domain is associated with a virtual server, you can configure Web server logging to create a separate log directory for each Web site. The following table displays the parameters for creating a filter.

Table 1. Parameters for Creating a Filter

Parameter	Specifies
filterName	Name of the filter (maximum 64 alphanumeric characters).
HOST name	Host name of the server for which the transactions are being logged.
IP ip	IP address of the server for which transactions are to be logged (for example, if the server has multiple domains that have one IP address).
IP ip 2...ip n:	Multiple IP addresses (for example, if the server domain has multiple IP addresses).
ip6 ip	IPv6 address of the server for which transactions are to be logged.
IP ip NETMASK mask	IP addresses and netmask combination to be used on a subnet.
ON | OFF	Enable or disable the filter to log transactions. If no argument is selected, the filter is enabled (ON).

To create a filter

To create a filter, enter the following command in the log.conf file:

- filter <filterName> <HOST name> | [**IP** <ip>] | [**IP** <ip 2...ip n>] | <IP ip NETMASK mask> [ON | OFF]
- filter <filterName> <HOST name> | [**IP6 ip**/<prefix length>] [ON | OFF]

To create a filter for a virtual server

To create a filter for a virtual server, enter the following command in the log.conf file:

filter <filterName> <VirtualServer IP address>

Example

In the following example, you specify an IP address of 192.168.100.0 and netmask of 255.255.255.0. The filter applies to IP addresses 192.168.100.1 through 192.168.100.254.

Filter F1 HOST www.netscaler.com ON
Filter F2 HOST www.netscaler.com IP 192.168.100.151 ON
Filter F3 HOST www.netscaler.com IP 192.168.100.151 192.165.100.152 ON
Filter F4 IP 192.168.100.151
Filter F5 IP 192.168.100.151 HOST www.netscaler.com OFF
Filter F6 HOST www.netscaler.com HOST www.xyz.com HOST www.abcxyz.com IP 192.168.100.200 ON
Filter F7 IP 192.250.100.0 NETMASK 255.255.255.0
Filter F8 HOST www.xyz.com IP 192.250.100.0 NETMASK 255.255.255.0 OFF
For creating filters for servers having IPv6 addresses.
Filter F9 2002::8/112 ON
Filter F10 HOST www.abcd.com IP6 2002::8 ON

Specifying Log Properties

Log properties are applied to all log entries associated with the filter. The log property definition begins with the keyword BEGIN and ends with END as illustrated in the following example:

```
BEGIN <filtername>
 logFormat ...
 logFilenameFormat ...
 logInterval ...
 logFileSize ....
 logExclude ....
 logTime ….
 END
```

Entries in the definition can include the following:

- **LogFormat** specifies the Web server logging feature that supports NCSA, W3C Extended, and custom log file formats.

  By default, the logformat property is w3c. To override, enter custom or NCSA in the configuration file, for example:

  ```
  LogFormat NCSA
  ```

  Note: For the NCSA and custom log formats, local time is used to time stamp transactions and for file rotation.

- **LogInterval** specifies the intervals at which new log files are created. Use one of the following values:

  - Hourly: A file is created every hour.
  - Daily: A file is created every day at midnight. Default value.
  - Weekly: A file is created every Sunday at midnight.
  - Monthly: A file is created on the first day of the month at midnight.
  - None: A file is created only once, when Web server logging starts.

  Example

  ```
  LogInterval Daily
  ```

- **LogFileSizeLimit** specifies the maximum size of the log file in MB. It can be used with any log interval (weekly, monthly, and so on.) A file is created when the maximum file size limit is reached or when the defined log interval time elapses.

  To override this behavior, specify the size as the loginterval property so that a file is created only when the log file size limit is reached.

  The default LogFileSizeLimit is 10 MB.

  Example

  ```
  LogFileSizeLimit 35
  ```

- **LogFilenameFormat** specifies the file name format of the log file. The name of the file can be of the following types:

  - Static: Specifies a constant string that contains the absolute path and file name.

    Dynamic: Specifies an expression containing the following format:

    - Server IP address (%A)
    - Date (%{format}t)
    - URL suffix (%x)
    - Host name (%v)

  Example

  ```
  LogFileNameFormat Ex%{%m%d%y}t.log
  ```

  This command creates the first file name as Exmmddyy.log, then every hour creates a file with file name: Exmmddyy.log.0, Exmmddyy.log.1,..., Exmmddyy.log.n.

  Example

  ```
  LogInterval size
  LogFileSize 100
  LogFileNameFormat Ex%{%m%d%y}t
  ```

  Caution: The date format %t specified in the LogFilenameFormat command overrides the log interval property for that filter. To prevent a new file being created every day instead of when the specified log file size is reached, do not use %t in the LogFilenameFormat.

- **LogExclude** prevents logging of transactions with the specified file extensions.

Example

```
LogExclude .html
```

This command creates a log file that excludes log transactions for *.html files.

- **LogTime** specifies log time as either GMT or LOCAL.

  The defaults are:

  - NCSA log file format: LOCAL
  - W3C log file format: GMT.

Understanding the NCSA and W3C Log Formats

The NetScaler supports the following standard log file formats:

- NCSA Common Log Format
- W3C Extended Log Format

NCSA Common Log Format

If the log file format is NCSA, the log file displays log information in the following format:

Client_IP_address -User_Name [Date:Time -TimeZone] "Method Object HTTP_version" HTTP_StatusCode Byte

To use the NCSA Common log format, enter NCSA in the LogFormat argument in the log.conf file.

The following table describes the NCSA Common log format.

Table 1. NCSA Common Log Format

Argument	Specifies
Client _IP_address	The IP address of the client computer.
User Name	The user name.
Date	The date of the transaction.
Time	The time when the transaction was completed.
Time Zone	The time zone (Greenwich Mean Time or local time).
Method	The request method (for example; GET, POST).
Object	The URL.
HTTP_version	The version of HTTP used by the client.
HTTP_StatusCode	The status code in the response.
Bytes Sent	The number of bytes sent from the server.

W3C Extended Log Format

An extended log file contains a sequence of lines containing ASCII characters terminated by either a Line Feed (LF) or the sequence Carriage Return Line Feed (CRLF.) Log file generators must follow the line termination convention for the platform on which they are run.

Log analyzers must accept either LF or CRLF form. Each line may contain either a directive or an entry. If you want to use the W3C Extended log format, enter W3C as the Log-Format argument in the log.conf file.

By default, the standard W3C log format is defined internally as the custom log format, shown as follows:

```
%{%Y-%m-%d%H:%M:%S}t %a %u %S %A %p %m %U %q %s %j %J %T %H %+{user-agent}i %+{cookie} i%+{referer}i
```

For a description of the meaning of this each custom format, see Appendix A: Arguments for Defining a Custom Log Format. You can also change the order or remove some fields in this W3C log format. For example:

```
logFormat W3C %{%Y-%m-%d%H:%M:%S}t %m %U
```

W3C log entries are created with the following format:

```
#Version: 1.0
#Fields: date time cs-method cs-uri
#Date: 12-Jun-2001 12:34
2001-06-12 12:34:23 GET /sports/football.html
2001-06-12 12:34:30 GET /sports/football.html
```

Entries

Entries consist of a sequence of fields relating to a single HTTP transaction. Fields are separated by white space; Citrix recommends the use of tab characters. If a field in a particular entry is not used, a dash (-) marks the omitted field.

Directives

Directives record information about the logging process. Lines beginning with the pound sign (#) contain directives.

The following table describes the directives.

Table 2. Directive Descriptions

Directive	Description
Version: <integer>.<integer>	Displays the version of the extended log file format used. This document defines version 1.0.
Fields: [<specifier>...]	Identifies the fields recorded in the log.
Software: <string>	Identifies the software that generated the log.
Start-Date: <date> <time>	Displays the date and time at which the log was started.
End-Date: <date> <time>	Displays the date and time at which logging finished.
Date: <date> <time>	Displays the date and time when the entry was added.
Remark: <text>	Displays comments. Analysis tools ignore data recorded in this field.

Note: The Version and Fields directives are required. They precede all other entries in the log file.

Example

The following sample log file shows the log entries in W3C Extended log format:

```
#Version: 1.0
#Fields: time cs-method cs-uri
#Date: 12-Jan-1996 00:00:00
00:34:23 GET /sports/football.html
12:21:16 GET /sports/football.html
12:45:52 GET /sports/football.html
12:57:34 GET /sports/football.html
```

Fields

The Fields directive lists a sequence of field identifiers that specify the information recorded in each entry. Field identifiers may have one of the following forms:

- **identifier:** Relates to the transaction as a whole.
- **prefix-identifier:** Relates to information transfer between parties defined by the value *prefix*.
- **prefix (header):** Specifies the value of the HTTP header field header for transfer between parties defined by the value *prefix*. Fields specified in this manner always have the type <string>.

The following table describes defined prefixes.

Table 3. Prefix Descriptions

Prefix	Specifies
c	Client
s	Server
r	Remote
cs	Client to server
sc	Server to client
sr	Server to remote server (prefix used by proxies)
rs	Remote server to server (prefix used by proxies)
x	Application-specific identifier

Examples

The following examples are defined identifiers that use prefixes:

cs-method: The method in the request sent by the client to the server.

sc(Referer): The Referer field in the reply.

c-ip: The IP address of the client.

Identifiers

The following table describes the W3C Extended log format identifiers that do not require a prefix.

Table 4. W3C Extended Log Format Identifiers (No Prefix Required)

Identifier	Description
date	The date on which the transaction was done.
time	The time when the transaction is done.
time-taken	The time taken (in seconds) for the transaction to complete.
bytes	The number of bytes transferred.
cached	Records whether a cache hit has occurred. A zero indicates a cache miss.

The following table describes the W3C Extended log format identifiers that require a prefix.

Table 5. W3C Extended Log Format Identifiers (Requires a Prefix)

Identifier	Description
IP	The IP address and the port number.
dns	The DNS name.
status	The status code.
comment	The comment returned with status code.
method	The method.
url	The URL.
url-stem	The stem portion of the URL.
url-query	The query portion of the URL.

The W3C Extended Log file format allows you to choose log fields. These fields are shown in the following table.

Table 6. W3C Extended Log File Format (Allows Log Fields)

Field	Description
Date	The date on which the transaction is done.
Time	The time when the transaction is done.
Client IP	The IP address of the client.
User Name	The user name.
Service Name	Theservice name, which is always HTTP.
Server IP	The server IP address.
Server Port	The server port number
Method	The request method (for example; GET, POST).
Url Stem	The URL stem.
Url Query	The query portion of the URL.
Http Status	The status code in the response.
Bytes Sent	The number of bytes sent to the server (request size, including HTTP headers).
Bytes Received	The number of bytes received from the server (response size, including HTTP headers).
Time Taken	The time taken for transaction to complete, in seconds.
Protocol Version	The version number of HTTP being used by the client.
User Agent	The User-Agent field in the HTTP protocol.
Cookie	The Cookie field of the HTTP protocol.
Referer	The Referer field of the HTTP protocol.

Creating a Custom Log Format

You can customize the display format of the log file data manually or by using the NSWL library. By using the custom log format, you can derive most of the log formats that Apache currently supports.

Creating a Custom Log Format by Using the NSWL Library

Use one of the following NSWL libraries depending on whether the NSWL executable has been installed on a Windows or Solaris host computer:

- **Windows:** The nswl.lib library located in \ns\bin directory on the system manager host computer.
- **Solaris:** The libnswl.a library located in /usr/local/netscaler/bin.

To create the custom log format by using the NSWL Library

1. Add the following two C functions defined by the system in a C source file:

   ns_userDefFieldName() : This function returns the string that must be added as a custom field name in the log record.

   ns_userDefFieldVal() : This function implements the custom field value, then returns it as a string that must be added at the end of the log record.

2. Compile the file into an object file.
3. Link the object file with the NSWL library (and optionally, with third party libraries) to form a new NSWL executable.
4. Add a %d string at the end of the logFormat string in the configuration file (log.conf).

Example

```
##########
# A new file is created every midnight or on reaching 20MB file size,
# and the file name is /datadisk5/netscaler/log/NS<hostname>/Nsmmddyy.log and create digital
#signature field for each record.
BEGIN CACHE_F
   logFormat   custom "%a - "%{user-agent}i" [%d/%B/%Y %T -%g] "%x" %s %b%{referrer}i "%{user-agent}i" "%{coo
   logInterval         Daily
```

```
    logFileSizeLimit        20
    logFilenameFormat       /datadisk5/netscaler/log/%v/NS%{%m%d%y}t.log
END CACHE_F
```

Creating a Custom Log Format Manually

To customize the format in which log file data should appear, specify a character string as the argument of the LogFormat log property definition. For more information, see Appendix A: Arguments for Defining a Custom Log Format. The following is an example where character strings are used to create a log format:

```
 LogFormat Custom ""%a - "%{user-agent}i" %[%d/%m/%Y]t %U %s %b %T"
```

- The string can contain the “c” type control characters \n and \t to represent new lines and tabs.
- Use the <Esc> key with literal quotes and backslashes.

The characteristics of the request are logged by placing % directives in the format string, which are replaced in the log file by the values.

If the %v (Host name) or %x (URL suffix) format specifier is present in a log file name format string, the following characters in the file name are replaced by an underscore symbol in the log configuration file name:

" * . / : < > ? \ |

Characters whose ASCII values lie in the range of 0-31 are replaced by the following:

%<ASCII value of character in hexadecimal>.

For example, the character with ASCII value 22 is replaced by %16.

Caution: If the %v format specifier is present in a log file name format string, a separate file is opened for each virtual host. To ensure continuous logging, the maximum number of files that a process can have open should be sufficiently large. See your operating system documentation for a procedure to change the number of files that can be opened.

Creating Apache Log Formats

You can derive from the custom logs most of the log formats that Apache currently supports. The custom log formats that match Apache log formats are:

NCSA/combined: LogFormat custom %h %l %u [%t] "%r" %s %B "%{referer}i" "%{user-agent}i"

NCSA/Common: LogFormat custom %h %l %u [%t] "%r" %s %B

Referer Log: LogFormat custom "%{referer}i" -> %U

Useragent: LogFormat custom %{user-agent}i

Similarly, you can derive the other server log formats from the custom formats.

Sample Configuration File

Following is a sample configuration file:

```
##########
# This is the NSWL configuration file
# Only the default filter is active
# Remove leading # to activate other filters
##########
##########
# Default filter (default on)
# W3C Format logging, new file is created every hour or on reaching 10MB file size,
# and the file name is Exyymmdd.log
##########
Filter default
begin default
	logFormat		W3C
	logInterval		Hourly
	logFileSizeLimit	10
	logFilenameFormat	Ex%{%y%m%d}t.log
end default
##########
# netscaler caches example
# CACHE_F filter covers all the transaction with HOST name www.netscaler.com and the listed server ip's
##########
#Filter CACHE_F HOST www.netscaler.com IP 192.168.100.89 192.168.100.95 192.168.100.52 192.168.100.53
##########
# netscaler origin server example
# Not interested in Origin server to Cache traffic transaction logging
##########
#Filter ORIGIN_SERVERS IP 192.168.100.64 192.168.100.65 192.168.100.66 192.168.100.67 192.168.100.225 1
100.227 192.168.100.228 OFF
##########
# netscaler image server example
# all the image server logging.
##########
#Filter IMAGE_SERVER HOST www.netscaler.images.com IP 192.168.100.71 192.168.100.72 192.168.100.169
0.171 ON
##########
# NCSA Format logging, new file is created every day midnight or on reaching 20MB file size,
# and the file name is /datadisk5/netscaler/log/NS<hostname>/Nsmmddyy.log.
# Exclude objects that ends with .gif .jpg .jar.
##########
#begin ORIGIN_SERVERS
#	logFormat		NCSA
#	logInterval		Daily
#	logFileSizeLimit	40
#	logFilenameFormat	/datadisk5/ORGIN/log/%v/NS%{%m%d%y}t.log
#	logExclude		.gif .jpg .jar
```

```
#end ORIGIN_SERVERS

##########
# NCSA Format logging, new file is created every day midnight or on reaching 20MB file size,
# and the file name is /datadisk5/netscaler/log/NS<hostname>/Nsmmddyy.log with log record timestamp as

Arguments for Defining a Custom Log Format

The following table describes the data that you can use as the Log Format argument string:

Table 1. Custom Log Format

Argument	Specifies
%a	The remote IPv4 address.
%A	The local IPv4 address.
%a6	The remote IPv6 address.
%A6	The local IPv6 address.
%B	The bytes sent, excluding the HTTP headers (response size).
%b	The bytes received, excluding the HTTP headers (request size).
%d	A user-defined field.
%g	The Greenwich Mean Time offset (for example, -0800 for Pacific Standard Time).
%h	The remote host.
%H	The request protocol.
%{Foobar}i	The contents of the Foobar: header line(s) in the request sent to the server. The system supports the User-Agent, Referer and cookie headers. The + after the % in this format informs the logging client to use the + as a word separator.
%j	The bytes received, including headers (request size)
%J	The bytes sent, including headers (response size)
%l	The remote log name (from identd, if supplied).
%m	The request method.
%M	The time taken to serve the request (i n microseconds)
%{Foobar}o	The contents of Foobar: header line(s) in the reply. We support the USER-AGENT, Referer, and cookie headers.

%p	The canonical port of the server serving the request.
%q	The query string (prefixed with a question mark (?) if a query string exists).
%r	The first line of the request.
%s	For requests that were redirected internally, this is the status of the original request.
%t	The time, in common log format (standard English time format).
%{format}t	The time, in the form given by format, must be in the strftime(3) format. For format descriptions, see Appendix B: Time Format Definition.
%T	The time taken to serve the request, in seconds.
%u	The remote user (from auth; may be bogus if return status (%s) is 401).
%U	The URL path requested.
%v	The canonical name of the server serving the request.
%V	This is the virtual server IPv4 address in the system, if load balancing, content switching, and/or cache redirection is used.
%V6	This is the virtual server IPv6 address in the system, if load balancing, content switching, and/or cache redirection is used.

For example, if you define the log format as %+{user-agent}i, and if the user agent value is Citrix NetScaler system Web Client, then the information is logged as Citrix NetScaler system +Web+Client. An alternative is to use double quotation marks. For example, “%{user-agent}i” logs it as “Citrix NetScaler system Web Client.” Do not use the <Esc> key on strings from %.. .r, %. . .i and, %. . .o. This complies with the requirements of the Common Log Format. Note that clients can insert control characters into the log. Therefore, you should take care when working with raw log files.

Time Format Definition

The following table lists the characters that you can enter as the format part of the %{format}t string described in the Custom Log Format table of Arguments for Defining a Custom Log Format. Values within brackets ([ ]) show the range of values that appear. For example, [1,31] in the %d description in the following table shows %d ranges from 1 to 31.

Table 1. Time Format Definition

Argument	Specifies
%%	The same as %.
%a	The abbreviated name of the week day for the locale.
%A	The full name of the week day for the locale.
%b	The abbreviated name of the month for the locale.
%B	The full name of the month for the locale.
%C	The century number (the year divided by 100 and truncated to an integer as a decimal number [1,99]); single digits are preceded by a 0.
%d	The day of month [1,31]; single digits are preceded by 0.
%e	The day of month [1,31]; single digits are preceded by a blank.
%h	The abbreviated name of the month for the locale.
%H	The hour (24-hour clock) [0,23]; single digits are preceded by a 0.
%I	The hour (12-hour clock) [1,12]; single digits are preceded by a 0.
%j	The number of the day in the year [1,366]; single digits are preceded by 0.
%k	The hour (24-hour clock) [0,23]; single digits are preceded by a blank.
%l	The hour (12-hour clock) [1,12]; single digits are preceded by a blank.
%m	The number of the month in the year [1,12]; single digits are preceded by a 0.

%M	The minute [00,59]; leading 0 is permitted but not required.
%n	Inserts a new line.
%p	The equivalent of either a.m. or p.m. for the locale.
%r	The appropriate time representation in 12-hour clock format with %p.
%S	The seconds [00,61]; the range of values is [00,61] rather than [00,59] to allow for the occasional leap second and for the double leap second.
%t	Inserts a tab.
%u	The day of the week as a decimal number [1,7]. 1 represents Sunday, 2 represents Tuesday and so on.
%U	The number of the week in the year as a decimal number [00,53], with Sunday as the first day of week 1.
%w	The day of the week as a decimal number [0,6]. 0 represents Sunday.
%W	Specifies the number of the week in the year as a decimal number [00,53]. Monday is the first day of week 1.
%y	The number of the year within the century [00,99]. For example, 5 would be the fifth year of that century.
%Y	The year, including the century (for example, 1993).

Note: If you specify a conversion that does not correspond to any of the ones described in the preceding table, or to any of the modified conversion specifications listed in the next paragraph, the behavior is undefined and returns 0.

The difference between %U and %W (and also between modified conversions %OU and %OW) is the day considered to be the first day of the week. Week number 1 is the first week in January (starting with a Sunday for %U, or a Monday for %W). Week number 0 contains the days before the first Sunday or Monday in January for %U and %W.

Advanced Configurations

You can configure network time protocol to synchronize a Citrix® NetScaler® appliance's local clock with the other servers on the network. If you enable path maximum transmission unit (PMTU) discovery, the NetScaler can use it to determine the maximum transmission unit of any Internet channel. For more efficient data transfer, you can configure TCP window scaling and selective acknowledgment. You can clear any basic or extended configuration on your NetScaler. You can view statistics associated with HTTP request and response sizes. For applying a specific HTTP and TCP settings to vservers and services, you can configure HTTP and TCP profiles.

Configuring Clock Synchronization

You can configure your NetScaler appliance to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network.

You can configure clock synchronization on your appliance by adding NTP server entries to the ntp.conf file from either the configuration utility or the NetScaler command line, or by manually modifying the ntp.conf file, and then starting the NTP daemon (NTPD). The clock synchronization configuration does not change if the appliance is restarted, upgraded, or downgraded. However, the configuration does not get propagated to the secondary NetScaler in a high availability setup.

Note: If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site, http://www.ntp.org, under Public Time Servers List. Before configuring your NetScaler to use a public NTP server, be sure to read the Rules of Engagement page (link included on all Public Time Servers pages).

Setting Up Clock Synchronization by Using the CLI or the Configuration Utility

To configure clock synchronization from the configuration utility or from the CLI, you add NTP servers and then enable NTP synchronization.

To add an NTP server by using the NetScaler command line

At the NetScaler command prompt, type the following commands to add an NTP server and verify the configuration:

- add ntp server (<serverIP> | <serverName>) [-**minpoll** <positive_integer>][-**maxpoll** <positive_integer>]
- show ntp server

Example

```
> add ntp server 1.2.3.5 -minpoll 6 -maxpoll 11
 Done
> sh ntp server

      NTP Server: xyz.net
      Minimum Poll Interval: 6 (64secs)
      Maximum Poll Interval: 9 (512secs)

      NTP Server: 1.2.3.5
      Minimum Poll Interval: 6 (64secs)
      Maximum Poll Interval: 11 (2048secs)
 Done
```

To modify or remove NTP servers by using the NetScaler command line

- To modify settings for an NTP server, type the set ntp server (<serverIP> | <serverName>) command and the parameters to be changed, with their new values.
- To remove an NTP server, type rm ntp server (<serverIP> | <serverName>)

Parameters for configuring an NTP server

serverIP

IP address of the NTP server.

serverName

Domain name of the NTP server.

minpoll

Minimum number of seconds after which the NTP server must poll the NTP messages, expressed as a power of 2. Minimum value: 4 (2^4=16 seconds). Maximum value: 17 (2^17=131072 seconds). Default: 6 (2^6=64 seconds).

maxpoll

Maximum number of seconds after which the NTP server must poll the NTP messages, expressed as a power of 2. Minimum value: 4 (2^4=16 seconds). Maximum value: 17 (2^17=131072 seconds). Default : 10 (2^10=1024 seconds).

To configure an NTP server by using the configuration utility

1. In the navigation pane, expand **System**, and then click **NTP Servers**.
2. In the details pane, do one of the following:
   - To add a new NTP server, click **Add**.
   - To modify settings for an existing NTP server, select the NTP server, and then click **Open**.
3. In the **Create NTP Server** or **Configure NTP Server** dialog box, specify values for the following parameters, which correspond to parameters described in “Parameters for configuring an NTP server” as shown:
   - NTP Server*—serverIP or serverName (Cannot be changed for an existing NTP server.)
   - Minimum Poll—minpoll
   - Maximum Poll—maxpoll

   * A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the NTP server has been configured successfully.

Starting or Stopping the NTP Daemon

When you enable NTP synchronization, the NetScaler starts the NTP daemon and uses the NTP server entries in the ntp.conf file to synchronize its local time setting. If you do not want to synchronize your NetScaler time with the other servers in the network, you can disable NTP synchronization, which stops the NTP daemon (NTPD).

To enable or disable NTP synchronization by using the NetScaler command line

At the NetScaler command prompt, type one of the following commands:

- enable ntp sync
- disable ntp sync

To enable or disable NTP synchronization by using the configuration utility

1. In the navigation pane, expand **System**, and then click **NTP Servers**.
2. On the **NTP Servers** page, click **NTP Synchronization - ON** or **NTP Synchronization - OFF**.

Configuring Clock Synchronization Manually

You can configure clock synchronization manually by logging on to the NetScaler and editing the ntp.conf file.

To enable clock synchronization on your NetScaler by modifying the ntp.conf file

1. Log on to the NetScaler command line.
2. Switch to the shell prompt.
3. Copy the /etc/ntp.conf file to /nsconfig/ntp.conf, unless the /nsconfig directory already contains an ntp.conf file.
4. Check the /nsconfig/ntp.conf file for the following entries and, if they are present, remove them:

   restrict localhost

   restrict 127.0.0.2
5. Add the IP address for the desired NTP server to the /nsconfig/ntp.conf file, beneath the file's server and restrict entries.

   Note: For security reasons, there should be a corresponding restrict entry for each server entry.
6. If the /nsconfig directory does not contain a file named rc.netscaler, create the file.
7. Add the following entry to /nsconfig/rc.netscaler: /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &

   This entry starts the ntpd service, checks the ntp.conf file, and logs messages in the /var/log directory.

   This process runs every time the NetScaler is restarted.
8. Reboot the NetScaler to enable clock synchronization.

   Note:

   If you want to start the time synchronization process without restarting the NetScaler, run the following command from the shell prompt:

   /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &

Viewing the System Date and Time

To change the system date and time, you must use the shell interface to the underlying FreeBSD OS. However, to view the system date and time, you can use the NetScaler command line or the configuration utility.

To view the system date and time by using the NetScaler command line

At the NetScaler command prompt, type:

show ns config

Example

```
> show ns config
        NetScaler IP: 10.102.29.170  (mask: 255.255.255.0)
        Number of MappedIP(s): 6
        Node: Standalone

        Global configuration settings:
                        HTTP port(s): (none)
                    Max connections: 0
          Max requests per connection: 0
                 Client IP insertion: DISABLED
                     Cookie version: 0
        Persistence Cookie Secure Flag: ENABLED
                      Min Path MTU: 576
               Path MTU entry timeout: 10
                     FTP Port Range: 0
                      CR Port Range: 0
                          Timezone: GMT+05:30-IST-Asia/Colombo
                       System Time: Tue Feb 22 16:50:44 2011
                Last Config Changed Time: Tue Feb 22 16:48:02 2011
                 Last Config Saved Time: Tue Feb 22 16:48:19 2011
 Done
```

To view the system date and time by using the configuration utility

1. In the navigation pane, click **System**.
2. In the details pane, select the **System Information** tab.
3. Under **System Information**, view the system date and time.

Configuring TCP Window Scaling

The TCP window scaling option, which is defined in RFC 1323, increases the TCP receive window size beyond its maximum value of 65,535 bytes. This option is required for efficient transfer of data over long fat networks (LFNs).

A TCP window determines the amount of outstanding (unacknowledged by the recipient) data a sender can send on a particular connection before receiving any acknowledgment from the receiver. The main purpose of the window is flow control.

The window size field in the TCP header is 16 bits, which limits the ability of the sender to advertise a window size larger than 65535 (2^16 - 1). The TCP window scale extension expands the definition of the TCP window by applying a scale factor to the value in the 16 bit window size field of the TCP header. (Although RFC 1323 describes expanding the definition to up to 30 bits, NetScaler window scaling expands the definition of the TCP window to up to 24 bits.) The scale factor is carried in the new TCP window scale field. This field is sent only in a SYN packet (a segment with the SYN bit on)

To fit a larger window size value into the 16-bit field, the sender right shifts the value by the number of bit positions specified by the scale factor. The receiver left shifts the value by the same number of positions. Therefore, the actual window size is equivalent to:

(2^<scale factor>) * <received window size>.

Before configuring window scaling, make sure that:

- You do not set a high value for the scale factor, because this could have adverse effects on the NetScaler and the network.
- You have enabled selective acknowledgement (SACK).
- You do not configure window scaling unless you clearly know why you want to change the window size.
- Both hosts in the TCP connection send a window scale option during connection establishment. If only one side of a connection sets this option, windows scaling is not used for the connection.
- Each connection for same session is an independent Window Scaling session. For example, when a client's request and the server's response flow through the NetScaler appliance, it is possible to have window scaling between the client and the appliance without window scaling between the appliance and the server.

By default, window scaling is not enabled.

To configure window scaling by using the NetScaler command line

At the NetScaler command prompt, type the following command to configure window scaling and verify the configuration:

- set ns tcpParam [-**WS** (ENABLED | DISABLED)] [-**WSVal** <positive_integer>]
- show ns tcpParam

Example

```
> set ns tcpParam -WS ENABLED  -WSVal 6
 Done
> sh ns tcpParam
       TCP Parameters

       Window Scaling status     : ENABLED
       Window Scaling factor     : 6
       SACK status                 : ENABLED
        .
      .
      .
     TCP minimum RTO in millisec: 1000
       TCP Slow start increment: 2
 Done
```

Parameters for configuring window scaling

WSVal

Factor used to calculate new window size. Possible values: 0 to 8. Default: 4.

WS

Enables or disables window scaling.

To configure window scaling by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Configure TCP Parameters**.
3. In the **Configure TCP Parameters** dialog box, under **TCP**, select the **Windows Scaling** check box to enable window scaling.
4. In the **Factor** text box, type a windows scaling factor (for example, **6**). For possible values, see “Parameters for configuring window scaling.”
5. Click **OK**. A message appears in the status bar, stating that window scaling has been configured successfully.

Configuring Selective Acknowledgment

NetScaler appliances support Selective Acknowledgment (SACK), as defined in RFC 2018. Using SACK, the data receiver (either a NetScaler or a client) notifies the sender about all the segments that have been received successfully. As a result, the sender (either a NetScaler or a client) needs to retransmit only those segments that were lost during transmission. This improves the performance of data transmission. SACK is important in long fat networks (LFNs). By default, SACK is disabled.

To enable Selective Acknowledgment (SACK) by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable Selective Acknowledgment (SACK) and verify the configuration:

- set ns tcpParam [-**SACK** (ENABLED | DISABLED)]
- show ns tcpParam

Example

```
> set ns tcpParam -SACK ENABLED
 Done
> show ns tcpParam
        TCP Parameters

        Window Scaling status     : ENABLED
        Window Scaling factor     : 4
        SACK status             : ENABLED
        MaxBurst setting          : 6 MSS
        Initial cwnd setting      : 4 MSS
        TCP Receive Buffer        : 8190 bytes
        TCP Delayed-ACK Timer     : 200 millisec
        Down Service Reset status : DISABLED
        Nagle's Algorithm : DISABLED
        Limited Persist Probes : ENABLED
        Maximum out-of-order packets to queue: 64
 Done
```

To enable SACK by using the Configuration Utility

1. In the navigation pane, expand **System**, and click **Settings**.

2. In the details pane, under **Settings**, click **Change TCP Parameters**.

3. In the **Configure TCP Parameters** dialog box, under **TCP**, select the **Selective Acknowledgment** check box, and then click **OK.** A message appears in the status bar, stating that SACK has been configured successfully.

Clearing the Configuration

You have the following three options for clearing your NetScaler configuration.

Basic level. Clearing your configuration at the basic level clears all settings except the following:

- NSIP, MIP(s), and SNIP(s)
- Network settings (Default Gateway, VLAN, RHI, NTP, and DNS settings)
- HA node definitions
- Feature and mode settings
- Default administrator password (nsroot)

Extended level. Clearing your configuration at the extended level clears all settings except the following:

- NSIP, MIP(s), and SNIP(s)
- Network settings (Default Gateway, VLAN, RHI, NTP, and DNS settings)
- HA node definitions

Feature and mode settings revert to their default values.

Full level. Clearing your configuration at the full level returns all settings to their factory default values. However, the NSIP and default gateway are not changed, because changing them could cause the NetScaler to lose network connectivity.

To clear a configuration by using the NetScaler command line

At the NetScaler command prompt, type the following command:

clear ns config < (basic | advanced | full)>

Example

> clear ns config basic

```
Are you sure you want to clear the configuration(Y/N)? [N]:Y
 Done
```

Parameters for clearing a configuration

level

A level representing the extent to which to clear the configuration. Possible values: basic, extended, full.

To clear a configuration by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Diagnostics**.
2. In the details pane, under **Maintenance**, click **Clear Configuration**.
3. In the **Clear Configuration** dialog box, for **Configuration Level**, select an option (for example, **basic**).
4. Click **Run**. A message appears in the status bar, stating that the configuration has been refreshed successfully.

Viewing the HTTP Band Statistics

You can view HTTP band statistics to obtain useful information such as:

- Average request/response band size.
- The size range to which most requests/responses belong.
- Contribution of HTTP pages, in a certain size range, to the overall HTTP traffic.

To view HTTP request and response size statistics by using the NetScaler command line

At the NetScaler command prompt, type:

show protocol httpBand **-type** (REQUEST|RESPONSE)

Example

```
show protocol httpBand -type REQUEST
show protocol httpBand -type RESPONSE
```

To view HTTP request and response size statistics by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **HTTP data band statistics**.
3. In the **HTTP Data Band Statistics** dialog box, view the HTTP request and HTTP response size statistics on the **Request** and **Response** tabs, respectively.

You can also modify the band range for HTTP request or response size statistics.

To modify the band range by using the NetScaler command line

At the NetScaler command prompt, type:

set protocol httpBand **reqBandSize** <value> **respBandSize** <value>

Example

set protocol httpBand reqBandSize 300 respBandSize 2048

Parameters for modifying the band range for HTTP request or response size statistics

reqBandSize

Band size for HTTP request band statistics, in bytes. Minimum value: 50. Maximum value: 2147483647. Default: 100.

respBandSize

Band size for HTTP response band statistics, in bytes. Minimum value: 50. Maximum value: 2147483647. Default: 1024.

To modify the band range by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **HTTP data band Statistics**. Do one or both of the following:

   To modify the band range of HTTP request statistics, click the **Request** tab,

   click the **Request** tab, and then click **Configure**. In **Change HTTP Request Band Size** dialog box, enter a value (for example, **300**) in **Request Data Band Size** text field, and then click **OK**.

   - To modify the band range of HTTP response statistics, click the **Response** tab, and then click **Configure**. In **Change HTTP Response Band Size** dialog box, enter a value (for example, **2048**) in **Response Data Band Size** text field, and then click **OK**.
3. Click **Close**.

Configuring HTTP Profiles

An HTTP profile is a collection of HTTP parameter settings that can be applied to virtual servers and services. An HTTP profile can be reused on multiple virtual servers or services.

You can use built-in HTTP profiles or configure custom profiles. The following table describes the built-in HTTP profiles.

Table 1. Built-in HTTP Profiles

Built-in profile	Description
nshttp_default_strict_validation	This profile is useful for deployments where strict validation of HTTP requests and responses is required.
nshttp_default_profile	This profile represents the default global HTTP settings on the NetScaler appliance.

To add an HTTP profile by using the NetScaler command line

At the NetScaler command prompt, type:

- add ns httpProfile name **-maxReusePool** <value> **-dropInvalReqs** (ENABLED | DISABLED) **-markHttp09Inval** (ENABLED | DISABLED) **-markConnReqInval** (ENABLED | DISABLED) **-cmpOnPush** (ENABLED | DISABLED) **-conMultiplex** (ENABLED | DISABLED)
- sh ns httpProfile

Example

```
add ns httpProfile http_profile1 -maxReusePool 30 -dropInvalReqs ENABLED -markHttp09Inval ENABLED
-markConnReqInval ENABLED -cmpOnPush ENABLED -conMultiplex DISABLED
```

Parameters for adding an HTTP profile

name

The name for an HTTP profile. An HTTP profile name can be from 1 to 127 characters and must begin with a letter, a number, or the underscore symbol (_). Other characters allowed after the first character in a name are the hyphen (-), period (.), pound sign (#), space ( ), at sign (@), and equals sign (=).

maxReusePool

A maximum limit on the number of connections, from the NetScaler to a particular server, in the reuse pool. This setting is helpful for optimal memory utilization and for reducing the idle connections to the server just after the peak time.

conMultiplex

When this option is enabled, the NetScaler appliance reuse the server connections for multiple client connections. Possible values: ENABLED, DISABLED. Default: ENABLED.

dropInvalReqs

Drop the invalid request or responses, either based on the header or body. Possible values: ENABLED, DISABLED. Default: DISABLED.

markHttp09Inval

Mark the 0.9 requests as invalid or not. Possible values: ENABLED, DISABLED. Default: DISABLED.

markConnReqInval

Mark the CONNECT requests invalid or not. Possible values: ENABLED, DISABLED. Default: DISABLED.

cmpOnPush

Use compression on PUSH for the HTTP VIP. Possible values: ENABLED, DISABLED. Default: DISABLED.

To add an HTTP profile by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Profiles**.
2. In the details pane, on the **HTTP Profiles** tab, click **Add**.
3. In the **Create HTTP Profile** dialog box, specify values for the following parameters, which correspond to parameters described in " Parameters for adding an HTTP profile" as shown:
   - **Name***—name
   - **Max Connection in reusepool**—maxReusePool
   - **Connection Multiplexing**—conMultiplex
   - **Drop invalid HTTP requests**—dropInvalReqs
   - **Mark HTTP/0.9 requests as invalid**—markHttp09Inval
   - **Mark CONNECT requests as invalid**—markConnReqInval
   - **Compression on PUSH packet**—cmpOnPush

   * A required parameter.
4. Click **Create**. A message appears in the status bar, stating that the HTTP profile has been configured successfully.

Configuring TCP Profiles

A Transmission Control Protocol (TCP) profile is a collection of TCP parameter settings that can be applied to virtual servers and services. A TCP profile can be reused on multiple virtual servers or services. You can use built-in TCP profiles or configure custom profiles. The following table describes the built-in TCP profiles.

Table 1. Built-in TCP Profiles

Built-in profile	Description
nstcp_default_tcp_lfp	This profile is useful for long fat pipe networks (WAN) on the client side. Long fat pipe networks have long delay, high bandwidth lines with minimal packet drops.
nstcp_default_tcp_lnp	This profile is useful for long narrow pipe networks (WAN) on the client side. Long narrow pipe networks have considerable packet loss once in a while.
nstcp_default_tcp_lan	This profile is useful for back-end server connections, where these servers reside on the same LAN as the NetScaler appliance.
nstcp_default_tcp_lfp_thin_stream	This profile is similar to the nstcp_default_tcp_lfp profile; however, the settings are tuned for small size packet flows.
nstcp_default_tcp_lnp_thin_stream	This profile is similar to the nstcp_default_tcp_lnp profile; however, the settings are tuned for small size packet flows.
nstcp_default_tcp_lan_thin_stream	This profile is similar to the nstcp_default_tcp_lan profile; however, the settings are tuned to small size packet flows.
nstcp_default_tcp_interactive_stream	This profile is similar to the nstcp_default_tcp_lan profile; however, it has a reduced delayed ACK timer and ACK on PUSH packet settings.
nstcp_internal_apps	This profile is useful for internal applications on the NetScaler appliance (for example, GSLB sitesyncing). This contains tuned window scaling and SACK options for the desired applications. This profile should not be bound to applications other than internal applications.

nstcp_defualt_profile	This profile represents the default global TCP settings on the NetScaler appliance.

To add a TCP profile by using the NetScaler command line

At the NetScaler command prompt, type the following commands to add a TCP profile and verify the configuration:

- add ns tcpProfile name **-WS** (ENABLED | DISABLED) **-SACK** (ENABLED | DISABLED) **-WSVal** <value> **-nagle** (ENABLED | DISABLED) **-ackOnPush** (ENABLED | DISABLED) **-maxBurst** value **-initialCwnd** <value> **-delayedAck** <value> **-oooQSize** <value> **-maxPktPerMss** <value> **-pktPerRetx** <value> **-minRTO** <value> **-slowStartIncr** <value>
- sh ns tcpProfile

Example

```
add ns tcpProfile tcp_profile1 -WS ENABLED -SACK ENABLED -WSVal 4 -nagle DISABLED
 -ackOnPush ENABLED -maxBurst 10 -initialCwnd 6 -delayedAck 200 -oooQSize 100
 -maxPktPerMss 0 -pktPerRetx 3 -minRTO 200 -slowStartIncr 3
```

Parameters for creating a TCP profile

name

The name for a TCP profile. A TCP profile name can be from 1 to 127 characters and must begin with a letter, a number, or the underscore symbol (_). Other characters allowed after the first character in a name are the hyphen (-), period (.), pound sign (#), space ( ), at sign (@), and equals sign (=).

WS

Enable or disable window scaling. Possible values: ENABLED, DISABLED. Default: DISABLED.

WSVal

The factor used to calculate the new window size. Possible values: 0 to 8. Default: 4.

maxBurst

The maximum number of TCP segments allowed in a burst. Minimum value: 2. Maximum value: 10. Default: 6.

initialCwnd

The initial maximum upper limit on the number of TCP packets that can be outstanding on the TCP link to the server. Minimum value: 2. Maximum value: 6. Default: 4.

delayedAck

The time-out for TCP delayed ACK, in milliseconds. Minimum value: 10. Maximum value: 200. Default: 300.

oooQSize

The maximum size of out-of-order packets queue. Minimum value: 0 0 means infinite). Maximum value: 512. Default: 64.

maxPktPerMss

The maximum number of TCP packets allowed per maximum segment size (MSS). Minimum value: 0. Maximum value: 1460. Default: 0 Means that no maximum is set.)

pktPerRetx

The maximum limit on the number of packets that should be retransmitted on receiving a partial ACK. Minimum value: 1. Maximum value: 100. Default: 1.

minRTO

The minimum round trip to origin (RTO) time, in milliseconds. Minimum value: 10. Maximum value: 64,000. Default: 1,000.

slowStartIncr

The multiplier that determines the rate at which slow start increases the size of the TCP transmission window after each acknowledgement of successful transmission. Minimum value: 1. Maximum value: 100. Default: 2.

SACK

Enable or disable selective acknowledgement (SACK). Possible values: ENABLED, DISABLED. Default: DISABLED.

nagle

Enable or disable the Nagle algorithm on TCP connections. Possible values: ENABLED, DISABLED. Default: DISABLED.

ackOnPush

Send immediate positive acknowledgement (ACK) on receipt of TCP packets when doing Web 2.0 PUSH. Possible values: ENABLED, DISABLED. Default: ENABLED.

To add a TCP profile by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Profiles**.
2. In the details pane, on the **TCP Profiles** tab, click **Add**.
3. In the **Create TCP Profiles** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for creating a TCP profile" as shown:
   - **Name***—name
   - **Window Scaling**—WS
   - **Factor**—WSVal
   - **Maximum Burst Limit**—maxBurst
   - **Initial Congestion Window Size**—initialCwnd
   - **TCP Delayed ACK Time-out (msec)**—delayedAck
   - **Maximum ooo Packet Queue Size**-oooQSize
   - **Maximum Packets Per MSS**—maxPktPerMss
   - **Maximum Packets per Retransmission**—pktPerRetx
   - **Minimum RTO (in millisec)**—minRTO
   - **Slow Start Increment**—slowStartIncr
   - **Selective Acknowledgement**—SACK
   - **Use Nagle's Algorithm**—nagle
   - **Immediate ACK on Receiving Packet with PUSH**—ackOnPush

   * A required parameter.
4. Click **Create**. A message appears in the status bar, stating that the TCP profile has been configured successfully.

Specifying a TCP Buffer Size

You can set the TCP buffer size, both globally and for individual virtual servers and services, through TCP profiles. The value that you set is the minimum value that is advertised by the NetScaler appliance, and this buffer size is reserved when a client initiates a connection that is associated with an endpoint-application function, such as compression or SSL. The managed application can request a larger buffer, but if it requests a smaller buffer, the request is not honored, and the specified buffer size is used. If the TCP buffer size is set both at the global level and at the entity level (virtual server or service level), the buffer specified at the entity level takes precedence. If the buffer size that you specify for a service is not the same as the buffer size that you specify for the virtual server to which the service is bound, the NetScaler appliance uses the buffer size specified for the virtual server for the client-side connection and the buffer size specified for the service for the server-side connection. However, for optimum results, make sure that the values specified for a virtual server and the services bound to it have the same value. The buffer size that you specify is used only when the connection is associated with endpoint-application functions, such as SSL and compression.

You set the TCP buffer size in a custom, entity-level TCP profile by setting the `bufferSize` parameter for the profile. To apply the buffer size setting specified in a custom, entity-level profile, you bind the profile to the virtual server or service. You set the global TCP buffer size by setting the `bufferSize` parameter in the global TCP profile `nstcp_default_profile`. You do not bind `nstcp_default_profile` to an entity. The settings in `nstcp_default_profile` are automatically applied globally.

Note: A high TCP buffer value could limit the number of connections that can be made to the NetScaler appliance. Additionally, the global TCP parameter `recvBuffSize`, which was set by the use of the `set ns tcpParam` command, has been deprecated. You can now specify the buffer size only through TCP profiles.

To set the TCP buffer size in an entity-level TCP profile by using the NetScaler command line

At the NetScaler command prompt, type the following commands to set the TCP buffer size in a TCP profile and verify the configuration:

```
set ns tcpProfile <name> -bufferSize <positive_integer>

show ns tcpProfile <name>
```

Example

```
> set ns tcpProfile profile1 -bufferSize 12000
 Done
```

```
> show ns tcpProfile profile1
      Name    : profile1
      Window Scaling status     : DISABLED
      Window Scaling factor     : 4
      .
      .
      .
      TCP Buffer Size     : 12000 bytes
      Reference count: 0

 Done
>
```

To set the TCP buffer size in the global TCP profile by using the NetScaler command line

At the NetScaler command prompt, type the following commands to set the TCP buffer size in the global TCP profile and verify the configuration:

- **set ns tcpProfile nstcp_default_profile –bufferSize** <positive_integer>
- **show ns tcpProfile nstcp_default_profile**

Example

```
> set ns tcpProfile nstcp_default_profile -bufferSize 12000
 Done
> show ns tcpProfile nstcp_default_profile
      Name    : nstcp_default_profile
      Window Scaling status     : DISABLED
      Window Scaling factor     : 4
      .
      .
      .
      TCP Buffer Size     : 12000 bytes
      Reference count: 200

 Done
>
```

Parameters for setting the TCP buffer size in a TCP profile

name

Name of the TCP profile. Maximum length: 127 characters.

bufferSize

TCP buffer size in bytes. Maximum value: 4194304. Minimum value: 8190. Default: 8190.

To set the TCP buffer size in a TCP profile by using the NetScaler configuration utility

1. In the navigation pane, expand **System**, and then click **Profiles**.
2. In the details pane, click the **TCP Profiles** tab, and then do one of the following:
   - To create a custom, entity-level TCP profile, click **Add** and, in the **Create TCP Profile** dialog box, type a name for the new profile.
   - To set the TCP buffer size for an existing TCP profile, click the name of the TCP profile, and then click **Open**. If you want to set the TCP buffer size in the global TCP profile, click **nstcp_default_profile**.
3. In the **Create TCP Profile** or **Configure TCP Profile** dialog box, in the **TCP Buffer Size (Bytes)** box, type the number of bytes to specify as the minimum TCP buffer size.
4. Click **Create** or **OK**.

Optimizing the TCP Maximum Segment Size for a Virtual Server Configuration

You can specify the Maximum Segment Size (MSS) that the Citrix® NetScaler® appliance advertises to a client when the client initiates a connection to a virtual server on the appliance. You can configure the MSS for the virtual servers configured on the appliance in two ways:

- You can set the MSS for each virtual server to a value of your choice in a TCP profile.

  You can set the `learnVsvrMSS` global TCP parameter to `ENABLED` to enable MSS learning for all the virtual servers configured on the appliance.

If you know the optimal MSS value for a given virtual server, you can specify the MSS in a TCP profile and bind the profile to the virtual server. When a client initiates a connection with the virtual server, the NetScaler appliance advertises the specified MSS value to the client. However, if the appliance is also configured to learn the optimum MSS value from bound services (as described in the following section), the learned MSS value takes precedence, and the value specified in the TCP profile is used only until the appliance learns the optimum MSS value. The appliance uses the learned MSS value until the appliance is restarted. If the appliance is restarted, the appliance defaults to the MSS value specified in the virtual server's TCP profile until it learns the MSS value again.

Specifying the MSS Value in a TCP Profile

If you know the optimal MSS value for a given virtual server, you can specify the MSS in a TCP profile and bind the profile to the virtual server. When a client initiates a connection with the virtual server, the NetScaler appliance advertises the specified MSS value to the client.

To specify the MSS value in a TCP profile by using the NetScaler command-line

At the NetScaler command prompt, type the following commands to specify the MSS value in a TCP profile and verify the configuration:

- **add ns tcpProfile** <name> **-mss** <positive_integer>
- **show ns tcpProfile**

```
> add ns tcpProfile tcp_prof1 -mss 1000
 Done
> show ns tcpProfile tcp_prof1
       Name    : tcp_prof1
       Window Scaling status     : DISABLED
       Window Scaling factor     : 4
       SACK status             : DISABLED
       MSS                   : 1000
       MaxBurst setting        : 6 MSS
       Initial cwnd setting      : 4 MSS
       .
       .
       .

 Done
>
```

Parameters for specifying the MSS value in a TCP profile

name

The name of the TCP profile.

mss

The maximum number of octets to allow in a TCP data segment.

To specify the MSS value in a TCP profile by using the NetScaler configuration utility

1. In the navigation pane, expand **System**, and then click **Profiles**.
2. In the details pane, do one of the following:
   - To create a TCP profile, click **Add**.
   - To specify the MSS in an existing TCP profile, click the name of the profile, and then click **Open**.
3. In the **Create TCP Profile** or **Configure TCP Profile** dialog box, specify values for the following parameters, which correspond to the parameters described in "Parameters for specifying the MSS value in a TCP profile" as shown:
   - **Name***—name (cannot be changed for an existing TCP profile)
   - **MSS***—mss

   * A required parameter
4. Click **Create** or **OK**.

Configuring the NetScaler to Learn the MSS Value from Bound Services

If you set the global TCP parameter `learnVsvrMSS` to `ENABLED`, the NetScaler appliance learns the most frequently used MSS value for each configured virtual server. When a client connects to a virtual server, the appliance advertises to the client the MSS value that is optimum for that virtual server. The optimum value is the MSS of the service or subset of bound services that are most frequently selected during load balancing. Consequently, each virtual server configuration uses its own MSS value. This enhancement enables the appliance to optimize the consumption of system resources.

The default value of the `learnVsvrMSS` parameter is `DISABLED`. When enabled, MSS learning is applicable only to virtual servers of type TCP, HTTP, and FTP.

To configure the NetScaler to learn the MSS for a virtual server by using the NetScaler command-line

At the NetScaler command prompt, type the following commands to configure the NetScaler to learn the MSS for a virtual server and verify the configuration:

- **`set ns tcpParam -learnVsvrMSS`** `(ENABLED|DISABLED)`
- **`show ns tcpParam`**

Example

```
> set ns tcpParam -learnVsvrMSS ENABLED
 Done
> show ns tcpParam
        TCP Parameters

        Window Scaling status     : DISABLED
        Window Scaling factor     : 4
        SACK status               : DISABLED
        Learn MSS for VServer     : ENABLED
        .
        .
        .
 Done
>
```

Parameters for configuring the NetScaler to learn the MSS for a virtual server

learnVsvrMSS

Enable or disable MSS learning for virtual servers. Possible values: `ENABLED`, `DISABLED`. Default: `DISABLED`.

To configure the NetScaler to learn the MSS for a virtual server by using the NetScaler configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, click **Change TCP parameters**.
3. In the **Configure TCP Parameters** dialog box, select the **Learn MSS** check box.

Web Interface

The Web Interface on Citrix® NetScaler® appliances is based on Java Server Pages (JSP) technology and provides access to Citrix® XenApp™ and Citrix® XenDesktop® applications. Users access resources through a standard Web browser or by using the Citrix XenApp plug-in.

The Web Interface runs as a service on port 8080 on the NetScaler appliance. To create Web Interface sites, Java is executed on Apache Tomcat Web server version 6.0.26 on the NetScaler appliance. The Web Interface sites provide user access to the XenApp and XenDesktop resources, which include applications, content, and desktops.

Note: This feature is supported only on NetScaler nCore builds.

The Web Interface installation includes installing the Web Interface tar file and JRE tar file on the NetScaler appliance. To configure the Web Interface, you create a Web Interface site and bind one or more XenApp or XenDesktop farms to it.

How Web Interface Works

The following figure illustrates a basic Web interface session.

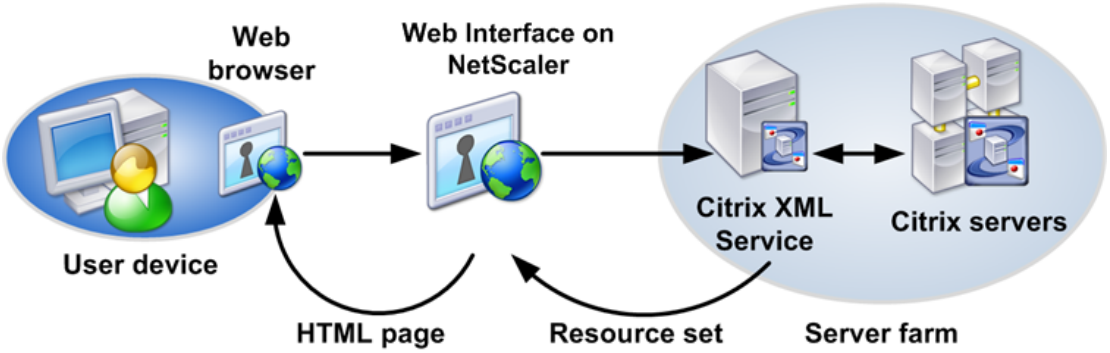

Figure 1. *A Basic Web Interface Session*

Following is a typical set of interactions among a user device, a NetScaler running the Web interface, and a server farm.

1. A user authenticates to the Web interface through a Web browser or by using the XenApp plug-in.
2. The Web interface reads the user's credentials and forwards the information to the Citrix XML Service running on servers in the server farm.
3. The Citrix XML Service on the designated server retrieves from the servers a list of resources that the user can access. These resources constitute the user's resource set and are retrieved from the Independent Management Architecture (IMA) system.
4. The Citrix XML Service then returns the user's resource set to the Web interface running on the NetScaler.
5. The user clicks an icon that represents a resource on the HTML page.
6. The Web interface queries the Citrix XML Service for the least busy server.
7. The Citrix XML Service returns the address of this server to the Web interface.
8. The Web interface sends the connection information to the Web browser.
9. The Web browser initiates a session with the server.

Prerequisites

The following prerequisites are required before you begin installing and configuring the Web interface.

- XenApp or XenDesktop farms are set up and running in your environment. For more information about XenApp, see the XenApp documentation at http://edocs.citrix.com/. For more information about XenDesktop, see the XenDesktop farms documentation at http://edocs.citrix.com/.

- Conceptual knowledge of the Web interface. For more information about Web interface running on a server, see the Web interface documentation at http://edocs.citrix.com/.

Installing the Web Interface

To install the Web interface, you need to install the following files:

- **Web interface tar file**. A setup file for installing the Web interface on the NetScaler. This tar file also includes Apache Tomcat Web server version 6.0.26. The file name has the following format: nswi-<version number>.tgz (for example, nswi-1.1.tgz).
- **JRE tar file**. This is Diablo Latte JRE version 1.6.0-7 for 64-bit FreeBSD 6.x/amd64 platform. To download the JRE tarball, see the FreeBSD Foundation Web site at http://www.freebsdfoundation.org/downloads/java.shtml.

Copy the tar files to a local workstation or to the /var directory of the NetScaler appliance.

These files install all the Web interface components and JRE on the NetScaler hard drive and configure automatic startup of the Tomcat Web server with Web interface at the NetScaler appliance startup time. Both tar files are internally expanded in the /var/wi directory on the hard drive.

To install the Web interface and JRE tar files by using the NetScaler command line

At the NetScaler command prompt, type:

install wi package **-wi** <URL> **-jre** <URL>

Example

install wi package -wi sftp://username:password@10.102.29.12/var/nswi-1.1.tgz -jre ftp://username:passw
install wi package -wi ftp://username:password@10.102.29.15/var/nswi-1.1.tgz -jre file:///var/diablo-jrefr

Parameters for installing the Web interface and JRE tar files

Web Interface tar file path

Complete path to the Web interface tar file.

JRE tar file path

Complete path to the JRE tar file.

To install the Web interface and JRE tar files by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Web Interface**.
2. In the details pane, under **Getting Started**, click **Install Web Interface**.
3. In the **Install Web Interface** dialog box, in the **Web Interface tar file path** text box, type the complete path to the Web interface tar file. You can also use the **browse** button to locate the file on your local system or the NetScaler hard drive.
4. In the **JRE tar file path** text box, type the complete path to the JRE tar file. You can also use the **browse** button to locate the file on your local system or the NetScaler hard drive.
5. Click **Install**.

Configuring the Web Interface

To configure the Web interface, you create a Web interface site and bind one or more XenApp or XenDesktop farms to it. You then configure the Web interface to work behind an HTTP or an HTTPS virtual server or Citrix Access Gateway™.

The following access methods are available for setting up Web interface sites:

Direct Mode. You create an HTTP or an HTTPS virtual server on the NetScaler appliance and bind the Web interface service, running on port 8080 of the NetScaler appliance, to the virtual server. Clients on the LAN use the virtual server IP address to access the Web interface. When using this access method, the URL format for the Web interface site is as follows:

```
<HTTP or HTTPS>://<HTTP or HTTPS vserver IP address>:<vserver port number>/<Web Interface site path>
```

Gateway Direct Mode. You associate the Web interface site with Access Gateway. Remote clients use the Access Gateway URL to access the Web interface site. With this access method, the URL format for the Web interface site is as follows:

```
HTTPS://<Access Gateway URL>/<Web Interface site path>
```

Parameters for configuring Web interface sites

Site Path

Path to the Web interface site. This parameter is required. Type a site path or select one of the following:

- /Citrix/XenApp/
- /Citrix/DesktopWeb/
- /Citrix/PNAgent/

Site Type

Type of site. Possible values: XenApp/XenDesktop Web Site (configures the Web interface site for access by a Web browser); XenApp/XenDesktop Services Site (configures the Web interface site for access by the XenApp plug-in). Default: XenApp/XenDesktop Web Site.

Published Resource Type

Method for accessing the published XenApp and XenDesktop resources. Possible values: Online (allows applications to be launched on the XenApp and XenDesktop servers); Offline (allows streaming of applications to the client); DualMode (allows both modes). Default: Online.

Direct Mode

The Web interface is accessed through an HTTP or an HTTPS loopback load balancing virtual server.

Virtual Server

Lists existing loopback load balancing virtual servers and an option to create a new one.

Protocol

The type of services to which the virtual server distributes requests. Possible values: HTTP, HTTPS. Default: HTTP.

IP Address

IP address of the virtual server. Can be an IPv4 or IPv6 address.

Port

Port on which the virtual server listens for client connections. Possible values: from 0 through 65535.

Gateway Direct Mode

The Web interface is accessed through a configured Access Gateway.

Authentication Point

Authentication point to be used for the site. Possible values: Web interface, AccessGateway. Default: AccessGateway.

Access Gateway URL

URL of the Access Gateway.

Add DNS Entry

Specifies whether to add DNS address record to resolve the specified Access Gateway URL. Possible values: ON, OFF. Default: ON.

Trust SSL Certificate

Specifies whether the Web interface site trusts certificates signed by a non-trusted CA. Possible values: ON, OFF. Default: ON.

STA Server URL

URL of the Secure Ticket Authority (STA) server.

STA Server URL (2)

URL of the second STA server.

Session Reliability

Specifies whether to use session reliability through the Access Gateway. Possible values: ON, OFF. Default: OFF.

Use Two STA Servers

Specifies whether the Web interface requests tickets from two separate gateway Secure Ticket Authorities when a resource is accessed. Possible values: ON, OFF. Default: OFF.

Kiosk Mode

Specifies whether user settings should be persistent or last only for the lifetime of the session. When Kiosk mode is enabled, user settings do not persist from one session to another. Possible values: ON, OFF. Default value: OFF.

Name

Name of a XenApp or XenDesktop farm. Any name can be used as a logical representation of a XenApp or XenDesktop farm. The name must not exceed 127 characters.

XML Service Addresses

Comma-separated IP addresses or host names of either XenApp or XenDesktop servers providing XML services.

XML Service Port

Port number to use for contacting the XML service. Default: 80.

Transport

Transport protocol to use for the XML service. Possible values: HTTP, HTTPS. Default: HTTP.

Load balance

Specifies whether to use all the XML servers (load balance mode) or only one (failover mode). Possible values: ON (load balance mode), OFF (failover mode). Default: ON.

Configuring a Web Interface Site for LAN Users Using HTTP

In this scenario, user and the Web interface setup are on the same enterprise LAN. The enterprise has both a XenApp and a XenDesktop farm. Users access the Web interface by using an HTTP vserver. The Web interface exposes its own login page for authentication. The vserver IP address is used to access the Web interface.

The following figure illustrates the Web interface running on the NetScaler appliance NS1. A Web interface site WINS1 is created and a XenApp farm XA1 and a XenDesktop farm XD1 are bound to it. An HTTP vserver HTTP_WI is also created. Client C1 uses the IP address of the HTTP_WI vserver to access the WINS1 site.

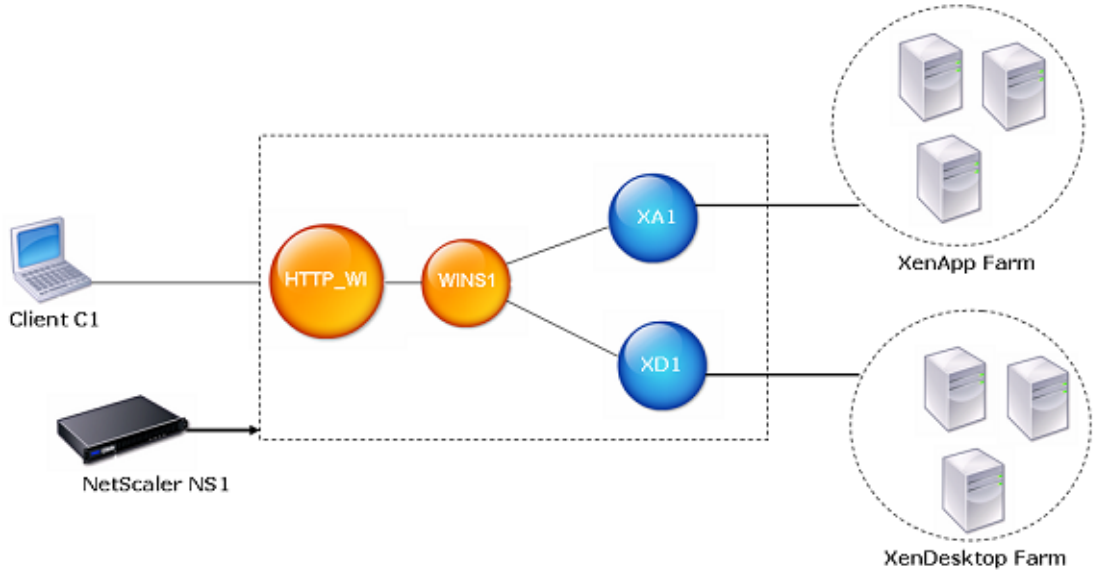

Figure 1. A Web Interface Site Configured for LAN Users Using HTTP

To configure a Web interface site for LAN users using HTTP by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Web Interface**.
2. In the details pane, click **Web Interface Wizard**.
3. On the wizard **Introduction** page, click **Next**.
4. On the wizard **Configure Web Interface Site** page, specify the values for the following parameters, which correspond to parameters described in Parameters for configuring Web interface sites as shown:

   - **Site Path*** (You cannot change the name of an existing Web interface site.)
   - **Site Type**
   - **Published Resource Type**
   - **Kiosk Mode**

   * A required parameter.
5. Select **Direct Mode** and specify values for the following parameters, which correspond to parameters described in Parameters for configuring Web interface sites as shown:

   - **Virtual Server**
   - **Protocol** (select **HTTP**)
   - **IP Address**
   - **Port**

   Note:

   When you create the HTTP vserver by using the configuration utility, the configuration utility automatically creates a service, which logically represents the Web interface service running on the NetScaler appliance, and binds the service to the HTTP virtual server.

   For more information about services and virtual servers, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.
6. Click **Next**.
7. On the wizard's **Configure XenApp/XenDesktop Farm** page, do one of the following:

   - To add a XenApp or XenDesktop farm, click **Add**.
   - To modify an existing XenApp or XenDesktop farm, select the farm, and then click **Open**.

8. In the **Create XenApp/XenDesktop Farm** or **Configure XenApp/XenDesktop Farm** dialog box, specify values for the following parameters, which correspond to parameters described in Parameters for configuring Web interface sites as shown:

   - **Name*** (You cannot change the name of an existing XenApp or XenDesktop farm.)
   - **XML Service Addresses***
   - **XML Service Port**
   - **Transport**
   - **Load Balance**

   * A required parameter.

9. Click **Next**, and then click **Finish**.

10. Verify that the Web interface site you configured is correct by selecting the site and viewing the **Details** section at the bottom of the pane. To view the Web interface site, in the navigation pane, expand **System**, expand **Web Interface**, and then click **Sites**.

To configure a Web interface site for LAN users using HTTP by using the command line

1. Add a Web interface site. At the NetScaler command prompt, type:

   add wi site <sitePath> **-siteType** (XenAppWeb | XenAppServices)**-publishedResourceType** (Online | Offline | DualMode) **-kioskMode** (ON | OFF)

   Example

   add wi site WINS1 -siteType XenAppWeb -publishedResourceType Online -kioskMode ON

2. Bind XenApp or XenDesktop farms to the Web interface site. At the NetScaler command prompt, type:

   bind wi site <sitePath> <farmName> <xmlServerAddresses> **-xmlPort** <value> **-transport** (HTTP | HTTPS) **-loadBalance** (ON | OFF)

   Example

   bind wi site WINS1 XA1 10.102.46.6 -xmlPort 80 -transport HTTP -LoadBalance OFF
   bind wi site WINS1 XD1 10.102.46.50 -xmlPort 80 -transport HTTP -LoadBalance OFF

3. Create a service that is a logical representation of the Web interface service running on the NetScaler appliance. At the NetScaler command prompt, type: add service <name> <IP address> <serviceType> <port> **Example**

   add service WI_Loopback_Service 127.0.0.1 HTTP 8080

   For more information, see the “Load Balancing” chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

4. Add an HTTP vserver. At the NetScaler command prompt, type:

   add lb vserver <virtualServerName> <protocol> <IPAddress> <port>

   Example

   add lb vserver HTTP_WI HTTP 10.102.29.5 80

   For more information, see the “Load Balancing” chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

5. Bind the Web interface service to the HTTP vserver. At the NetScaler command prompt, type:

   bind lb vserver <virtualServerName> <serviceName>

   Example

   bind lb vserver HTTP_WI WI_Loopback_Service

   For more information, see the “Load Balancing” chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Configuring a Web Interface Site for LAN Users Using HTTPS

In this scenario, user accounts and the Web interface setup are on the same enterprise LAN. Users access the Web interface by using an SSL-based (HTTPS) vserver. The Web interface exposes its own login page for authentication. SSL offloading is done by this vserver on the NetScaler. The vserver IP address is used to access the Web interface instead of the NetScaler IP address (NSIP).

The following figure illustrates the Web interface running on the NetScaler appliance NS1. A Web interface site WINS1 is created and a XenApp farm XA1 and a XenDesktop farm XD1 are bound to it. An HTTPS vserver HTTPS_WI is also created. Client C1 uses the IP address of the HTTPS_WI vserver to access the WINS1 site.

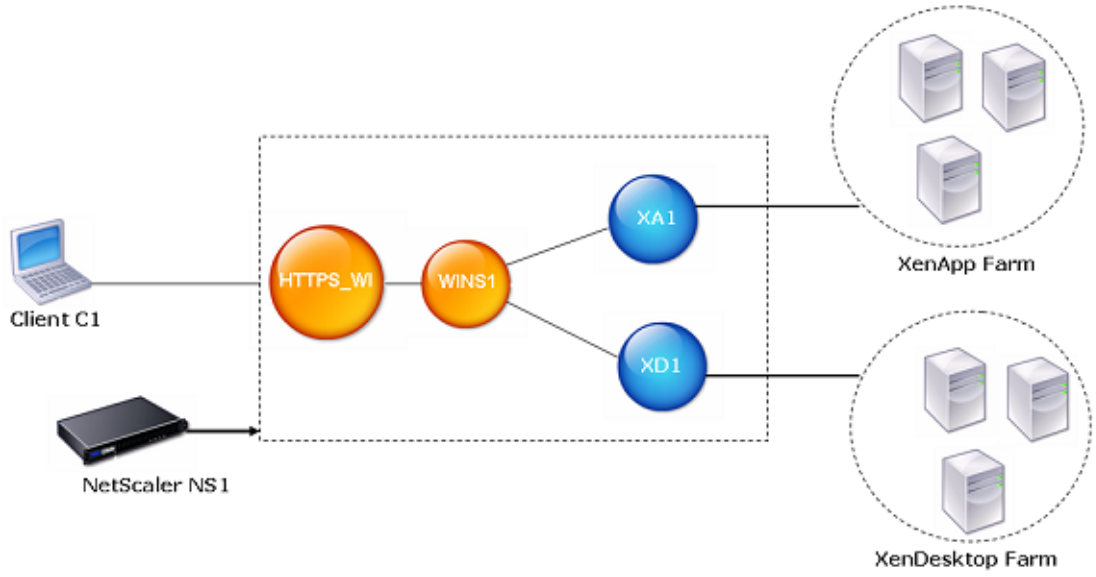

Figure 1. A Web Interface Site Configured for LAN Users Using HTTPS

To configure a Web interface site for LAN users using HTTPS by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Web Interface**.
2. In the details pane, click **Web Interface Wizard**.
3. On the wizard **Introduction** page, click **Next**.
4. On the wizard **Configure Web Interface Site** page, specify the values for the following parameters, which correspond to parameters described in Parameters for configuring Web interface sites as shown:

   - **Site Path*** (You cannot change the name of an existing Web interface site.)
   - **Site Type**
   - **Published Resource Type**
   - **Kiosk Mode**

   * A required parameter.
5. Select **Direct Mode** and specify values for the following parameters, which correspond to parameters described in Parameters for configuring Web interface sites as shown:

   - **Virtual Server**
   - **Protocol** (select **HTTPS**)
   - **IP Address**
   - **Port**

   Note:

   When you create the HTTPS vserver by using the configuration utility, the configuration utility automatically creates a service, which logically represents the Web interface service running on the NetScaler appliance, and binds the service to the HTTPS virtual server.

   For more information about services and virtual servers, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.
6. Click **Next**.
7. On the wizard's **Specify a server Certificate** page, you create or specify an existing SSL certificate-key pair. The SSL certificate-key pair is automatically bound to the HTTPS vserver.

   For more information, see “Binding an SSL Certificate Key Pair to the Virtual Server” in the “Secure Sockets Layer (SSL) Acceleration” chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

8. On the wizard's **Configure XenApp/XenDesktop Farm** page, do one of the following:
   - To add a XenApp or XenDesktop farm, click **Add**.
   - To modify an existing XenApp or XenDesktop farm, select the farm, and then click **Open**.
9. In the **Create XenApp/XenDesktop Farm** or **Configure XenApp/XenDesktop Farm** dialog box, specify values for the following parameters, which correspond to parameters described in Parameters for configuring Web interface sites as shown:
   - **Name*** (You cannot change the name of an existing XenApp or XenDesktop farm.)
   - **XML Service Addresses***
   - **XML Service Port**
   - **Transport**
   - **Load Balance**

   * A required parameter.
10. Click **Next**, and then click **Finish**.
11. Verify that the Web interface site you configured is correct by selecting the site and viewing the **Details** section at the bottom of the pane. To view the Web interface site, in the navigation pane, expand **System**, expand **Web Interface**, and then click **Sites**.

To configure a Web interface site for LAN users using HTTPS by using the command line

1. Add a Web interface site. At the NetScaler command prompt, type:

   add wi site <sitePath> **-siteType** (XenAppWeb | XenAppServices)**-publishedResourceType** (Online | Offline | DualMode) **-kioskMode** (ON | OFF)

   Example

   add wi site WINS1 -siteType XenAppWeb -publishedResourceType Online -kioskMode ON

2. Bind XenApp or XenDesktop farms to the Web interface site. At the NetScaler command prompt, type:

   bind wi site <sitePath> <farmName> <xmlServerAddresses> **-xmlPort** <value> **-transport** (HTTP | HTTPS) **-loadBalance** (ON | OFF)

   Example

   bind wi site WINS1 XA1 10.102.46.6 -xmlPort 80 -transport HTTP -LoadBalance OFF
   bind wi site WINS1 XD1 10.102.46.50 -xmlPort 80 -transport HTTP -LoadBalance OFF

3. Create a service that is a logical representation of the Web interface service running on the NetScaler appliance. At the NetScaler command prompt, type: add service <name> <IPAddress> <serviceType> <port> **Example**

   add service WI_Loopback_Service 127.0.0.1 HTTP 8080

   For more information, see the “Load Balancing” chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

4. Add an HTTPS vserver. At the NetScaler command prompt, type:

   add lb vserver <virtualServerName> <protocol> <IPAddress> <port>

   Example

   add lb vserver HTTPS_WI SSL 10.102.29.3 443

   For more information, see “Adding an SSL-Based Virtual Server” in the “Secure Sockets Layer (SSL) Acceleration” chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

5. Bind the Web interface service to the HTTPS vserver. At the NetScaler command prompt, type:

   bind lb vserver <virtualServerName> <serviceName>

   Example

   bind lb vserver HTTPS_WI WI_Loopback_Service

For more information, see “Binding Services to the Virtual Server” in the “Secure Sockets Layer (SSL) Acceleration” chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

6. Create an SSL certificate key pair. At the NetScaler command prompt, type:

   add ssl certkey <certificate-KeyPairName> **-cert** <certificateFileName> **-key** <privateKeyFileName>

   Example

   add ssl certkey SSL-Certkey-1 -cert /nsconfig/ssl/test1.cer -key /nsconfig/ssl/test1

   For more information, see “Adding a Certificate Key Pair” in the “Secure Sockets Layer (SSL) Acceleration” chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

7. Bind the SSL certificate key pair to the HTTPS vserver. At the NetScaler command prompt, type:

   bind ssl vserver <vserverName> **-certkeyName** <certificate- KeyPairName>

   Example

   bind ssl vserver HTTPS_WI -certkeyName SSL-Certkey-1

   For more information, see “Binding an SSL Certificate Key Pair to the Virtual Server” in the “Secure Sockets Layer (SSL) Acceleration” chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

8. Add a rewrite action. At the NetScaler command prompt, type:

   add rewrite action <name> <type> <target> [<stringBuilderExpr>] [(**-pattern** <expression>]

   Example

   add rewrite action Replace_HTTP_to_HTTPS INSERT_AFTER "HTTP.RES.HEADER(\"Location\").Value(0).Pre

   For more information, see “Configuring a Rewrite Action” in the “Rewrite” chapter of the *Citrix NetScaler AppExpert Guide* at http://support.citrix.com/article/CTX128682.

9. Create a rewrite policy and bind the rewrite action to it. At the NetScaler command prompt, type:

   add rewrite policy <name> <expression> <rewriteAction>

   Example

   add rewrite policy rewrite_location "HTTP.RES.STATUS == 302 && HTTP.RES.HEADER(\"Location\").Value(

   For more information, see “Configuring a Rewrite Policy” in the “Rewrite” chapter of the *Citrix NetScaler AppExpert Guide* at http://support.citrix.com/article/CTX128682.

10. Bind the rewrite policy to the HTTPS vserver. At the NetScaler command prompt, type:

bind lb vserver <VserverName> **-policyname** <rewritePolicyName> **-priority** <value> **-type** response

Example

bind lb vserver HTTPS_WI -policyname rewrite_location -priority 10 -type response

For more information, see “Binding a Rewrite Policy” in the “Rewrite” chapter of the *Citrix NetScaler AppExpert Guide* at http://support.citrix.com/article/CTX128682.

Configuring a Web Interface Site for Remote Users Using AGEE

In this scenario, user accounts and the Web interface setup are on different networks. Users access a Web interface site by using Access Gateway Enterprise Edition (AGEE) URL. SmartAccess is automatically enabled.

The following figure illustrates the Web interface running on the NetScaler appliance NS1. A Web interface site WINS1 is created and a XenApp farm XA1 and a XenDesktop XD1 are bound to it. An AGEE VPN vserver AGEE_WI is also configured. The client uses the AGEE URL of the AGEE_WI to access the WINS1 site.

For more information about configuring AGEE, see the AGEE documentation at http://edocs.citrix.com/.

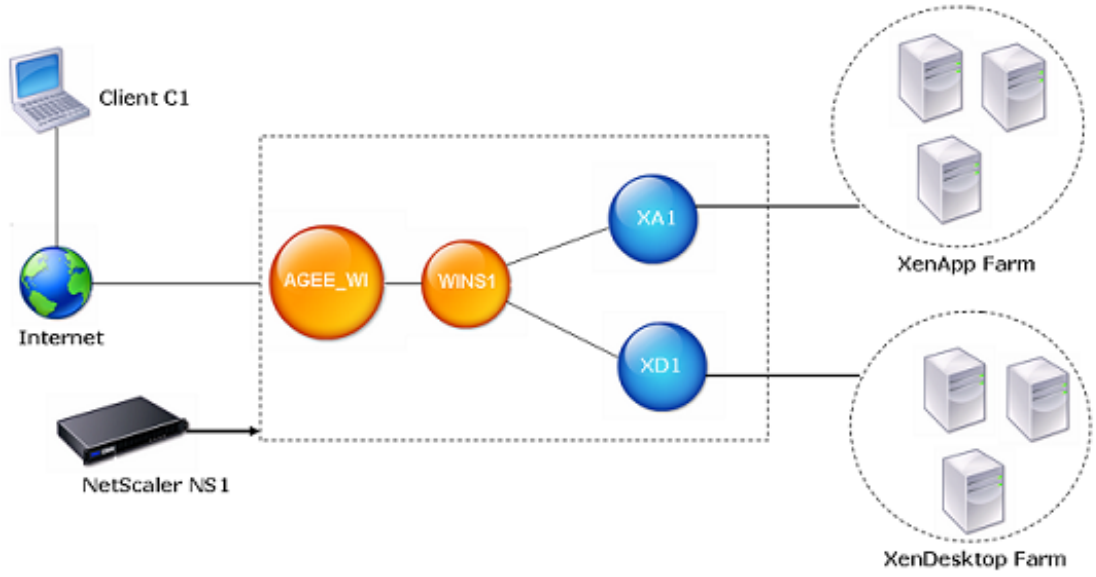

Figure 1. A Web Interface Site Configured for Remote Users Using AGEE

To configure a Web interface site for remote users using AGEE by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Web Interface**.
2. In the details pane, click **Web Interface Wizard**.
3. On the wizard **Introduction** page, click **Next**.
4. On the wizard **Configure Web Interface Site** page, specify the values for the following parameters, which correspond to parameters described in Parameters for configuring Web interface sites as shown:

   - **Site Path*** (You cannot change the name of an existing Web interface site.)
   - **Site Type**
   - **Published Resource Type**
   - **Kiosk Mode**

   * A required parameter.
5. Select **Gateway Direct Mode** and specify values for the following parameters, which correspond to parameters described in Parameters for configuring Web interface sites as shown:

   - **Authentication Point**
   - **Access Gateway URL**
   - **Add DNS Entry**
   - **Trust SSL Certificate**
   - **STA Server URL**
   - **STA Server URL (2)**
   - **Session Reliability**
   - **Use two STA Servers**
6. Click **Next**.
7. On the wizard's **Configure XenApp/XenDesktop Farm** page, do one of the following:

   - To add a XenApp or XenDesktop farm, click **Add**.
   - To modify an existing XenApp or XenDesktop farm, select the farm, and then click **Open**.
8. In the **Create XenApp/XenDesktop Farm** or **Configure XenApp/XenDesktop Farm** dialog box, specify values for the following parameters, which correspond to parameters described in Parameters for configuring Web interface sites as shown:

- **Name*** (You cannot change the name of an existing XenApp or XenDesktop farm.)
- **XML Service Addresses***
- **XML Service Port**
- **Transport**
- **Load Balance**

* A required parameter.

9. Click **Next**, and then click **Finish**.
10. Verify that the Web interface site you configured is correct by selecting the site and viewing the **Details** section at the bottom of the pane. To view the Web interface site, in the navigation pane, expand **System**, expand **Web Interface**, and then click **Sites**.

To configure a Web interface site for remote users using AGEE by using the command line

1. Add a Web interface site. At the NetScaler command prompt, type:

   add wi site <sitePath> <agURL> <staURL> **-sessionReliability** (ON | OFF) -useTwoTickets (ON | OFF) **-s**
   XenAppWeb | XenAppServices) **-publishedResourceType** (Online | Offline | DualMode) **-kioskMode** (O

   Example

   add wi site WINS1 https://ag.mycompany.com http://ag.staserver.com -sessionReliability OFF -authenti

2. Bind XenApp or XenDesktop farms to the Web interface site. At the NetScaler command prompt, type:

   bind wi site <sitePath> <farmName> <xmlServerAddresses> **-xmlPort** <value> **-transport** (HTTP | HTTPS)

   Example

   bind wi site WINS1 XA1 10.102.46.6 -xmlPort 80 -transport HTTP -LoadBalance OFF
   bind wi site WINS1 XD1 10.102.46.50 -xmlPort 80 -transport HTTP -LoadBalance OFF

Enhanced Application Visibility Using AppFlow

The Citrix® NetScaler® appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits the information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called *flow records*, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.

AppFlow use actions and policies to send records for a selected flow to specific set of collectors. An AppFlow action specifies which set of collectors will receive the AppFlow records. Policies, which are based on Advanced expressions can be configured to select flows for which flow records will be sent to the collectors specified by the associated AppFlow action.

To limit the types of flows, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

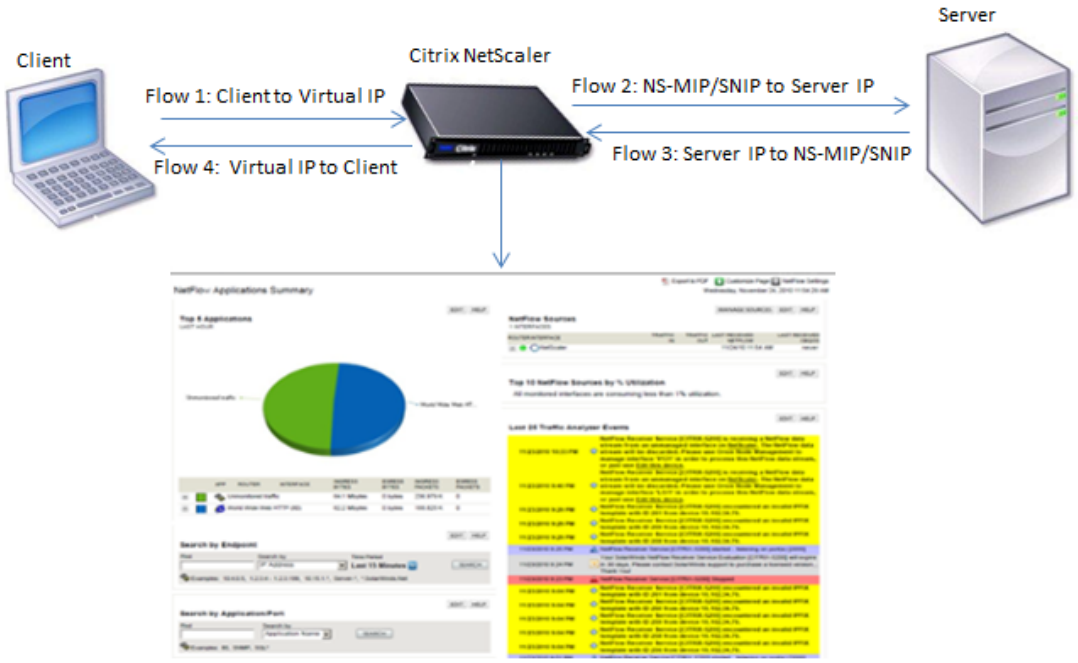
Note: This feature is supported only on NetScaler nCore builds.

How AppFlow Works

In the most common deployment scenario, inbound traffic flows to a Virtual IP address (VIP) on the NetScaler appliance and is load balanced to a server. Outbound traffic flows from the server to a mapped or subnet IP address on the NetScaler and from the VIP to the client. A flow is a unidirectional collection of IP packets identified by the following five tuples: sourceIP, sourcePort, destIP, destPort, and protocol.

The following figure describes how the AppFlow feature works.

Figure 1. NetScaler Flow Sequence



As shown in the figure, the network flow identifiers for each leg of a transaction depend on the direction of the traffic.

The different flows that form a flow record are:

Flow1: <Client-IP, Client-Port, VIP-IP, VIP-port, Protocol>

Flow2: <NS-MIP/SNIP, NS-port, Server-IP, Server-Port, Protocol>

Flow3: <Server-IP, Server-Port, NS-MIP/SNIP, NS-Port, Protocol>

Flow4: <VIP-IP, VIP-port, Client-IP, Client-Port, Protocol>

To help the collector link all four flows in a transaction, AppFlow adds a custom transactionID element to each flow. For application-level content switching, such as HTTP, it is possible for a single client TCP connection to be load balanced to different backend TCP connections for each request. AppFlow provides a set of records for each transaction.

Flow Records

AppFlow records contain standard NetFlow or IPFIX information, such as time stamps for the beginning and end of a flow, packet count, and byte count. AppFlow records also contain application-level information (such as HTTP URLs, HTTP request methods and response status codes, server response time, and latency). IPFIX flow records are based on templates that need to be sent before sending flow records.

Templates

AppFlow defines a set of templates, one for each type of flow. Each template contains a set of standard Information Elements (IEs) and Enterprise-specific Information Elements (EIEs). IPFIX templates define the order and sizes of the Information Elements (IE) in the flow record. The templates are sent to the collectors at regular intervals, as described in RFC 5101.

A template can include the following EIEs:

transactionID

An unsigned 32-bit number identifying an application-level transaction. For HTTP, this corresponds to a request and response pair. All flow records that correspond to this request and response pair have the same transaction ID. In the most common case, there are four uniflow records that correspond to this transaction. If the NetScaler generates the response by itself (served from the integrated cache or by a security policy), there may be only two flow records for this transaction.

connectionID

An unsigned 32-bit number identifying a layer-4 connection (TCP or UDP). The NetScaler flows are usually bidirectional, with two separate flow records for each direction of the flow. This information element can be used to link the two flows.

For the NetScaler, connectionID is an identifier for the connection data structure to track the progress of a connection. In an HTTP transaction, for instance, a given connectionID may have multiple transactionID elements corresponding to multiple requests that were made on that connection.

tcpRTT

The round trip time, in milliseconds, as measured on the TCP connection. This can be used as a metric to determine the client or server latency on the network.

httpRequestMethod

An 8-bit number indicating the HTTP method used in the transaction. An options template with the number-to-method mapping is sent along with the template.

httpRequestSize

An unsigned 32-bit number indicating the request payload size.

httpRequestURL

The HTTP URL requested by the client.

httpUserAgent

The source of incoming requests to the Web server.

httpResponseStatus

An unsigned 32-bit number indicating the response status code.

httpResponseSize

An unsigned 32-bit number indicating the response size.

httpResponseTimeToFirstByte

An unsigned 32-bit number indicating the time taken to receive the first byte of the response.

httpResponseTimeToLastByte

An unsigned 32-bit number indicating the time taken to receive the last byte of the response.

flowFlags

An unsigned 64-bit flag used to indicate different flow conditions.

Configuring the AppFlow Feature

You configure AppFlow in the same manner as most other policy-based features. First, you enable the AppFlow feature. Then you specify the collectors to which the flow records are sent. After that, you define actions, which are sets of configred collectors. Then you configure one or more policies and associate a action to each policy. The policy tells the NetScaler appliance to select requests the flow records of which are sent to the associated action. Finally, you bind each policy either globally or to a specific vservers to put it into effect.

You can further set AppFlow parameters to specify the template refresh interval and to enable the exporting of httpURL, httpCookie, and httpReferer information. On each collector, you must specify the NetScaler IP address as the address of the exporter.

Note: For information about configuring the NetScaler as an exporter on the collector, see the documentation for the specific collector.

The configuration utility provides tools that help users define the policies and actions that determine exactly how the NetScaler appliance export records for a particular flow to a set of collectors(action.) The NetScaler command line provides a corresponding set of CLI-based commands for experienced users who prefer a command line.

Enabling or Disabling the AppFlow Feature

To be able to use the AppFlow feature, you must first enable it.

To enable or disable the AppFlow feature by using the NetScaler command line

At the NetScaler command prompt, type one of the following commands:

- `enable ns feature appflow`
- `disable ns feature appflow`

To enable the AppFlow feature by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Configure advanced features**.
3. In the **Configure Advanced Features** dialog box, select the **AppFlow** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** dialog box, click **Yes**.

Specifying a Collector

A collector receives flow records generated by the NetScaler appliance. To be able to send flow records, you must specify at least one collector. You can specify up to four. However, you cannot export the same data to multiple collectors. You can remove unused collectors.

To specify a collector by using the NetScaler command line

At the NetScaler command prompt, type the following commands to add a collector and verify the configuration:

- add appflowCollector <name> **-IPAddress** <ipaddress> **-port** <port_number>
- show appflowCollector <name>

Example

```
> add appflowCollector coll1 -IPAddress 10.102.29.251 -port 8000
Done

> show appflowCollector coll1

1)Collector name: coll1
      Collector IPv4 address: 10.102.29.251
      Collector UDP port: 8000
```

To remove a collector by using the NetScaler command line

At the NetScaler command prompt, type:

rm appflowCollector <name>

Parameters for specifying a collector

name

Name of the collector to which to export data. Maximum characters: 255.

ipaddress

The IPv4 address of the collector.

port

The UDP port on which the collector is listening. Default port: 4739.

To specify a collector by using the configuration utility

1. In the navigation pane, expand **AppFlow**, and then click **Collectors**.
2. In the details pane, click **Add**.
3. In the **Create AppFlow Collector** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for specifying a collector" as shown:
   - **Name***—name (cannot be changed for an existing collector)
   - **IP Address***—ipaddress (cannot be changed for an existing collector)
   - **Port**—port (cannot be changed for an existing collector)

   *A required parameter
4. To remove a collector from the list, select the collector, and then click **Remove**.
5. Click **Create**, and then click **Close**.

Setting the AppFlow Parameters

You can set AppFlow parameters to customize the exporting of data to the collectors.

To set the AppFlow Parameters by using the NetScaler Command Line

At the NetScaler command prompt, type the following commands to set the AppFlow parameters and verify the settings:

- set appflowParam [**-templateRefresh** <secs>] [-**appnameRefresh** <secs>] [-**flowRecordInterval** <secs>] [**-udpPmtu** <positive_integer>] [**-httpUrl** (**ENABLED** | **DISABLED**)] [**-httpCookie** (**ENABLED** | **DISABLED**)] [**-httpReferer** (**ENABLED** | **DISABLED**)] [**-httpMethod** (**ENABLED** | **DISABLED**)] [**-httpHost** (**ENABLED** | **DISABLED**)] [**-httpUserAgent** (**ENABLED** | **DISABLED**)] [**-clientTrafficOnly** (**YES** | **NO**)]
- show appflowParam

Example

```
> set appflowParam -templateRefresh 240 -udpPmtu 128 -httpUrl enabled
Done

> show appflowparam
 AppFlow parameters
 IPFIX template refresh interval: 600 seconds
 IPFIX UDP Path MTU: 1472 bytes
 HTTP URL logging: DISABLED
 HTTP cookie logging: DISABLED
 HTTP referer logging: DISABLED
 HTTP method logging: ENABLED
 HTTP host logging: ENABLED
 HTTP user-agent logging: ENABLED
 Log only client-side traffic: NO
   Done
```

To return AppFlow parameters to their default values by using the NetScaler command line

Type the unset appflowParam command and the names of the parameters to be returned to the default values.

AppFlow Parameters

templateRefresh

The refresh interval, in seconds, at which to export the template data. Because data transport is in the UDP protocol, the templates must be resent at regular intervals. Minimum value: 60. Maximum value: 3600. Default: 600.

appnameRefresh

Interval at which Appnames are sent to the configured collectors, in seconds. Minimum value: 60. Maximum value: 3600. Default: 600.

flowRecordInterval

Interval at which flow records are sent to the configured collectors, in seconds. Minimum value: 60. Maximum value: 3600. Default: 600.

udpPmtu

The maximum length of the UDP datagram. Default: 1472.

httpUrl

The http URL received by the NetScaler appliance from the client. Possible values: ENABLED, DISABLED. Default: DISABLED.

httpCookie

Include the cookie that was in the HTTP request received by the NetScaler appliance from the client. Possible values: ENABLED, DISABLED. Default: DISABLED.

httpReferer

Include the Web page that was last visited by the client. Possible values: ENABLED, DISABLED. Default: DISABLED.

httpMethod

Include the method that was specified in the HTTP request received by the NetScaler appliance from the client. Possible values: ENABLED, DISABLED. Default: DISABLED.

httpHost

Include the host identified in the HTTP request received by the NetScaler appliance from the client. Possible values: ENABLED, DISABLED. Default: DISABLED.

httpUserAgent

Include the client application through which the HTTP request was received by the NetScaler appliance. Possible values: ENABLED, DISABLED. Default: DISABLED.

clientTrafficOnly

Generate AppFlow records only for the traffic from the client. Possible values: YES, NO. Default: NO.

To set the AppFlow parameters by using the configuration utility

1. In the navigation pane, click **AppFlow**.
2. On the **AppFlow** landing page, under **Settings**, click **Change AppFlow Settings**.
3. In the **Configure AppFlow Settings** dialog box, specify values for the following parameters, which correspond to parameters described in "AppFlow Parameters" as shown:
   - **Template Refresh Interval**—templateRefresh
   - **AppName Refresh Interval**—appnameRefresh
   - **Flow Record Export Interval**—flowRecordInterval
   - **HTTP URL**—httpUrl
   - **HTTP Cookie**—httpCookie
   - **HTTP Referer**—httpReferer
   - **HTTP Method**—httpMethod
   - **HTTP Host**—httpHost
   - **HTTP User-Agent**—httpUserAgent
   - **Template Refresh Interval**—templateRefresh
   - **UDP Maximum Transmission Unit**—udpPmtu
4. Click **OK**, and then click **Close**.

Reporting Tool

Use the Citrix® NetScaler® Reporting tool to view NetScaler performance statistics data as reports. Statistics data are collected by the nscollect utility and are stored in a database. When you want to view certain performance data over a period of time, the Reporting tool pulls out specified data from the database and displays them in charts.

Reports are a collection of charts. The Reporting tool provides built-in reports as well as the option to create custom reports. In a report, you can modify the charts and add new charts. You can also modify the operation of the data collection utility, nscollect, and stop or start its operation.

Using the Reporting Tool

The Reporting tool is a Web-based interface accessed from the Citrix® NetScaler® appliance. Use the Reporting tool to display the performance statistics data as reports containing graphs. In addition to using the built-in reports, you can create custom reports, which you can modify at any time. Reports can have between one and four charts. You can create up to 256 custom reports.

To invoke the Reporting tool

1. Use the Web browser of your choice to connect to the IP address of the NetScaler (for example, http://10.102.29.170/). The Web Logon screen appears.
2. In the **User Name** text box, type the user name assigned to the NetScaler.
3. In the **Password** text box, type the password.
4. In the **Start in** drop-down box, select **Reporting**.
5. Click **Login**.

The following screen shots show the report toolbar and the chart toolbar, which are frequently referenced in this documentation.

Figure 1. *Report Toolbar*

Figure 2. *Chart Toolbar*

Working with Reports

You can plot and monitor statistics for the various functional groups configured on the NetScaler over a specified time interval. Reports enable you to troubleshoot or analyze the behavior of your appliance. There are two types of reports: built-in reports and custom reports. Report content for built-in or custom reports can be viewed in a graphical format or a tabular format. The graphical view consists of line, area, and bar charts that can display up to 32 sets of data (counters). The tabular view displays the data in columns and rows. This view is useful for debugging error counters.

The default report that is displayed in the Reporting tool is CPU vs. Memory Usage and HTTP Requests Rate. You can change the default report view by displaying the report you want as your default view, and then clicking **Default Report**.

Reports can be generated for the last hour, last day, last week, last month, last year, or you can customize the duration.

You can do the following with reports:

- Toggle between a tabular view of data and a graphical view of data.
- Change the graphical display type, such as bar chart or line chart.
- Customize charts in a report.
- Export the chart as an Excel comma-separated value (CSV) file.
- View the charts in detail by zooming in, zooming out, or using a drag-and-drop operation (scrolling).
- Set a report as the default report for viewing whenever you log on.
- Add or remove counters.
- Print reports.
- Refresh reports to view the latest performance data.

Using Built-in Reports

The Reporting tool provides built-in reports for frequently viewed data. Built-in reports are available for the following seven functional groups: System, Network, SSL, Compression, Integrated Cache, Access Gateway, and Application Firewall. By default, the built-in reports are displayed for the last day. However, you can view the reports for the last hour, last week, last month, or last year.

Note: You cannot save changes to built-in reports, but you can save a modified built-in report as a custom report.

To display a built-in report

1. In the left pane of the Reporting tool, under **Built-in Reports**, expand a group (for example, **SSL**).
2. Click a report (for example, **SSL** > **All Backend Ciphers**).

Creating and Deleting Reports

You can create your own custom reports and save them with user-defined names for reuse. You can plot different counters for different groups based on your requirements. You can create up to 256 custom reports.

You can either create a new report or save a built-in report as a custom report. By default, a newly created custom report contains one chart named **System Overview**, which displays the **CPU Usage** counter plotted for the last day. You can customize the interval and set the data source and time zone from the report toolbar. Within a report, you can use the chart toolbars to add, modify, or delete charts, as described in Working with Charts.

By default, newly created custom reports contain one chart named **System Overview** that displays a **CPU Usage** counter plotted for the last day.

To create a custom report

1. In the Reporting tool, on the report toolbar, click **Create**, or if you want to create a new custom report based on an existing report, open the existing report, and then click **Save As**.
2. In **Report Name** box, type a name for the custom report.
3. Do one of the following:
   - To add the report to an existing folder, in **Create in** or **Save in**, click the down arrow to choose an existing folder, and then click **OK**.
   - To create a new folder to store the report, click the **Click to add folder** icon, in **Folder Name**, type the name of the folder, and in **Create in**, specify where you want the new folder to reside in the hierarchy, and then click **OK**.

   Note: You can create up to 128 folders.

To delete a custom report

1. In the left pane of the Reporting tool, next to **Custom Reports**, click the **Click to manage custom reports** icon.
2. Select the check box that corresponds with the report you want to delete, and then click **Delete**.

   Note: When you delete a folder, all the contents of that folder are deleted.

Modifying the Time Interval

By default, built-in reports display data for the last day. However, if you want to change the time interval for a built-in report, you can save the report as a custom report. The new interval applies to all charts in the report. The following table describes the time-interval options.

Table 1. Time Intervals

Time interval	Displays
 Last Hour	Statistics data collected for the last hour.
 Last Day	Statistics data collected for the last day (24 hours).
 Last Week	Statistics data collected for the last week (7 days).
 Last Month	Statistics data collected for the last month (31 days).
 Last Year	Statistics data collected for the last year (365 days).
 Custom	Statistics data collected for a time period that you are prompted to specify.

To modify the time interval

1. In the left pane of the Reporting tool, click a report.
2. On the report toolbar, click **Duration**, and then click a time interval.

Setting the Data Source and Time Zone

You can retrieve data from different data sources to display them in the reports. For information about data sources, see How Data Collection Works. You can also define the

time zone for the reports and apply the currently displayed report's time selection to all the reports, including the built-in reports.

To set the data source and time zone

1. In the **Reporting tool**, on the report toolbar, click **Settings**.
2. In the **Settings** dialog box, in **Data Source**, select the data source from which you want to retrieve the counter information.
3. Do one or both of the following:
   - If you want the tool to remember the time period for which a chart is plotted, select the **Remember time selection for charts** check box.
   - If you want the reports to use the time settings of your NetScaler appliance, select the **Use Appliance's time zone** check box.

Exporting and Importing Custom Reports

You can share reports with other NetScaler administrators by exporting reports. You can also import reports.

To export or import custom reports

1. In the left pane of the Reporting tool, next to **Custom Reports**, click the **Click to manage custom reports** icon.
2. Select the check box that corresponds with the report you want to export or import, and then click **Export** or **Import**.

   Note: When you export the file, it is exported in a .gz file format.

Working with Charts

Use charts to plot and monitor counters or groups of counters. You can include up to four charts in one report. In each chart, you can plot up to 32 counters. The charts can use different graphical formats (for example, area and bar). You can move the charts up or down within the report, customize the colors and visual display for each counter in a chart, and delete a chart when you do not want to monitor it.

In all report charts, the horizontal axis represents time and the vertical axis represents the value of the counter.

Adding a Chart

When you add a chart to a report, the **System Overview** chart appears with the **CPU Usage** counter plotted for the last one day. To plot a different group of statistics or select a different counter, see Modifying a Chart.

Note: If you add charts to a built-in report, and you want to retain the report, you must save the report as a custom report.

Use the following procedure to add a chart to a report.

To add a chart to a report

1. In the left pane of the **Reporting tool**, click a report.
2. Under the chart where you want to add the new chart, click the **Add** icon.

Modifying a Chart

You can modify a chart by changing the functional group for which the statistics are displayed and by selecting different counters.

To modify a chart

1. In the left pane of the Reporting tool, click a report.
2. Under the chart that you want to modify, click **Counters**.
3. In the dialog box that appears, in the **Title** box, type a name for the chart.
4. Next to **Plot chart for**, do one of the following:
   - To plot counters for global counters, such as Integrated Cache and Compression, click **System global statistics**.
   - To plot entity counters for entity types, such as Load Balancing and GSLB, click **System entities statistics**.
5. In **Select group**, click the desired entity.
6. Under **Counters**, in **Available**, click the counter name(s) that you want to plot, and then click the **>** button.
7. If you selected **System entities statistics** in step 4, on the **Entities** tab, under **Available**, click the entity instance name(s) you want to plot, and then click the **>** button.
8. Click **OK**.

Viewing a Chart

You can specify the graphical formats of the plotted counters in a chart. Charts can be viewed as line charts, spline charts, step-line charts, scatter charts, area charts, bar charts, stacked area charts, and stacked bar charts. You can also zoom in, zoom out, or scroll inside the plot area of a chart. You can zoom in or out for all data sources for 1 hour, 1 day, 1 week, 1 month, 1 year, and 3 years.

Other options for customizing the view of a chart include customizing the axes of the charts, changing the background and edge color of the plot area, customizing the color and size of the grids, and customizing the display of each data set (counter) in a chart.

Data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if **CPU usage** and **Memory usage** are displayed in first and second order at the bottom of the chart, **CPU usage** is equal to **Data Set 1** and **Memory usage** is equal to **Data Set 2**.

Whenever you modify a built-in report, you need to save the report as a custom report to retain your changes.

To change the graph type of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart you want to view, on the chart toolbar, click **Customize**.
3. On the **Chart** tab, under **Category**, click **Plot type**, and then click the graph type you want to display for the chart. If you want to display the graph is 3D, select the **Use 3D** check box.

To refocus a chart with detailed data

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click **Zoom In**, and do one or both of the following:
   - To refocus the chart to display data for a specific time window, drag and drop the cursor from the start time to the end time. For example, you can view data for a one-hour period on a certain day.
   - To refocus the chart to display data for a data point, simply click once on chart where you want to zoom in and get more detailed information.
3. Once you have the desired range of time for which you want to view detailed data, on the report toolbar, click **Tabular View**. Tabular view displays the data in numeric form in rows and columns.

To view numeric data for a graph

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click **Tabular View**. To return to the graphical view, click **Graphical View**.

   Note: You can also view the numeric data in the graphical view by hovering your cursor over the notches in the gridlines.

To scroll through time in a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, on the report toolbar, click **Scroll**, and then click inside the chart and drag the cursor in the direction for which you want to see data for a new time period. For example, if you want to view data in the past, click and drag to the left.

To change the background color and text color of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the axes, click **Customize**.
3. On the **Chart** tab, under **Category**, click one or more of the following:
   - To change the background color, click **Background Color**, and then select the options for color, transparency, and effects.
   - To change the text color, click **Text Color**, and then select the options for color, transparency, and effects.

To customize the axes of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the axes, click **Customize**.
3. On the **Chart** tab, under **Category**, click one or more of the following:
   - To change the scale of the left y-axis, click **Left Y-Axis**, and then select the scale you want.
   - To change the scale of the right y-axis, click **Right Y-Axis**, in **Data set to plot**, select the date set, and then select the scale you want.

     Note: The data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if **CPU usage** and **Memory usage** are displayed in first and second order at the bottom of the chart, **CPU usage** is equal to **Data Set 1** and **Memory usage** is equal to **Data Set 2**.
   - To plot each data set in its own hidden y-axis, click **Multiple Axes**, and then click **Enable**.

To change the background color, edge color, and gridlines for a plot area of a chart

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the plot area, click **Customize**.
3. On the **Plot Area** tab, under **Category**, click one or more of the following:
   - To change the background color and edge color of the chart, click **Background Color** and **Edge Color**, and then select the options for color, transparency, and effects.
   - To change the horizontal or vertical grids of the chart, click **Horizontal Grids** or **Vertical Grids**, and then select the options for displaying the grids, grid width, grid color, transparency, and effects.

To change the color and graph type of a data set

1. In the left pane of the Reporting tool, select a report.
2. In the right pane, under the chart for which you want to customize the display of the data set (counters), click **Customize**.
3. On the **Data Set** tab, in **Select Data Set**, select the data set (counter) for which you want to customize the graphical display.

   Note: The data set numbers, such as Data Set 1, correspond to the order in which the counters in your graph are displayed at the bottom of the chart. For example, if **CPU usage** and **Memory usage** are displayed in first and second order at the bottom of the chart, **CPU usage** is equal to **Data Set 1** and **Memory usage** is equal to **Data Set 2**.
4. Under **Category**, do one of more of the following:
   - To change the background color, click **Color**, and then select the options for color, transparency, and effects.
   - To change the graph type, click **Plot type**, and then select the graph type you want to display for the data set. If you want to display the graph as 3D, select the **Use 3D** check box.

Exporting Chart Data to Excel

For further data analysis, you can export charts to Excel in a comma-separated value (CSV) format.

To export chart data to Excel

1. In the left pane of the Reporting tool, select a report.

2. In the right pane, under the chart with the data you want to export to Excel, click **Export**.

Deleting a Chart

If you do not want to use a chart, you can remove it from the report. You can permanently remove charts from custom reports only. If you delete a chart from a built-in report and want to retain the changes, you need to save the report as a custom report.

To delete a chart

1. In the left pane of the Reporting tool, select a report.

2. In the right pane, under the chart that you want to delete, click the **Delete** icon.

Examples

To display the trend report for CPU usage and memory usage for the last week

1. In the left pane of the Reporting tool, under **Built-in Reports**, expand **System**.
2. Click the report **CPU vs. Memory Usage and HTTP Requests Rate**.
3. In the right pane, on the report toolbar, click **Duration**, and then click **Last Week**.

To compare the bytes received rate and the bytes transmitted rate between two interfaces for the last week

1. In the right pane, on the report toolbar, click **Create.**
2. In the **Report Name** box, type a name for the custom report (for example, `Custom_Interfaces`), and then click **OK**. The report is created with the default **System Overview** chart, which displays the **CPU Usage** counter plotted for the last hour.
3. Under **System Overview**, on the chart toolbar, click **Counters**.
4. In the counter selection pane, in **Title**, type a name for the chart (for example, `Interfaces bytes data`).
5. In **Plot chart for**, click **System entities statistics**, and then in **Select Group**, select **Interface**.
6. On the **Entities** tab, click the interface name(s) you want to plot (for example, **1/1** and **1/2**), and then click the **>** button.
7. On the **Counters** tab, click **Bytes received (Rate)** and **Bytes transmitted (Rate)** and then click the **>** button.
8. Click **OK**.
9. On the report toolbar, click **Duration**, and then click **Last Week**.

Stopping and Starting the Data Collection Utility

The performance data is stored in different data sources on the Citrix® NetScaler® appliance. The default data source is /var/log/db/default. You can create up to 32 data sources.

The data collection utility nscollect retrieves data from the NetScaler and updates the data source. This utility runs automatically when you start the NetScaler. It creates a database for global counters at /var/log/db/<DataSourceName>. The entity-specific databases are created based on the entities configured on the NetScaler. A specific folder is created for each entity type in

/var/log/db/<DataSourceName/EntityNameDB>

Before creating a database for an entity, nscollect allocates a unique number to the entity and creates the database based on that number. It retrieves all the counters available for a group. However, there is a limit on the number of different entities that nscollect can retrieve, as described in the following table.

Table 1. Limits on Entity Numbers Retrieved by nscollect

Entity name	Limit
Content Switching Virtual Servers	100
Cache Redirection Virtual Servers	50
DOS Policies	100
GSLB Domains	100
GSLB Services	100
GSLB Sites	32
GSLB Virtual Servers	100
Interfaces	8
LB Virtual Servers	100
ACLs	100
ACL6	50
Priority Queuing Policies	100
RNAT IP Addresses	100
SureConnect Policies	100
Services	250
Service Groups	100

System CPU	8
VLAN	25
VPN Virtual Servers	5

The nscollect utility retrieves n number of entity counters and creates the entity database. If the first *n* counters change in the subsequent fetch, the database stores more than n entries for that entity type. However, you need to delete the unused entity counters manually.

Note: The Reporting tool supports only numerical counters.

By default, nscollect retrieves data at every 5-minute interval. Data is maintained in 5-minute granularity for one day, hourly for the last 30 days, and daily for three years.

When you start the NetScaler, the nscollect utility automatically starts. However, if data is not updated accurately, or there is corrupted data displayed in the reports, you can stop and then restart the utility. You may also want to stop nscollect to back up the databases or to create a new data source.

To stop nscollect

At a NetScaler command prompt, type the following:

/netscaler/nscollect stop
You can start nscollect on either the local system or a remote system.

To start nscollect on the local system

At a NetScaler command prompt, type the following:

/netscaler/nscollect start

To start nscollect on the remote system

At a NetScaler command prompt, type the following:

/netscaler/nscollect start **-U** *NS_IP:UserName:Password* **-ds** *DataSourceName*

Example

/netscaler/nscollect start -U 10.102.29.170:nsroot:nsroot -ds default

Advanced Networking

The following topics provide a conceptual reference and instructions for configuring the various networking components on the NetScaler appliance.

IP Addressing	Learn the various types of NetScaler-owned IP addresses and how to create, customize, and remove them.
Interfaces	Configure some of the basic network configurations that must be done to get started.
Access Control Lists (ACLs)	Configure the different types of Access Control Lists and how to create, customize, and remove them.
IP Routing	Learn and configure the routing functionality of the NetScaler appliance, both static and dynamic.
Internet Protocol version 6 (IPv6)	Learn how the NetScaler appliance supports IPv6.
High Availability	Learn how High Availability (HA) works in a NetScaler deployment to ensure uninterrupted operation in any transaction.

IP Addressing

Before you can configure the NetScaler® appliance, you must assign the NetScaler IP Address (NSIP), also known as the Management IP address. You can also create other NetScaler-owned IP addresses for abstracting servers and establishing connections with the servers. In this type of configuration, the appliance serves as a proxy for the abstracted servers. You can also proxy connections by using network address translations (INAT and RNAT). When proxying connections, the appliance can behave either as a bridging (Layer 2) device or as a packet forwarding (Layer 3) device. To make packet forwarding more efficient, you can configure static ARP entries. For IPv6, you can configure neighbor discovery (ND).

IP Addressing

Before you can configure the NetScaler® appliance, you must assign the NetScaler IP Address (NSIP), also known as the Management IP address. You can also create other NetScaler-owned IP addresses for abstracting servers and establishing connections with the servers. In this type of configuration, the appliance serves as a proxy for the abstracted servers. You can also proxy connections by using network address translations (INAT and RNAT). When proxying connections, the appliance can behave either as a bridging (Layer 2) device or as a packet forwarding (Layer 3) device. To make packet forwarding more efficient, you can configure static ARP entries. For IPv6, you can configure neighbor discovery (ND).

Configuring NetScaler-Owned IP Addresses

The NetScaler-owned IP Addresses—NetScaler IP Address (NSIP), Virtual IP Addresses (VIPs), Subnet IP Addresses (SNIPs), Mapped IP Addresses (MIPs), and Global Server Load Balancing Site IP Addresses (GSLBIPs)—exist only on the NetScaler appliance. The NSIP uniquely identifies the NetScaler on your network, and it provides access to the appliance. A VIP is a public IP address to which a client sends requests. The NetScaler terminates the client connection at the VIP and initiates a connection with a server. This new connection uses a SNIP or a MIP as the source IP address for packets forwarded to the server. If you have multiple data centers that are geographically distributed, each data center can be identified by a unique GSLBIP.

You can configure some NetScaler-owned IP addresses to provide access for management applications.

Configuring the NetScaler IP Address (NSIP)

The NetScaler IP (NSIP) address is the IP address at which you access the NetScaler for management purposes. The NetScaler can have only one NSIP, which is also called the Management IP address. You must add this IP address when you configure the NetScaler for the first time. If you modify this address, you must reboot the NetScaler. You cannot remove an NSIP address. For security reasons, NSIP should be a non-routable IP address on your organization's LAN.

Note: Configuring the NetScaler IP address is mandatory.

To create the NetScaler IP address by using the NetScaler command line

At the NetScaler command prompt, type:

- set ns config [**-IPAddress** <ip_addr> **-netmask** <netmask>]
- show ns config

Example

```
> set ns config -ipaddress 10.102.29.170 -netmask 255.255.255.0
 Done
> show ns config
        NetScaler IP: 10.102.29.170  (mask: 255.255.255.0)
        Number of MappedIP(s): 1
        Node: Standalone
        Global configuration settings:
                        HTTP port(s): (none)
                    Max connections: 0
          Max requests per connection: 0
                 Client IP insertion: DISABLED
                     Cookie version: 0
        Persistence Cookie Secure Flag: ENABLED
                        Min Path MTU: 576
               Path MTU entry timeout: 10
                     FTP Port Range: 0
                          Timezone: GMT-11:00-SST-Pacific/Pago_Pago
 Done
```

Parameters for configuring the NSIP address

IPAddress

Unique identification used to represent an entity. This is a mandatory parameter.

netmask

Subnet mask associated with the IP address. This is a mandatory parameter.

type

Type of the IP address. Possible values: SNIP, VIP, MIP, and GSLBsiteIP.

To configure the NetScaler IP address by using the configuration utility

1. In the navigation pane, click **NetScaler**.
2. On the **System Overview** page, click **Setup Wizard**.
3. In the **Setup Wizard** dialog box, click **Next**.
4. Under **System Configuration**, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring the NetScaler IP address" as shown:
   - **IP Address***—IPAddress
   - **Netmask***—netmask

   * A required parameter
5. Follow the instructions in the **Setup Wizard** to complete the configuration.

Configuring and Managing Virtual IP Addresses (VIPs)

Configuration of a virtual server IP address (VIP) is not mandatory during initial configuration of the NetScaler. When you configure load balancing, you assign VIPs to virtual servers.

For more information about configuring the load balancing setup, see the "Load Balancing" chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

In some situations, you need to customize VIP attributes or enable or disable a VIP. A VIP is usually associated with a virtual server, and some of the attributes of the VIP are customized to meet the requirements of the virtual server. You can host the same virtual server on multiple NetScaler appliances residing on the same broadcast domain, by using ARP and ICMP attributes. After you add a VIP (or any IP address), the NetScaler sends, and then responds to, ARP requests. VIPs are the only NetScaler-owned IP addresses that can be disabled. When a VIP is disabled, the virtual server using it goes down and does not respond to ARP, ICMP, or L4 service requests.

As an alternative to creating VIPs one at a time, you can specify a consecutive range of VIPs.

To create a VIP address by using the NetScaler command line

At the NetScaler command prompt, type:

- add ns ip <IPAddress> <netmask> **-type** <type>
- show ns ip <IPAddress>

Example

```
> add ns ip 10.102.29.59 255.255.255.0 -type VIP
 Done
> show ns ip 10.102.29.59

      IP: 10.102.29.59
      Netmask: 255.255.255.0
      Type: VIP
      state: Enabled
```

```
        arp: Enabled
        icmp: Enabled
        vserver: Enabled
        management access: Disabled
          telnet: Disabled
          ftp: Disabled
          ssh: Disabled
          gui: Disabled
          snmp: Enabled
        Restrict access: Disabled
        dynamic routing: Disabled
        hostroute: Disabled
Warning: management access is disabled
Done
```

To create a range of VIP addresses by using the NetScaler command line

At the NetScaler command prompt, type:

- add ns ip <IPAddress> <netmask> **-type** <type>
- show ns ip <IPAddress>

Example

```
> add ns ip 10.102.29.[60-64] 255.255.255.0 -type VIP
ip "10.102.29.60" added
ip "10.102.29.61" added
ip "10.102.29.62" added
ip "10.102.29.63" added
ip "10.102.29.64" added
 Done

> show ip
  Ipaddress       Type          Mode    Arp     Icmp    Vserver  State
  ---------       ----          ----    ---     ----    -------  ------
1) 10.102.29.170   NetScaler IP    Active   Enabled  Enabled  NA      Enabled
2) 10.102.29.171   MIP           Active   Enabled  Enabled  NA      Enabled
.
.
46) 10.102.29.60    VIP           Active   Enabled  Enabled  Enabled  Enabled
47) 10.102.29.61    VIP           Active   Enabled  Enabled  Enabled  Enabled
48) 10.102.29.62    VIP           Active   Enabled  Enabled  Enabled  Enabled
49) 10.102.29.63    VIP           Active   Enabled  Enabled  Enabled  Enabled
50) 10.102.29.64    VIP           Active   Enabled  Enabled  Enabled  Enabled
 Done
```

Parameters for configuring VIP addresses

ipAddress (IP Address)

Unique identification used to represent an entity. This is a required parameter.

netmask (Netmask)

Subnet mask associated with the IP address. This is a required parameter.

type (Type)

Type of the IP address. Specify **VIP**.

arp (ARP)

Use Address Resolution Protocol (ARP) to map IP addresses to the corresponding hardware addresses. Possible values: Enabled, Disabled. Default: Enabled.

icmpresponse (ICMP Response)

NetScaler sends ICMP responses to PING requests according to this value. The user network applications that use ICMP are PING and TRACEROUTE. This parameter can be set only if type is set as VIP. Possible values: NONE, ONE_VSERVER, ALL_VSERVERS, and VSVR_CNTRLD. Default value: NONE.

- When you select NONE, NetScaler always responds (even when the virtual server is DOWN).
- When you select ONE_VSERVER, NetScaler responds if at least one virtual server on this IP address is UP.
- When you select ALL_VSERVERS, NetScaler responds only if all the virtual servers on this IP address are UP.
- When you select VSVR_CNTRLD, the behavior depends on the ICMP VSERVER RESPONSE setting on the virtual server.

The following settings can be made on a virtual server:

- When you set ICMP VSERVER RESPONSE to PASSIVE on all virtual servers, NetScaler always responds.
- When you set ICMP VSERVER RESPONSE to ACTIVE on all virtual servers, NetScaler responds even if one virtual server is UP.
- When you set ICMP VSERVER RESPONSE to ACTIVE on some and PASSIVE on others, NetScaler responds even if one virtual server set to ACTIVE is UP.

Note: This parameter is supported only on NetScaler 9.3.e.

arpresponse (ARP Response)

NetScaler appliance sends ARP responses according to this value. This parameter can be set only if type is set as VIP. Possible values: NONE, ONE_VSERVER. Default value: NONE.

- When you select NONE, NetScaler always responds (even when the virtual server is DOWN).
- When you select ONE_VSERVER, NetScaler responds if at least one virtual server on this IP address is UP.
- When you select ALL_VSERVERS, NetScaler responds only if all the virtual servers on this IP address are UP.

Note: This parameter is supported only on NetScaler 9.3.e.

vServer (Virtual Server)

Apply the vserver attribute to this IP address. Possible values: Enabled, Disabled. Default: Enabled.

state (State)

State of the VIP. Possible values: Enabled, Disabled. Default: Enabled.

To configure a VIP address by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **IPs**.
2. In the details pane, do one of the following:
   - To create a new IP, click **Add**.
   - To modify an existing IP, select the IP, and then click **Open**.
3. In the **Create IP** or **Configure IP** dialog box, set the following parameters:
   - **IP Address***
   - **Netmask***
   - **IP Type**: Select **VIP**.
   - **ARP Response**
   - **ICMP Response**
   - **ARP**
   - **Virtual Server**
   - **Dynamic Routing**
   - **Host Route**
   - **Gateway IP***
   - **Metric**
   - **V Server RHI Level**
   - **OSPF LSA Type**
   - **Area**

   *A required parameter
4. Click **Create** or **OK**, and then click **Close**. The IP address that you configured appears in the details pane.

To create a range of VIP addresses by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **IPs**.
2. In the details pane, click **Add Range**.
3. In the **Create IP - Range** dialog box, set the following parameters:
   - **IP Address***
   - **Netmask***
   - **Type**—type. Select **VIP**.
   - **IP Type**
   - **ARP**
   - **ICMP Response**
   - **Virtual Server**
   - **Dynamic Routing**
   - **Host Route**
   - **Gateway IP***
   - **Metric**
   - **V Server RHI Level**
   - **OSPF LSA Type**
   - **Area**

   *A required parameter
4. Click **Create**, and then click **Close**. The range of IP addresses that you created appears in the details pane.

To enable or disable an IPv4 VIP address by using the NetScaler command line

At the NetScaler command prompt, type one of the following sets of commands to enable or disable a VIP and verify the configuration:

- enable ns ip <IPAddress>
- show ns ip <IPAddress>

- disable ns ip <IPAddress>
- show ns ip <IPAddress>

Example

```
> enable ns ip 10.102.29.79
 Done
> show ns ip 10.102.29.79

        IP: 10.102.29.79
        Netmask: 255.255.255.255
        Type: VIP
        state: Enabled
        arp: Enabled
        icmp: Enabled
        vserver: Enabled
        management access: Disabled
          telnet: Disabled
          ftp: Disabled
          ssh: Disabled
          gui: Disabled
          snmp: Disabled
        Restrict access: Disabled
        dynamic routing: Disabled
        hostroute: Disabled
 Done
> disable ns ip 10.102.29.79
 Done
> show ns ip 10.102.29.79

        IP: 10.102.29.79
        Netmask: 255.255.255.255
        Type: VIP
        state: Disabled
        arp: Enabled
        icmp: Enabled
        vserver: Enabled
        management access: Disabled
          telnet: Disabled
          ftp: Disabled
          ssh: Disabled
          gui: Disabled
          snmp: Disabled
        Restrict access: Disabled
        dynamic routing: Disabled
        hostroute: Disabled

 Done
```

To enable or disable a VIP address by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **IPs**.
2. In the details pane, on the **IPv4s** tab, select the VIP address and do one of the following:
   - To enable the selected IP address, click **Enable**.
   - To disable the selected IP address, click **Disable**.
3. In the details pane, verify that the VIP address is enabled or disabled, as appropriate.

Configuring ARP response Suppression for Virtual IP addresses (VIPs)

You can configure the NetScaler appliance to respond or not respond to ARP requests for a Virtual IP (VIP) address on the basis of the state of the virtual servers associated with that VIP.

Note: This feature is supported only on NetScaler 9.3.e.

For example, if virtual servers V1, of type HTTP, and V2, of type HTTPs, share VIP address 10.102.29.45 on a NetScaler appliance, you can configure the appliance to not respond to any ARP request for VIP 10.102.29.45 if both V1 and V2 are in the DOWN state.

The following three options are available for configuring ARP-response suppression for a virtual IP address.

- **NONE**. The NetScaler appliance responds to any ARP request for the VIP address, irrespective of the state of the virtual servers associated with the address.
- **ONE VSERVER**. The NetScaler appliance responds to any ARP request for the VIP address if at least one of the associated virtual servers is in UP state.
- **ALL VSERVER**. The NetScaler appliance responds to any ARP request for the VIP address if all of the associated virtual servers are in UP state.

Following table shows the sample behavior of NetScaler appliance for a VIP configured with two virtual servers:

Associated virtual servers for a VIP	**STATE 1**	**STATE 2**	**STATE 3**	**STATE 4**
NONE				
V1	UP	UP	DOWN	DOWN
V2	UP	DOWN	UP	DOWN
Respond to an ARP request for this VIP?	Yes	Yes	Yes	Yes
ONE VSERVER				
V1	UP	UP	DOWN	DOWN
V2	UP	DOWN	UP	DOWN
Respond to an ARP request for this VIP?	Yes	Yes	Yes	No
ALL VSERVER				

V1	UP	UP	DOWN	DOWN
V2	UP	DOWN	UP	DOWN
Respond to an ARP request for this VIP?	Yes	No	No	No

Consider an example where you want to test the performance of two virtual servers, V1 and V2, which have the same VIP address but are of different types and are each configured on NetScaler appliances NS1 and NS2. Let's call the shared VIP address *VIP1*.

V1 load balances servers S1, S2, and S3. V2 load balances servers S4 and S5.

On both NS1 and NS2, for VIP1, the ARP suppression parameter is set to ALL_VSERVER. If you want to test the performance of V1 and V2 on NS1, you must manually disable V1 and V2 on NS2, so that NS2 does not respond to any ARP request for VIP1.

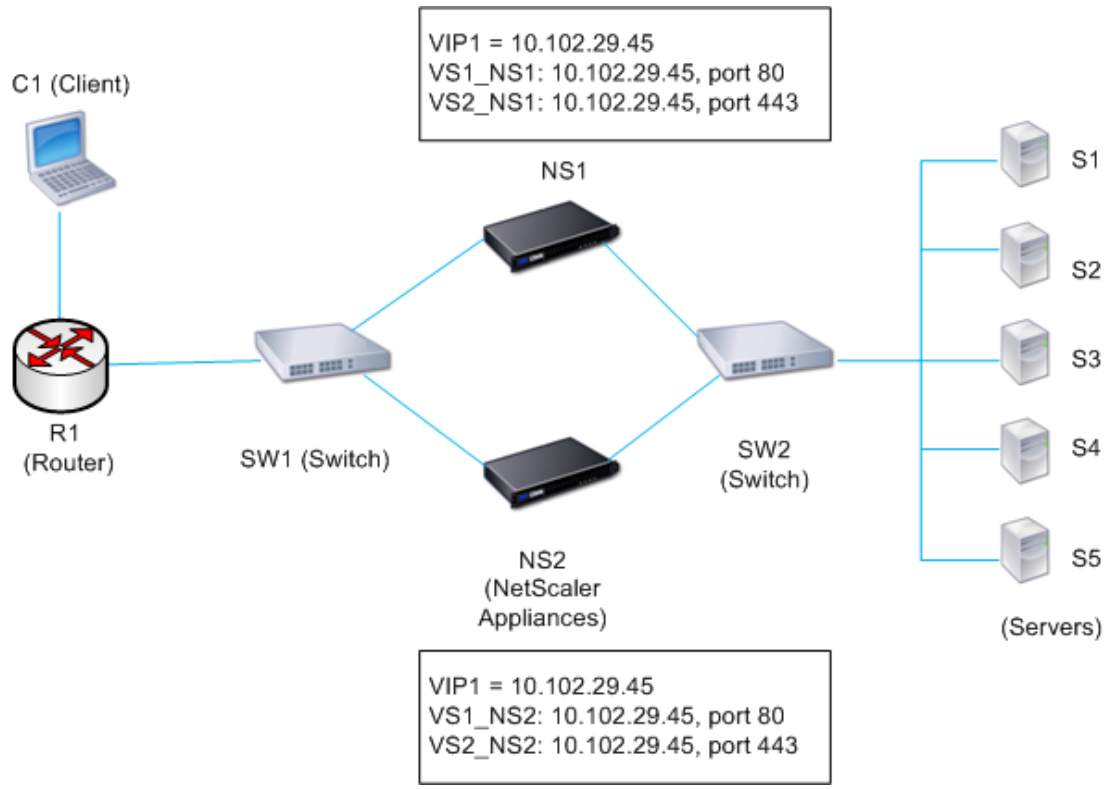


Figure 1.

The execution flow is as follows:

1. Client C1 sends a request to V1. The request reaches R1.
2. R1 does not have an APR entry for the IP address (VIP1) of V1, so R1 broadcasts an ARP request for VIP1.
3. NS1 replies with source MAC address MAC1 and source IP address VIP1. NS2 does not reply to the ARP request.
4. SW1 learns the port for VIP1 from the ARP reply and updates its bridge table, and R1 updates the ARP entry with MAC1 and VIP1.

5. R1 forwards the packet to address VIP1 on NS1.

6. NS1's load balancing algorithm selects server S2, and NS1 opens a connection between one of its SNIP or MIP addresses and S2. When S2 sends a response to the client, the response returns by the same path.

7. Now you want to test the performance of V1 and V2 on NS2, so you enable V1 and V2 on NS2 and disable them on NS1. NS2 now broadcasts an ARP message for VIP1. In the message, MAC2 is the source MAC address and VIP1 is the source IP address.

8. SW1 learns the port number for reaching MAC2 from the ARP broadcast and updates its bridge table to send subsequent client requests for VIP1 to NS2. R1 updates its ARP table.

9. Now suppose the ARP entry for VIP1 times out in the ARP table of R1, and client C1 sends a request for V1. Because R1 does not have an APR entry for VIP1, it broadcasts an ARP request for VIP1.

10. NS2 replies with a source MAC address and VIP1 as the source IP address. NS1 does not reply to the ARP request.

To configure ARP response supression by using the NetScaler command line

At the NetScaler command prompt, type:

- set ns ip -arpResponse <arpResponse>]
- show ns ip <IPAddress>

Example

```
> set ns ip 10.102.29.96 -arpResponse ALL_VSERVERS
 Done
> show ns ip 10.102.29.96

      IP: 10.102.29.96
      Netmask: 255.255.255.255
      Type: VIP
      state: Enabled
      arp: Enabled
      arpResponse: ALL_VSERVERS
                        icmp: Enabled
      icmpResponse: NONE
                        vserver: Enabled
      management access: Disabled
        telnet: Disabled
        ftp: Disabled
        ssh: Disabled
```

```
        gui: Disabled
        snmp: Enabled
      Restrict access: Disabled
      dynamic routing: Disabled
      hostroute: Disabled
Warning: management access is disabled
Done
```

Parameter for configuring ARP response supression

arpresponse (ARP Response)

NetScaler appliance sends ARP responses according to this value. This parameter can be set only if type is set as VIP. Possible values: NONE, ONE_VSERVER. Default value: NONE.

- When you select NONE, NetScaler always responds (even when the virtual server is DOWN).
- When you select ONE_VSERVER, NetScaler responds if at least one virtual server on this IP address is UP.
- When you select ALL_VSERVERS, NetScaler responds only if all the virtual servers on this IP address are UP.

To configure ARP response supression by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **IPs**.
2. In the details pane, select the IP, and then click **Open**.
3. In the **Configure IP** dialog box, set the following parameter:
   - **ARP Response**

   *A required parameter
4. Click **OK**, and then click **Close**.

Configuring Subnet IP Addresses (SNIPs)

A subnet IP (SNIP) address is used in connection management and server monitoring. It is not mandatory to specify a SNIP when you initially configure the NetScaler appliance. In a multiple-subnet scenario, the NetScaler IP (NSIP) address, the mapped IP (MIP) address, and the IP address of a server can exist on different subnets. To eliminate the need to configure additional routes on devices such as servers, you can configure subnet IP addresses (SNIPs) on the NetScaler. With Use SNIP (USNIP) mode enabled, a SNIP is the source IP address of a packet sent from the NetScaler to the server, and the SNIP is the IP address that the server uses to access the NetScaler. This mode is enabled by default.

When you add a SNIP, a route corresponding to the SNIP is added to the routing table. The NetScaler determines the next hop for a service from the routing table, and if the IP address of the hop is within the range of a SNIP, the NetScaler uses the SNIP to source traffic to the service. When multiple SNIPs cover the IP addresses of the next hops, the SNIPs are used in round robin manner.

The following figure illustrates USNIP mode.

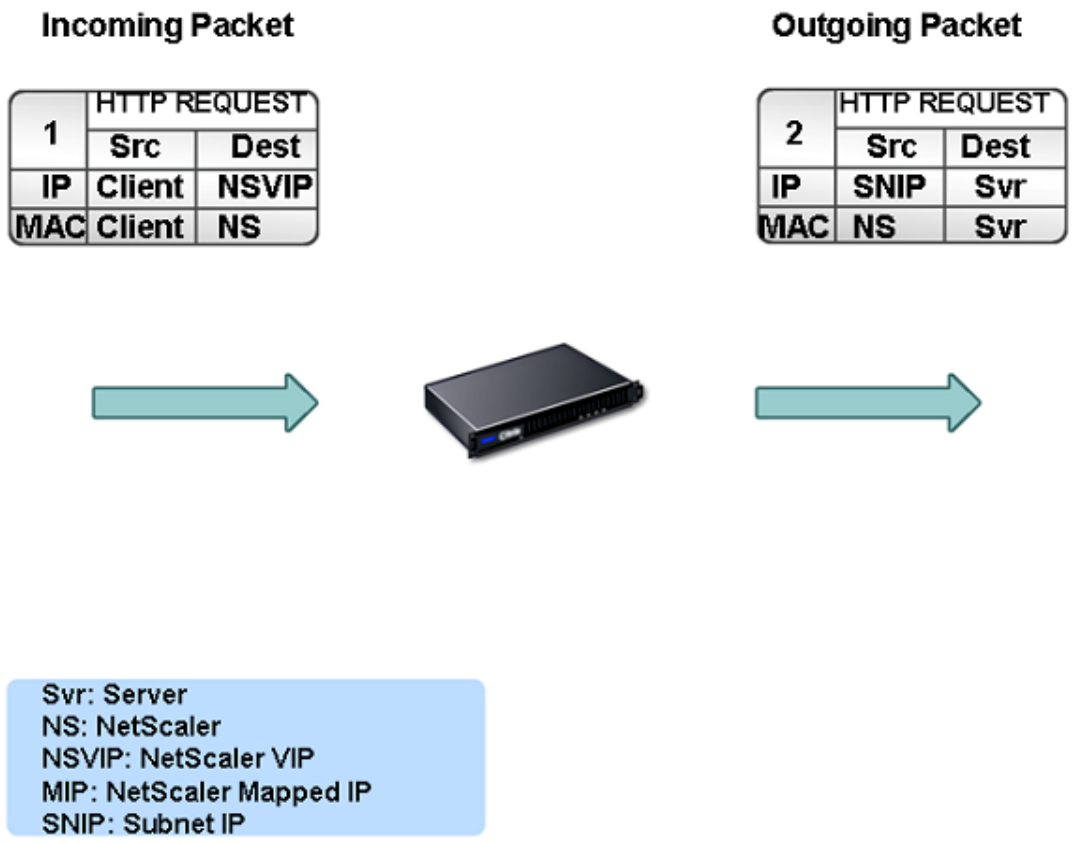

Figure 1. USNIP Mode

As an alternative to creating SNIPs one at a time, you can specify a consecutive range of SNIPs.

To configure a SNIP address by using the NetScaler command line

At the NetScaler command prompt, type:

- add ns ip <IPAddress> <netmask> **-type** <type>
- show ns ip <IPAddress>

Example

```
> add ns ip 10.102.29.203 255.255.255.0 -type SNIP
 Done
> sh ns ip 10.102.29.103

   IP: 10.102.29.103
   Netmask: 255.255.255.0
   Type: SNIP
   state: Enabled
   arp: Enabled
   icmp: Enabled
   vserver: NA
   management access: Disabled
     telnet: Enabled
     ftp: Enabled
     ssh: Enabled
     gui: Enabled
     snmp: Enabled
   Restrict access: Disabled
   dynamic routing: Disabled
   hostroute: Disabled
   # free ports: 1032111
 Warning: management access is disabled
 Done
```

To create a range of SNIP addresses by using the NetScaler command line

At the NetScaler command prompt, type:

- add ns ip <IPAddress> <netmask> **-type** <type>
- show ns ip <IPAddress>

Example

```
> add ns ip 10.102.29.[205-209] 255.255.255.0 -type SNIP
ip "10.102.29.205" added
ip "10.102.29.206" added
ip "10.102.29.207" added
ip "10.102.29.208" added
ip "10.102.29.209" added
 Done

> sh ns ip
  Ipaddress       Type          Mode     Arp      Icmp     Vserver  State
  ---------       ----          ----     ---      ----     -------  ------
1) 10.102.29.170   NetScaler IP    Active   Enabled  Enabled  NA      Enabled
2) 10.102.29.171   MIP           Active   Enabled  Enabled  NA      Enabled
.
.
51) 10.102.29.205   SNIP          Active   Enabled  Enabled  NA      Enabled
52) 10.102.29.206   SNIP          Active   Enabled  Enabled  NA      Enabled
53) 10.102.29.207   SNIP          Active   Enabled  Enabled  NA      Enabled
54) 10.102.29.208   SNIP          Active   Enabled  Enabled  NA      Enabled
55) 10.102.29.209   SNIP          Active   Enabled  Enabled  NA      Enabled
 Done
```

Parameters for configuring SNIP addresses

IPAddress

Unique identification used to represent an entity. This is a required parameter.

netmask

Subnet mask associated with the IP address. This is a required parameter.

type

Type of the IP address. Specify **SNIP**.

To configure a SNIP address by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **IPs**.
2. In the details pane, do one of the following:
   - To create a new IP address, click **Add**.
   - To modify an existing IP address, select the address, and then click **Open**.
3. In the **Create IP** or **Configure IP** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring SNIP addresses" as shown:
   - **IP Address***—IPAddress
   - **Netmask***—netmask
   - **Type**—type (Select **SNIP**.)

   *A required parameter
4. Click **Create** or **OK**, and then click **Close**. The IP address that you configured appears in the details pane.

To create a range of SNIP addresses by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **IPs**.
2. In the details pane, click **Add Range**.
3. In the **Create IP - Range** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring SNIP addresses" as shown:
   - **IP Address***—IPAddress
   - **Netmask***—netmask
   - **Type**—type (Select **SNIP**.)

   *A required parameter
4. Click **Create**, and then click **Close**. The range of IP addresses that you created appears in the details pane.

To enable or disable USNIP mode by using the NetScaler command line

At the NetScaler command prompt, type one of the following commands:

- enable ns mode usnip
- disable ns mode usnip

To enable or disable USNIP mode by using the configuration utility

1. In the navigation pane, expand **System** and click **Settings**.
2. In the details pane, in the **Modes and Features** group, click **Change modes**.
3. In the **Configure Modes** dialog box, do one of the following:
   - To enable USNIP, select the **Use Subnet IP** check box.
   - To disable USNIP, clear the **Use Subnet IP** check box.
4. Click **OK**.
5. In the **Enable/Disable Feature(s)?** dialog box, click **Yes**.

Configuring Mapped IP Addresses (MIPs)

Mapped IP addresses (MIP) are used for server-side connections. A MIP can be considered a default Subnet IP (SNIP) address, because MIPs are used when a SNIP is not available or Use SNIP (USNIP) mode is disabled.

If the mapped IP address is the first in the subnet, the NetScaler appliance adds a route entry, with this IP address as the gateway to reach the subnet. You can create or delete a MIP during run time without rebooting the appliance.

As an alternative to creating MIPs one at a time, you can specify a consecutive range of MIPs.

To create a MIP address by using the NetScaler command line

At the NetScaler command prompt, type:

- add ns ip <IPAddress> <netmask> **-type** <type>
- show ns ip <IPAddress>

Example

```
> add ns ip 10.102.29.171 255.255.255.0 -type MIP
 Done
> sh ns ip 10.102.29.171

   IP: 10.102.29.171
   Netmask: 255.255.255.0
   Type: MIP
   state: Enabled
   arp: Enabled
   icmp: Enabled
   vserver: NA
   management access: Disabled
     telnet: Enabled
     ftp: Enabled
     ssh: Enabled
     gui: Enabled
     snmp: Enabled
   Restrict access: Disabled
   dynamic routing: Disabled
   hostroute: Disabled
```

```
   # free ports: 1031960
Warning: management access is disabled
Done
```

To create a range of MIP addresses by using the NetScaler command line

At the NetScaler command prompt, type:

- add ns ip <IPAddress> <netmask> **-type** <type>
- show ns ip <IPAddress>

Example

```
> add ns ip 10.102.29.[173-175] 255.255.255.0 -type MIP
ip "10.102.29.173" added
ip "10.102.29.174" added
ip "10.102.29.175" added
Done

> sh ns ip
  Ipaddress       Type          Mode     Arp     Icmp    Vserver  State
  ---------       ----          ----     ---     ----    -------  ------
1) 10.102.29.170   NetScaler IP    Active   Enabled  Enabled  NA      Enabled
2) 10.102.29.171   MIP           Active   Enabled  Enabled  NA      Enabled
.
.
56) 10.102.29.173   MIP          Active   Enabled  Enabled  NA      Enabled
57) 10.102.29.174   MIP          Active   Enabled  Enabled  NA      Enabled
58) 10.102.29.175   MIP          Active   Enabled  Enabled  NA      Enabled
 Done
```

Parameters for configuring MIP addresses

IPAddress

Unique identification used to represent an entity. This is a required parameter.

netmask

Subnet mask associated with the IP address. This is a required parameter.

type

Type of the IP address. Specify **MIP**.

To configure a MIP address by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **IPs**.
2. In the details pane, do one of the following:
   - To create a new IP address, click **Add**.
   - To modify an existing IP address, select the address, and then click **Open**.
3. In the **Create IP** or **Configure IP** dialog box, specify values for the following parameters, which correspond to parameters described in “Parameters for configuring MIP addresses” as shown:
   - **IP Address***—IPAddress
   - **Netmask***—netmask
   - **Type**—type (Select **MIP**.)

   *A required parameter
4. Click **Create** or **OK**, and then click **Close**. The IP address that you configured appears in the details pane.

To create a range of MIP addresses by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **IPs**.
2. In the details pane, click **Add Range**.
3. In the **Create IP - Range** dialog box, specify values for the following parameters, which correspond to parameters described in “Parameters for configuring MIP addresses” as shown:
   - **IP Address***—IPAddress
   - **Netmask***—netmask
   - **Type**—type (Select **MIP**.)

   *A required parameter
4. Click **Create**, and then click **Close**. The range of IP addresses that you created appears in the details pane.

Configuring GSLB Site IP Addresses (GSLBIP)

A GSLB site IP (GSLBIP) address is an IP address associated with a GSLB site. It is not mandatory to specify a GSLBIP address when you initially configure the NetScaler appliance. A GSLBIP address is used only when you create a GSLB site.

For more information about creating a GSLB site IP address, see the "Global Server Load Balancing" chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Removing a NetScaler-Owned IP Address

You can remove any IP address except the NSIP. The following table provides information about the processes you must follow to remove the various types of IP addresses. Before removing a VIP, remove the associated virtual server.

Table 1. Implications of Removing a NetScaler-Owned IP Address

IP address type	Implications
Subnet IP address (SNIP)	If IP address being removed is the last IP address in the subnet, the associated route is deleted from the route table. If the IP address being removed is the gateway in the corresponding route entry, the gateway for that subnet route is changed to another NetScaler-owned IP address.
Mapped IP address (MIP)	If a SNIP exists, you can remove the MIPs. The NetScaler uses NSIP and SNIPs to communicate with the servers when the MIP is removed. Therefore, you must also enable use SNIP (USNIP) mode. For information about enabling and disabling USNIP mode, see Configuring Subnet IP Addresses (SNIPs).
Virtual Server IP address (VIP)	Before removing a VIP, you must first remove the vserver associated with it. For information about removing the vserver, see the "Load Balancing" chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.
GSLB-Site-IP address	Before removing a GSLB site IP address, you must remove the site associated with it. For information about removing the site, see the "Global Server Load Balancing" chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To remove an IP address by using the NetScaler command line

At the NetScaler command prompt, type:

rm ns ip <IPaddress>

Example

rm ns ip 10.102.29.54

To remove an IP address by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **IPs**.
2. On the **IPs** page, on the **IPv4s** tab, select the IP address that you want to remove, and then click **Remove**.
3. In the **Remove** dialog box, click **Yes**. A message appears in the status bar, stating that the IP address has been removed successfully.

Configuring Application Access Controls

Application access controls, also known as management access controls, form a unified mechanism for managing user authentication and implementing rules that determine user access to applications and data. You can configure MIPs and SNIPs to provide access for management applications. Management access for the NSIP is enabled by default and cannot be disabled. You can, however, control it by using ACLs.

For information about using ACLs, see Access Control Lists (ACLs).

The NetScaler appliance does not support management access to VIPs.

The following table provides a summary of the interaction between management access and specific service settings for Telnet.

Management Access	Telnet (State Configured on the NetScaler)	Telnet (Effective State at the IP Level)
Enable	Enable	Enable
Enable	Disable	Disable
Disable	Enable	Disable
Disable	Disable	Disable

The following table provides an overview of the IP addresses used as source IP addresses in outbound traffic.

Application/ IP	NSIP	MIP	SNIP	VIP
ARP	Yes	Yes	Yes	No
Server side traffic	No	Yes	Yes	No
RNAT	No	Yes	Yes	Yes
ICMP PING	Yes	Yes	Yes	No
Dynamic routing	Yes	No	Yes	Yes

The following table provides an overview of the applications available on these IP addresses.

Application/ IP	NSIP	MIP	SNIP	VIP
SNMP	Yes	Yes	Yes	No
System access	Yes	Yes	Yes	No

You can access and manage the NetScaler by using applications such as Telnet, SSH, GUI, and FTP.

Note: Telnet and FTP are disabled on the NetScaler for security reasons. To enable them, contact the customer support. After the applications are enabled, you can apply the controls at the IP level.

To configure the NetScaler to respond to these applications, you need to enable the specific management applications. If you disable management access for an IP address, existing connections that use the IP address are not terminated, but no new connections can be initiated.

Also, the non-management applications running on the underlying FreeBSD operating system are open to protocol attacks, and these applications do not take advantage of the NetScaler appliance's attack prevention capabilities.

You can block access to these non-management applications on a MIP, SNIP, or NSIP. When access is blocked, a user connecting to a NetScaler by using the MIP, SNIP, or NSIP is not be able to access the non-management applications running on the underlying operating system.

To configure management access for an IP address by using the NetScaler command line

At the NetScaler command prompt, type:

set ns ip <IPAddress> **-mgmtAccess** <value> **-telnet** <value> **-ftp** <value> **-gui** <value> **-ssh** <value> **-snmp** <value> **-restrictAccess** (ENABLED | DISABLED)

Example

```
set ns ip 10.102.29.54 -mgmtAccess enabled -restrictAccess ENABLED
```

Parameters for customizing a SNIP or MIP address

telnet

Allow Telnet access to the IP address. Possible values: ENABLED, DISABLED. Default: ENABLED.

ftp

Allow File Transfer Protocol (FTP) access to the IP address. Possible values: ENABLED, DISABLED. Default: ENABLED.

gui

Allow Graphical User Interface (GUI) access to the IP address. Possible values: ENABLED, SECUREONLY, DISABLED. Default: ENABLED.

ssh

Allow Secure Shell (SSH) access to the IP address. Possible values: ENABLED, DISABLED. Default: ENABLED.

snmp

Allow Simple Network Management Protocol (SNMP) access to the IP address. Possible values: ENABLED, DISABLED. Default: ENABLED.

mgmtAccess

Allow external access to the IP address. Possible values: ENABLED, DISABLED. Default: DISABLED.

dynamicRouting

Allow dynamic routing on the IP address. Specific to SNIP. Possible values: Enabled, Disabled. Default: Disabled.

restrictAccess

Block access to non-management applications on this IP. This options is applicable for MIPs, SNIPs, and NSIP, and is disabled by default. Non-management applications may run on the underlying NetScaler Free BSD operating system. Possible values: ENABLED, DISABLED. Default: DISABLED.

To enable management access for an IP address by using the configuration utility

1. In the navigation pane, expand **Network** and click **IPs**.
2. On the **IPs** page, select the IP address that you want to modify (for example, **10.102.29.54**), and then click **Open**.
3. In the **Configure IP** dialog box, under **Application Access Control**, select the **Enable Management Access control to support the below listed applications** check box.
4. Select the application or applications that you want to enable.
5. To block access to non-management applications on an IP address, select the **Allow access only to management applications** check box.
6. Click **OK**.

How the NetScaler Proxies Connections

When a client initiates a connection, the NetScaler appliance terminates the client connection, initiates a connection to an appropriate server, and sends the packet to the server. The appliance does not perform this action for service type UDP or ANY.

For more information about service types, see "Load Balancing" chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

You can configure the NetScaler to process the packet before initiating the connection with a server. The default behavior is to change the source and destination IP addresses of a packet before sending the packet to the server. You can configure the NetScaler to retain the source IP address of the packets by enabling Use Source IP mode.

How the Destination IP Address Is Selected

Traffic sent to the NetScaler appliance can be sent to a virtual server or to a service. The appliance handles traffic to virtual servers and services differently. The NetScaler terminates traffic received at a virtual server IP (VIP) address and changes the destination IP address to the IP address of the server before forwarding the traffic to the server, as shown in the following diagram.

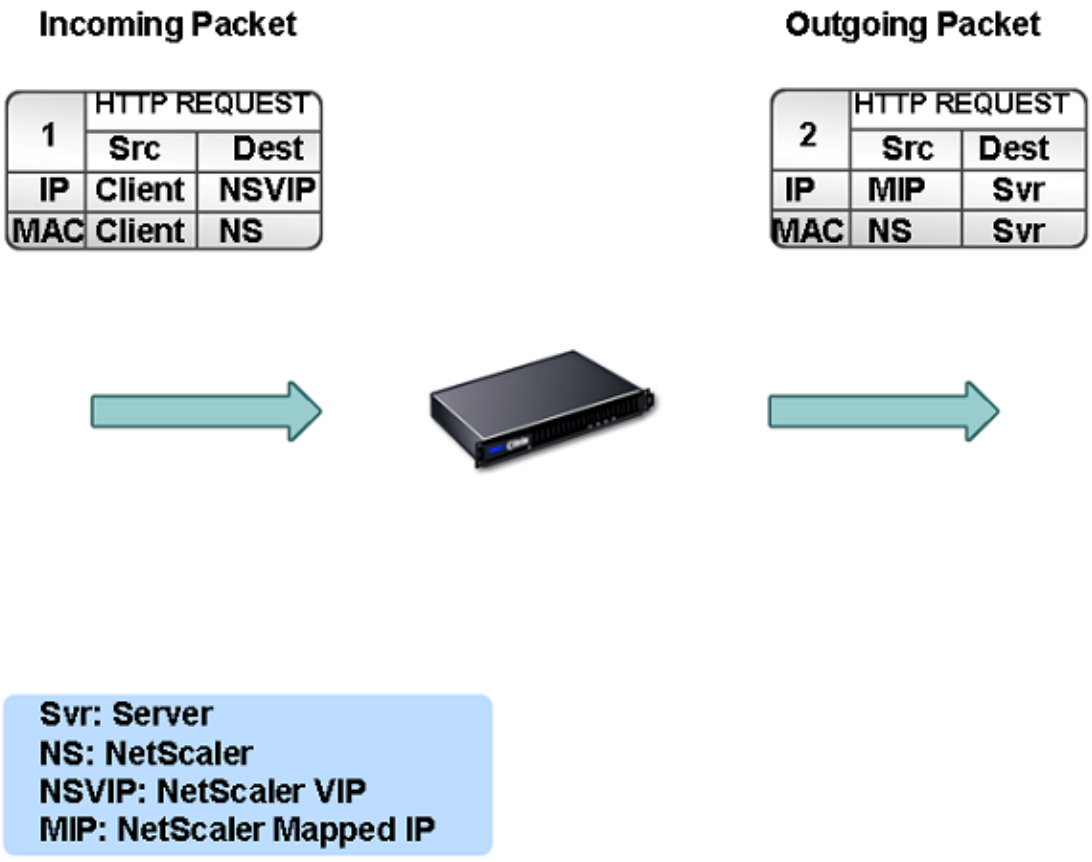

Figure 1. Proxying Connections to VIPs

Packets destined for a service are sent directly to the appropriate server, and the NetScaler does not modify the destination IP addresses. In this case, the NetScaler functions as a proxy.

How the Source IP Address Is Selected

When the NetScaler appliance communicates with the physical servers or peer devices, by default, it does not use the IP address of the client. NetScaler maintains a pool of mapped IP addresses (MIPs) and subnet IP addresses (SNIPs), and selects an IP address from this pool to use as the source IP address of a connection to the physical server. Depending on the subnet in which the physical server is placed, NetScaler decides whether a MIP should be used or SNIP.

Note: If the Use Source IP (USIP) option is enabled, NetScaler uses the IP address of the client.

Enabling Use Source IP Mode

When the NetScaler appliance communicates with the physical servers or peer devices, by default, it uses one of its own IP addresses as the source IP. The appliance maintains a pool of mapped IP addresses (MIPs) and subnet IP addresses (SNIPs), and selects an IP address from this pool to use as the source IP address for a connection to the physical server. The decision of whether to select a MIP or a SNIP depends on the subnet in which the physical server resides.

If necessary, you can configure the NetScaler appliance to use the client's IP address as source IP. Some applications need the actual IP address of the client. The following use cases are a few examples:

- Client's IP address in the web access log is used for billing purposes or usage analysis.
- Client's IP address is used to determine the country of origin of the client or the originating ISP of the client. For example, many search engines such as Goggle provide content relevant to the location to which the user belongs.
- The application must know the client's IP address to verify that the request is from a trustworthy source.
- Sometimes, even though an application server does not need the client's IP address, a firewall placed between the application server and the NetScaler may need the client's IP address for filtering the traffic.

Enable **Use Source IP** mode (USIP) mode if you want NetScaler to use the client's IP address for communication with the servers. By default, USIP mode is disabled. USIP mode can be enabled globally on the NetScaler or on a specific service. If you enable it globally, USIP is enabled by default for all subsequently created services. If you enable USIP for a specific service, the client's IP address is used only for the traffic directed to that service.

As an alternative to USIP mode, you have the option of inserting the client's IP address (CIP) in the request header of the server-side connection for an application server that needs the client's IP address.

In earlier NetScaler releases, USIP mode had the following source-port options for server-side connections:

- Use the client's port. With this option, connections cannot be reused. For every request from the client, a new connection is made with the physical server.
- Use proxy port. With this option, connection reuse is possible for all requests from the same client. Before NetScaler release 8.1 this option imposed a limit of 64000 concurrent connections for all server-side connections.

In the later NetScaler releases , if USIP is enabled, the default is to use a proxy port for server-side connections and not reuse connections. Not reusing connections may not effect the speed of establshing connections.

By default, the **Use Proxy Port** option is enabled if the **USIP** mode is enabled. For more information about the Use Proxy Port option, see Using the Client Port When Connecting to the Server.

Note: f you enable the **USIP** mode, it is recommended to enable the **Use Proxy Port** option.

The following figureshows how the NetScaler uses IP addresses in USIP mode.

Figure 1. IP Addressing in USIP Mode

Recommended Usage

Enable **USIP** in the following situations:

- Load balancing of Intrusion Detection System (IDS) servers
- Stateless connection failover
- Sessionless load balancing
- If you use the Direct Server Return (DSR) mode

Note: When USIP is required in the one-arm mode installation of the NetScaler appliance, make sure that the server's gateway is one of the IP addresses owned by the NetScaler. For more information about NetScaler owned IP addresses, see Configuring NetScaler owned IP addresses.

- If you enable USIP, set the idle timeout for server connections to a value lower than the default value, so that idle connections are cleared quickly on the server side.

  For more information about setting an idle time-out value, see "Load Balancing" chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

- For transparent cache redirection, if you enable USIP, enable **L2CONN** also.

- Because HTTP connections are not reused when USIP is enabled, a large number of server-side connections may accumulate. Idle server connections can block connections for other clients. Therefore, set limits on maximum number of connections to a service. Citrix also recommendeds setting the HTTP server time-out value, for a service on which USIP is enabled, to a value lower than the default, so that idle connections are cleared quickly on the server side.

To globally enable or disable USIP mode by using the NetScaler command line

At the NetScaler command prompt, type one of the following commands:

- enable ns mode usip
- disable ns mode usip

To enable USIP mode for a service by using the NetScaler command line

At the NetScaler command prompt, type:

set service <ServiceName> -**usip** (YES | NO)

Example

set service Service-HTTP-1 -usip YES

To globally enable or disable USIP mode by using the configuration utility

1. In the navigation pane, expand **System** and click **Settings**.
2. On the **Settings** page, under **Modes and Features**, click **Configure modes**.
3. In the **Configure Modes** dialog box, do one of the following:
   - To enable Use Source IP mode, select the **Use Source IP** check box.
   - To disable Use Source IP mode, clear the **Use Source IP** check box.
4. Click **OK**.
5. In the **Enable/Disable Feature(s)?** dialog box, click **Yes**.

To enable USIP mode for a service by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Services**.
2. In the details pane, select the service for which you want to enable the USIP mode, and then click **Open**.
3. In the **Configure Service** dialog box, click the **Advanced** tab.
4. Under **Settings**, select the **Use Source IP** check box.
5. Click **OK**.

Configuring Network Address Translation

Network address translation (NAT) involves modification of the source and/or destination IP addresses and/or the TCP/UDP port numbers of IP packets that pass through the NetScaler appliance. Enabling NAT on the appliance enhances the security of your private network, and protects it from a public network such as the Internet, by modifying your network's source IP addresses when data passes through the NetScaler. Also, with the help of NAT entries, your entire private network can be represented by a few shared public IP addresses. The NetScaler supports the following two types of network address translation:

- Inbound NAT (INAT), in which the NetScaler replaces the destination IP address in the packets generated by the client with the private IP address of the server.
- Reverse NAT (RNAT), in which the NetScaler replaces the source IP address in the packets generated by the servers with the public NAT IP addresses.

Configuring INAT

When a client sends a packet to a NetScaler appliance that is configured for Inbound Network Address Translation (INAT), the appliance translates the packet's public destination IP address to a private destination IP address and forwards the packet to the server at that address.

The following configurations are supported:

- **IPv4-IPv4 Mapping**: A public IPv4 address on the NetScaler appliance listens to connection requests on behalf of a private IPv4 server. The NetScaler appliance translates the packet's public destination IP address to the destination IP address of the server and forwards the packet to the server at that address.
- **IPv4-IPv6 Mapping**: A public IPv4 address on the NetScaler appliance listens to connection requests on behalf of a private IPv6 server. The NetScaler appliance creates an IPv6 request packet with the IP address of the IPv6 server as the destination IP address.
- **IPv6-IPv4 Mapping**: A public IPv6 address on the NetScaler appliance listens to connection requests on behalf of a private IPv4 server. The NetScaler appliance creates an IPv4 request packet with the IP address of the IPv4 server as the destination IP address.
- **IPv6-IPv6 Mapping**: A public IPv6 address on the NetScaler appliance listens to connection requests on behalf of a private IPv6 server. The NetScaler appliance translates the packet's public destination IP address to the destination IP address of the server and forwards the packet to the server at that address.

When the appliance forwards a packet to a server, the source IP address assigned to the packet is determined as follows:

- If use subnet IP (USNIP) mode is enabled and use source IP (USIP) mode is disabled, the NetScaler uses a subnet IP address (SNIP) as the source IP address.
- If USNIP mode is disabled and USIP mode is disabled, the NetScaler uses a mapped IP address (MIP) as the source IP address.
- If USIP mode is enabled, and USNIP mode is disabled the NetScaler uses the client IP (CIP) address as the source IP address.
- If both USIP and USNIP modes are enabled, USIP mode takes precedence.
- You can also configure the NetScaler to use a unique IP address as the source IP address, by setting the proxyIP parameter.
- If none of the above modes is enabled and a unique IP address has not been specified, the NetScaler attempts to use a MIP as the source IP address.

- If both USIP and USNIP modes are enabled and a unique IP address has been specified, the order of precedence is as follows: USIP-unique IP-USNIP-MIP-Error.

To protect the NetScaler from DoS attacks, you can enable TCP proxy. However, if other protection mechanisms are used in your network, you may want to disable them.

You can create, modify, or remove an INAT entry.

To create an INAT entry by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create an INAT entry and verify its configuration:

- add inat <name> <publicIP> <privateIP> [**-tcpproxy** (ENABLED | DISABLED)] [**-ftp** (ENABLED | DISABLED)] [**-usip** (ON | OFF)] [**-usnip** (ON | OFF)] [**-proxyIP** <ip_addr|ipv6_addr>]

- show inat [<name>]

Example

```
> add inat ip4-ip4 172.16.1.2 192.168.1.1 -proxyip 10.102.29.171
 Done
> show inat ip4-ip4

1) NAME: ip4-ip4
   Public IP: 172.16.1.2
   Private IP: 192.168.1.1
   Tcpproxy: DISABLED
   Ftp:       DISABLED
   USNIP : ON
   USIP: ON
   Proxy IP: 10.102.29.171
 Done
```

To modify an INAT entry by using the NetScaler command line

To modify an INAT entry, type the set inat command, the name of the entry, and the parameters to be changed, with their new values.

To remove an INAT configuration by using the NetScaler command line

At the NetScaler command prompt, type:

rm inat <name>

Example

```
> rm inat ip4-ip4
 Done
```

Basic parameters for configuring INAT

name

Name of the Inbound NAT entry being added.

publicIP

Public destination IP address of packets received on the NetScaler. This IP address can be an IPv4 or IPv6 address. Possible values: NetScaler-owned VIPs.

privateIP

Private destination IP address of the server to which the packet is sent by the NetScaler. This IP address can be an IPv4 or IPv6 address. Possible values: IP addresses of the servers.

usip

Use source IP mode. Possible values: Enabled, Disabled. Default: Enabled.

usnip

Use subnet IP mode. Possible values: Enabled, Disabled. Default: Enabled.

proxyIP

A unique IP address used as the source IP address in packets sent to the server.

tcpproxy

Allow TCP traffic. Possible values: Enabled, Disabled. Default: Disabled.

ftp

Allow FTP. Possible values: Enabled, Disabled. Default: Disabled.

To configure an INAT entry by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **Routes**.
2. On the **Routes** page, on the **INAT** tab, do one of the following:
   - To create a new INAT entry, click **Add**.
   - To modify an existing INAT entry, select the entry, and then click **Open**.
3. In the **Create INAT** or **Configure INAT** dialog box, specify values for the following parameters, which correspond to parameters described in "Basic parameters for configuring INAT" as shown:
   - **Name*** —name
   - **Public IP Address*** —publicIP

     Note: To use an IPv6 address, select the **IPv6** check box and enter the address in IPv6 format.
   - **Private IP Address*** —privateIP

     Note: To use an IPv6 address, select the **IPv6** check box and enter the address in IPv6 format.
   - **Proxy IP Address** —proxyIP
   - **TCP Proxy Mode** —tcpproxy
   - **FTP Mode** —ftp
   - **Use Source IP Mode** —usip
   - **Use Subnet IP Mode** —usnip

   * A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the INAT entry has been configured successfully.

To remove an INAT configuration by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **Routes**.
2. On the **INAT** tab, select the name of the INAT configuration that you want to remove.
3. Click **Remove**, and then click **Close**. A message appears in the status bar, stating that the INAT has been removed successfully.

Coexistence of INAT and Virtual Servers

If both INAT and RNAT are configured, the INAT rule takes precedence over the RNAT rule. If RNAT is configured with a network address translation IP (NAT IP) address, the NAT IP address is selected as the source IP address for that RNAT client.

The default public destination IP in an INAT configuration is the virtual IP (VIP) address of the NetScaler device. virtual servers also use VIPs. When both INAT and a virtual server use the same IP address, the Vserver configuration overrides the INAT configuration.

Following are a few sample configuration setup scenarios and their effects.

Case	Result
You have configured a virtual server and a service to send all data packets received on a specific NetScaler port to the server directly. You have also configured INAT and enabled TCP. Configuring INAT in this manner sends all data packets received through a TCP engine before sending them to the server.	All packets received on the NetScaler, except those received on the specified port, pass through the TCP engine.
You have configured a virtual server and a service to send all data packets of service type TCP, that are received on a specific port on the NetScaler, to the server after passing through the TCP engine. You have also configured INAT and disabled TCP. Configuring INAT in this manner sends the data packets received directly to the server.	Only packets received on the specified port pass through the TCP engine.
You have configured a virtual server and a service to send all data packets received to either of two servers. You are attempting to configure INAT to send all data packets received to a different server.	The INAT configuration is not allowed.
You have configured INAT to send all received data packets directly to a server. You are attempting to configure a virtual server and a service to send all data packets received to two different servers.	The vserver configuration is not allowed.

Configuring RNAT

In Reverse Network Address Translation (RNAT), the NetScaler appliance replaces the source IP addresses in the packets generated by the servers with public NAT IP addresses. By default, the appliance uses a Mapped IP address (MIP) as the NAT IP address. You can also configure the appliance to use a unique NAT IP address for each subnet. You can also configure RNAT by using Access Control Lists (ACLs).

Use Source IP (USIP), Use Subnet IP (USNIP), and Link Load Balancing (LLB) modes affect the operation of RNAT. You can display statistics to monitor RNAT.

You can use either a network addrress or an extended ACL as the condition for an RNAT entry:

- **Using a Network address.** When you use a network address, RNAT processing is performed on all of the packets coming from the specified network.
- **Using Extended ACLs.**When you use ACLs, RNAT processing is performed on all packets that match the ACLs. To configure the NetScaler appliance to use a unique IP address for traffic that matches an ACL, you must perform the following three tasks:

  1. Configure the ACL.
  2. Configure RNAT to change the source IP address and Destination Port.
  3. Apply the ACL.

  The following diagram illustrates RNAT configured with an ACL.

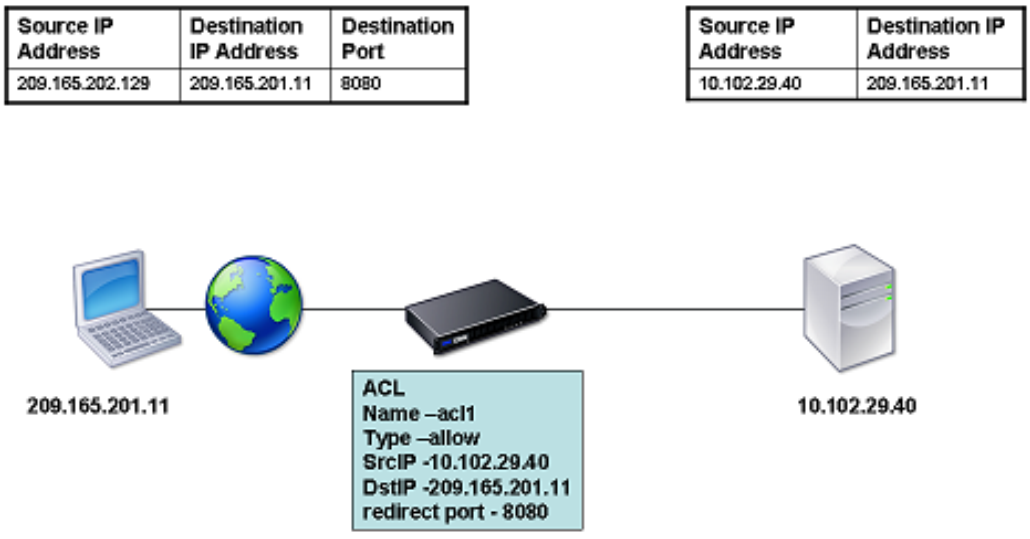

Figure 1. RNAT with an ACL

You have the following basic choices for the type of NAT IP address:

- **Using a MIP or SNIP as the NAT IP Address.** When using a MIP as the NAT IP address, the NetScaler appliance replaces the source IP addresses of server-generated packets with the a MIP. Therefore, the MIP address must be a public IP address. If Use Subnet IP (USNIP) mode is enabled, the NetScaler can use a subnet IP address (SNIP) as the NAT IP address.

- **Using a Unique IP Address as the NAT IP Address.** When using a unique IP address as the NAT IP address, the NetScaler appliance replaces the source IP addresses of server-generated packets with the unique IP address specified. The unique IP address must be a public NetScaler-owned IP address. If multiple NAT IP addresses are configured for a subnet, NAT IP selection uses the round robin algorithm.

  This configuration is illustrated in the following diagram.

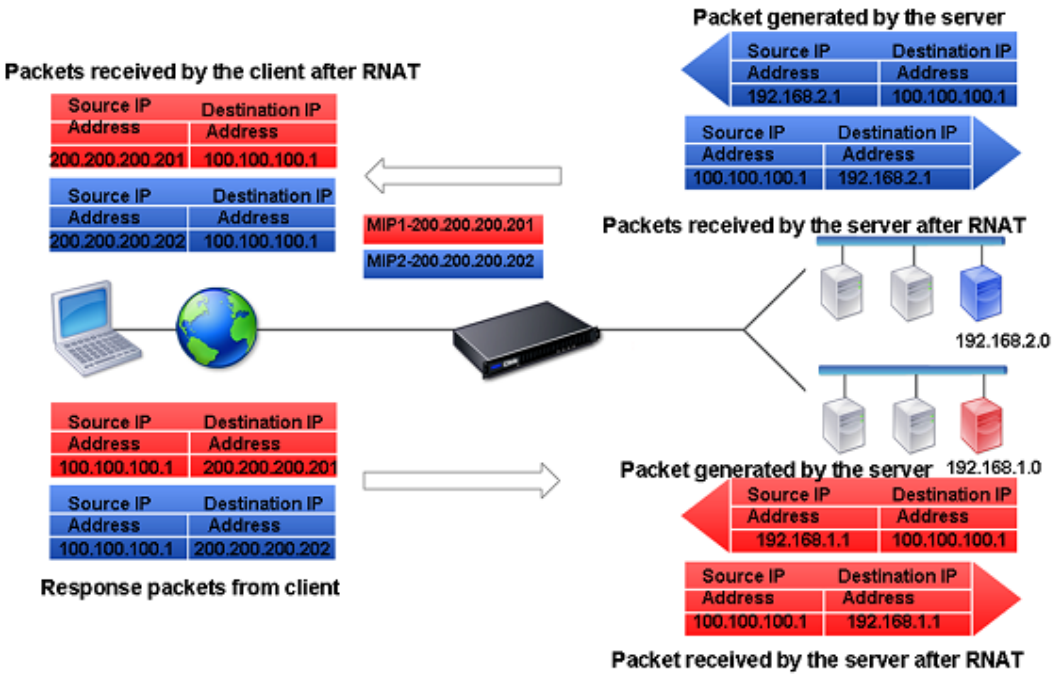

Figure 2. Using a Unique IP Address as the NAT IP Address

Creating an RNAT Entry

The following instructions provide separate command-line procedures for creating RNAT entries that use different conditions and different types of NAT IP addresses. In the configuration utility, all of the variations can be configured in the same dialog box, so there is only one procedure for configuration utility users.

To create an RNAT entry by using the NetScaler command line

At the NetScaler command prompt, type one the following commands to create, respectively, an RNAT entry that uses a network address as the condition and a MIP or SNIP as the NAT IP address, an RNAT entry that uses a network address as the condition and a unique IP address as the NAT IP address, an RNAT entry that uses an ACL as the condition and a MIP or SNIP as the NAT IP address, or an RNAT entry that uses an ACL as a condition and a unique IP address as the NAT IP address:

- set rnat <IPAddress> <netmask>
- set rnat IPAddress <netMask> **-natip** <NATIPAddress>
- set rnat <aclname> [**-redirectPort** <port>]
- set rnat <aclname> [**-redirectPort** <port>] **-natIP** <NATIPAddress>

  Use the following command to verify the configuration:

- show rnat

Examples

A network address as the condition and a MIP or SNIP as the NAT IP address:

```
> set rnat 192.168.1.0 255.255.255.0
 Done
> show rnat
1)      Network: 192.168.1.0      Netmask: 255.255.255.0
        NatIP: *
 Done
```

A network address as the condition and a unique IP address as the NAT IP address:

```
> set rnat 192.168.1.0 255.255.255.0 -natip 10.102.29.50
 Done
```

```
> show rnat
1)      Network: 192.168.1.0      Netmask: 255.255.255.0
        NatIP: 10.102.29.50
 Done
```

If instead of a single NAT IP address you specify a range, RNAT entries are created with all the NetScaler-ow

```
> set rnat 192.168.1.0 255.255.255.0  -natIP 10.102.29.[50-110]
 Done
> show rnat
1)      Network: 192.168.1.0      Netmask: 255.255.255.0
        NatIP: 10.102.29.59
2)      Network: 192.168.1.0      Netmask: 255.255.255.0
        NatIP: 10.102.29.66
3)      Network: 192.168.1.0      Netmask: 255.255.255.0
        NatIP: 10.102.29.67
4)      Network: 192.168.1.0      Netmask: 255.255.255.0
        NatIP: 10.102.29.79
5)      Network: 192.168.1.0      Netmask: 255.255.255.0
        NatIP: 10.102.29.90
6)      Network: 192.168.1.0      Netmask: 255.255.255.0
        NatIP: 10.102.29.102
7)      Network: 192.168.1.0      Netmask: 255.255.255.0
        NatIP: 10.102.29.103
 Done
```

An ACL as the condition and a MIP or SNIP as the NAT IP address:

```
> set rnat acl1
 Done
> show rnat
1)      ACL Name: acl1
        NatIP: *
 Done
```

An ACL as a condition and a unique IP address as the NAT IP address:

```
> set rnat acl1  -natIP 209.165.202.129
Done
> show rnat
1)      ACL Name: acl1
        NatIP: 209.165.202.129
 Done
```

If instead of a single NAT IP address you specify a range, RNAT entries are created with all the NetScaler-ow

```
> set rnat acl1  -natIP 10.102.29.[50-70]
 Done
> show rnat
1)      ACL Name: acl1
        NatIP: 10.102.29.59
2)      ACL Name: acl1
        NatIP: 10.102.29.66
3)      ACL Name: acl1
        NatIP: 10.102.29.67
```

Done

Parameters for creating an RNAT entry

IPAddress

Address of the network or subnet from which the traffic is flowing.

netmask

Subnet mask associated with the network.

aclname

The name of an extended ACL. The rule of the ACL will be used as an RNAT rule.

redirectPort

The redirect port.

natip

Any NetScaler-owned IPv4 address except the NSIP address. The NetScaler appliance replaces the source IP addresses of server-generated packets with the IP address specified. The IP address must be a public NetScaler-owned IP address. If you specify multiple NetScaler-owned IP addresses for this field, NAT IP selection uses the round robin algorithm for each session. At the NetScaler command line, you can specify a range of IP addresses for this field. All the NetScaler-owned IP addresses, except the NSIP, that fall within the range specified will be set for this field.

To create an RNAT entry by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **Routes**.
2. On the **Routes** page, click the **RNAT** tab.
3. In the details pane, click **Configure RNAT**.
4. In the **Configure RNAT** dialog box, do one of the following:
   - If you want to use the network address as a condition for creating an RNAT entry, click **Network**. Specify values for the following parameters, which correspond to parameters described in "Parameters for creating an RNAT entry" as shown:
     - **Network**—IPAddress
     - **Netmask**—netmask
   - If you want to use an extended ACL as a condition for creating an RNAT entry, click **ACL**. Specify values for the following parameters, which correspond to parameters described in "Parameters for creating an RNAT entry" as shown:
     - **ACL Name**—aclname
     - **Redirect Port**—redirectPort
5. To set a MIP or SNIP as a NAT IP, jump to Step 7.
6. To set a unique IP address as a NAT IP, in the **Available NAT IP (s)** list, select the IP address that you want to set as the NAT IP, and then click **Add**. The NAT IP you selected appears in the **Configured NAT IP(s)** list.
7. Click **Create**, and then **Close**. A message appears in the status bar, stating that the RNAT has been configured successfully.

Monitoring RNAT

You can display RNAT statistics to troubleshoot issues related to IP address translation.

To view RNAT statistics by using the NetScaler command line

At the NetScaler command prompt, type:

stat rnat

Example

```
> stat rnat

RNAT summary
                        Rate (/s)          Total
Bytes Received                0                0
Bytes Sent                    0                0
Packets Received              0                0
Packets Sent                  0                0
Syn Sent                      0                0
Current RNAT sessions         --               0
 Done
>
```

The following tables describes the statistics associated with RNAT and RNAT IP.

Table 1. RNAT Statistics

Statistic	Description
Bytes received	Bytes received during RNAT sessions
Bytes sent	Bytes sent during RNAT sessions
Packets received	Packets received during RNAT sessions
Packets sent	Packets sent during RNAT sessions
Syn sent	Requests for connections sent during RNAT sessions

Current sessions	Currently active RNAT sessions

To monitor RNAT by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **Routes**.
2. In the details pane, on the **RNAT** tab, click **Statistics**. The **Statistics** dialog box appears, displaying the RNAT statistics.

RNAT in USIP, USNIP, and LLB Modes

When RNAT and Use Source IP (USIP) are both configured, RNAT takes precedence. When RNAT and USNIP are configured, selection of the source IP address is based on the state of USNIP, as follows:

- If USNIP is off, the NetScaler appliance uses the mapped IP addresses.
- If USNIP is on, the NetScaler uses a SNIP as the NAT IP address.

This behavior does not apply when a unique NAT IP address is used.

In a topology where the NetScaler appliance performs both Link Load Balancing (LLB) and RNAT for traffic originating from the server, the appliance selects the source IP address based on the router. The LLB configuration determines selection of the router.

For more information about LLB, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Configuring Prefix-Based IPv6-IPv4 Translation

Prefix-based translation is a process of translating packets sent from private IPv6 servers into IPv4 packets, using an IPv6 prefix configured in the NetScaler appliance. This prefix has a length of 96 bits (128-32=96). The IPv6 servers embed the destination IP address of the IPv4 servers or hosts in the last 32 bits of the destination IP address field of the IPv6 packets. The first 96 bits of the destination IP address field are set as the IPv6 NAT prefix.

The NetScaler appliance compares the first 96 bits of the destination IP address of all the incoming IPv6 packets to the configured prefix. If there is a match, the NetScaler appliance generates an IPv4 packet and sets the destination IP address as the last 32 bits of the destination IP address of the matched IPv6 packet. IPv6 packets addressed to this prefix have to be routed to the NetScaler so that the IPv6-IPv4 translation is done by the NetScaler.

In the following diagram, 3ffe::/96 is configured as the IPv6 NAT prefix on NetScaler NS1. The IPv6 host sends an IPv6 packet with destination IP address 3ffe::74.125.91.105. NS1 compares the first 96 bits of the destination IP address of all the incoming IPv6 packets to the configured prefix, and they match. NS1 then generates an IPv4 packet and sets the destination IP address as 74.125.91.105.

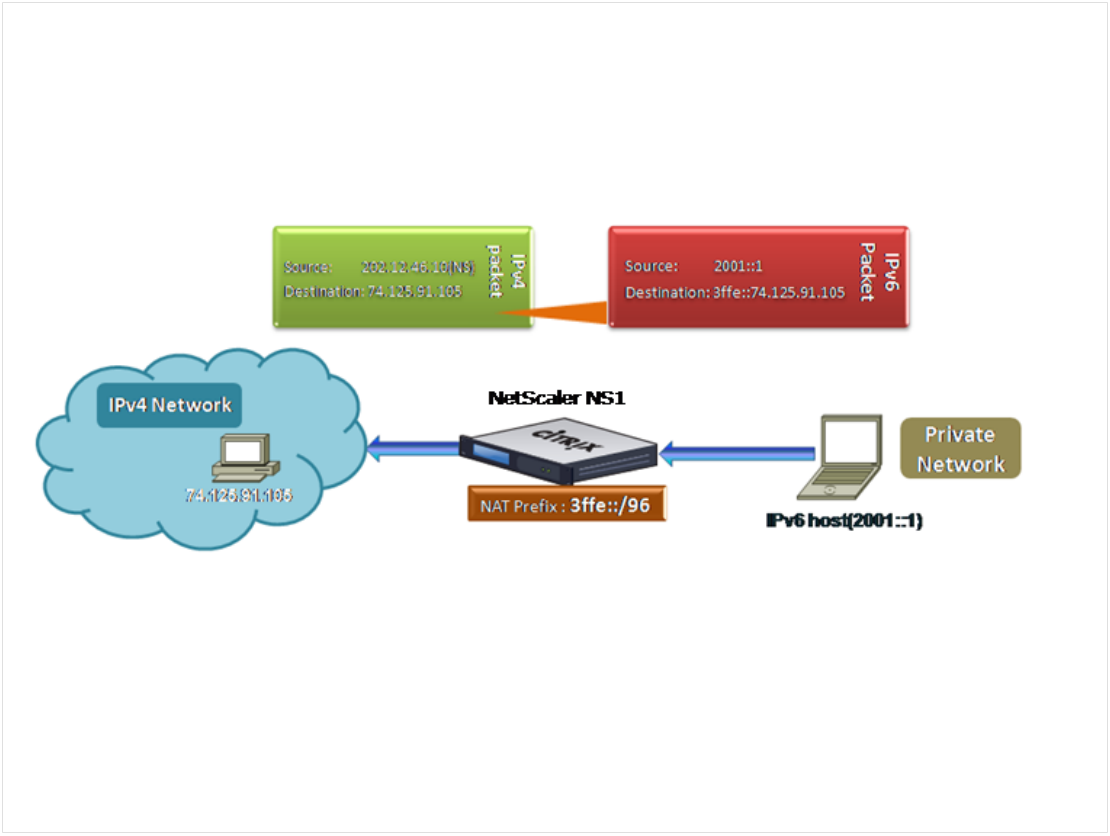

Figure 1. IPv6-IPv4 Prefix-Based Translation

To configure prefix-based IPv6-IPv4 translation by using the NetScaler command line

At the NetScaler command prompt, type the following commands to set a nat prefix and verify its configuration:

- set ipv6 [**-natprefix** <ipv6_addr|*>]
- show ipv6

Example

```
> set ipv6 -natprefix 3ffe::/96
 Done
> show ipv6
 IPv6 NAT prefix : 3ffe::/96
 IPv6 RA learning : DISABLED
 ND6 base reachable time : 30000 ms
 ND6 computed reachable time : 16848 ms
 ND6 retransmission time : 1000 ms
 Done
```

Parameter for configuring prefix-based IPv6-IPv4 translation

natprefix

The prefix used for translating packets from private IPv6 servers to IPv4 packets. This prefix has a length of 96 bits (128-32=96). The IPv6 servers embed the destination IP address of the IPv4 servers or hosts in the last 32 bits of the destination IP address field of the IPv6 packets. The first 96 bits of the destination IP address field are set as the IPv6 NAT prefix. IPv6 packets addressed to this prefix have to be routed to the NetScaler so that the IPv6-IPv4 translation is done by the NetScaler.

To configure prefix-based IPv6-IPv4 translation by using the configuration utility

1. In the navigation pane, expand **Network**.
2. In the details pane, in the **Settings** group, click **Change IPv6 Settings**.
3. In the **Configure IPv6 settings** dialog box, set the following parameter, which corresponds to the parameter described in "Parameter for configuring prefix-based IPv6-IPv4 translation" as shown:
   - **IPv6 NAT prefix**—natprefix
4. Click **OK**. A message appears in the status bar, stating that the IPv6 NAT prefix entry has been configured successfully.

Configuring Static ARP

You can add static ARP entries to and remove static ARP entries from the ARP table. After adding an entry, you should verify the configuration. If the IP address, port, or MAC address changes after you create a static ARP entry, you must remove or manually adjust the static entry. Therefore, creating static ARP entries is not recommended unless necessary.

To add a static ARP entry by using the NetScaler command line

At the NetScaler command prompt, type:

- add arp **-IPAddress** <ip_addr> **-mac**<mac_addr> **-ifnum** <interface_name>
- show arp <IPAddress>

Example

```
> add arp -ip 10.102.29.6 -mac 00:24:e8:73:ca:ec -ifnum 1/1
 Done
> show arp 10.102.29.6
      IP             MAC              Iface VLAN  Origin
      --             ---              ----- ----  ------
1)     10.102.29.6      00:24:e8:73:ca:ec  1/1   1     DYNAMIC
 Done
```

To remove a static ARP entry by using the NetScaler command line

At the NetScaler command prompt, type the rm arp command and the IP address.

Parameters for adding a static ARP entry

IPAddress

The IP address of the server.

mac

The MAC address of the server. Type the MAC address with colons (:) as shown in the example above.

ifnum

The physical interface for the ARP entry. Use the show interface command to view the valid interface names.

To add a static ARP entry by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **ARP Table**.
2. On the **ARP Table** page, in the details pane, click **Add**.
3. In the **Create ARP entry** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for adding an ARP entry" as shown:
   - **IP Address***—ip
   - **MAC Address***—mac
   - **Interface Number***—ifnum

   *A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the ARP entry has been configured successfully.

Setting the Timeout for Dynamic ARP Entries

You can globally set an aging time (time-out value) for dynamically learned ARP entries. The new value applies only to ARP entries that are dynamically learned after the new value is set. Previously existing ARP entries expire after the previously configured aging time.

You can specify an ARP time-out value of from 1 through 1200 seconds.

To set the time-out for dynamic ARP entries by using the NetScaler command line

At the NetScaler command prompt, type the following commands to set the time-out for dynamic ARP entries and verify its configuration:

- set arpparam **-timeout** <positive_integer>]
- show arpparam

Example

```
> set arpparam -timeout 500
 Done
> show arpparam
       ARP Parameters
      Aging time for ARP table entry : 500
 Done
```

To set the time-out for dynamic ARP entries to its default value by using the NetScaler command line

At the NetScaler command prompt, type the following commands to set the time-out for dynamic ARP entries to its default value and verify its configuration:

- unset arpparam
- show arpparam

Example

```
> unset arpparam
 Done
> show arpparam
       ARP Parameters
       Aging time for ARP table entry : 1200
 Done
```

To set the time-out for dynamic ARP entries by using the configuration utility

1. In the navigation pane, click **Network**.
2. In the details pane, in the **Settings** group, click **Configure ARP Global Parameters**.
3. In the **Configure ARP Global Parameters** dialog box, type a value for **ARP Table Entry Timeout**.
4. Click **OK**. A message appears in the status bar, stating that the ARP Global settings have been changed successfully.

Configuring Neighbor Discovery

Neighbor discovery (ND) is one of the most important protocols of IPv6. It is a message-based protocol that combines the functionality of the Address Resolution Protocol (ARP), Internet Control Message Protocol (ICMP), and Router Discovery. ND allows nodes to advertise their link layer addresses and obtain the MAC addresses or link layer addresses of the neighboring nodes.This process is performed by the Neighbor Discovery protocol (ND6).

Neighbor discovery can perform the following functions:

Router Discovery

Enables a host to discover the local routers on an attached link and automatically configure a default router.

Prefix Discovery

Enables the host to discover the network prefixes for local destinations.

Note: Currently, the NetScaler does not support Prefix Discovery.

Parameter Discovery

Enables a host to discover additional operating parameters, such as MTU and the default hop limit for outbound traffic.

Address Autoconfiguration

Enables hosts to automatically configure IP addresses for interfaces both with and without stateful address configuration services such as DHCPv6. The NetScaler does not support Address Autoconfiguration for Global IPv6 addresses.

Address Resolution

Equivalent to ARP in IPv4, enables a node to resolve a neighboring node's IPv6 address to its link-layer address.

Neighbor Unreachability Detection

Enables a node to determine the reachability state of a neighbor.

Duplicate Address Detection

Enables a node to determine whether an NSIP address is already in use by a neighboring node.

Redirect

Equivalent to the IPv4 ICMP Redirect message, enables a router to redirect the host to a better first-hop IPv6 address to reach a destination.

Note: The NetScaler does not support IPv6 Redirect.

To enable neighbor discovery, you create entries for the neighbors.

Adding IPv6 Neighbors

Adding IPv6 neighbors enables neighbor discovery.

To add an IPv6 neighbor by using the NetScaler command line

At the NetScaler command prompt, type:

- add nd6 <neighbor> <mac> <ifnum> [**-vlan** <integer>]
- show nd6

Example

```
> add nd6 2001::1 00:04:23:be:3c:06 1/1 –vlan 1
 Done
> show nd6
   Neighbor              MAC-Address(Vlan, Interface)      State       TIME
   --------              ----------------------------      -----     --------
1) ::1                   00:d0:68:0b:58:da(   1,  LO/1)   REACHABLE     PERMANENT
2) fe80::2d0:68ff:fe0b:58da 00:d0:68:0b:58:da(   1,  LO/1)   REACHABLE     PERMANENT
3) 2001::1               00:04:23:be:3c:06(   1,   1/1)   REACHABLE       STATIC
 Done
```

Neighbor Discovery Parameters

neighbor

IPv6 neighbor entry. Mandatory.

mac

Unique address assigned to identify the network appliance. Mandatory.

ifnum

The interface on which the MAC resides. Mandatory.

vlan

Virtual LAN (VLAN) that the neighbor is part of.

To add an IPv6 neighbor by using the configuration utility

1. In the navigation pane, expand **Network** and click **IPv6 Neighbors**.
2. In the details pane, click **Add**.
3. In the **CreateIPv6 Neighbor** dialog box, in the **Neighbor** and **MAC Address** text boxes, respectively, type IPv6 address and MAC Address of the neighbour (for example, 3ffe:100:100::1, 00:d0:68:0b:58:da).
4. If the neighbor is part of a VLAN, in the and **VLAN** field, type the VLAN ID (for example, 1).
5. In the **Interface** list box, select the interface of the neighbour (for example, LO/1).
6. Click **Create**, and click **Close**.

Removing IPv6 Neighbors

To remove a neighbor discovery entry by using the NetScaler command line

At the NetScaler command prompt, type:

rm nd6 <Neighbour> **-vlan** <VLANID>

Example

```
rm nd6 3ffe:100:100::1 -vlan 1
```

To remove all neighbor discovery entries by using the NetScaler command line

At the NetScaler command prompt, type:

clear nd6

To remove a neighbor discovery entry by using the configuration utility

1. In the navigation pane, expand **Network** and click **IPv6 Neighbor**.
2. In the details pane, select the neighbour entry that you want to remove (for example,3ffe:100:100::1).
3. Click **Remove**.

To remove all neighbor discovery entries by using the configuration utility

1. In the navigation pane, expand **Network** and click **IPv6 Neighbor**.
2. In the **IPv6 Neighbors** page, click **Clear**.

Configuring IP Tunnels

An IP Tunnel is a communication channel, that can be created by using encapsulation technologies, between two networks that do not have a routing path. Every IP packet that is shared between the two networks is encapsulated within another packet and then sent via the tunnel.

The NetScaler appliance implements IP Tunneling in the following ways:

- NetScaler as an Encapsulator (Load Balancing with DSR mode)
- NetScaler as a Decapsulator

NetScaler as an Encapsulator (Load Balancing with DSR Mode)

Consider an organization that has multiple data centers across different countries, where the NetScaler maybe at one location and the back-end servers are located in a different country. In essence, the NetScaler and the back-end servers are on different networks and are connected via a router.

When you configure Direct Server Return (DSR) on this NetScaler, the packet sent from the source subnet is encapsulated by the NetScaler and sent via a router and tunnel to the appropriate back-end server. The back-end server decapsulates the packet and responds directly to the client, without allowing the packet to pass via the NetScaler.

NetScaler as a Decapsulator

Consider an organization having multiple data centers each having NetScalers and back-end servers. When a packet is sent from data center A to data center B it is usually sent via an intermediary, say a router or another NetScaler. The NetScaler processes the packet and then forwards the packet to the back-end server. However, if an encapsulated packet is sent, the NetScaler must be able to decapsulate the packet before sending it to the back-end servers. To enable the NetScaler to function as a decapsulator, a tunnel is added between the router and the NetScaler. When the encapsulated packet, with additional header information, reaches the NetScaler, the data packet is decapsulated i.e. the additional header information is removed, and the packet is then forwarded to the appropriate back-end servers.

The NetScaler can also be used as a decapsulator for the Load Balancing feature, specifically in scenarios when the number of connections on a vserver exceeds a threshold value and all the new connections are then diverted to a back-up vserver.

Creating IP Tunnels

For enabling IP/IP (IP Tunneling) for a specific virtual IP (VIP) address you need to create an IP tunnel manually, known as configured tunnels. For Cloud Bridge, you need to create GRE tunnels.

To create an IP tunnel by using the NetScaler command line

At the NetScaler command prompt type:

- add iptunnel <name> <remoteIp> <remoteSubnetMask> <localIp> **-type** -**protocol** (ipoverip | GRE) -**secure** (YES | NO)
- show iptunnel

To modify or remove an IP tunnel by using the NetScaler command line

- To modify an IP tunnel, type the set iptunnel command, the name of the tunnel, and the parameters to be changed, with their new values.
- To remove an IP tunnel, type the rm iptunnel command and the name of the tunnel.

Parameters for creating an IP tunnel

name

Name of the IP Tunnel. This alphanumeric string is required and cannot be changed after the service group is created. The name must not exceed 127 characters, and the leading character must be a number or letter. The following characters are also allowed: @ _ - . (period) : (colon) # and space ( ).

remoteIp

A public IPv4 address of the remote NetScaler appliance used to set up the tunnel.

remoteSubnetMask

Subnet mask of the remote IP address of the tunnel.

localIp

A public IPv4 address of the local NetScaler appliance used to set up the tunnel. Possible values: Auto, MIP, SNIP, and VIP. Default: Auto.

protocol

The protocol to be used in setting up the IP tunnel. Select GRE for using the Generic Routing Encapsulation (GRE) protocol to set up a GRE tunnel.

secure

Enable or disable IPSec for securing communication in the GRE tunnel.

To create an IP Tunnel by using the configuration utility

1. In the navigation pane, expand **Network**, and click **IP Tunnels**.
2. In the details pane, click **Add**.
3. In the **Add IP Tunnel** dialog box, specify values for the following parameters:
   - **Name*—**name
   - **Remote IP*—**remoteIp
   - **Remote Mask*—**remoteSubnetMask
   - **Local IP Type***—localIp (in the **local IP Type** drop down list, select one of the IP type (Mapped IP, Subnet IP, and Virtual). All the configured IPs of the selected IP type will be populated in the **Local IP** drop down list. Select the desired IP from the list.)
   - **Protocol—**protocol
   - **Secure—**secure

   *A required parameter.
4. Click **Create**, and then click **Close.**

Customizing IP Tunnels Globally

By globally specifying the source IP address, you can assign a common source IP address across all tunnels. Also, because fragmentation is CPU-intensive, you can globally specify that the NetScaler appliance drop any packet that requires fragmentation. Alternatively, if you would like to fragment all packets as long as a CPU threshold value is not reached, you can globally specify the CPU threshold value.

To globally customize IP tunnels by using the NetScaler command line

At the NetScaler command prompt, type the following commands to globally customize IP tunnels and verify the configuration:

- set iptunnelparam -srcIP <sourceIPAddress> **-srcIPRoundRobin** (**YES** | **NO**)-dropFrag [**YES** | **NO**] **-dropFragCpuThreshold** <Positive integer>
- show iptunnelparam

Example

```
> set iptunnelparam –srcIP 12.12.12.22 -dropFrag Yes –dropFragCpuThreshold 50
 Done
> show iptunnelparam
Tunnel Source IP: 12.12.12.22
Round Robin of Tunnel Source IP: NO
Drop if Fragmentation Needed: Yes
CPU usage threshold to avoid fragmentation: 50
 Done
> set iptunnelparam -srcIPRoundRobin YES -dropFrag Yes –dropFragCpuThreshold 50
 Done
> show iptunnelparam
Tunnel Source IP: 0.0.0.0
Round Robin of Tunnel Source IP: Yes
Drop if Fragmentation Needed: Yes
CPU usage threshold to avoid fragmentation: 50
 Done
```

Note: To create a new MIP or SNIP address to use as the global source IP address, use the add ns ip command before you type the set iptunnelparam command.

Parameters for customizing IP tunnels globally

srcIP

The common source IP address for all tunnels. Must be a MIP or a SNIP address.

srcIPRoundRobin

Use a different source IP address for each new session through a particular IP tunnel, as determined by round robin selection of one of the SNIP addresses. This setting is ignored if a common global source IP address has been specified for all the IP tunnels. This setting does not apply to a tunnel for which a source IP address has been specified. Possible values: YES, NO. Default: NO.

dropFrag

Drop any packet that requires fragmentation. Possible values: YES, NO. Default: NO.

dropFragCpuThreshold

Threshold value, as a percentage of CPU usage, at which to drop packets that require fragmentation. Applies only if dropFrag is set to NO. Minimum value: 1. Maximum value: 100. Default: 0 (Not set).

To globally customize IP tunnels by using the configuration utility

1. In the navigation pane, expand **Network**.
2. In the details pane, in the **Settings** group, click **IP Tunnel Global Settings**.
3. In the **Configure IP Tunnel Global Parameters** dialog box, set the following parameters, which correspond to parameters described in "Parameters for customizing the IP tunnels globally" as shown:
   - **Source IP**—srcIP
   - **Round Robin of Source IP**—srcIPRoundRobin
   - **Drop Packet if Fragmentation is required**—dropFrag
   - **Don’t fragment and drop packet if CPU usage is >=** —dropFragCpuThreshold
4. Click **OK** and then click **Close.** A message appears in the status bar, stating that the IP Tunnel Global Parameters have been configured successfully.

Interfaces

Before you begin configuring interfaces, decide whether your configuration can use MAC-based forwarding mode, and either enable or disable this system setting accordingly. The number of interfaces in your configuration is different for the different models of the Citrix® NetScaler® appliance. In addition to configuring individual interfaces, you can logically group interfaces, using VLANs to restrict data flow within a set of interfaces, and you can aggregate links into channels. In a high availability setup, you can configure a virtual MAC (VMAC) address if necessary. If you use L2 mode, you might want to modify the aging of the bridge table.

When your configuration is complete, decide whether you should enable the system setting for path MTU discovery. NetScaler appliances can be deployed in active-active mode using VRRP. An active-active deployment, in addition to preventing downtime, makes efficient use of all the NetScaler appliances in the deployment. You can use the Network Visualizer tool to view the network configuration of a NetScaler deployment and configure interfaces, channels, VLANs, and bridge groups.

Configuring MAC-Based Forwarding

With MAC-based forwarding (MBF) enabled, when a request reaches the NetScaler appliance, the appliance remembers the source MAC address of the frame and uses it as the destination MAC address for the resulting replies. MAC-based forwarding can be used to avoid multiple-route/ARP lookups and to avoid asymmetrical packet flows. MAC-based forwarding may be required when the NetScaler is connected to multiple stateful devices, such as VPNs or firewalls, because it ensures that the return traffic is sent to the same device that the initial traffic came from.

MAC-based forwarding is useful when you use VPN devices, because it guarantees that all traffic flowing through a VPN passes back through the same VPN device.

The following topology diagram illustrates the process of MAC-based forwarding.

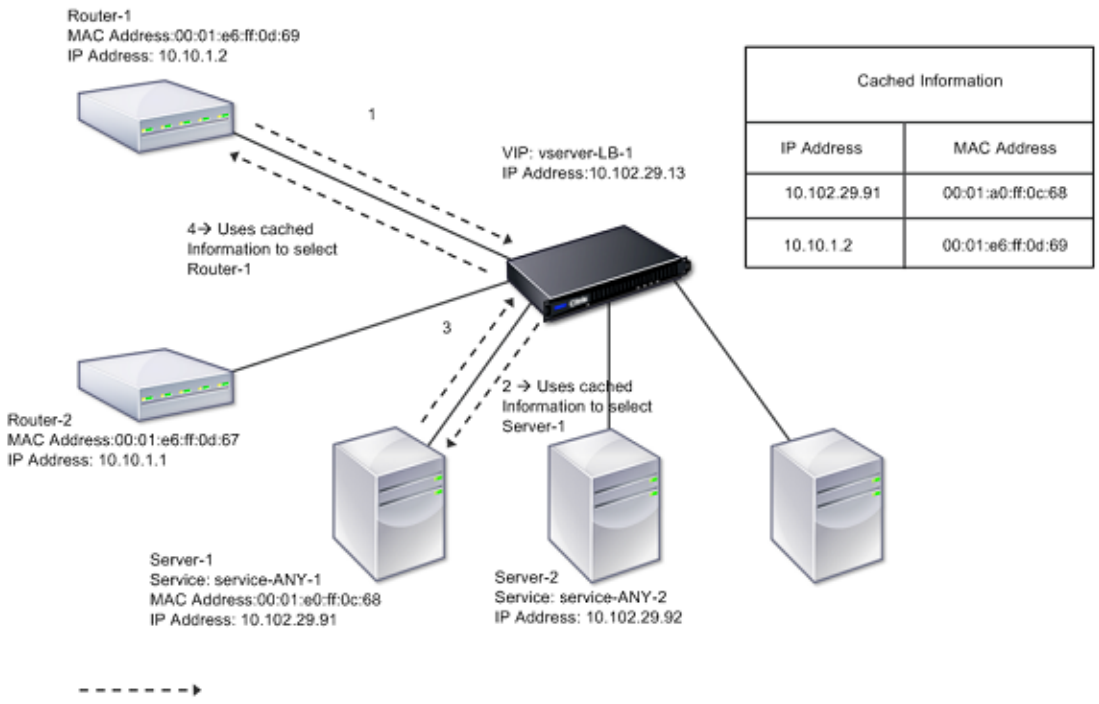

Figure 1. MAC-Based Forwarding Mode

When MAC-based forwarding (MBF) is enabled, the NetScaler caches the MAC address of:

- The source (a transmitting device such as router, firewall, or VPN device) of the inbound connection.
- The server that responds to the requests.

When a server replies through the NetScaler appliance, the appliance sets the destination MAC address of the response packet to the cached address, ensuring that the traffic flows

in a symmetric manner, and then forwards the response to the client. The process bypasses the route table lookup and ARP lookup functions. However, when the NetScaler initiates a connection, it uses the route and ARP tables for the lookup function. In a direct server return configuration, you must enable MAC-based forwarding.

For more information about direct server return configurations, see "Load Balancing" chapter of the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Some deployment topologies may require the incoming and outgoing paths to flow through different routers. MAC-based forwarding would break this topology design.

MBF should be disabled in the following situations:

- **When you configure link load balancing.** In this case, asymmetric traffic flows are desirable because of link costs.
- **When a server uses network interface card (NIC) teaming without using LACP (802.1ad Link Aggregation).** To enable MAC-based forwarding in this situation, you must use a layer 3 device between the NetScaler and server.

  Note: MBF can be enabled when the server uses NIC teaming with LACP, because the virtual interface uses one MAC address.
- When firewall clustering is used. Firewall clustering assumes that ARP is used to resolve the MAC address for inbound traffic. Sometimes the inbound MAC address can be a non-clustered MAC address and should not be used for inbound packet processing.

When MBF is disabled, the NetScaler uses L2 or L3 connectivity to forward the responses from servers to the clients. Depending on the route table, the routers used for outgoing connection and incoming connection can be different. In the case of reverse traffic (response from the server):

- If the source and destination are on different IP subnets, the NetScaler uses the route lookup to locate the destination.
- If the source is on the same subnet as the destination, the NetScaler looks up the ARP table to locate the network interface and forwards the traffic to it. If the ARP table does not exist, the NetScaler requests the ARP entries.

To enable or disable MAC-based forwarding by using the NetScaler command line

At the NetScaler command prompt, type:

- enable ns mode mbf
- disable ns mode mbf

To enable or disable MAC-based forwarding by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, in the **Modes and Features** group, click **Configure modes**.
3. In the **Configure Modes** dialog box, do one of the following:
   - To enable MAC-based forwarding, select the **MAC-based forwarding** check box.
   - To disable MAC-based forwarding, clear the **MAC-based forwarding** check box.
4. Click **OK**.
5. In the **Enable/Disable Feature(s)?** dialog box, click **Yes**. A message appears in the status bar, stating that the selected modes are enabled and the unselected modes are disabled.

Configuring Network Interfaces

Network interfaces in the NetScaler appliance are numbered in <slot>/<port> notation. After configuring your interfaces, you should display the interfaces and their settings to verify the configuration. You can also display this information to troubleshoot a problem in the configuration.

To manage the network interfaces, you might have to enable some interfaces and disable others. You can reset an interface to renegotiate its settings. You can clear the accumulated statistics for an interface. To verify the configuration, you can display the interface settings. You can display the statistics for an interface to evaluate its health.

Setting the Network Interface Parameters

The network interface configuration is neither synchronized nor propagated. For an HA pair, you must perform the configuration on each unit independently.

Network interface parameters include Link Aggregate Control Protocol (LACP) settings. For more information about Link Aggregate Control Protocol (LACP), see Configuring Link Aggregation Using the Link Aggregate Channel Protocol.

To set the network interface parameters by using the NetScaler command line

At the NetScaler command prompt, type:

- set interface <id> [**-speed** <speed>] [**-duplex** <duplex>] [**-flowControl** <flowControl>] [**-autoneg** (DISABLED | ENABLED)] [**-haMonitor** (ON | OFF)] [**-trunk** (ON | OFF)] [**-lacpMode** <lacpMode>] [**-lacpKey**<positive_integer>] [**-lacpPriority** <positive_integer>] [**-lacpTimeout** (LONG | SHORT)] [**-ifAlias** <string>] [**-throughput** <positive_integer>][**-bandwidthHigh** <positive_integer> [**-bandwidthNormal** <positive_integer>]]

- show interface [<id>]

Example

```
> set interface 1/8 -duplex full
 Done
> show interface 1/8
      Interface 1/8 (Gig Ethernet 10/100/1000 MBits) #2
      flags=0x4004000 <ENABLED, DOWN, BOUND to LA/1, down, autoneg, 802.1q>
      MTU=1514, MAC=00:d0:68:15:fd:3d, downtime 906h53m53s
      Requested: media UTP, speed AUTO, duplex FULL, fctl OFF, throughput 0
      RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
      TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
      NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0) Muted(0)
      Bandwidth thresholds are not set.
Done
```

Parameters for setting a Network Interface

id

The number assigned to the interface.

speed

Ethernet speed for the interface. Possible values: AUTO, 10, 100, 1000, and 10000 Mbps. Default: AUTO. A setting other than AUTO requires the same configuration for device at the other end of the link. Mismatched speed or duplex configurations can cause link errors, packet losses, and other errors. Some network interfaces do not support certain speeds. An attempt to set an unsupported speed is reported as an error.

duplex

Duplex mode for the interface. Possible values: AUTO, HALF, and FULL. Default: AUTO. AUTO is recommended. If you force HALF or FULL mode, you must manually configure the same mode and identical speed on both sides of the link.

flowControl

Apply 802.3x flow control to the interface. Possible values: OFF, RX, TX, RXTX, and ON (forced RXTX). Default: OFF. Real flow control status depends on the auto-negotiation results. Link parameter mismatches must be checked for and avoided because, for example, they can cause the NetScaler to drop packets, or the link may not be accessible.

autoneg

Use auto negotiation on the interface. Possible values: DISABLED and ENABLED.

haMonitor

Monitor the interface for failure events. Possible values: ON and OFF. Default: ON. When ON in an HA configuration, failover occurs when a network interface fails. If a network interface is not being used, or if failover is not required, select OFF. (Also, if the network interface is not used in the configuration, you must disable it.)

trunk

Trunk port functionality for the interface. Possible values: ON and OFF. Default: OFF. With the ON setting, traffic is tagged for the VLANs bound to this network interface, including the default VLAN. If you require 802.1q behavior with backward compatibility, you must set this parameter to OFF.

lacpMode

LACP mode. Possible values: DISABLED, ACTIVE, and PASSIVE. Default: DISABLED

lacpKey

LACP key for the interface. Possible values: 1 to 4.

lacpPriority

LACP port priority. Possible values: 1 to 65535. Default: 32768.

lacpTimeout

LACP timeout setting. Possible values: LONG and SHORT. Default: LONG.

ifAlias

Alias name for the interface.

throughput

Minimum required throughput for the interface.

To set the network interface parameters by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **Interfaces**.
2. On the **Interfaces** pane, select the network interface that you want to modify (for example, **1/8**), and then click **Open**.
3. In the **Configure Interface** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring a network interface" as shown:
   - **Speed**—speed
   - **Duplex**—duplex
   - **Flow Control**—flowControl
   - **Auto Negotiation**—autoneg
   - **HA Monitoring**—haMonitor
   - **Trunk**—trunk
   - **Alias Name**—ifAlias
   - **Throughput**—throughput
   - **Bandwidth High**—bandwidthHigh
   - **Bandwidth Normal**—bandwidthNormal
   - **LACP Mode**—lacpMode
   - **LACP Key**—lacpKey
   - **LACP Time**—out-lacpTimeout
   - **LACP Priority**—lacpPriority
4. Click **OK**. A message appears in the status bar, stating that the interface has been configured successfully.

Enabling and Disabling Network Interfaces

By default, the network interfaces are enabled. You must disable any network interface that is not connected to the network, so that it cannot send or receive packets. Disabling a network interface that is connected to the network in a high availability setup can cause failover.

For more information about high availability, see High Availability.

To enable or disable a network interface by using the NetScaler command line

At the NetScaler command prompt, type one of the following pairs of commands to enable or disable an interface and verify the setting:

- enable interface <interface_num>
- show interface <interface_num>
- disable interface <interface_num>
- show interface <interface_num>

Example

```
> enable interface 1/8
 Done
> show interface 1/8
      Interface 1/8 (Gig Ethernet 10/100/1000 MBits) #2
      flags=0x4004000 <ENABLED, DOWN, BOUND to LA/1, down, autoneg, 802.1q>
      MTU=1514, MAC=00:d0:68:15:fd:3d, downtime 906h58m40s
      Requested: media UTP, speed AUTO, duplex FULL, fctl OFF, throughput 0
      RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
      TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
      NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0) Muted(0)
      Bandwidth thresholds are not set.
Done
```

To enable or disable a network interface by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **Interfaces**.
2. On the **Interfaces** pane, select the network interface that you want to enable or disable, and do one of the following:
   - To enable a network interface, click **Enable**.
   - To disable a network interface, click **Disable**.

   A message appears in the status bar, stating that the network interface has been enabled or disabled successfully.

Resetting Network Interfaces

Network interface settings control properties such as duplex and speed. To renegotiate the settings of a network interface, you must reset it.

To reset a network interface by using the NetScaler command line

At the NetScaler command prompt, type the following commands to reset an interface and verify the setting:

- reset interface <interface_num>
- show interface <interface_num>

Example

```
> reset interface 1/8
 Done
> show interface 1/8
        Interface 1/8 (Gig Ethernet 10/100/1000 MBits) #2
        flags=0x4004000 <disabled, DOWN, BOUND to LA/1, down, autoneg, 802.1q>
        MTU=1514, MAC=00:d0:68:15:fd:3d, downtime 907h04m59s
        Requested: media UTP, speed AUTO, duplex FULL, fctl OFF, throughput 0
        RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
        TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
        NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0) Muted(0)
        Bandwidth thresholds are not set.
Done
```

To reset a network interface by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **Interfaces**.
2. On the **Interfaces** pane, select the network interface that you want to reset (for example, **1/8**).
3. Click **Reset Interface**. A message appears in the status bar, stating that the network interface has been reset successfully.

Monitoring a Network Interface

You can display network interface statistics to monitor parameters such as packets sent and packets received, throughput, Link Aggregate Control Protocol (LACP) data units, and errors, and use the information to check the health of the network interface. You can clear the statistics of a network interface to monitor its statistics from the time the statistics are cleared.

To display the statistics of the network interfaces by using the NetScaler command line

At the NetScaler command prompt, type:

stat interface <interface_num>

Example

```
> stat interface 1/8
Interface [1/8]:
Interface State                 DOWN
Link uptime                  00:00:00
Link downtime                8.01:01:34

Throughput Statistics
                          Rate (/s)          Total
Bytes received                   0              0
Bytes transmitted                0              0
Packets received                 0              0
Packets transmitted              0              0

Packet Statistics
                          Rate (/s)          Total
Multicast packets                0              0
NetScaler packets                0              0

LACP Statistics
                          Rate (/s)          Total

```

To display the statistics of an Interface by using the configuration utility

1. In the navigation pane, expand **Network** and click **Interfaces**.
2. On the **Interfaces** page, select the network interface whose statistics you want to display (for example, **1/8**).
3. Click **Statistics**.

To clear a network interface's statistics by using the NetScaler command line

At the NetScaler command prompt, type:

clear interface <interface_num>

Example

```
> clear interface 1/8
 Done
```

To clear a network interface's statistics by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **Interfaces**.

2. On the **Interfaces** pane, select the network interface whose statistics youwant to clear (for example, **1/8**).

3. Click **Clear Statistics**. A message appears in the status bar, stating that the statistics have been successfully cleared.

Configuring Forwarding Session Rules

By default, the NetScaler appliance does not create session entries for traffic that it only forwards (L3 mode). For a case in which a client request that the appliance forwards to a server results in a response that has to return by the same path, you can create a forwarding-session rule. A forwarding-session rule creates forwarding-session entries for traffic that originates from or is destined for a particular network and is forwarded by the NetScaler.

Note: This feature is supported only on NetScaler 9.3.e.

To create a forwarding session rule by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create a forwarding-session rule and verify the configuration:

- add forwardingSession <name> [<network> <netmask>] | [-**aclname** <string>]
- show forwardingSession

Examples

A network address as the condition:

```
> add forwardingSession fs-nw-1 10.102.105.51 255.255.255.255
 Done

> show forwardingSession fs-nw-1
1)      Forward Session: fs-nw-1
       Network: 10.102.105.51     Netmask: 255.255.255.255

 Done
```

An ACL as the condition:

```
> add forwardingSession fs-acl-1 acl1
 Done

> show forwardingSession fs-acl-1
1)      Forward Session: fs-acl-1
       ACL Name: acl1
 Done
```

Parameters for configuring a forwarding session rule

name (Name)

The name of the forwarding session rule that you are configuring. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.

network (Subnet IP)

The network address from which the forwarded traffic originates or to which it is destined.

netmask (Netmask)

Subnet mask associated with the network.

aclname (ACL Name)

The name of an extended ACL with action set to ALLOW. The rule specified in the ACL is used as a forwarding-session rule.

To configure a forwarding session rule by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **Forwarding Sessions**.
2. In the details pane, click **Add**.
3. In the **Create Forwarding Session** dialog box, set the **Name** parameter:
4. Do one of the following:
   - If you want to use the network address as a condition for creating a forwarding session rule, click **Subnet** and set the following parameters:
     - **Subnet IP**
     - **Netmask**
   - If you want to use an extended ACL as a condition for creating a forwarding session rule, click **ACL** and set the **ACL Name** parameter:
5. Click **Create**, and then **Close**. A message appears in the status bar, stating that the forwarding session rule has been configured successfully.

Understanding VLANs

A NetScaler appliance supports Layer 2 port and IEEE 802.1q tagged VLANs. VLAN configurations are useful when you need to restrict traffic to certain groups of stations. You can configure a network interface as a part of multiple VLANs by using IEEE 802.1q tagging.

You can configure VLANs and bind them to IP subnets. The NetScaler then performs IP forwarding between these VLANs (if it is configured as the default router for the hosts on these subnets).

The NetScaler supports the following types of VLANs:

Port-Based VLANs. The membership of a port-based VLAN is defined by a set of network interfaces that share a common, exclusive Layer 2 broadcast domain. You can configure multiple port-based VLANs. By default, all network interfaces on the NetScaler are members of VLAN 1.

If you apply 802.1q tagging to the port, the network interface belongs to a port-based VLAN. Layer 2 traffic is bridged within a port-based VLAN, and Layer 2 broadcasts are sent to all members of the VLAN if Layer 2 mode is enabled. When you add an untagged network interface as a member of a new VLAN, it is removed from its current VLAN.

Default VLAN. By default, the network interfaces on the NetScaler are included in a single, port-based VLAN as untagged network interfaces. This VLAN is the default VLAN. It has a VLAN ID (VID) of 1. This VLAN exists permanently. It cannot be deleted, and its VID cannot be changed.

When you add a network interface to a to a different VLAN as an untagged member, the network interface is automatically removed from the default VLAN. If you unbind a network interface from its current port-based VLAN, it is added to the default VLAN again.

Tagged VLANs. 802.1q tagging (defined in the IEEE 802.1q standard) allows a networking device (such as the NetScaler) to add information to a frame at Layer 2 to identify the VLAN membership of the frame. Tagging allows network environments to have VLANs that span multiple devices. A device that receives the packet reads the tag and recognizes the VLAN to which the frame belongs. Some network devices do not support receiving both tagged and untagged packets on the same network interface—in particular, Force10 switches. In such cases, you need to contact customer support for assistance.

The network interface can be a tagged or untagged member of a VLAN. Each network interface is an untagged member of one VLAN only (its native VLAN). This network interface transmits the frames for the native VLAN as untagged frames. A network interface can be a part of more than one VLAN if the other VLANs are tagged.

When you configure tagging, be sure to match the configuration of the VLAN on both ends of the link. The port to which the NetScaler connects must be on the same VLAN as the NetScaler network interface.

Note: This VLAN configuration is neither synchronized nor propagated, therefore you must perform the configuration on each unit in an HA pair independently.

Applying Rules to Classify Frames

VLANs have two types of rules for classifying frames:

Ingress rules. Ingress rules classify each frame as belonging only to a single VLAN. When a frame is received on a network interface, the following rules are applied to classify the frame:

- If the frame is untagged, or has a tag value equal to 0, the VID of the frame is set to the port VID (PVID) of the receiving interface, which is classified as belonging to the native VLAN. (PVIDs are defined in the IEEE 802.1q standard.)
- If frame has a tag value equal to FFF, the frame is dropped.
- If the VID of the frame specifies a VLAN of which the receiving network interface is not a member, the frame is dropped. For example, if a packet is sent from a subnet associated with VLAN ID 12 to a subnet associated with VLAN ID 10, the packet is dropped. If an untagged packet with VID 9 is sent from the subnet associated with VLAN ID 10 to a network interface PVID 9, the packet is dropped.

Egress Rules. The following egress rules are applied:

- If the VID of the frame specifies a VLAN of which the transmission network interface is not a member, the frame is discarded.
- During the learning process (defined by the IEEE 802.1q standard), the Src MAC and VID are used to update the bridge lookup table of the NetScaler.
- A frame is discarded if its VID specifies a VLAN that does not have any members. (You define members by binding network interfaces to a VLAN.)

VLANs and Packet Forwarding on the NetScaler

The forwarding process on the NetScaler appliance is similar to that on any standard switch. However, the NetScaler performs forwarding only when Layer 2 mode is on. The key features of the forwarding process are:

- Topology restrictions are enforced. Enforcement involves selecting each network interface in the VLAN as a transmission port (depending on the state of the network interface), bridging restrictions (do not forward on the receiving network interface), MTU restrictions, and so on.
- Frames are filtered on the basis of information in the bridge table lookup in the forwarding database (FDB) table of the NetScaler. The bridge table lookup is based on the destination MAC and the VID. Packets addressed to the MAC address of the NetScaler are processed at the upper layers.
- All broadcast and multicast frames are forwarded to each network interface that is a member of the VLAN, but forwarding occurs only if L2 mode is enabled. If L2 mode is disabled, the broadcast and multicast packets are dropped. This is also true for MAC addresses that are not currently in the bridging table.
- A VLAN entry has a list of member network interfaces that are part of its untagged member set. When forwarding frames to these network interfaces, a tag is not inserted

in the frame.

- If the network interface is a tagged member of this VLAN, the tag is inserted in the frame when the frame is forwarded.

When a user sends any broadcast or multicast packets without the VLAN being identified, that is, during duplicate address detection (DAD) for NSIP or ND6 for the next hop of the route, the packet is sent out on all the network interfaces, with appropriate tagging based on either the Ingress and Egress rules. ND6 usually identifies a VLAN, and a data packet is sent on this VLAN only. Port-based VLANs are common to IPv4 and IPv6. For IPv6, the NetScaler supports prefix-based VLANs.

Configuring a VLAN

You can implement VLANs in the following environments:

- Single subnet
- Multiple subnets
- Single LAN
- VLANs (no tagging)
- VLANs (802.1q tagging)

If you configure VLANs that have only untagged network interfaces as their members, the total number of possible VLANs is limited to the number of network interfaces available in the NetScaler. If more IP subnets are required with a VLAN configuration, 802.1q tagging must be used.

When you bind a network interface to a VLAN, the network interface is removed from the default VLAN. If the network interfaces need to be a part of more than one VLAN, you can bind the network interfaces to the VLANs as tagged members.

You can configure the NetScaler to forward traffic between VLANs at Layer 3. In this case, a VLAN is associated with a single IP subnet. The hosts in a VLAN that belong to a single subnet use the same subnet mask and one or more default gateways connected to that subnet. Configuring Layer 3 for a VLAN is optional. Layer 3 is used for IP forwarding (inter-VLAN routing). Each VLAN has a unique IP address and subnet mask that define an IP subnet for the VLAN. In an HA configuration, this IP address is shared with the other NetScaler appliances. The NetScaler forwards packets between configured IP subnets (VLANs).

When you configure the NetScaler, you must not create overlapping IP subnets. Doing so impedes Layer 3 functionality.

Each VLAN is a unique Layer 2 broadcast domain. Two VLANs, each bound to separate IP subnets, cannot be combined into a single broadcast domain. Forwarding traffic between two VLANs requires a Layer 3 forwarding (routing) device, such as the NetScaler appliance.

Creating or Modifying a VLAN

To configure a VLAN, you create a VLAN entity, and then bind network interfaces and IP addresses to the VLAN. If you remove a VLAN, its member interfaces are added to the default VLAN.

To create a VLAN by using the NetScaler command line

At the NetScaler command prompt, type:

add vlan <id> [**-aliasName** <string>] [**-ipv6DynamicRouting** (ENABLED|DISABLED)]

Example

add vlan 2 –aliasName “Network A”

To bind an interface to a VLAN by using the NetScaler command line

At the NetScaler command prompt, type:

bind vlan <id> **-ifnum** <slot/port>

Example

bind vlan 2 -ifnum 1/8

To bind an IP address to a VLAN by using the NetScaler command line

At the NetScaler command prompt, type:

bind vlan <id> **-IPAddress** <IPAddress> <netMask>

Example

bind vlan 2 -IPAddress 10.102.29.54 255.255.255.0

To remove a VLAN by using the NetScaler command line

At the NetScaler command prompt, type:

rm vlan <id>

Parameters for configuring a VLAN

id

An integer that uniquely identifies the VLAN to which a particular frame belongs. The NetScaler supports a maximum of 4094 VLANs. ID 1 is reserved for the default VLAN. Minimum value: 2. Maximum value: 4094.

aliasName

A name for the VLAN. Must begin with a letter, a number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should choose a name that helps identify the VLAN. However, you cannot perform any VLAN operation by specifying the alias name instead of the VLAN ID.

ipv6DynamicRouting

Enable or disable IPv6 dynamic routing on this VLAN. Possible values: ENABLED, DISABLED. Default: DISABLED.

ifNum

The name, in <slot>/<port> notation, of an interface to be bound to the VLAN.

IPAddress

The IP address that is to be assigned to the VLAN. An entry for the subnet must be in the routing table before you issue this command. Overlapping subnets are not allowed. The IP address specified can be used as the default gateway among the hosts in the subnet to

allow for IP forwarding between VLANs.

Caution: DO NOT specify an IP address for VLAN 1.

netMask

Defines the network mask for the subnet defined for this VLAN.

To configure a VLAN by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **VLANs**.
2. In the details pane, do one of the following:
   - To create a new VLAN, click **Add**.
   - To modify an existing VLAN, click **Open**.
3. In the **Add VLAN** or **Configure/Modify VLAN** dialog box, specify values for the following parameters, which correspond to parameters described in “Parameters for configuring a VLAN” as shown:
   - **VLAN ID***—id
   - **Enable IPv6 dynamic routing**—ipv6DynamicRouting
   - **Alias Name**—aliasName

   * A required parameter
4. To bind an IP address to a VLAN, under **IPs**, select the **Active** check box corresponding to the IP address that you want to bind to the VLAN (for example, **10.102.29.54**). The **Type** column displays the IP address type (such as mapped IP, virtual IP, or subnet IP) for each IP address in the **IP Addresses** column.
5. To bind a network interface to a VLAN, under **Interfaces**, select the **Active** check box corresponding to the interface that you want to bind to the VLAN (for example, **1/8**).
6. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the VLAN has been configured successfully.

Monitoring VLANS

You can display VLAN statistics such as packets received, bytes received, packets sent, and bytes sent, and use the information to identify anomalies and or debug a VLAN.

To view the statistics of a VLAN by using the NetScaler command line

At the NetScaler command prompt, type:

stat vlan <vlanID>

Example

stat vlan 2

To view the statistics of a VLAN by using the configuration utility

1. In the navigation pane, expand **Network** and click **VLANs**.
2. On the **VLANs** page, select the VLAN whose statistics you want to view (for example, **2**).
3. Click **Statistics**.

Configuring VLANs in an HA Setup

VLAN configuration for a high-availability setup requires that the NetScaler appliances have the same hardware configuration, and the VLANs configured on them must be mirror images.

The correct VLAN configuration is implemented automatically when the configuration is synchronized between the NetScaler appliances. The result is identical actions on all the appliances. For example, adding network interface 0/1 to VLAN2 adds this network interface to VLAN 2 on all the appliances participating in the high-availability setup.

Note: If you use network-interface-specific commands in an HA setup, the configurations you create are not propagated to the other NetScaler appliance. You must perform these commands on each appliance in an HA pair to ensure that the configuration of the two appliances in the HA pair remains synchronized.

Configuring VLANs on a Single Subnet

Before configuring a VLAN on a single subnet, make sure that Layer 2 Mode is enabled.

The following figure shows a single subnet environment

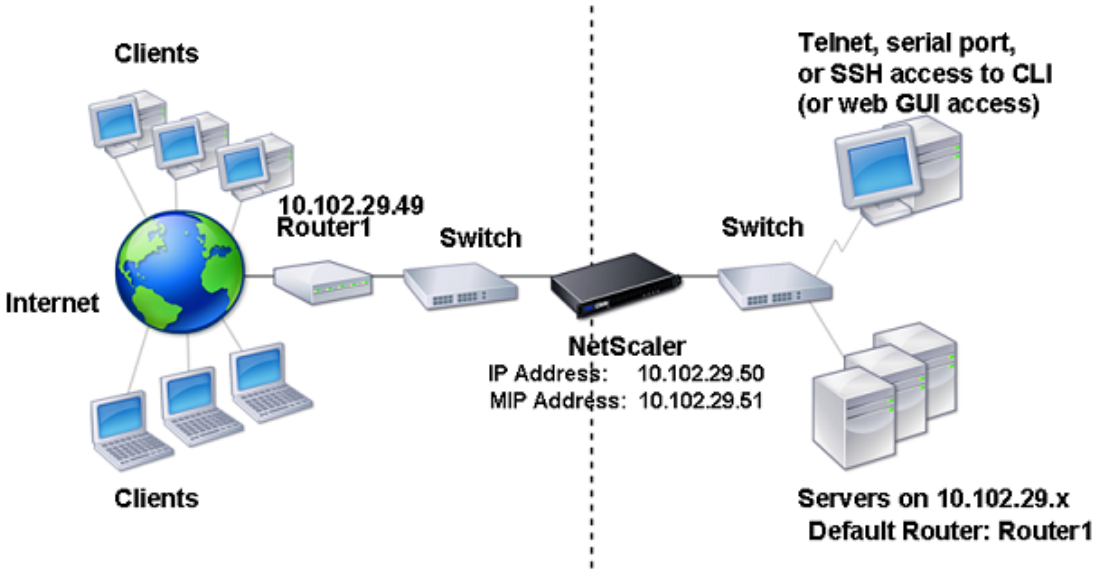

Figure 1. VLAN on a Single Subnet

In the above figure:

1. The default router for the NetScaler and the servers is Router 1.

   Layer 2 mode must be enabled on the NetScaler for the NetScaler to have direct access to the servers.

3. For this subnet, a virtual server can be configured for load balancing on the NetScaler.

To configure a VLAN on a single subnet, follow the procedures described in Creating or Modifying a VLAN. VLAN configuration parameters are not required, because the network interfaces are members of this VLAN.

Configuring VLANs on Multiple Subnets

To configure a single VLAN across multiple subnets, you must add a VIP for the VLAN and configure the routing appropriately. The following figure shows a single VLAN configured across multiple subnets.

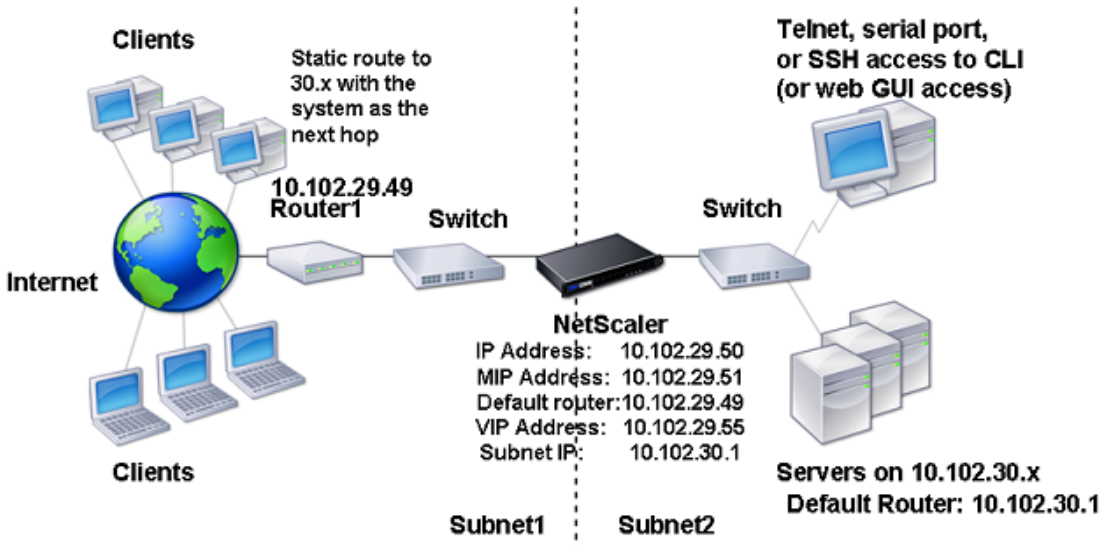

Figure 1. Multiple Subnets in a Single VLAN

To configure a single VLAN across multiple subnets, perform the following tasks:

Disable Layer 2 mode. For the procedure to disable Layer 2 mode, see the "Configuring System Management Settings" chapter of the *Citrix NetScaler Getting Started Guide* at http://support.citrix.com/article/CTX128672.

Add a VIP.

For the procedure to add a VIP, see Configuring and Managing Virtual IP Addresses (VIPs).

Configure RNAT ID.

For the procedure to configure the RNAT ID, see Configuring RNAT.

Configuring Multiple Untagged VLANS across Multiple Subnets

In environments with multiple untagged VLANs across multiple subnets, a VLAN is configured for each IP subnet. A network interface is bound to one VLAN only. The following figure shows this configuration.

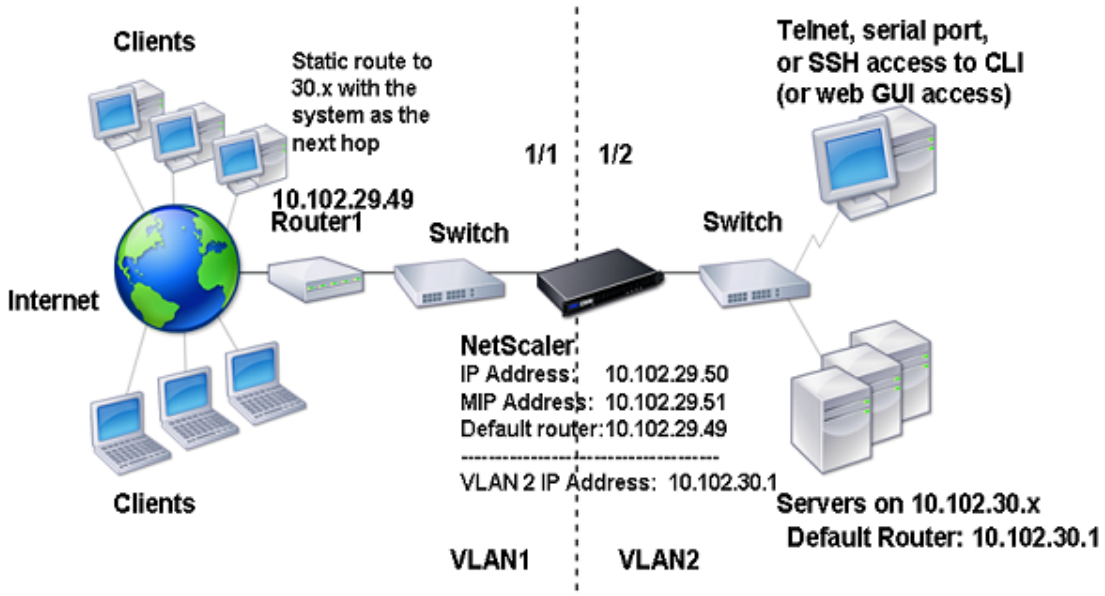

Figure 1. Multiple Subnets with VLANs - No Tagging

To implement the configuration shown in the above figure, perform the following tasks:

Add VLAN 2.

For the procedure to create a VLAN, see Creating or Modifying a VLAN.

Bind the 1/2 network interface of the NetScaler to VLAN 2 as an untagged network interface.

For the procedure to bind a network interface to a VLAN, see Creating or Modifying a VLAN.

Bind the IP address and subnet mask to VLAN 2.

For the procedure to bind a network interface to a VLAN, see Creating or Modifying a VLAN.

Configuring Multiple VLANs with 802.1q Tagging

For multiple VLANs with 802.1q tagging, each VLAN is configured with a different IP subnet. Each network interface is in one VLAN. One of the VLANs is set up as tagged. The following figure shows this configuration.

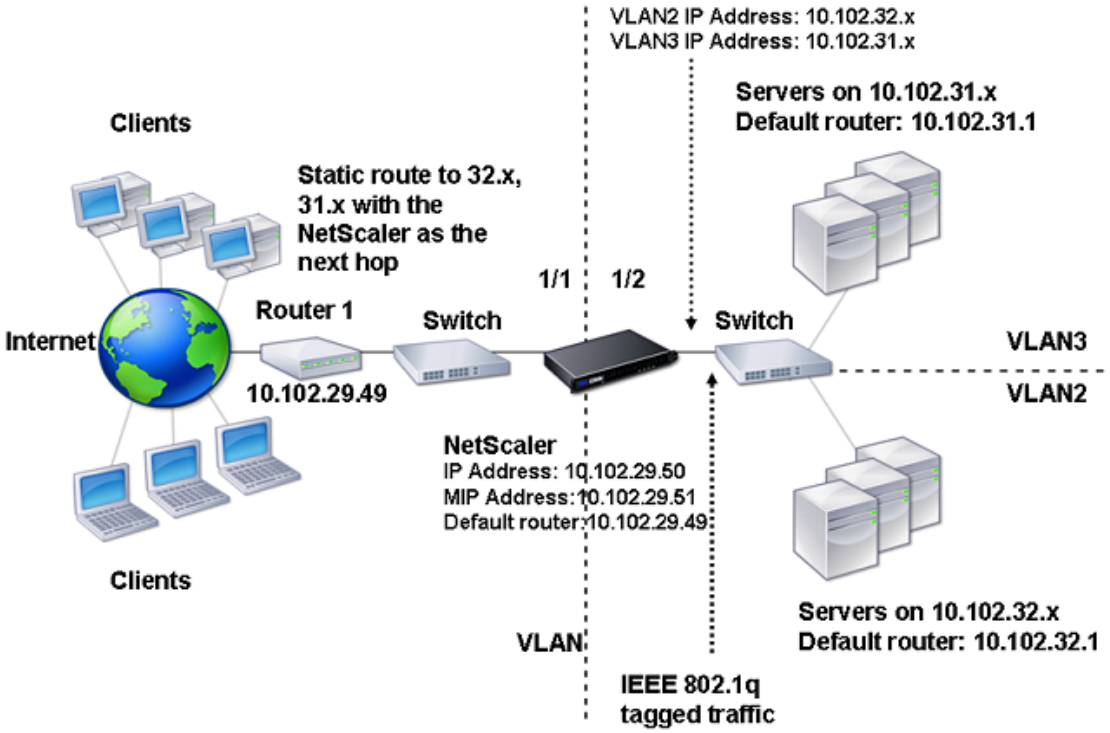

Figure 1. Multiple VLANs with IEEE 802.1q Tagging

To implement the configuration shown in the above figure, perform the following tasks:

1. Add VLAN 2.

   For the procedure to create a VLAN, see Creating or Modifying a VLAN.

2. Bind the 1/2 network interface of the NetScaler to VLAN 2 as an untagged network interface.

   For the procedure to bind a network interface to a VLAN, see Creating or Modifying a VLAN.

3.

Bind the IP address and netmask to VLAN 2.

For the procedure to bind an IP address to a VLAN, see Creating or Modifying a VLAN.

4. Add VLAN 3.

   For the procedure to create a VLAN, see Creating or Modifying a VLAN.

5. Bind the 1/2 network interface of the NetScaler to VLAN 3 as a tagged network interface.

   For the procedure to bind a network interface to a VLAN, see Creating or Modifying a VLAN.

   For the procedure to bind a tagged network interface, see Creating or Modifying a VLAN.

6. Bind the IP address and netmask to VLAN 3.

   For the procedure to bind an IP address to a VLAN, see Creating or Modifying a VLAN.

Configuring NSVLAN

NSVLAN is a VLAN to which the NetScaler management IP (NSIP) address's subnet is bound. The NSIP subnet is available only on interfaces that are associated with NSVLAN. By default, NSVLAN is VLAN1, but you can designate a different VLAN as NSVLAN. If you do so, you must reboot the NetScaler appliance for the change to take effect. After the reboot, NSIP subnet traffic is restricted to the new NSVLAN.

The traffic from the NetScaler IP subnet can be tagged (802.1q) with the VLAN ID specified for NSVLAN. You must configure the attached switch interface to tag and allow this same VLAN ID on the connected interface.

If you remove your NSVLAN configuration, the NSIP subnet is automatically bound to VLAN1, restoring the default NSVLAN.

To configure NSVLAN by using the NetScaler command line

At the NetScaler command prompt, type:

- set ns config -**nsvlan** <positive_integer> -**ifnum** <interface_name> ... [-**tagged** (YES|NO)]
- show ns config

Note: The configuration will take effect after the NetScaler appliance is rebooted.

Example

```
> set ns config -nsvlan 300 -ifnum 1/1 1/2 1/3 -tagged NO
 Done

> save config
 Done

> show ns config
      NetScaler IP: 10.102.29.170  (mask: 255.255.255.0)
      Number of MappedIP(s): 6
      Node: Standalone
      NetScaler IP Vlan: 300 Tagged: NO Bound Ports: 1/1 ½ 1/3

      Global configuration settings:
                  HTTP port(s): (none)
              Max connections: 0
        Max requests per connection: 0
```

```
                Client IP insertion: DISABLED
                    Cookie version: 0
        Persistence Cookie Secure Flag: ENABLED
                      Min Path MTU: 576
              Path MTU entry timeout: 10
                    FTP Port Range: 0
                     CR Port Range: 0
                         Timezone: GMT+05:30-IST-Asia/Colombo
                       System Time: Tue Feb 22 16:50:44 2011
            Last Config Changed Time: Tue Feb 22 16:48:02 2011
              Last Config Saved Time: Tue Feb 22 16:48:19 2011
WARNING: The configuration must be saved and the system rebooted for these settings to take effect
 Done
```

To restore the default NSVLAN configuration by using the NetScaler command line

At the NetScaler command prompt, type:

- unset ns config -**nsvlan**
- show ns config

Example

```
> unset ns config -nsvlan
 Done

> sh ns config
      NetScaler IP: 10.102.29.170  (mask: 255.255.255.0)
      Number of MappedIP(s): 6
      Node: Standalone

      Global configuration settings:
                    HTTP port(s): (none)
                  Max connections: 0
        Max requests per connection: 0
              Client IP insertion: DISABLED
                  Cookie version: 0
      Persistence Cookie Secure Flag: ENABLED
                    Min Path MTU: 576
            Path MTU entry timeout: 10
                  FTP Port Range: 0
                   CR Port Range: 0
                       Timezone: GMT+05:30-IST-Asia/Colombo
                     System Time: Mon Feb 28 11:04:48 2011
          Last Config Changed Time: Mon Feb 28 11:04:40 2011
            Last Config Saved Time: Mon Feb 28 10:14:30 2011
 Done
```

Parameters for configuring NSVLAN

nsvlan

An integer that uniquely identifies the NSVLAN. Minimum value: 2. Maximum value: 4094.

ifNum

The name, in <slot>/<port> notation, of an interface to be bound to NSVLAN.

tagged

Designate all interfaces associated with NSVLAN as 802.1q tagged interfaces. The appliance adds a four-byte 802.1q tag to every packet sent on one of these interfaces. The tag identifies the VLAN. Possible values: YES, NO. Default: YES.

To configure NSVLAN by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change NSVLAN Settings**.
3. In the **Configure NSVLAN Settings** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring NSVLAN" as shown:
   - **NSVLAN ID**—nsvlan
   - **Tagged**—tagged

   *A required parameter
4. Under **Interfaces**, select interfaces from the **Available Interfaces** list and click **Add** to move them to the **Configured Interfaces** list.
5. Click **OK**. In the **Warning** dialog box, click **OK**. The configuration takes effect after the NetScaler appliance is rebooted.

Configuring Bridge Groups

Typically, when you want to merge two or more VLANs into a single domain, you change the VLAN configuration on all the devices in the separate domains. This can be a tedious task. To more easily merge multiple VLANs into a single broadcast domain, you can use bridge groups.

The bridge groups feature works the same way as a VLAN. Multiple VLANS can be bound to a single bridge group, and all VLANs bound to same bridge group form a single broadcast domain. You can bind only Layer 2 VLANs to a bridge group. For Layer 3 functionality, you must assign an IP address to a bridge group.

In Layer 2 mode, a broadcast packet received on an interface belonging to a particular VLAN is bridged to other VLANs that belong to the same bridge group. In the case of a unicast packet, the NetScaler appliance searches its bridge table for the learned MAC addresses of all the VLANs belonging to same bridge group.

In Layer 3 forwarding mode, an IP subnet is bound to a bridge group. The NetScaler accepts incoming packets belonging to the bound subnet and forwards the packets only on VLANs that are bound to the bridge group.

IPv6 routing can be enabled on a configured bridge group.

To add a bridge group and bind VLANs by using the NetScaler command line

To add a bridge group and bind VLANs and verify the configuration, type the following commands:

- add bridgegroup <id> [**-ipv6DynamicRouting** (ENABLED | DISABLED)]
- show bridgegroup <id>
- bind bridgegroup <id> **-vlan** <positive_integer>
- show bridgegroup <id>

Example

```
> add bridgegroup 12
 Done
> show bridgegroup 12
1)    Bridge Group: 12
      Member Interfaces : None
```

```
      Member vlans:
 Done
> bind bridgegroup 12 -vlan 4
 Done
> show bridgegroup 12
1)     Bridge Group: 12
       Member Interfaces : 1/8        Tagged: None
       Member vlans: 4
 Done
```

To remove a bridge group by using the NetScaler command line

At the NetScaler command prompt, type:

rm bridgegroup <id>

Example

```
 rm bridgegroup 12
```

Parameters for configuring bridge groups

id

A unique number that identifies a bridge group. Possible values: 1 to 1000.

vlan

The ID of a VLAN to be bound to the bridge group.

-ipv6DynamicRouting

Enable or disable IPv6 dynamic routing on this bridge group. Possible values: ENABLED, DISABLED. Default: DISABLED

To configure a bridge group by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **Bridge Groups**.
2. In the details pane, do one of the following:
   - To create a new bridge group, click **Add**.
   - To modify an existing bridge group, click **Open**.
3. In the **Create Bridge Group** or **Configure Bridge Group** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring bridge groups" as shown:
   - **Bridge Group Id***—id
   - **Enable IPv6 dynamic routing**—ipv6DynamicRouting

   * A required parameter
4. To bind a VLAN to a bridge group, under **VLANs**, select the **Active** check box corresponding to the interface that you want to bind to the bridge group (for example, **1/8**).
5. To bind an IP address to a bridge group, under **IPs**, select the **Active** check box corresponding to the IP address that you want to bind to the bridge group (for example, **10.102.29.54**).
6. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the bridge group has been configured successfully.

Configuring VMACs

The primary and secondary nodes in a high availability (HA) setup share the Virtual MAC address (VMAC) floating entity. The primary node owns the floating IP addresses (such as MIP, SNIP, and VIP) and responds to ARP requests for these IP addresses with its own MAC address. Therefore, the ARP table of an external device, such as an upstream router, is updated with the floating IP address and the MAC address of the primary node.

When a failover occurs, the secondary node takes over as the new primary node. The former secondary node uses Gratuitous ARP (GARP) to advertise the floating IP addresses that it had learned from the old primary node. The MAC address that the new primary node advertises is the MAC address of its own network interface. Some devices (a few routers) do not accept these GARP messages. Therefore, these external devices retain the IP address-to-MAC address mapping that the old primary node had advertised. This can result in a GSLB site going down.

Therefore, you must configure a VMAC on both nodes of an HA pair. This means that both nodes have identical MAC addresses. When a failover occurs, the MAC address of the secondary node remains unchanged, and the ARP tables on the external devices do not need to be updated.

For the procedures to configure a VMAC, see High Availability.

Configuring Link Aggregation

Link aggregation combines data coming from multiple ports into a single high-speed link. Configuring link aggregation increases the capacity and availability of the communication channel between the NetScaler appliance and other connected devices. An aggregated link is also referred to as a "channel." You can configure the channels manually, or you can use Link Aggregation Control Protocol (LACP). You cannot apply LACP to a manually configured channel, nor can you manually configure a channel created by LACP.

When a network interface is bound to a channel, the channel parameters have precedence over the network interface parameters. (That is, the network interface parameters are ignored.) A network interface can be bound only to one channel.

When a network interface is bound to a channel, it drops its VLAN configuration. When network interfaces are bound to a channel, either manually or by LACP, they are removed from the VLANs that they originally belonged to and added to the default VLAN. However, you can bind the channel back to the old VLAN, or to a new one. For example, if you bind the network interfaces 1/2 and 1/3 to a VLAN with ID 2, and then bind them to a channel LA/1, the network interfaces are moved to the default VLAN, but you can bind them back to VLAN 2.

Configuring Link Aggregation Manually

When you create a link aggregation channel, its state is DOWN until you bind an active interface to it. You can modify a channel at any time. You can remove channels, or you can enable/disable them.

To create a link aggregation channel by using the NetScaler command line

At the NetScaler command prompt, type:

- add channel <id> [**-ifnum** <interfaceName> ...] [**-state** (ENABLED | DISABLED)] [**-speed** <speed>] [**-flowControl** <flowControl>] [**-haMonitor** (ON | OFF)][**-tagall** (ON | OFF)] [**-ifAlias** <string>] [**-throughput** <positive_integer>] [**-bandwidthHigh** <positive_integer> [**-bandwidthNormal** <positive_integer>]]
- show channels

Example

```
add channel LA/1 -ifnum 1/8
show channels
```

To bind an interface to or unbind an interface from an existing link aggregation channel by using the NetScaler command line

At the NetScaler command prompt, type one of the following commands:

- bind channel <id> <interfaceName>
- unbind channel <id> <interfaceName>

Example

bind channel LA/1 1/8

To modify a link aggregation channel by using the NetScaler command line

At the NetScaler command prompt, type the set channel command, the channel ID, and the parameters to be changed, with their new values.

Parameters for configuring a link aggregation channel

id

LA channel name, in form LA/*

(* An ID number for this channel)

ifnum

The name, in <slot>/<port> notation, of an interface to be bound to the channel.

state

Initial state for the channel. Possible values: ENABLED, DISABLED. Default: ENABLED.

speed

Speed for the channel. Possible values: AUTO, 10, 100, and 1000, and 10000. Default value:AUTO.

flowControl

Flow control for the channel. Possible values: OFF, RX, TX, and RXTX. Default value: OFF.

haMonitor

HA-monitoring control for the channel. Possible values: ON and OFF. Default value: ON.

tagall

Make this port a trunk port. When ON, port membership in all VLANs is tagged. If 802.1q behavior with native VLAN is required, use the OFF setting. Possible values: ON, OFF. Default: OFF.

ifAlias

Alias name for the channel. Maximum Length: 31.

throughput

Minimum required throughput for the network interface.

bandwidthHigh

Configured high threshold of the interface bandwidth usage in Mbps. An SNMP Trap message is generated if bandwidth usage of the interface crosses this limit. This parameter can be set only by using NetScaler command line.

bandwidthNormal

Configured normal threshold of the interface bandwidth usage in Mbits/s. A trap is generated if bandwidth usage of the interface returns to this level after exceeding the bandWidthHigh limit. This parameter can be set only by using NetScaler command line.

To configure a link aggregation channel by using the configuration utility

1. In the navigation pane, expand **Network** and click **Channels**.
2. In the details pane, do one of the following:
   - To create a new link aggregation channel, click **Add**.
   - To modify an existing link aggregation channel, select a channel and then click **Open**.
3. In the **Create Channel** or **Configure Channel** dialog box, specify values for the following parameters, which correspond to paremeters described in “Parameters for configuring a link aggregation channel as shown:
   - **Channel ID*****—id (Select a channel name from the drop-down list.)
   - **State**—state
   - **Throughput**— throughput
4. To bind an interface to the channel, on the **Bind/Unbind** tab, select an interface (for example, **1/8**) and click **Add**. (To remove an interface, select it and click **Remove**.)
5. Optionally, on the **Settings** tab, specify values for the following parameters, which correspond to paremeters described in “Parameters for configuring a link aggregation channel” as shown:
   - **Speed**—speed
   - **Flow Control**—flowControl
   - **HA Monitoring**—haMonitor
   - **Tag all VLANs**— tagall
   - **Alias Name**—ifAlias

To remove a link aggregation channel by using the NetScaler command line

Important: When a channel is removed, the network interfaces bound to it induce network loops that decrease network performance. You must disable the network interfaces before you remove the channel.

At the NetScaler command prompt, type:

rm channel <id>

Example

rm channel LA/1

To remove a link aggregation channel by using the configuration utility

Important: Important: When a channel is removed, the network interfaces bound to it induce network loops that decrease network performance. You must disable the network interfaces before you remove the channel.

1. In the navigation pane, expand **Network** and click **Channels**.
2. In the details pane, select the channel that you want to remove (for example, **LA/1**), and click **Remove**.
3. In the **Remove** dialog box, click **Yes**.

Configuring Link Aggregation by Using the Link Aggregation Control Protocol

The Link Aggregation Control Protocol (LACP) enables network devices to exchange link aggregation information by exchanging LACP Data Units (LACPDUs). Therefore, you cannot enable LACP on network interfaces that are members of a channel that you created manually.

When using LACP to configure link aggregation, you use different commands and parameters for modifying link aggregation channels than you do for creating link aggregation channels. To remove a channel, you must disable LACP on all interfaces that are part of the channel.

Note: In an High Availability configuration, LACP configurations are neither propagated nor synchronized.

Creating Link Aggregation Channels

For creating a link aggregation channel by using LACP, you need to enable LACP and specify the same LACP key on each interface that you want to be the part of the channel. For example, if you enable LACP and set the LACP Key to 3 on interfaces 1/1 and 1/2, a link aggregation channel LA/3 is created and interfaces 1/1 and 1/2 are automatically bound to it.

Note: When enabling LACP on a network interface, you must specify the LACP Key.

By default, LACP is disabled on all network interfaces.

To create an LACP channel by using the NetScaler command line

At the NetScaler command prompt, type:

- set interface <id> [**-lacpMode** <lacpMode>] [**-lacpKey**<positive_integer>] [**-lacpPriority** <positive_integer>] [**-lacpTimeout** (LONG | SHORT)]
- show interface [<id>]

Parameters for creating an LACP channel

id

The number assigned to the interface.

LacpMode

LACP mode. Possible values: DISABLED, ACTIVE, and PASSIVE. Default: DISABLED

lacpKey

LACP key for the interface. Possible values: 1 to 4.

lacpPriority

LACP port priority. Possible values: 1 to 65535. Default: 32768.

lacpTimeout

LACP timeout setting. Possible values: LONG and SHORT. Default: LONG.

To create an LACP channel by using the NetScaler the configuration utility

1. In the navigation pane, expand **Network**, and then click **Interfaces**.
2. On the **Interfaces** pane, select the network interface that you want to modify (for example, **1/8**), and then click **Open**.
3. In the **Configure interface** dialog box, specify values for the following parameters, which correspond to parameters described in "Parameters for creating a LACP channel" as shown:
   - **LACP Mode**—lacpMode
   - **LACP Key**—lacpKey
   - **LACP Time-out**—lacpTimeout
   - **LACP Priority**—lacpPriority
4. Click **OK**. A message appears in the status bar, stating that the interface has been configured successfully.

Modifying Link aggregation Channels

After you have created an LACP channel by specifying interfaces, you can modify properties of the channel.

To modify an LACP channel using the NetScaler command line.

At the NetScaler command prompt, type:

- set channel <id> [**-ifnum** <interfaceName> ...] [**-state** (ENABLED | DISABLED)] [**-speed** <speed>] [**-flowControl** <flowControl>] [**-haMonitor** (ON | OFF)] [**-ifAlias** <string>] [**-throughput** <positive_integer>] [**-tagall** (ON | OFF)] [**-bandwidthHigh** <positive_integer> [**-bandwidthNormal** <positive_integer>]]
- show channels

Example

set channel LA/3 –state ENABLED –speed 10000
show channels

Parameters for modifying an LACP channel

id

LA channel name, in form LA/*

(* An ID number for this channel)

state

Initial state for the channel. Possible values: ENABLED, DISABLED. Default: ENABLED.

speed

Speed for the channel. Possible values: AUTO, 10, 100, and 1000, and 10000. Default value:AUTO.

flowControl

Flow control for the channel. Possible values: OFF, RX, TX, and RXTX. Default value: OFF.

haMonitor

HA-monitoring control for the channel. Possible values: ON and OFF. Default value: ON.

tagall

Make this port a trunk port. When ON, port membership in all VLANs is tagged. If 802.1q behavior with native VLAN is required, use the OFF setting. Possible values: ON, OFF. Default: OFF.

ifAlias

Alias name for the channel. Maximum Length: 31.

throughput

Minimum required throughput for the network interface.

bandwidthHigh

Configured high threshold of the interface bandwidth usage in Mbps. An SNMP Trap message is generated if bandwidth usage of the interface crosses this limit. This parameter can be set only by using NetScaler command line.

bandwidthNormal

Configured normal threshold of the interface bandwidth usage in Mbits/s. A trap is generated if bandwidth usage of the interface returns to this level after exceeding the bandWidthHigh limit. This parameter can be set only by using NetScaler command line.

To modify an LACP channel by using the configuration utility

1. In the navigation pane, expand **Network** and click **Channels**.
2. In the details pane, select a LACP channel and then click **Open**.
3. In the **Configure Channel** dialog box, specify values for the following parameters, which correspond to paremeters described in “Parameters for configuring a link aggregation channel as shown:
   - **State**—state
   - **Throughput**— throughput
4. Optionally, on the **Settings** tab, specify values for the following parameters, which correspond to paremeters described in “Parameters for modifying an LACP channel” as shown:
   - **Speed**—speed
   - **Flow Control**—flowControl
   - **HA Monitoring**—haMonitor
   - **Tag all VLANs**— tagall
   - **Alias Name**—ifAlias

Removing a Link Aggregation Channel

To remove a link aggregation channel that was created by using LACP, you need to disable LACP on all the interfaces that are part of the channel.

To remove an LACP channel by using the NetScaler command line

At the NetScaler command prompt, type:

- set interface <id> **-lacpMode** Diasble
- show interface [<id>]

To remove an LACP channel by using the NetScaler configuration utility

1. In the navigation pane, expand **Network**, and then click **Interfaces**.
2. On the **Interfaces** pane, select the network interface that you want to modify (for example, **1/8**), and then click **Open**.
3. In the **Configure Interface** dialog box, clear the **Enable LACP** check box.
4. Click **OK**. A message appears in the status bar, stating that the interface has been configured successfully.

Binding an SNIP address to an Interface

You can now bind a NetScaler owned SNIP address to an interface without using Layer 3 VLANs. Any packets related to the SNIP address will go only through the bound interface.

Note: This feature is supported only on NetScaler 9.3.e.

This feature can be useful in a scenario where the upstream switch does not support Link Aggregation channels and you want the NetScaler appliance to load balance traffic, originated from a server, across the four links to the upstream switch as shown in the following illustration.

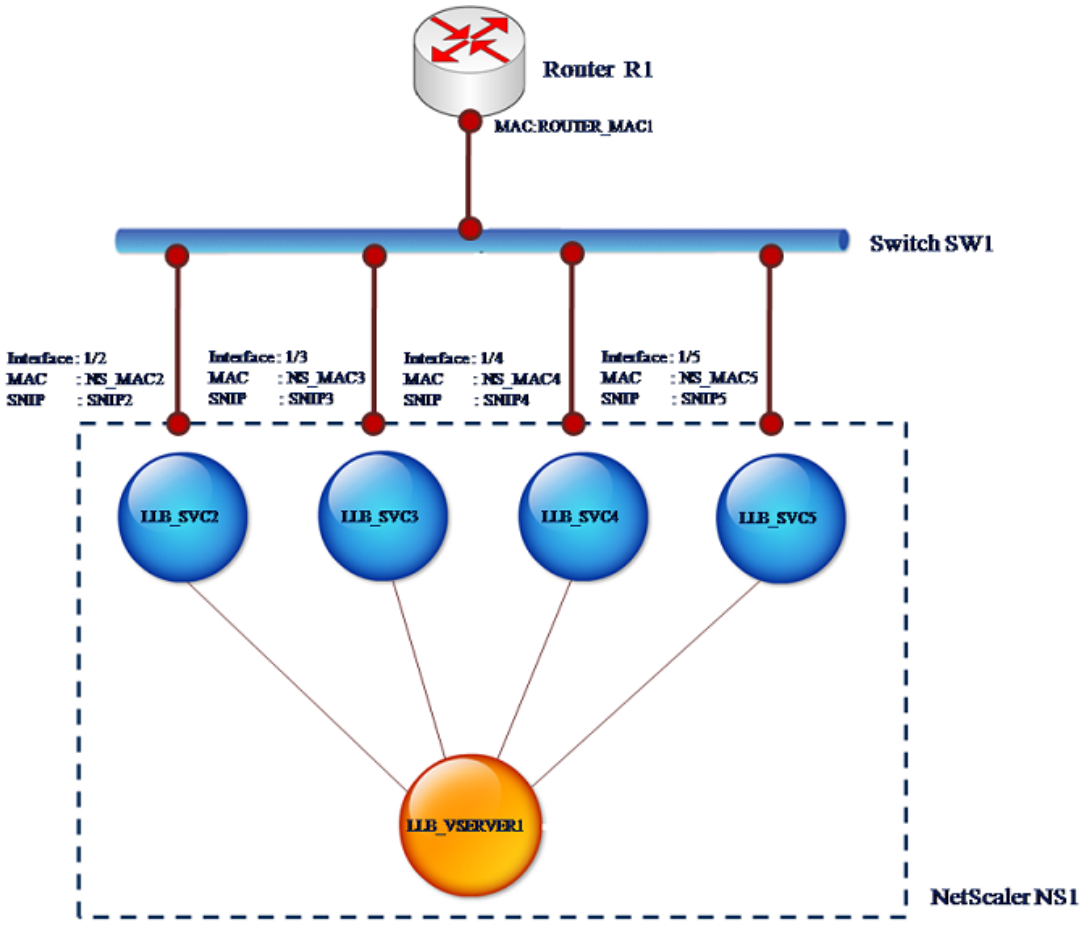

Figure 1.

The following tables describe the example settings for the scenario:

Entity	Name	Value

SNIP addresses on NS1	SNIP2 (for reference purpose only)	10.10.10.2
	SNIP3 (for reference purpose only)	10.10.10.3
	SNIP4 (for reference purpose only)	10.10.10.4
	SNIP5 (for reference purpose only)	10.10.10.5
LLB virtual server on NS1	LLB_VSERVER1	-
Transparent monitor on NS1	TRANS_MON	-
LLB services on NS1	LLB_SVC2	10.10.10.240
	LLB_SVC3	10.10.10.120
	LLB_SVC4	10.10.10.60
	LLB_SVC5	10.10.10.30
MAC address of interface 1/2 on NS1	NS_MAC_2 (for reference purpose only)	00:e0:ed:0f:bc:e0
MAC address of interface 1/3 on NS1	NS_MAC_3 (for reference purpose only)	00:e0:ed:0f:bc:df
MAC address of interface 1/4 on NS1	NS_MAC_4 (for reference purpose only)	00:e0:ed:0f:bc:de
MAC address of interface 1/5 on NS1	NS_MAC_5 (for reference purpose only)	00:e0:ed:1c:89:53
IP address of Router R1	Router_IP (for reference purpose only)	10.10.10.1
MAC address of interface of R1	ROUTER_MAC1 (for reference purpose only)	00:21:a1:2d:db:cc

To configure the example settings

1. Add four different SNIPs in different subnet ranges. This is for ARP to be resolved on four different links. For more information on creating a SNIP address, see Configuring Subnet IP Addresses (SNIPs).

   Command Line Interface example

   ```
   > add ns ip 10.10.10.2 255.255.255.0 -type SNIP
    Done
   > add ns ip 10.10.10.3 255.255.255.128 –type SNIP
   Done
   > add ns ip 10.10.10.4 255.255.255.192 –type SNIP
   Done
   > add ns ip 10.10.10.5 255.255.255.224 –type SNIP
   Done
   ```

2. Add four different dummy services in the added SNIP subnets. This is to ensure that the traffic is sent out with source IP as one of the four configured SNIPs. For more information on creating a service, see Configuring Services

   Command Line Interface example

   ```
   > add service LLB_SVC2 10.10.10.240 any *
    Done
   > add service LLB_SVC3 10.10.10.120 any *
    Done
   > add service LLB_SVC4 10.10.10.60 any *
    Done
   > add service LLB_SVC5 10.10.10.30 any *
    Done
   ```

3. Add a transparent ping monitor for monitoring the gateway. Bind the monitor to each of the configured dummy services. This is to make the state of the services as UP. For more information on creating a transparent monitor, see Creating and Binding a Transparent Monitor.

   Command Line Interface example

   ```
   > add monitor TRANS_MON ping -destIP 10.10.10.1 -transparent YES
    Done
   > bind monitor TRANS_MON LLB_SVC2
    Done
   > bind monitor TRANS_MON LLB_SVC3
    Done
   > bind monitor TRANS_MON LLB_SVC4
    Done
   > bind monitor TRANS_MON LLB_SVC5
    Done
   ```

4. Add a link load balancing (LLB) virtual server and bind the dummy services to it. For more information on creating an LLB virtual server, see Configuring an LLB Virtual Server and Binding a Service.

   Command Line Interface example

   ```
   > add lb vserver LLB_VSERVER1 any
    Done
   > set lb vserver LLB_VSERVER1 -lbmethod ROUNDROBIN
    Done
   > bind lb vserver LLB_VSERVER1 LLB_SVC2
    Done
   > bind lb vserver LLB_VSERVER1 LLB_SVC2
    Done
   > bind lb vserver LLB_VSERVER1 LLB_SVC2
    Done
   > bind lb vserver LLB_VSERVER1 LLB_SVC2
    Done
   ```

5. Add the LLB virtual server as the default LLB route. For more information on creating an LLB route see Configuring an LLB Route.

   Command Line Interface example

   ```
   > add lb route 0.0.0.0 0.0.0.0  LLB_VSERVER1
    Done
   ```

6. Add an ARP entry for each of the dummy services with the MAC address of the gateway. This way the gateway is reachable through these dummy services. For more information on adding an ARP entry, see Configuring Static ARP.

   Command Line Interface example

   ```
   > add arp -ipaddress 10.10.10.240 -mac 00:21:a1:2d:db:cc -ifnum 1/2
    Done
   > add arp -ipaddress 10.10.10.120 -mac 00:21:a1:2d:db:cc -ifnum 1/3
    Done
   > add arp -ipaddress 10.10.10.60 -mac 00:21:a1:2d:db:cc -ifnum 1/4
    Done
   > add arp -ipaddress 10.10.10.30 -mac 00:21:a1:2d:db:cc -ifnum 1/5
    Done
   ```

7. Bind a specific interface to an SNIP by adding an ARP entry for each of these SNIPs. This is to ensure that the response traffic will reach the same interface through which the request went out. For more information on adding an ARP entry, see Configuring Static ARP.

   Command Line Interface example

```
> add arp -ipAddress 10.10.10.2 -mac 00:e0:ed:0f:bc:e0 -ifnum 1/2
 Done
> add arp -ipAddress 10.10.10.3 -mac 00:e0:ed:0f:bc:df -ifnum 1/3
 Done
> add arp -ipAddress 10.10.10.4 -mac 00:e0:ed:0f:bc:de -ifnum 1/4
 Done
> add arp -ipAddress 10.10.10.5 -mac 00:e0:ed:1c:89:53 -ifnum 1/5
 Done
```

Monitoring the Bridge Table and Changing the Aging time

NetScaler appliance bridges frames on the basis of bridge table lookup of the destination MAC address and the VLAN ID. However, the appliance performs forwarding only when Layer 2 mode is enabled.

The bridge table is dynamically generated, but you can display it, modify the aging time for the bridge table, and view bridging statistics.

To display the bridge table by using NetScaler command line

At the NetScaler command prompt, type:

sh bridgetable

Example

```
> show bridgetable

      Ageing time for bridge table entries : 300 seconds

      MAC               Iface    VLAN
      ---               -----    ----
1)    00:d0:68:0b:58:da    1/1      1
2)    00:00:5e:00:02:21    1/1      1
3)    00:11:95:1d:87:40    1/1      1
4)    00:d0:68:07:8b:bf    1/1      1
5)    00:e0:81:01:13:5a    1/1      1
6)    00:d0:68:10:6d:7a    1/1      1
7)    00:30:48:90:fa:d2    1/1      1
8)    02:d0:68:15:fd:3d    1/1      1
9)    00:0d:88:24:5f:30    1/1      1
10)   00:21:55:24:b8:3f    1/1      1
11)   00:d0:68:15:fd:36    1/1      1
 Done
```

To display the bridge table by using the configuration utility

1. In the navigation pane, expand **Network** and click **Bridge Table**.
2. Optionally on the **Bridge Table** page, select an entry to display its properties at the bottom of the screen.

To change the aging time by using the NetScaler command line

At the NetScaler command prompt, type:

- set bridgetable -bridgeAge <positive_integer>
- show bridgetable

Example

```
> set bridgetable -bridgeage 70
 Done
> show bridgetable

      Ageing time for bridge table entries : 70 seconds

      MAC               Iface    VLAN
      ---               -----    ----
1)     00:d0:68:0b:58:da    1/1      1
2)     00:00:5e:00:02:21    1/1      1
3)     00:11:95:1d:87:40    1/1      1
4)     00:d0:68:07:8b:bf    1/1      1
5)     00:e0:81:01:13:5a    1/1      1
6)     00:d0:68:10:6d:7a    1/1      1
7)     00:30:48:67:11:00    1/1      1
8)     00:30:48:90:fa:d2    1/1      1
9)     02:d0:68:15:fd:3d    1/1      1
10)    00:0d:88:24:5f:30    1/1      1
11)    00:21:55:24:b8:3f    1/1      1
12)    00:d0:68:15:fd:36    1/1      1
 Done
```

Parameter for changing the aging time

bridgeAge

The bridge aging time in seconds. Possible values: 60 to 300. Default: 300.

To change the aging time by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **Bridge Table**.
2. In the details pane, click **Change Ageing Time**.
3. In the **Change Ageing Time** dialog box, in the **Ageing Time (seconds)** text box, type the aging time (for example, **70**).
4. Click **OK**. All the MAC entries in the bridge table are updated with the aging time.

To view the statistics of a bridge table by using the NetScaler command line

At the NetScaler command prompt, type:

stat bridge

Example

```
> stat bridge
Bridging Statistics
                    Rate (/s)          Total
Loops                    0                 0
Collisions               0                 0
Interface muted          0                 0
 Done
```

To view the statistics of a bridge table by using the configuration utility

1. On the **Bridge Table** page, select the MAC address for which you want to view the statistics (for example, **00:12:01:0a:5f:46**).
2. Click **Statistics**.

Understanding NetScaler Appliances in Active-Active Mode Using VRRP

An active-active deployment, in addition to preventing downtime, makes efficient use of all the NetScaler appliances in the deployment. In active-active deployment mode, the same VIPs are configured on all NetScaler appliances in the configuration, but with different priorities, so that a given VIP can be active on only one appliance at a time.

Note: This feature is supported only on NetScaler nCore builds.

The active VIP is called the master VIP, and the corresponding VIPs on the other NetScaler appliances are called the backup VIPs. If a master VIP fails, the backup VIP with the highest priority takes over and becomes the master VIP. All the NetScaler appliances in an active-active deployment use the Virtual Router Redundancy Protocol (VRRP) protocol to advertise their VIPs and the corresponding priorities at regular intervals.

NetScaler appliances in active-active mode can be configured so that no NetScaler is idle. In this configuration, different sets of VIPs are active on each NetScaler. For example, in the following diagram, VIP1, VIP2, VIP3, and VIP4 are configured on appliances NS1, NS2, and NS3. Because of their priorities, VIP1 and VIP 2 are active on NS1, VIP3 is active on NS2 and VIP 4 is active on NS3. If, for example, NS1 fails, VIP1 on NS3 and VIP2 on NS2 become active.

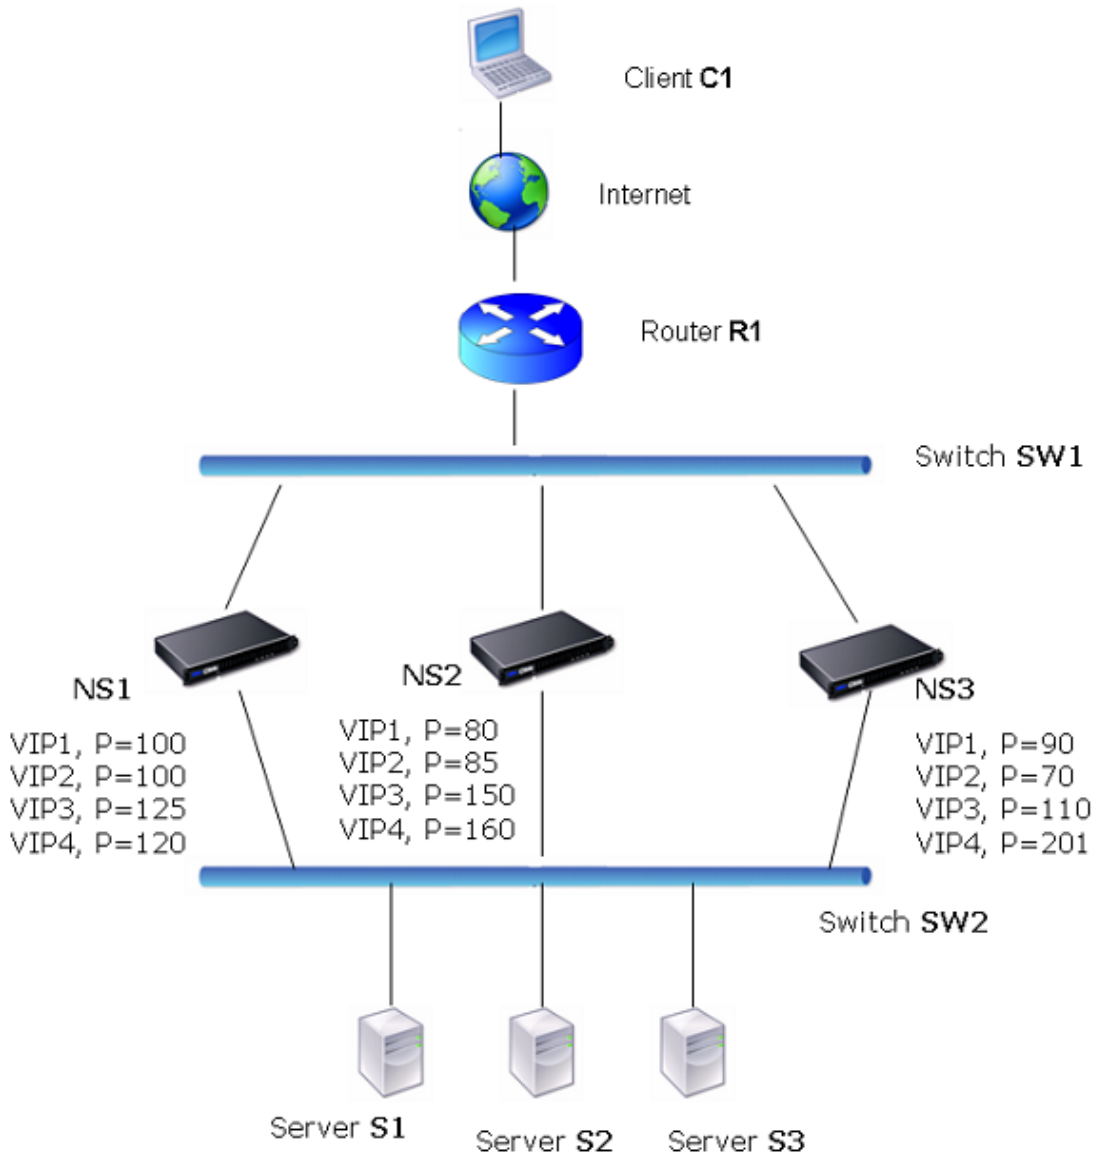

Figure 1. An Active-Active Configuration

The NetScaler appliances in the above diagram process traffic as follows:

1. Client C1 sends a request to VIP1. The request reaches R1.
2. R1 does not have an APR entry for VIP1, so it broadcasts an ARP request for VIP1.
3. VIP1 is active in NS1, so NS1 replies with a source MAC address as the VMAC (for example VMAC1) associated with VIP1, and VIP1 as the source IP address.
4. SW1 learns the port for VIP1 from the ARP reply and updates its bridge table.
5. R1 updates the ARP entry with VMAC1 and VIP1.
6. R1 forwards the packet to the VIP1 on NS1.

7. NS1's load balancing algorithm selects server S2, and NS1 opens a connection between one of its SNIP or MIP addresses and S2.

8. S2 replies to the SNIP or MIP on the NetScaler.

9. NS1 sends S2's reply to the client. In the reply, NS1 inserts MAC address of the physical interface as the source MAC address and VIP1 as the source IP address.

10. Should NS1 fail, the NetScaler appliances use the VRRP protocol to select the VIP1 with the highest priority. In this case, VIP1 on NS3 becomes active, and the following two steps update the active-active configuration.

11. NS3 broadcasts a GARP message for VIP1. In the message, VMAC1 is the source MAC address and VIP1 is the source IP address.

12. SW1 learns the new port for VMAC1 from the GARP broadcast and updates its bridge table to send subsequent client requests for VIP1 to NS3. R1 updates its ARP table.

The priority of a VIP can be modified by health tracking. If you enable health tracking, you should make sure that preemption is also enabled, so that a VIP whose priority is lowered can be preempted by another VIP.

In some situations, traffic might reach a backup VIP. To avoid dropping such traffic, you can enable sharing, on a per-node basis, as you create an active-active configuration. Or you can enable the global send to master option. On a node on which sharing is enabled, it takes precedence over send to master.

Health Tracking

Base priority (BP-range 1-255) ordinarily determines which VIP is the master VIP, but effective priority (EP) can also affect the determination.

For example, if a VIP on NS1 has a priority of 101 and same VIP on NS2 has a priority of 99, the VIP on NS1 is active. However, if two vservers are using the VIP on NS1 and one of them goes DOWN, health tracking can reduce the EP of VIP on NS1. VRRP then makes the VIP on NS2 the active VIP.

Following are the health tracking options for modifying EP:

- **NONE.** No tracking. EP = BP

- **ALL.** If all virtual servers are UP, then EP = BP. Otherwise, EP = 0.

- **ONE.** If at least one virtual server is UP, then EP = BP. Otherwise, EP = 0.

- **PROGRESSIVE.** If ALL virtual servers are UP, then EP = BP. If ALL virtual servers are DOWN then EP = 0. Otherwise EP = BP (1 - K/N), where N is the total number of virtual servers associated with the VIP and k is the number of virtual servers that are down.

Note: If you specify a value other than NONE, preemption should be enabled, so that the backup VIP with the highest priority becomes active if the priority of the master VIP is downgraded.

Preemption

Preemption of an active VIP by another VIP that attains a higher priority is enabled by default, and normally should be enabled. In some cases, however, you may want to disable it. Preemption is a per-node setting for each VIP.

Preemption can occur in the following situations:

- An active VIP goes down and a VIP with a lower priority takes its place. If the VIP with the higher priority comes back online, it preempts the currently active VIP.
- Health tracking causes the priority of a backup VIP to become higher than that of the active VIP. The backup VIP then preempts the active VIP.

Sharing

In the event that traffic reaches a backup VIP, the traffic is dropped unless the sharing option is enabled on the backup VIP. This behavior is a per node setting for each VIP and is disabled by default.

In the figureAn Active-Active Configuration, VIP1 on NS1 is active and VIP1 VIPs on NS2 and NS3 are backups. Under certain circumstances, traffic may reach VIP1 on NS2. If Sharing is enabled on NS2, this traffic is processed instead of dropped.

Configuring Active-Active Mode

On each NetScaler appliance that you want to deploy in active-active mode, you must add a VMAC and bind the VMAC to a VIP. The VMAC for a given VIP must be same on each appliance. For example, if VIP 10.102.29.5, is created on the appliances, a virtual router ID must be created on each NetScaler and bound to VIP 10.102.29.5 on each NetScaler. When you bind a VMAC to a VIP, the NetScaler sends VRRP advertisements to each VLAN that is bound to that VIP. The VMAC can be shared by different VIPs configured on the same NetScaler.

Adding a VMAC

To add a VMAC for an active-active configuration, you create a virtual router ID. To bind a VMAC to a VIP, you associate the VMAC's virtual router ID with the VIP.

To add a VMAC by using the NetScaler command line

At the NetScaler command prompt, type:

add vrID <value> **-priority** <value> **-preemption** (ENABLED|DISABLED) **-sharing** (ENABLED | DISABLED) **-tracking** (NONE|ONE|ALL|PROGRESSIVE)

Example

```
add vrID 125 -priority 100 -sharing ENABLED -tracking ONE
```

Parameters for configuring a VMAC

vrID

The VRID that identifies the VMAC. Possible values: 1 - 255.

priority

The base priority of the VMAC. Range: 1 - 255. Default: 255.

tracking

The health tracking options for this VMAC. Possible values: NONE, ONE, ALL, PROGRESSIVE Default: NONE.

preemption

Make a backup VIP the master if its priority becomes higher than that of a master VIP that is bound to this VMAC. Possible values: ENABLED, DISABLED. Default: ENABLED.

sharing

Enable or disable sharing for this VMAC. Default: Disabled.

To add a VMAC by using the configuration utility

1. In the navigation pane, expand **Network** and click **VMAC**.
2. On the **VMAC** page, click **Add**.
3. In the **Add VMAC** dialog box, in **Virtual Router ID** text box, type a number (for example, **125**) to assign as the VMAC ID.
4. In the **Priority** text box, enter a priority number (for example, **100**) that will associated with VIPs bound this VMAC.
5. In the **Tracking** drop down box, select a health tracking option (for example, **ONE**).
6. Select or clear the **Preemption** check box to disable or enable preemption on VIPs that are bound to this VMAC.
7. Select or clear the **Sharing** check box to enable or disable sharing on VIPs that are bound to this VMAC.
8. Click **Create**.

To bind a VMAC by using the NetScaler command line

At the NetScaler command prompt, type:

set ns ip VIP <address> **-vrid** <value>

Example

set ns ip 10.102.29.5 -vrid 125

To bind a VMAC to a VIP by using the NetScaler configuration utility

1. In the navigation pane, expand **Network**, and then click **IPs**.
2. In the details pane, on the **IPv4s** tab, select the VIP address (for example, **10.102.29.5**) that you want to bind to a VMAC, and then click **Open**.
3. In the **Configure IP** dialog box, in the **Virtual Router Id** drop down box, select a virtual router ID (for example, **125**).
4. Click **OK**.

Configuring Send to Master

Usually, the traffic destined to a VIP reaches the NetScaler appliance on which the VIP is active, because an ARP request with the VIP and a VMAC on that appliance has reached the upstream router. But in some cases, such as static routes configured on the upstream router for the VIP subnet, or a topology that blocks this route, the traffic can reach a NetScaler appliance on which the VIP is in backup state. If you want this appliance to forward the data packets to the appliance on which the VIP is active, you need to enable the send to master option. This behavior is a per node setting and is disabled by default.

For example, in the following diagram, VIP1 is configured on NS1, NS2, and NS3 and is active on NS1. Under certain circumstances, traffic for VIP1 (active on NS1) may reach VIP1 on NS3. When the send to master option is enabled on NS3, NS3 forwards the traffic to NS1 through NS2 by using route entries for NS1.

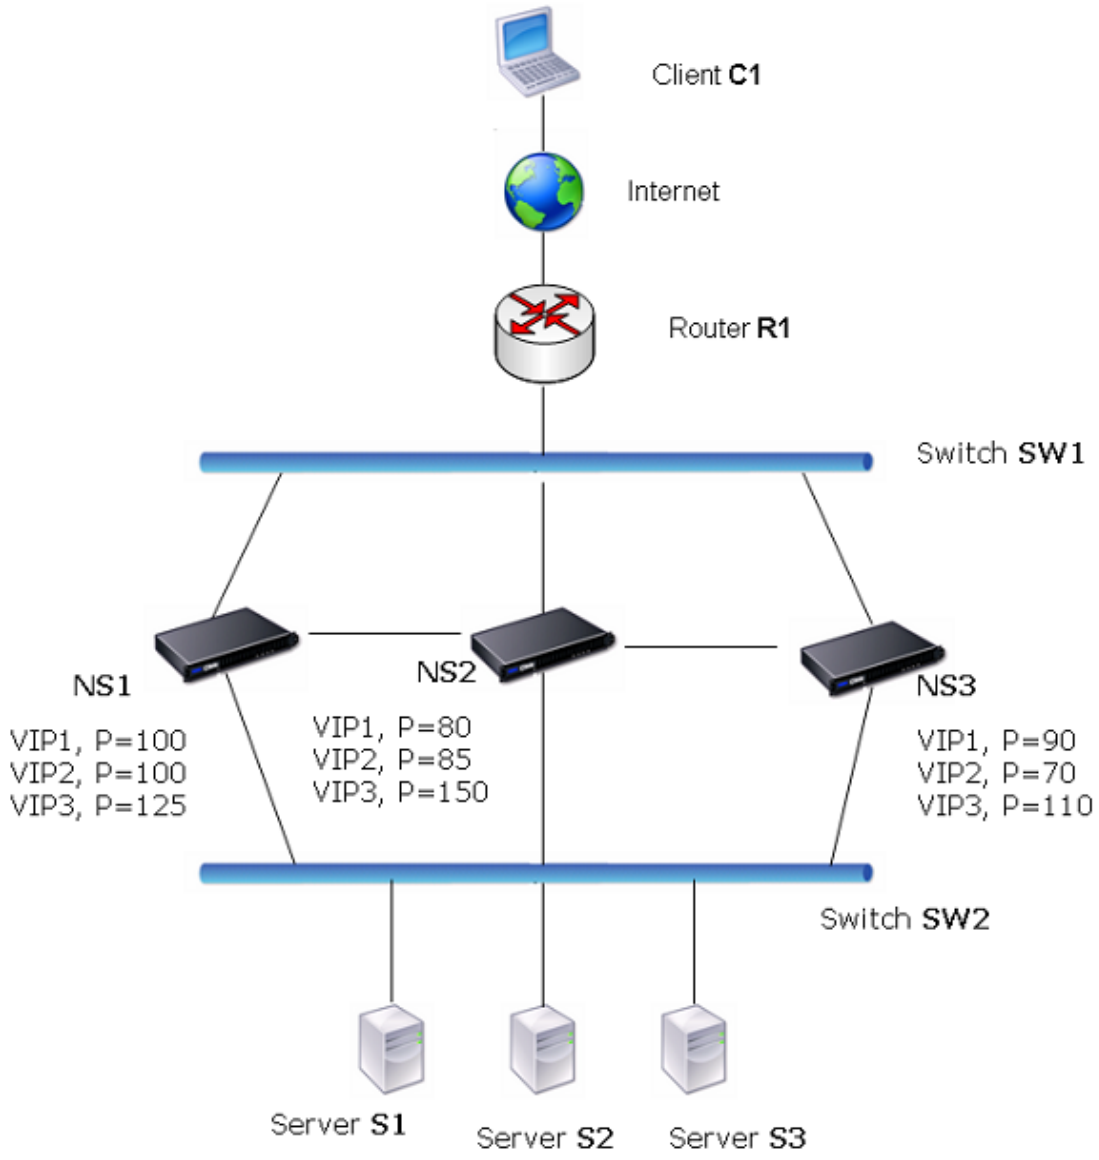

Figure 1. An Active-Active Configuration with Send to Master Option Enabled

To enable send to master by using the NetScaler command line

At the NetScaler command prompt, type:

set vrIDParam **-sendToMaster** (ENABLED|DISABLED)

Example

```
set vrIDParam -sendToMaster ENABLED
```

Parameter for enabling send to master

sendToMaster

Forward the packet to the master node if the VIP bound to the VMAC is in backup state and sharing is disabled.

Possible values: ENABLED, DISABLED. Default: DISABLED.

To enable send to master by using the configuration utility

1. In the navigation pane, expand **Network**.
2. In the details pane, under **Settings**, click **Virtual Router Parameters**.
3. In the **Virtual Router Parameters** dialog box, select **Send to Master** option.
4. Click **OK**.

An Active-Active Deployment Scenario

Following is an example of a possible active-active deployment scenario.

In the following diagram, VIP1, VIP 2 and VIP3 are configured on all three appliances, NS1, NS2, and NS3. Base Priorities for each VIPs are as shown in the diagram. Health tracking is disabled for each VIP. The priorities of VIPs are set so that VIP1, VIP2, and VIP3 are active on NS3. If NS3 fails, VIP1, VIP2, and VIP3 become active on NS1.

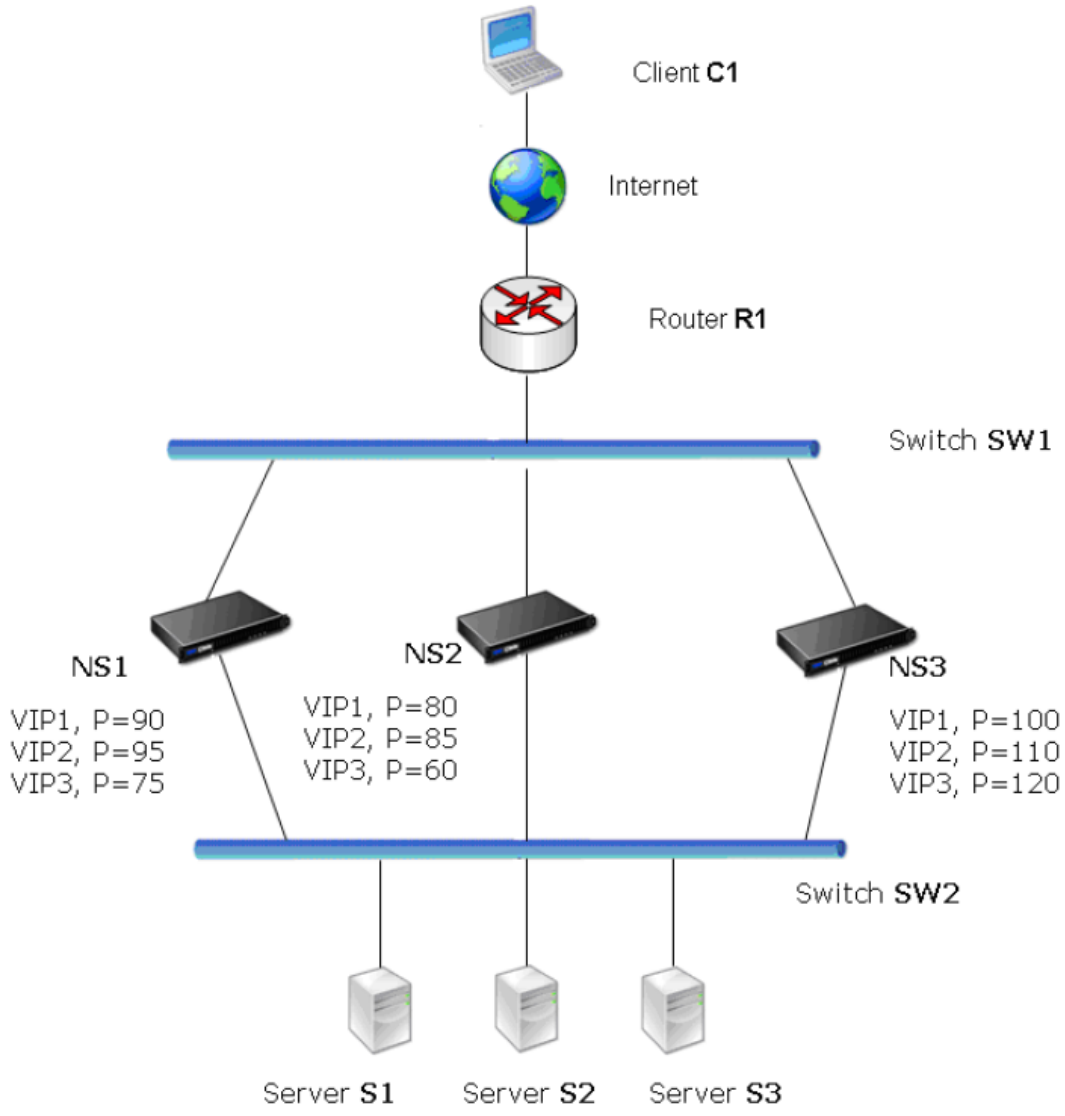

Figure 1. An Active-Active Deployment Scenario

Using the Network Visualizer

The Network Visualizer is a tool that you can use to view the network configuration of a NetScaler node, including the network configuration of the nodes in a high availability (HA) deployment. You can also modify the configuration of VLANs, interfaces, channels, and bridge groups, and perform HA configuration tasks.

In an HA deployment, you can both view and configure network entities on the node to which you are logged on, but you can view the details of only the network entities that are configured on the peer node. However, you can perform certain tasks, such as viewing details and statistics of the peer node and forcing a failover.

When you are logged on to a standalone appliance, you can use the Network Visualizer to do the following:

- View a consolidated graphical summary of key network components, such as VLANs, interfaces, channels, and bridge groups. You can also view the individual details of various network components.
- Modify appliance settings.
- Add, modify, and enable and disable interfaces and channels that are configured on the NetScaler appliance.
- Add and modify VLANs and bridge groups.
- Configure an HA deployment (add a node).
- View node details, node statistics, and statistics for VLANs and interfaces.
- Copy the properties of a network entity to a document or spreadsheet.

When you are logged on to an appliance in an HA deployment, you can perform the above tasks only on the appliance to which you are logged on. Following are additional tasks that you can perform in the Network Visualizer when you are logged on to one of the appliances in an HA pair:

- View the configuration details and high availability details of both nodes in an HA pair.
- Perform HA configuration tasks, such as synchronization and force failover.
- Remove the peer node from the HA configuration.
- View statistics for the peer node.
- Copy the properties of the peer node to a document or spreadsheet.

To open the Network Visualizer

1. In the navigation pane, click **Network**.
2. In **Monitor Connections**, click **Network Visualizer**.

To locate a VLAN or bridge group in the Visualizer

1. Open the **Network Visualizer**, and then do the following:
   - To locate a VLAN or bridge group, in the **Search** text field, begin typing the ID of the VLAN or the bridge group that you want to locate.

     Alternatively, begin typing the IP address of a bound subnet or the ID of a bound interface. The VLANs or bridge groups whose names match the typed characters are highlighted.

     To highlight multiple entities simultaneously, separate the IDs and IP addresses with white spaces. Entities whose IDs or IP addresses match any of the typed IDs and IP addresses are highlighted.
   - To clear the Search field, click the **x** adjacent to the field.

To view the configuration details of an entity by using the Visualizer

1. Open the **Network Visualizer** and do one of the following:
   - To view a brief summary of the entity, place the pointer on the entity.

     A brief summary of the entity appears at the bottom of the viewable area.
   - To view the detailed configuration information about the entity, click the entity.

     The configuration details for that entity appear in the Details area.

To modify the network settings of the appliance by using the Visualizer

1. Open the **Network Visualizer** and click the icon representing the appliance to which you are logged on.
2. In **Related Tasks**, click **Open**.

To add a channel by using the Visualizer

1. Open the **Network Visualizer** and click a network interface.
2. In **Related Tasks**, click **Add Channel**.

To add a VLAN by using the Visualizer

1. Open the **Network Visualizer**, click the appliance to which you are logged on, and then do one of the following:
   - Click an existing **VLAN**, and then, in **Related Tasks**, click **Add**.
   - Click an existing bridge group, and then, in **Related Tasks**, click **Add VLAN**.

To add a bridge group by using the Visualizer

1. Open the **Network Visualizer**, click the appliance to which you are logged on, and then do one of the following:
   - Click an existing bridge group, and then, in **Related Tasks**, click **Add**.
   - Click an existing **VLAN**, and then, in **Related Tasks**, click **Add Bridge Group**.

To modify the settings of an interface or channel by using the Visualizer

1. Open the **Network Visualizer** and click the interface whose settings you want to modify.
2. In **Related Tasks**, click **Open**.

To enable or disable an interface or channel by using the Visualizer

1. Open the **Network Visualizer** and click the interface or channel that you want to enable or disable.
2. In **Related Tasks**, do one of the following.
   - To enable the interface or channel, click **Enable**.
   - To disable the interface or channel, click **Disable**.

To remove a configured channel, VLAN, or bridge group by using the Visualizer

1. Open the **Network Visualizer** and click the channel, VLAN, or bridge group that you want to remove from the configuration.
2. In **Related Tasks**, click **Remove**.

To view statistics for a node, channel, interface, or VLAN by using the Visualizer

1. Open the **Network Visualizer** and click the node, interface, or VLAN whose statistics you want to view.
2. In **Related Tasks**, click **Statistics**.

To set up an HA deployment by using the Visualizer

1. Open the **Network Visualizer** and click the appliance.
2. In **Related Tasks**, click **HA Setup**.

To view the high availability details of a node by using the Visualizer

1. Open the **Network Visualizer** and click the node whose high availability details you want to view.
2. In **Related Tasks**, click **Details**.

To force the secondary node to take over as the primary by using the Visualizer

1. Open the **Network Visualizer** and click one of the nodes.
2. In **Related Tasks**, click **Force Failover**.

To synchronize the secondary node's configuration with the primary node by using the Visualizer

1. Open the **Network Visualizer** and click one of the nodes.
2. In **Related Tasks**, click **Force Synchronization**.

To remove the peer node from the HA configuration

1. Open the **Network Visualizer** and click the peer node.
2. In **Related Tasks**, click **Remove**.

To copy the properties of a node or network entity by using the Visualizer

1. Open the **Network Visualizer** and click the appliance or network entity whose properties you want to copy to a document or spreadsheet.
2. In **Related Tasks**, click **Copy Properties**.

Access Control Lists

Access Control Lists (ACLs) filter IP traffic and secure your network from unauthorized access. An ACL consists of a set of conditions that the NetScaler® appliance uses to allow or deny access. Consider a small organization that consists of 3 departments, Finance, HR, and Documentation, where no department wants another to access its data. The administrator of the organization can configure ACLs on the NetScaler to allow or deny access. When the NetScaler receives a data packet, it compares the information in the data packet with the conditions specified in the ACL and allows or denies access. The NetScaler supports simple ACLs, extended ACLs, and ACL6s. If both simple and extended ACLs are configured, incoming packets are compared to the simple ACLs first.

Simple ACLs filter packets on the basis of their source IP address and, optionally, their destination port and/or their protocol. Any packet that has the characteristics specified in the ACL is dropped.

Extended ACLs filter data packets on the basis of various parameters, such as source IP address, source port, action, and protocol. An extended ACL defines the conditions that a packet must satisfy for the NetScaler to process the packet, bridge the packet, or drop the packet. These actions are known as "processing modes."

The processing modes are:

- ALLOW - The NetScaler processes the packet.
- BRIDGE - The NetScaler bridges the packet to the destination without processing it.
- DENY - The NetScaler drops the packet.

The NetScaler processes an IP packet directly when both of the following conditions exist:

- ACLs are configured on the NetScaler.
- The IP packet does not match any of the ACLs

ACL6s are ACLs created specifically for IPv6 addresses. ACL6s filter packets on the basis of packet parameters, such as source IP address, source port, action, and so on. An ACL6 defines the condition that a packet must satisfy for the NetScaler to process the packet, bridge the packet, or drop the packet. These actions are known as "processing modes."

The processing modes are:

- ALLOW - The NetScaler processes the packet.
- BRIDGE - The NetScaler bridges the packet to the destination without processing it.
- DENY - The NetScaler drops the packet.

The NetScaler processes an IP packet directly when both of the following conditions exist:

- ACL6s are configured on the NetScaler.
- The IP packet does not match any of the ACL6s.

ACL Precedence

An IPv4 packet that matches the conditions specified in a simple ACL is dropped. If the packet does not match any simple ACL, the NetScaler compares the packet's characteristics to those specified in any configured extended ACLs. If the packet matches an extended ACL, the NetScaler applies the action specified in theExtended ACL, as shown in the following diagram.

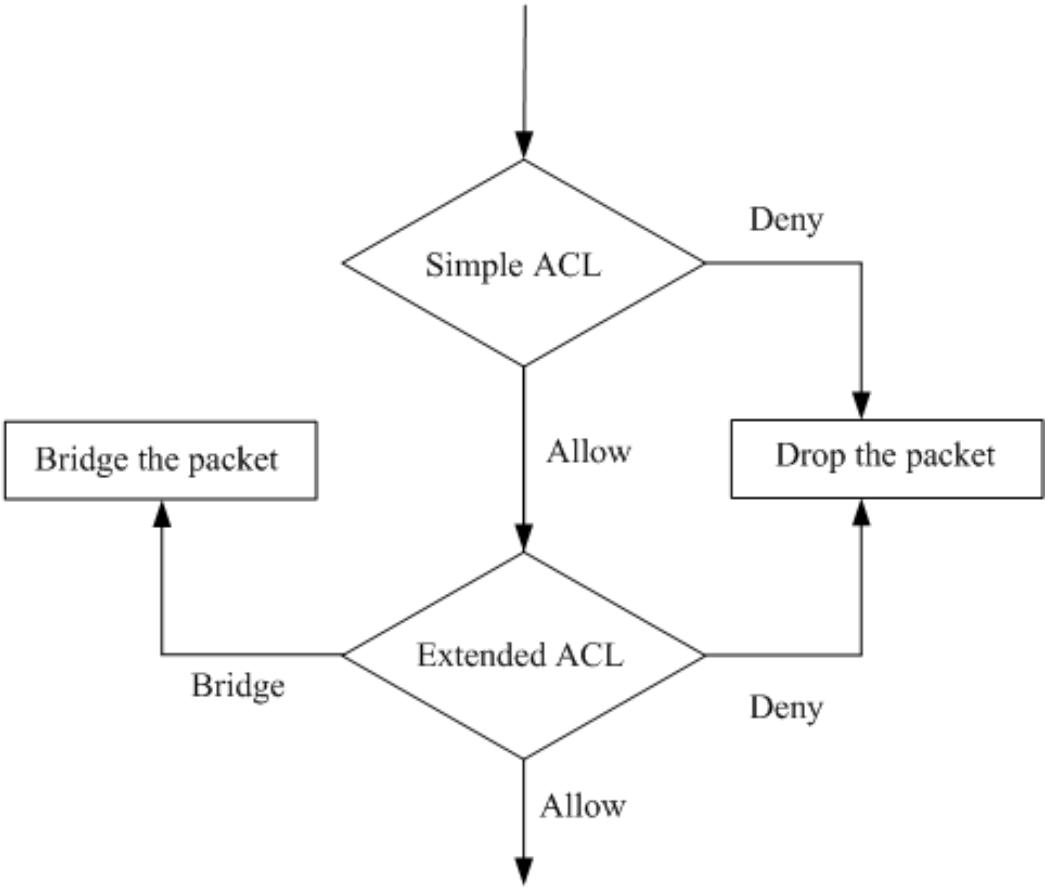

Figure 1. Simple and Extended ACLs Flow Sequence

IPv6 packets are compared only to ACL6s.

Configuring Simple ACLs

A simple ACL, which uses few parameters, cannot be modified once created. When creating a simple ACL, you can specify a time to live (TTL), in seconds, after which the ACL expires. ACLs with TTLs are not saved when you save the configuration. You can also remove a simple ACL manually. You can display simple ACLs to verify their configuration, and you can display statistics to monitor their performance.

Creating Simple ACLs

Use either of the following procedures to create a simple ACL.

To create a simple ACL by using the NetScaler command line

At the NetScaler command prompt, type the following commands to add an ACL and verify the configuration:

- add ns simpleacl <aclname> **DENY -srcIP** <ip_addr> [**-destPort**<port> **-protocol** (TCP | UDP)] [**-TTL** <positive_integer>]
- show ns simpleacl [<aclname>]

Example

```
> add simpleacl rule1 DENY -srcIP 10.102.29.5 -TTL 600
 Done

> show simpleacl rule1
      Name: rule1                    Action: DENY
      srcIP = 10.102.29.5
      Protocol:                     DestPort:
      Hits: 0                      TTL: 590(seconds)
 Done
```

Parameters for configuring a Simple ACL

Parameter

Specifies

aclName

Alphanumeric name of the ACL. Maximum length: 127 characters.

srcIP

IP address of the source machine. You can also specify a range of addresses.

destPort

A destination port on the NetScaler. If you do not specify a port, you create an all-ports ACL, which matches any port. In that case, you cannot create another ACL specifying a specific port and the same source IP address.

protocol

Underlying protocol for this connection. You must specify a value for this parameter if you set the destPort parameter. Possible values: TCP or UDP.

TTL

Number of seconds after which the ACL is to expire. Possible values: 1 to 2147483647. Default: The ACL does not expire. (If you do not want the ACL to expire, do not specify a TTL value.)

To create a simple ACL by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the **ACLs** pane, on the **Simple ACLs** tab, click **Add**.
3. In the **Add Simple ACL** dialog box, specify values for the following parameters:
   - **Name*—**aclName
   - **Protocol—**protocol
   - **Source IP Address—**srcIP
   - **Destination Port**—port
   - **TTL**—TTL (If you do not want the ACL to expire, leave the TTL field blank.)

   *A required parameter
4. Click **Create,** and then click **Close.**
5. On the **Simple ACLs** tab, select the ACL that you created and verify that the settings displayed at the bottom of the screen are correct.

Monitoring Simple ACLs

You can display the simple-ACL statistics, which include the number of hits, the number of misses, and the number of simple ACLs configured.

To view simple ACL statistics by using the NetScaler command line

At the NetScaler command prompt, type:

stat ns simpleacl

Example

```
>stat ns simpleacl

                        Rate (/s)          Total
Deny SimpleACL hits             0              0
SimpleACL hits                  0              0
SimpleACL misses                0             11
SimpleACLs count               --              1
 Done
```

The following table describes statistics you can display for simple ACLs.

Table 1. Simple ACL Statistics

Statistic	Indicates
Deny SimpleACL hits	Packets dropped because they match deny simple ACL
SimpleACL hits	Packets matching a simple ACL
SimpleACL misses	Packets not matching any simple ACL
SimpleACL count	Number of simple ACLs configured

To display simple ACL statistics by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, select the **ACL** whose statistics you want to display (for example, rule1).
3. Click **Statistics**.
4. View the ACL statistics in the new window that opens.

Removing Simple ACLs

If you need modify a simple ACL, you must remove it and create a new one.

To remove a single simple ACL by using the NetScaler command line

At the NetScaler command prompt, type:

- rm ns simpleacl <aclname>
- show ns simpleacl

To remove all simple ACLs by using the NetScaler command line

At the NetScaler command prompt, type:

- clear ns simpleacl
- show ns simpleacl

To remove a single simple ACL by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, on the **Simple ACLs** tab, select the simple ACL that you want to remove (for example, rule1).
3. Click **Remove**.
4. In the **Remove** dialog box, click **Yes**.
5. In the details pane, on the **Simple ACLs** tab, verify that the entry for rule1 has been removed

To remove all simple ACLs by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, on the **Simple ACLs** tab, click **Clear**.
3. In the **Clear Simple ACL (s)** dialog box, click **Yes**.
4. In the details pane, verify that there are no entries in the **Simple ACLs** tab.

Configuring Extended ACLs

To configure extended ACLs, many users first create extended ACLs and then modify them.

For any of the following actions to take effect, they must be applied, by clicking the **Commit** button:

- Activate
- Remove
- Disable
- Change the Priority

Other actions include:

- Configure logging
- Verify the configuration
- Monitor ACL statistics

Note: If you configure both simple and extended ACLs, simple ACLs take precedence over extended ACLs.

Parameters of Extended ACLs can be configured during creation. Additionally, the following actions can be performed on Extended ACLs: Modify, Remove, Apply, Disable, Enable and Renumber the priority of Extended ACLs.

You can collect statistics of packets using Extended ACLs by enabling logging.

Creating and Modifying an Extended ACL

To create an extended ACL by using the NetScaler command line

At the NetScaler command prompt, type:

- add ns acl <aclname> <aclaction> [**-srcIP** [<operator>] <srcIPVal>] [**-srcPort** [<operator>] <srcPortVal>] [**-destIP** [<operator>] <destIPVal>] [**-destPort** [<operator>] <destPortVal>] [**-TTL** <positive_integer>] [**-srcMac** <mac_addr>] [(**-protocol** <protocol> [**-established**]) | **-protocolNumber** <positive_integer>] [**-vlan** <positive_integer>] [**-interface** <interface_name>] [**-icmpType** <positive_integer> [**-icmpCode** <positive_integer>]] [**-priority** <positive_integer>] [**-state** (ENABLED | DISABLED)] [**-logstate** (ENABLED | DISABLED) [**-ratelimit** <positive_integer>]]

- show ns acl [<aclname>]

Example

```
> add ns acl restrict DENY -srcport 45-1024 -destIP 192.168.1.1 -protocol TCP
 Done
> show ns acl restrict
      Name: restrict                  Action: DENY     Hits: 0
      srcIP
      destIP = 192.168.1.1
      srcMac:                       Protocol: TCP
      srcPort =  45-1024               destPort
      Vlan:                        Interface:
      Active Status: ENABLED             Applied Status: NOTAPPLIED
      Priority: 10                   NAT: NO
      TTL:
      Log Status: DISABLED
 Done
```

Parameters for configuring an extended ACL

aclname

Alphanumeric name of the ACL. Maximum length: 127 characters.

aclaction

The action associated with the ACL. The valid options for this parameter are BRIDGE, DENY, and ALLOW.

srcIP

IP address of the source machine. You can also specify a range of addresses, by enclosing the low and high addresses in brackets (for example, [10.102.29.30-10.102.29.189]).

operator

You can use the following operators while creating ACLs: = and !=.

destIP

The IP address of the destination system. You can also specify a range of addresses, by enclosing the low and high addresses in brackets (for example, [10.102.33.31-10.102.33.100]).

protocol

The protocol field in the IP header. Possible values: ICMP, IGMP, TCP, EGP, IGP, ARGUS, UDP, RDP, RSVP, EIGRP, L2TP, and ISIS.

protocolNumber

The IP protocol number (decimal). Minimum value: 1. Maximum value: 255.

srcPort

The port address of the source system. You can also specify a range of ports, by enclosing the low and high port numbers in brackets (for example [30-90]).

Note: The Source Port can be modified only for TCP and UDP.

destPort

The port address of the destination system. You also can specify a range of ports, by enclosing the low and high port numbers in brackets (for example [30-90]).

Note: The Destination Port can be modified only for TCP and UDP.

established

Use the ACL for TCP response traffic only.

TTL

ACLs can be configured to expire after a specified amount of time (in seconds). Possible values: 1 to 2147483647. Default: The ACL does not expire. (If you do not want the ACL to expire, do not specify a TTL value.)

srcMac

The MAC address of the source system. Only the last 32 bits are considered during a lookup.

vlan

The VLAN ID present in the VLAN tag of the packet. Possible values: 1 to 4094.

interface

This is the network interface on which the packet arrived.

icmpType

The ICMP message type. For example, to block DESTINATION UNREACHABLE messages, you must specify 3 as the ICMP type. For a complete list of ICMP types, see http://www.iana.org/assignments/icmp-parameters. Possible values: 0 to 255.

icmpCode

The ICMP message code. For example, to block DESTINATION HOST UNREACHABLE messages, specify 3 as the ICMP type and 1 as the ICMP code. For a complete list of ICMP types and codes, see http://www.iana.org/assignments/icmp-parameters. Possible values: 0 to 255.

priority

The priority of the ACL, which determines the order in which it will be evaluated relative to other extended ACLs. Possible values: 0 to 10240.

state

The state of the ACL. Possible values: ENABLED, DISABLED. Default: Enabled.

ratelimit

Log message rate limit for ACL. Possible values: 1 to 10000. Default:100.

To create an extended ACL by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, on the **Extended ACLs** tab, click **Add**.
3. In the **Create ACL** window, specify values for the following parameters, which correspond to parameters described in "Parameters for configuring an extended ACL" as shown:

   - **Name***—aclname
   - **Action***—aclaction
   - **Source**, **Operator**—operator
   - **Source**, **Low/High**—srcIP (To specify a single IP address, type the same address in both fields.)
   - **Destination**, **Operator**—operator
   - **Destination**, **Low/High**—destIP (To specify a single IP address, type the same address in both fields.)
   - **Protocol**—protocol
   - **Source Port, operator**—operator
   - **Source Port**, **Low/High**—srcPort (To specify a single port, type the same port number in both fields.)
   - **Destination Port, Operator**—operator
   - **Destination Port, Low/High**—destPort (To specify a single port, type the same port number in both fields.)
   - **Established**—established
   - **ICMP Message Type**—icmpType
   - **ICMP Message Code**—icmpCode
   - **Source Mac**—srcMac
   - **VLAN**—vlan
   - **Interface**—interface
   - **Priority**—priority
   - **TTL**—TTL

- **Enable ACL**—state
- **Log State**—logstate
- **Log Rate Limit**—ratelimit

*A required parameter

4. Click **Create**, and then click **Close**.
5. In the details pane, verify that the settings for ACL that you configured are correct.

Applying an Extended ACL

After you create or modify an extended ACL, you must activate it by using one of the following procedures. These procedures reapply all the ACLs.

For example, if you have created the ACLs rule1 through rule10, and then you create an ACL called rule11, and apply it, all of the ACLs (rule1 through rule11) are applied afresh.

If a session has a DENY ACL related to it, that session is destroyed.

To apply an ACL by using the NetScaler command line

At the NetScaler command prompt, type:

- apply ns acls
- show ns acl

To apply an ACL by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. Click **Commit**.
3. In the **Apply ACL(s)** dialog box, click **Yes**.
4. Verify the information on the **Extended ACLs** tab.

Disabling and Enabling Extended ACLs

By default, ACLs are enabled. This means when ACLs are applied, the NetScaler appliance compares incoming packets against the ACLs.

Disable an ACL if it will not be used for a certain period. After the ACLs are applied, the NetScaler does not compare incoming packets against disabled ACLs.

To disable or enable an extended ACL by using the NetScaler command line

At the NetScaler command prompt, type one of the following pairs of commands to disable or enable an ACL and verify the result:

- disable ns acl <aclname>
- show ns acl [<aclname>]
- enable ns acl <aclname>
- show ns acl [<aclname>]

Example

```
> disable ns acl restrict
 Done

> show ns acl restrict
      Name: restrict                  Action: DENY     Hits: 0
      srcIP
      destIP = 192.168.1.1
      srcMac:                       Protocol: TCP
      srcPort =  45-1024               destPort
      Vlan:                        Interface:
      Active Status: DISABLED            Applied Status: NOTAPPLIED
      Priority: 10                   NAT: NO
      TTL:
      Log Status: DISABLED
 Done

> enable ns acl restrict
 Done

> show ns acl restrict
```

```
    Name: restrict                  Action: DENY     Hits: 0
    srcIP
    destIP = 192.168.1.1
    srcMac:                       Protocol: TCP
    srcPort =  45-1024              destPort
    Vlan:                       Interface:
    Active Status: ENABLED            Applied Status: APPLIED
    Priority: 10                  NAT: NO
    TTL:
    Log Status: DISABLED
Done
```

To disable or enable an extended ACL by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, on the **Extended ACLs** tab, select the ACL (for example, rule1) and click **Open**.
3. In the **Configure ACL** dialog box, select the **Enable ACL** check box to enable, or clear the check box to disable, the ACL.
4. Click **OK**.
5. If you want to apply the new setting, which reapplies all ACLs, click **Commit**, and then, in the **Apply ACL(s)** dialog box, click **Yes**.
6. In the details pane, on the **Extended ACLs** tab, view the list to verify the changed status under the column **Active Status**.

Renumbering the priority of Extended ACLs

The renumber procedure resets the priorities of the ACLs to multiples of 10. The priority (an integer value) defines the order in which the NetScaler appliance evaluates ACLs. All priorities are multiples of 10, unless you configure a specific priority to an integer value. When you create an ACL without specifying a priority, the NetScaler automatically assigns a priority that is a multiple of 10.

If a packet matches the condition defined by the ACL, the NetScaler performs an action. If the packet does not match the condition defined by the ACL, the NetScaler compares the packet against the ACL with the next-highest priority.

Consider the following example. Two ACLs, rule1 and rule2, are automatically assigned priorities 20 and 30 when they are created. You need to add a third ACL, rule3, to be evaluated immediately after rule1. Rule3 must have a priority between 20 and 30. In this case, you can specify the priority as 25. Later, you can easily renumber the ACLs with priorities that are multiples of 10, without affecting the order in which the ACLs are applied.

To renumber the ACLs by using the NetScaler command line

At the NetScaler command prompt, type:

renumber ns acls

To renumber the ACLs by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **ACLs**.
2. In the details pane, on the **Extended ACLs** tab, click **Renumber Priority (s)**.
3. In the **Renumber Priority (s) ACL(s)** dialog box, click **Yes**.
4. In the details pane, on the **Extended ACLs** tab, verify the changed priority.

Configuring Extended ACL Logging

You can configure the NetScaler appliance to log details for packets that match an extended ACL. In addition to the ACL name, the logged details include packet-specific information such as the source and destination IP addresses. The information is stored either in the syslog file or in the nslog file, depending on the type of global logging (syslog or nslog) enabled.

Logging can be enabled at both the global level and the ACL level. The global setting takes precedence.

For more information about enabling logging globally, see Audit Logging.the *Citrix NetScaler Administration Guide* at http://support.citrix.com/article/CTX128667.

To optimize logging, when multiple packets from the same flow match an ACL, only the first packet's details are logged, and the counter is incremented for every packet that belongs to the same flow. A flow is defined as a set of packets that have the same values for the following parameters:

- Source IP address
- Destination IP address
- Source port
- Destination port
- Protocol

If the packet is not from the same flow, or if the time duration is beyond the mean time, a new flow is created. Mean time is the time during which packets of the same flow do not generate additional messages (although the counter is incremented).

Note: The total number of different flows that can be logged at any given time is limited to 10,000.

To configure ACL Logging by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure logging and verify the configuration:

- set ns acl <aclName> [**-logState** (ENABLED | DISABLED)] [**-rateLimit** <positive_integer>]
- show ns acl [<aclName>]

Example

```
>set ns acl restrict -logstate ENABLED -ratelimit 120

Warning: ACL modified, apply ACLs to activate change

      > apply ns acls
      Done

> show ns acl restrict
      Name: restrict                  Action: DENY     Hits: 0
      srcIP
      destIP = 192.168.1.1
      srcMac:                        Protocol: TCP
      srcPort =  45-1024                 destPort
      Vlan:                         Interface:
      Active Status: ENABLED              Applied Status: APPLIED
      Priority: 10                    NAT: NO
      TTL:
      Log Status: ENABLED                 Log Rate limit: 120
 Done
```

Logging parameters of an extended ACL

aclName

The alphanumeric name of the ACL.

logState

State of the logging feature for the ACL. Possible Values: Enabled, Disabled. Default: Disabled.

rateLimit

Number of log messages that a specific ACL can generate. Default: 100.

To configure ACL Logging by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, click the **Extended ACLs** tab, and then select the ACL for which you want to configure logging (for example, rule1).
3. Click **Open**.
4. In the **Configure ACL** dialog box, specify values for the following parameters, which correspond to parameters described in "Logging parameters of an extended ACL" as shown:
   - **Log State**—logState
   - **Log Rate Limit**—rateLimit
5. Click **OK**.
6. In the**ACL modified, apply ACLs to activate change** dialog box, click **OK**.
7. Select the modified ACL and, under **Details**, verify the log state.

Monitoring the Extended ACL

You can display statistics for monitoring the performance of an extended ACL.

To display the statistics of an extended ACL by using the NetScaler command line

At the NetScaler command prompt, type:

stat ns acl

Example

```
>stat ns acl rule1

ACL: rule1
                          Rate (/s)          Total
Hits for this ACL                 0              0
 Done
```

The following table lists the statistics associated with extended ACLs and their descriptions.

Table 1. Extended ACL Statistics

Statistic	Specifies
Allow ACL hits	Packets matching ACLs with processing mode set to ALLOW. NetScaler processes these packets.
NAT ACL hits	Packets matching a NAT ACL, resulting in a NAT session.
Deny ACL hits	Packets dropped because they match ACLs with processing mode set to DENY.
Bridge ACL hits	Packets matching a bridge ACL, which in transparent mode bypasses service processing.
ACL hits	Packets matching an ACL.
ACL misses	Packets not matching any ACL.

To display the statistics of an extended ACL by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, on the **Extended ACLs** tab, select the ACL whose statistics you want to view (for example, rule1).
3. Click **Statistics**.
4. View the statistics in the new window that opens.

Removing Extended ACLs

You can remove a single extended ACL or all extended ACLs.

To remove a single extended ACL by using the NetScaler command line

At the NetScaler command prompt, type:

- rm ns acl <aclName>
- show ns acl

To remove all extended ACLs by using the NetScaler command line

At the NetScaler command prompt, type:

- clear ns acls
- show ns acl

To remove a single extended ACL by using the configuration utility

1. In the navigation pane, expand **Network** and click ACLs.
2. In the details pane, on the **Extended ACLs** tab, select the ACL that you want to remove (for example, rule1).
3. Click **Remove**.
4. In the **Remove** dialog box, click **Yes**.

To remove all extended ACLs by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, on the **Extended ACLs** tab, click **Clear**.
3. In the **Clear ACL (s)** dialog box, click **Yes**.
4. In the details pane, on the **Extended ACLs** tab, verify that no ACLs are listed.

Configuring Simple ACL6s

A simple ACL6, which uses few parameters, cannot be modified once created. Instead, you must remove the simple ACL6 and create a new one. When creating a simple ACL6, you must specify its name, and a source IP address value against which to match packets. Optionally, you can specify a destination port and a time to live (TTL) value. A TTL is the number of seconds after which the simple ACL6 expires. ACL6s with TTLs are not saved when you save the configuration.

Creating Simple ACL6s

To create a simple ACL6, you must specify its name and source IP address. You can also specify a destination port and time to live (TTL).

To create a simple ACL6 by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create a simple ACL6 and verify the configuration:

- add ns simpleacl6 <aclname> **DENY -srcIPv6** <ipv6_addr|null> [**-destPort**<port> **-protocol** (TCP | UDP)] [**-TTL** <positive_integer>]
- show ns simpleacl6 [<aclname>]

Example

```
>  add ns simpleacl6 rule1 DENY –srcIPv6 3ffe:192:168:215::82 -destPort 80 -Protocol TCP -TTL 9000
 Done

> show simpleacl6 rule1
      Name: rule1
      Action: DENY                    Hits: 5
      srcIP6= 3ffe:192:168:215::82
      Protocol: TCP                   DestPort = 80
      TTL: 8922(seconds)
 Done
```

Parameters for configuring a simple ACL6

acl6name (Name)

A name for the simple ACL6. The name can begin with a letter, number, or the underscore symbol, and can consist of up to 127 letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed after the simple ACL6 has been created.)

DENY

Drop the packet. This is the only action available for a simple ACL6.

srcIPv6 (Source IP Address)

The IP address that the simple ACL6 rule compares to the address in the source IP address field of every incoming IPv6 packet.

destPort (Destination Port)

A destination port on the NetScaler appliance. If you do not specify a port, you create an all-ports ACL6, which matches any port. In that case, you cannot create another simple ACL6 specifying a specific port and the same source IPv6 address.

protocol (Protocol)

Underlying protocol name that the simple ACL6 rule will check in protocol name field of all the incoming IPv6 packets. You must specify a value for this parameter if you set the destPort parameter. Possible values: TCP, UDP. Simple ACL6s can traverse the extension headers (if present) of the incoming IPv6 packets to identify the protocol name.

TTL (TTL)

Number of seconds after which the ACL6 is to expire. Possible values: 1 to 2147483647. Default: The ACL6 does not expire. (If you do not want the ACL6 to expire, do not specify a TTL value.)

To create a simple ACL6 by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **ACLs**.
2. In the **ACLs** pane, on the **Simple ACL6s** tab, click **Add**.
3. In the **Add Simple ACL6** dialog box, specify values for the following parameters:
   - **Name***
   - **Protocol**
   - **Source IP Address**
   - **Destination Port**
   - **TTL**

   *A required parameter
4. Click **Create**, and then click **Close.**
5. On the **Simple ACL6s** tab, select the ACL that you created and verify that the settings displayed at the bottom of the screen are correct.

To remove a single simple ACL6 by using the NetScaler command line

At the NetScaler command prompt, type:

- rm ns simpleacl6 <aclname>
- show ns simpleacl6

To remove all simple ACL6s by using the NetScaler command line

At the NetScaler command prompt, type:

- clear ns simpleacl6
- show ns simpleacl6

To remove one or all simple ACL6s by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **ACLs**.
2. In the details pane, on the **Simple ACL6s** tab, do one of the following:
   - Select the simple ACL6 that you want to remove, and then click **Remove**.
   - To remove all simple ACL6s, click **Clear**.
3. In the **Proceed or Clear Simple ACL6(s)** dialog box, click **Yes**.
4. In the details pane, on the **Simple ACL6s** tab, verify that the entry or entries have been removed.

Monitoring Simple ACL6s

You can display the following simple ACL6 statistics:

Table 1. Simple ACL6 Statistics

Statistic	Indicates
Deny simpleACL6 hits	Packets dropped because they match a simple deny ACL6
Simple ACL6 hits	Packets matching a simple ACL6
Simple ACL6 misses	Packets not matching any simple ACL6
Simple ACL6 count	Number of simple ACL6s configured

To display simple ACL6 statistics by using the NetScaler command line

At the NetScaler command prompt, type:

stat ns simpleacl6

Example

```
>stat ns simpleacl6

                        Rate (/s)          Total
Deny SimpleACL6 hits            0              0
SimpleACL6 hits                 0              0
SimpleACL6 misses               0             11
SimpleACL6s count              --              1
```

Done

To display simple ACL6 statistics by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, on the **Simple ACL6s** tab, select the simple ACL6 whose statistics you want to display.
3. Click **Statistics**.

Configuring ACL6s

ACL6s can be configured during creation. Additionally, the following actions can be performed on ACL6s: Modify, Apply, Disable, Enable, Renumber and Remove the priority of ACL6s.Log files of ACL6s can be configured to collect statistics of packets. If a packet matches the condition defined by the ACL6, the NetScaler performs an action. If the packet does not match the condition defined by the ACL6, the NetScaler compares the packet against the ACL6 with the next-highest priority.

Creating and Modifying ACL6s

To create an ACL6 by using the NetScaler command line

At the NetScaler command prompt, type:

- add ns acl6 <acl6name> <acl6action> [**-srcIPv6** [<operator>] <srcIPv6Val>] [**-srcPort** [<operator>] <srcPortVal>] [**-destIPv6** [<operator>] <destIPv6Val>] [**-destPort** [<operator>] <destPortVal>] [**-TTL** <positive_integer>] [**-srcMac** <mac_addr>] [(**-protocol** <protocol> [**-established**]) | **-protocolNumber** <positive_integer>] [**-vlan** <positive_integer>] [**-interface** <interface_name>] [**-icmpType** <positive_integer> [**-icmpCode** <positive_integer>]] [**-priority** <positive_integer>] [**-state** (ENABLED | DISABLED)]

- show ns acl6 [<acl6name>]

Example

Example
> add ns acl6 rule6 DENY -srcport 45-1024 -destIPv6 2001::45 -protocol TCP
 Done

> show ns acl6 rule6
 Name: rule6 Action: DENY
 srcIPv6
 destIPv6 = 2001::45
 srcMac: Protocol: TCP
 srcPort = 45-1024 destPort
 Vlan: Interface:
 Active Status: ENABLED Applied Status: NOTAPPLIED
 Priority: 10 Hits: 0
 TTL:
 Done

To modify or remove an ACL6 by using the NetScaler command line

- To modify an ACL6, type the set ns ACL6 command, the name of the ACL6, and the parameters to be changed, with their new values.

- To remove an ACL6, type the rm ns ACL6 command and the name of the <entity>.

Parameters for configuring an ACL6

acl6name (Name)

A name for the simple ACL6. The name can begin with a letter, number, or the underscore symbol, and can consist of up to 127 letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed after the ACL6 has been created.)

acl6action (Action)

The action associated with the ACL6. Possible values: BRIDGE, DENY, ALLOW.

srcIPv6 (Source, Low/High)

The IP address that the ACL6 rule checks in source IP address field of all the incoming IPv6 packets. You can also specify a range of addresses, by enclosing the low and high addresses in brackets.

operator (Operator)

The type of operation for matching the ACL6 against packets. Possible values: = (equals), != (does not equal).

destIPv6 (Destination, Low/High)

The IP address that the ACL6 rule compares to the address in the destination IP address field of every incoming IPv6 packet. You can also specify a range of addresses, by enclosing the low and high addresses in brackets, with a hyphen between the two addresses.

protocol (Protocol)

The protocol field in the IP header. Possible values: TCP, UDP, ICMPv6. ACL6s can traverse through the extension headers (if present) of the incoming IPv6 packets to find out the protocol name.

protocolNumber

The IP protocol number (decimal). Minimum value: 1. Maximum value: 255.

srcPort (Source Port, Low/High)

The port number that the ACL6 rule compares to the port number in the source port field of every incoming IPv6 packet. You also can specify a range of ports, by enclosing the low and high port numbers in brackets, with a hyphen between the low and high port numbers (for example [40-90]).

Note: The Source Port can be modified only for TCP and UDP.

destPort (Destination Port, Low/High)

The port number that the ACL6 rule compares to the port number in the destination port field of every incoming IPv6 packet. You also can specify a range of ports, by enclosing

the low and high port numbers in brackets (for example [30-90]).

Note: The Destination Port can be modified only for TCP and UDP.

established

Use the ACL for TCP response traffic only.

TTL (TTL)

Expire the ACL6 after the specified amount of time (in seconds). Possible values: 1 to 2147483647. Default: The ACL does not expire. (If you do not want the ACL to expire, do not specify a TTL value.)

srcMac (Source MAC

The MAC address of the source system. Only the last 32 bits are considered during a lookup.

vlan (VLAN)

The VLAN ID present in the VLAN tag of the packet. Possible values: 1 to 4094.

interface (Interface)

The network interface on which the packet arrived.

icmpType (ICMP Message Type)

The ICMPv6 message type. For example, to block DESTINATION UNREACHABLE messages, you must specify 1 as the ICMP type. For a complete list of ICMP types, see http://www.iana.org/assignments/icmp-parameters. Possible values: 0 to 255.

icmpCode (ICMP Message Code)

The ICMPv6 message code. For example, to block DESTINATION UNREACHABLE NO ROUTE TO DESTINATION messages, specify 1 as the ICMP type and 0 as the ICMPv6 code . For a complete list of ICMP types and codes, see http://www.iana.org/assignments/icmp-parameters. Possible values: 0 to 255.

priority (Priority)

The priority of the ACL6, which determines the order in which it will be applied relative to other ACL6s. Possible values: 0 to 10240.

state (Enable ACL6)

The state of the ACL6. Possible values: ENABLED, DISABLED. Default: ENABLED.

To create an ACL6 by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, on the ACL6s tab, do one of the following:
   - To create a new ACL6, click **Add**.
   - To modify an existing ACL6, select the <entity>, and then click **Open**.
3. In the **Create ACL** window, set the following parameters:

   - **Name***
   - **Action***
   - **Source**, **Operator**
   - **Source**, **Low/High** (To specify a single IP address, type the same address in both fields.)
   - **Destination**, **Operator**
   - **Destination**, **Low/High** (To specify a single IP address, type the same address in both fields.)
   - **Protocol**
   - **Source Port, operator**
   - **Source Port**, **Low/High** (To specify a single port, type the same port number in both fields.)
   - **Destination Port, Operator**
   - **Destination Port, Low/High** (To specify a single port, type the same port number in both fields.)
   - **Established**
   - **ICMP Message Type**
   - **ICMP Message Code**
   - **Source Mac**
   - **VLAN**
   - **Interface**
   - **Priority**
   - **TTL**

- **Enable ACL6**

*A required parameter

4. Click **Create** and click **Close**.
5. In the details pane, you can view the ACL you created under the **ACL6s** tab.

Applying ACL6s

After you create an ACL6, you must activate it. The following procedures reapply all the ACL6s.

For example, if you have created the ACL6s rule1 through rule10, and then you create an ACL6 called rule11 and apply it, all of the ACL6s (rule1 through rule11) are applied afresh.

If a session has a DENY ACL related to it, the session is destroyed.

You must apply one of the following procedures after every action you perform on an ACL6 (for example, after disabling an ACL6). However, you can add or modify more than one ACL6 and apply all of them at the same time.

Note: ACL6s created on the NetScaler do not work until they are applied.

To apply ACL6s by using the NetScaler command line

At the NetScaler command prompt, type:

apply ns acls6

To apply ACL6s by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. Click **Commit**.
3. In the **Apply ACL(s)** dialog box that appears, click **Yes**.
4. Verify that the settings displayed on the **ACL6s** tab are correct.

Enabling and Disabling ACL6s

By default, ACL6s are enabled. Therefore, after the ACL6s are applied, the NetScaler appliance compares incoming packets against the configured ACL6s.

If an ACL6 is not required to be part of the lookup table but needs to be retained in the configuration, it must be disabled before the ACL6s are applied. After the ACL6s are applied, the NetScaler does not compare incoming packets against disabled ACL6s.

To disable or enable an ACL6 by using the NetScaler command line

At the NetScaler command prompt, type:

- enable ns acl6 <acl6name>
- show ns acl6 [<acl6name>]
- disable ns acl6 <acl6name>
- show ns acl6 [<acl6name>]

Note: ACL6s created on the NetScaler do not work until they are applied.

Example

```
> enable ns acl6 rule6
 Done

> show ns acl6 rule6
      Name: rule6                    Action: DENY
      srcIPv6
      destIPv6 = 2001::45
      srcMac:                      Protocol: TCP
      srcPort =  45-1024               destPort
      Vlan:                       Interface:
      Active Status: ENABLED             Applied Status: NOTAPPLIED
      Priority: 10                 Hits: 0
      TTL:
 Done

> disable ns acl6 rule6
 Done
```

```
> show ns acl6 rule6
      Name: rule6                    Action: DENY
      srcIPv6
      destIPv6 = 2001::45
      srcMac:                      Protocol: TCP
      srcPort =  45-1024              destPort
      Vlan:                       Interface:
      Active Status: DISABLED           Applied Status: NOTAPPLIED
      Priority: 10                 Hits: 0
      TTL:
Done
```

To disable or enable an ACL6 by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, on the **ACL6s** tab, select the ACL (for example, rule1) and do one of the following:
   - To disable the extended ACL6, click **Disable**.
   - To enable the extended ACL6, click **Enable**.
3. If you want to apply the new setting, which reapplies all ACLs, click **Commit**, and then, in the **Apply ACL6(s)** dialog box, click **Yes**.
4. In the details pane, on the **Extended ACL6s** tab, view the list to verify the changed status under the column **Active Status**.

Renumbering the Priority of ACL6s

The renumber procedure resets the priorities of the ACL6s to multiples of 10. The priority (an integer value) defines the order in which the NetScaler appliance evaluates ACL6s. All priorities are multiples of 10, unless you configure a specific priority to an integer value. When you create an ACL6 without specifying a priority, the NetScaler automatically assigns a priority that is a multiple of 10.

If a packet matches the condition defined by the ACL6, the NetScaler performs an action. If the packet does not match the condition defined by the ACL6, the NetScaler compares the packet against the ACL6 with the next-highest priority.

Consider the following example. Two ACL6s, rule1 and rule2, are automatically assigned priorities 20 and 30 when they are created. You need to add a third ACL, rule3, to be evaluated immediately after rule1. Rule3 must have a priority between 20 and 30. In this case, you can specify the priority as 25. Later, you can easily renumber the ACL6s with priorities that are multiples of 10, without affecting the order in which the ACLs6are applied.

To renumber the priorities of the ACL6s by using the NetScaler command line

At the NetScaler command prompt, type:

renumber ns acls6

Example

```
> renumber ns acls6
Done
```

To renumber the priority of ACL6s by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, on the ACL6s tab, click **Renumber Priority (s)** ACL(s).
3. In the **Renumber Priority (s)** ACL(s) dialog box, click **Yes**.
4. Verify the action in the details pane.

Monitoring ACL6s

You can display statistics for monitoring the performance of an ACL6.

To display the statistics for an ACL6s by using the NetScaler command line

At the NetScaler command prompt, type:

stat ns acl6 <acl6name>

Example

```
> stat ns acl6 rule6
ACL6: rule6
                       Rate (/s)          Total
Hits for this ACL6             0              0
 Done
```

The following table lists the statistics associated with ACL6s and their descriptions.

Table 1. ACL6 Statistics

Statistic	Specifies
Allow ACL6 hits	Packets matching IPv6 ACLs with processing mode set to ALLOW. The NetScaler processes these packets.
NAT ACL6 hits	Packets matching a NAT ACL6, resulting in a NAT session.
Deny ACL6 hits	Packets dropped because they match IPv6 ACLs with processing mode set to DENY.
Bridge ACL6 hits	Packets matching a bridge IPv6 ACL, which in transparent mode bypasses service processing.
ACL6 hits	Packets matching an IPv6 ACL.
ACL6 misses	Packets not matching any IPv6 ACL.

To display the statistics for an ACL6 by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, on the **ACL6s** tab, select the ACL whose statistics you want to view (for example, rule1).
3. Click **Statistics**.
4. View the statistics in the new window that opens.

Removing ACL6s

You can remove a single ACL6 or all ACL6s.

To remove an extended ACL6 by using the NetScaler command line

At the NetScaler command prompt, type:

- rm ns acl6 <acl6name>
- show ns acl6

To remove all extended ACL6s by using the NetScaler command line

At the NetScaler command prompt, type:

clear ns acls6

To remove an extended ACL6 by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, on the **ACL6s** tab, select the ACL that you want to remove (for example, rule1).
3. Click **Remove**.
4. In the **Remove** dialog box, click **Yes**.
5. In the details pane, on the **ACL6s** tab, verify that the ACL6 is not listed

To remove all extended ACLs by using the configuration utility

1. In the navigation pane, expand **Network** and click **ACLs**.
2. In the details pane, on the **ACL6s** tab, click **Clear**.
3. In the **Clear ACL (s)** dialog box, click **Yes**
4. In the details pane, on the **Extended ACLs** tab, verify that no ACLs are listed

IP Routing

NetScaler® appliances support both dynamic and static routing. Because simple routing is not the primary role of a NetScaler, the main objective of running dynamic routing protocols is to enable route health injection (RHI), so that an upstream router can choose the best among multiple routes to a topographically distributed virtual server.

Most NetScaler implementations use some static routes to reduce routing overhead. You can create backup static routes and monitor routes to enable automatic switchover in the event that a static route goes down. You can also assign weights to facilitate load balancing among static routes, create null routes to prevent routing loops, and configure IPv6 static routes. You can configure policy based routes (PBRs), for which routing decisions are based on criteria that you specify

Configuring Dynamic Routes

When a dynamic routing protocol is enabled, the corresponding routing process monitors route updates and advertises routes. Routing protocols enable an upstream router to use the equal cost multipath (ECMP) technique to load balance traffic to identical virtual servers hosted on two standalone NetScaler appliances. Dynamic routing on a NetScaler appliance uses three routing tables. In a high-availability setup, the routing tables on the secondary appliance mirror those on the primary.

The NetScaler supports the following protocols:

- Routing Information Protocol (RIP) version 2
- Open Shortest Path First (OSPF) version 2
- Border Gateway Protocol (BGP)
- Routing Information Protocol next generation (RIPng) for IPv6
- Open Shortest Path First (OSPF) version 3 for IPv6

You can enable more than one protocol simultaneously.

Routing Tables in the NetScaler

In a NetScaler appliance, the NetScaler kernel routing table, the FreeBSD kernel routing table, and the NSM FIB routing table each hold a different set of routes and serve a different purpose. They communicate with each other by using UNIX routing sockets. Route updates are not automatically propagated from one routing table to another. You must configure propagation of route updates for each routing table.

NS Kernel Routing Table

The NS kernel routing table holds subnet routes corresponding to the NSIP and to each SNIP and MIP. Usually, no routes corresponding to VIPs are present in the NS kernel routing table. The exception is a VIP added by using the `add ns ip` command and configured with a subnet mask other than 255.255.255.255. If there are multiple IP addresses belonging to the same subnet, they are abstracted as a single subnet route. In addition, this table holds a route to the loopback network (127.0.0.0) and any static routes added through the NetScaler command-line interface (CLI). The entries in this table are used by the NetScaler in packet forwarding. From the NetScaler CLI, they can be inspected with the `show route` command.

FreeBSD Routing Table

The sole purpose of the FreeBSD routing table is to facilitate initiation and termination of management traffic (telnet, ssh, etc.). In a NetScaler appliance, these applications are tightly coupled to FreeBSD, and it is imperative for FreeBSD to have the necessary information to handle traffic to and from these applications. This routing table contains a route to the NSIP subnet and a default route. In addition, FreeBSD adds routes of type `WasCloned(W)` when the NetScaler establishes connections to hosts on local networks. Because of the highly specialized utility of the entries in this routing table, all other route updates from the NS kernel and NSM FIB routing tables bypass the FreeBSD routing table. Do not modify it with the `route` command. The FreeBSD routing table can be inspected by using the `netstat` command from any UNIX shell.

Network Services Module (NSM) FIB

The NSM FIB routing table contains the advertisable routes that are distributed by the dynamic routing protocols to their peers in the network. It may contain:

Connected routes

IP subnets that are directly reachable from the NetScaler. Typically, routes corresponding to the NSIP subnet and subnets over which routing protocols are enabled are present in NSM FIB as connected routes.

Kernel routes

All the VIP addresses on which the **-hostRoute** option is enabled are present in NSM FIB as kernel routes if they satisfy the required RHI Levels. In addition, NSM FIB contains any static routes configured on the NetScaler CLI that have the - advertise option enabled. Alternatively, if the NetScaler is operating in Static Route Advertisement (SRADV) mode, all static routes configured on the NetScaler CLI are present in NSM FIB. These static routes are marked as kernel routes in NSM FIB, because they actually belong to the NS kernel routing table.

Static routes

Normally, any static route configured in VTYSH is present in NSM FIB. If administrative distances of protocols are modified, this may not always be the case. An important point to note is that these routes can never get into the NS kernel routing table.

Learned routes

If the NetScaler is configured to learn routes dynamically, the NSM FIB contains routes learned by the various dynamic routing protocols. Routes learned by OSPF, however, need special processing. They are downloaded to FIB only if the **fib-install** option is enabled for the OSPF process. This can be done from the router-config view in VTYSH.

High Availability Setup

In a high availability setup, the primary node runs the routing process and propagates routing table updates to the secondary node. The routing table of the secondary node mirrors the routing table on the primary node.

Non-Stop Forwarding

After failover, the secondary node takes some time to start the protocol, learn the routes, and update its routing table. But this does not affect routing, because the routing table on the secondary node is identical to the routing table on the primary node. This mode of operation is known as non-stop forwarding.

Black Hole Avoidance Mechanism

After failover, the new primary node injects all its VIP routes into the upstream router. However, that router retains the old primary node's routes for 180 seconds. Because the router is not aware of the failover, it attempts to load balance traffic between the two nodes. During the 180 seconds before the old routes expire, the router sends half the traffic to the old, inactive primary node, which is, in effect, a black hole.

To prevent this, the new primary node, when injecting a route, assigns it a metric that is slightly lower than the one specified by the old primary node.

Interfaces for Configuring Dynamic Routing

To configure dynamic routing, you can use either the configuration utility or a command-line interface. The NetScaler supports two independent command-line interfaces: the NetScaler CLI and the Virtual Teletype Shell (VTYSH). The NetScaler CLI is the appliance's native shell. VTYSH is exposed by ZebOS. The NetScaler routing suite is based on ZebOS, the commercial version of GNU Zebra.

Note: Citrix recommends that you use VTYSH for all commands except those that can be configured only on the NetScaler CLI. Use of the NetScaler CLI should generally be limited to commands for enabling the routing protocols, configuring host route advertisement, and adding static routes for packet forwarding.

Configuring RIP

Routing Information Protocol (RIP) is a Distance Vector protocol. The NetScaler supports RIP as defined in RFC 1058 and RFC 2453. RIP can run on any subnet.

After enabling RIP, you need to configure advertisement of RIP routes. For troubleshooting, you can limit RIP propagation. You can display RIP settings to verify the configuration.

Enabling and Disabling RIP

Use either of the following procedures to enable or disable RIP. After you enable RIP, the NetScaler appliance starts the RIP process. After you disable RIP, the appliance stops the RIP process.

To enable or disable RIP routing by using the NetScaler command line

At the NetScaler command prompt, enter one of the following commands to enable or disable RIP:

- enable ns feature RIP
- disable ns feature RIP

To enable or disable RIP routing by using the configuration utility

1. In the navigation pane, expand **System,** and then click **Settings**.
2. In the details pane, under the **Modes and Features** group, click **Change advanced features**.
3. In the **Configure Advanced Features** dialog box, do one of the following:
   - To enable OSPF routing, select the **RIP Routing** check box.
   - To disable OSPF routing, clear the **RIP Routing** check box.
4. Click **OK**.
5. In the **Enable/Disable Feature(s)?** dialog box, click **Yes**.

Advertising Routes

RIP enables an upstream router to load balance traffic between two identical virtual servers hosted on two standalone NetScaler appliances. Route advertisement enables an upstream router to track network entities located behind the NetScaler.

To configure RIP to advertise routes by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
router rip	Start the RIP routing process and enter configuration mode for the routing process.
redistribute static	Redistribute static routes.
redistribute kernel	Redistribute kernel routes.

Example:

```
>VTYSH
NS# configure terminal
NS(config)# router rip
NS(config-router)# redistribute static
NS(config-router)# redistribute kernel
```

Limiting RIP Propagations

If you need to troubleshoot your configuration, you can configure listen-only mode on any given interface.

To limit RIP propagation by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
router rip	Start the RIP routing process and enter configuration mode for the routing process.
passive-interface < vlan_name>	Suppress routing updates on interfaces bound to the specified VLAN.

Example

```
>VTYSH
NS# configure terminal
NS(config)# router rip
NS(config-router)# passive-interface VLAN0
```

Verifying the RIP Configuration

You can display the routing table and other RIP settings.

To view the RIP settings by using the VTYSH command line

At the NetScaler command prompt, type the following commands in the following order:

Command	Specifies
VTYSH	Display VTYSH command prompt.
sh rip	Display updated RIP routing table.
sh rip interface <vlan_name>	Displays RIP information for the specified VLAN.

Example

```
NS# VTYSH
NS# sh rip
NS# sh rip interface VLAN0
```

Configuring OSPF

The NetScaler supports Open Shortest Path First (OSPF) Version 2 (RFC 2328). The features of OSPF on the NetScaler are:

- The NetScaler supports OSPF within a single area only.
- If a vserver is active, the host routes to the vserver can be injected into the routing protocols.
- OSPF can run on any subnet.
- Route learning advertised by neighboring OSPF routers can be disabled on the NetScaler.
- The NetScaler can advertise Type-1 or Type-2 external metrics for all routes.
- The NetScaler can advertise user-specified metric settings for VIP routes. For example, you can configure a metric per VIP without special route maps.
- You can specify the OSPF area ID for the NetScaler.
- The NetScaler supports not-so-stubby-areas (NSSAs). An NSSA is similar to an OSPF stub area but allows injection of external routes in a limited fashion into the stub area. To support NSSAs, a new option bit (the N bit) and a new type (Type 7) of Link State Advertisement (LSA) area have been defined. Type 7 LSAs support external route information within an NSSA. An NSSA area border router (ABR) translates a type 7 LSA into a type 5 LSA that is propagated into the OSPF domain. The OSPF specification defines only the following general classes of area configuration:
    - Type 5 LSA: Originated by routers internal to the area are flooded into the domain by AS boarder routers (ASBRs).
    - Stub: Allows no type 5 LSAs to be propagated into/throughout the area and instead depends on default routing to external destinations.

After enabling OSPF, you need to configure advertisement of OSPF routes. For troubleshooting, you can limit OSPF propagation. You can display OSPF settings to verify the configuration.

Enabling and Disabling OSPF

To enable or disable OSPF, you must use either the NetScaler command line or the configuration utility. When OSPF is enabled, the NetScaler starts the OSPF process. When OSPF is disabled, the NetScaler stops the OSPF routing process.

To enable or disable OSPF routing by using the NetScaler command line

At the NetScaler command prompt, type one of the following commands:

1. enable ns feature OSPF
2. disable ns feature OSPF

To enable or disable OSPF routing by using the configuration utility

1. In the navigation pane, expand **System,** and then click **Settings**.
2. In the details pane, under the **Modes and Features** group, click **Change advanced features**.
3. In the **Configure Advanced Features** dialog box, do one of the following:
   - To enable OSPF routing, select the **OSPF Routing** check box.
   - To disable OSPF routing, clear the **OSPF Routing** check box.
4. Click **OK**.
5. In the **Enable/Disable Feature(s)?** dialog box, click **Yes**.

Advertising OSPF Routes

OSPF enables an upstream router to load balance traffic between two identical virtual servers hosted on two standalone NetScaler appliances. Route advertising enables an upstream router to track network entities located behind the NetScaler.

To configure OSPF to advertise routes by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enters global configuration mode.
router OSPF	Start OSPF routing process and enter configuration mode for the routing process.
redistribute static	Redistribute static routes.
redistribute kernel	Redistribute kernel routes.

Example

```
>VTYSH
NS# configure terminal
NS(config)# router OSPF
NS(config-router)# redistribute static
NS(config-router)# redistribute kernel
```

Limiting OSPF Propagations

If you need to troubleshoot your configuration, you can configure listen-only mode on any given VLAN.

To limit OSPF propagation by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
router OSPF	Start OSPF routing process and enters configuration mode for the routing process.
passive-interface < vlan_name>	Suppress routing updates on interfaces bound to the specified VLAN.

Example

```
>VTYSH
NS# configure terminal
NS(config)# router OSPF
NS(config-router)# passive-interface VLAN0
```

Verifying the OSPF Configuration

You can display current OSPF neighbors, and OSPF routes.

To view the OSPF settings by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
sh OSPF neighbor	Displays current neighbors.
sh OSPF route	Displays OSPF routes.

Example

```
>VTYSH
NS# sh OSPF neighbor
NS# sh OSPF route
```

Configuring BGP

The NetScaler appliance supports BGP (RFC 4271). The features of BGP on the NetScaler are:

- The NetScaler advertises routes to BGP peers.
- The NetScaler injects host routes to virtual IP addresses (VIPs), as determined by the health of the underlying virtual servers.
- The NetScaler generates configuration files for running BGP on the secondary node after failover in an HA configuration.
- This protocol supports IPv6 route exchanges.

After enabling BGP, you need to configure advertisement of BGP routes. For troubleshooting, you can limit BGP propagation. You can display BGP settings to verify the configuration.

Prerequisites for IPv6 BGP

Before you begin configuring IPv6 BGP, do the following:

- Make sure that you understand the IPv6 BGP protocol.
- Install the IPv6PT license on the NetScaler appliance.
- After installing the IPv6PT license, enable the IPv6 feature.

Enabling and Disabling BGP

To enable or disable BGP, you must use either the NetScaler command line or the configuration utility. When BGP is enabled, the NetScaler appliance starts the BGP process. When BGP is disabled, the appliance stops the BGP process.

To enable or disable BGP routing by using the NetScaler command line

At the NetScaler command prompt, type one of the following commands:

- enable ns feature BGP
- disable ns feature BGP

To enable or disable BGP routing by using the configuration utility

1. In the navigation pane, expand **System** and click **Settings**.
2. In the details pane, under the **Modes and Features** group, click **Change advanced features**.
3. In the **Configure Advanced Features** dialog box, do one of the following:
   - To enable BGP routing, select the **BGP Routing** check box.
   - To disable BGP routing, clear the **BGP Routing** check box.
4. Click **OK**.
5. In the **Enable/Disable Feature(s)?** dialog box, click **Yes**.

Advertising IPv4 Routes

You can configure the NetScaler appliance to advertise host routes to VIPs and to advertise routes to downstream networks.

To configure BGP to advertise IPv4 routes by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
router BGP < ASnumber>	BGP autonomous system. < Asnumber> is a required parameter. Possible values: 1 to 4,294,967,295.
Neighbor < IPv4 address> **remote-as** < as-number>	Update the IPv4 BGP neighbor table with the link local IPv4 address of the neighbor in the specified autonomous system.
Address-family ipv4	Enter address family configuration mode.
Neighbor < IPv4 address> **activate**	Exchange prefixes for the IPv4 router family between the peer and the local node by using the link local address.
redistribute kernel	Redistribute kernel routes.
redistribute static	Redistribute static routes.

Example

```
>VTYSH
NS# configure terminal
NS(config)# router BGP 5
NS(config-router)# Neighbor a1bc::102 remote-as 100
NS(config-router)# Address-family ipv4
NS(config-router-af)# Neighbor 10.102.29.170 activate
NS(config-router)# redistribute kernel
NS(config-router)# redistribute static
```

Advertising IPv6 BGP Routes

Border Gateway Protocol (BGP) enables an upstream router to load balance traffic between two identical virtual servers hosted on two standalone NetScaler appliances. Route advertising enables an upstream router to track network entities located behind the NetScaler.

To configure BGP to advertise IPv6 routes by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
router BGP < ASnumber>	BGP autonomous system. < Asnumber> is a required parameter. Possible values: 1 to 4,294,967,295.
Neighbor < IPv6 address> **remote-as** < as-number>	Update the IPv6 BGP neighbor table with the link local IPv6 address of the neighbor in the specified autonomous system.
Address-family ipv6	Enter address family configuration mode.
Neighbor < IPv6 address> **activate**	Exchange prefixes for the IPv6 router family between the peer and the local node by using the link local address.
redistribute kernel	Redistribute kernel routes.
redistribute static	Redistribute static routes.

Example

```
>VTYSH
NS# configure terminal
NS(config)# router BGP 5
NS(config-router)# Neighbor a1bc::102 remote-as 100
NS(config-router)# Address-family ipv6
NS(config-router-af)# Neighbor a1bc::102 activate
NS(config-router)# redistribute kernel
NS(config-router)# redistribute static
```

Verifying the BGP Configuration

You can use VTYSH to display BGP settings.

To view the BGP settings using the VTYSH command line

At the NetScaler command prompt, type:

VTYSH
You are now in the VTYSH command prompt. An output similar to the following appears:
NS170#
At the VTYSH command prompt, type:
NS170# sh ip BGP
NS170# sh BGP
NS170# sh ip BGP neighbors
NS170# sh ip BGP summary
NS170# sh ip BGP route-map <map-tag>

Configuring IPv6 RIP

IPv6 Routing Information Protocol (RIP) or RIPng is a Distance Vector protocol. This protocol is an extension of RIP to support IPv6. After enabling IPv6 RIP, you need to configure advertisement of IPv6 RIP routes. For troubleshooting, you can limit IPv6 RIP propagation. You can display IPv6 RIP settings to verify the configuration.

Prerequisites for IPv6 RIP

Before you begin configuring IPv6 RIP, do the following:

- Make sure that you understand the IPv6 RIP protocol.
- Install the IPv6PT license on the NetScaler appliance.
- Enable the IPv6 feature.

Enabling IPv6 RIP

You can enable or disable IPv6 RIP by using VTYSH. After you enable IPv6 RIP, the NetScaler starts the IPv6 RIP daemon. After you disable IPv6 RIP, the NetScaler stops the RIP daemon.

To enable IPv6 RIP by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
ns IPv6-routing	Start IPv6 dynamic routing daemon.
interface < vlan_name>	Enter VLAN configuration mode.
router ipv6 RIP	Start IPv6 RIP routing process on the VLAN.

Example

```
> VTYSH
NS# configure terminal
NS(config)# ns IPv6-routing
NS(config)# interface vlan0
NS(config-if)# router ipv6 RIP
```

Advertising IPv6 RIP Routes

IPv6 RIP enables an upstream router to load balance traffic between two identical vservers hosted on two standalone NetScaler devices. Route advertisement enables an upstream router to track network entities located behind the NetScaler.

To configure IPv6 RIP to advertise IPv6 routes by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
router ipv6 rip	Start IPv6 RIP routing process and enter configuration mode for the routing process.
redistribute static	Redistribute static routes.
redistribute kernel	Redistribute kernel routes.

Example

```
>VTYSH
NS# configure terminal
NS(config)# router ipv6 rip
NS(config-router)# redistribute static
NS(config-router)# redistribute kernel
```

Limiting IPv6 RIP Propagations

If you need to troubleshoot your configuration, you can configure the listen-only mode on any given interface.

To limit IPv6 RIP propagation by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
router ipv6 rip	Start IPv6 RIP routing process and enter configuration mode for the routing process.
passive-interface < vlan_name>	Suppress routing updates on interfaces bound to the specified VLAN.

Example

```
>VTYSH
NS# configure terminal
NS(config)# router ipv6 rip
NS(config-router)# passive-interface VLAN0
```

Verifying the IPv6 RIP Configuration

You can use VTYSH to display the IPv6 RIP routing table and IPv6 RIP information for a specified VLAN.

To view the IPv6 RIP settings by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Commands	Specifies
VTYSH	Display VTYSH command prompt.
sh ipv6 rip	Display updated IPv6 RIP routing table.
sh ipv6 rip interface <vlan_name>	Display IPv6 RIP information for the specified VLAN.

Example

```
NS# VTYSH
NS# sh ipv6 rip
NS# sh ipv6 rip interface VLAN0
```

Configuring IPv6 OSPF

IPv6 OSPF or OSPF version 3 (OSPF v3) is a link state protocol that is used to exchange IPv6 routing information. After enabling IPv6 OSPF, you need to configure advertisement of IPv6 OSPF routes. For troubleshooting, you can limit IPv6 OSPF propagation. You can display IPv6 OSPF settings to verify the configuration.

Prerequisites for IPv6 OSPF

Before you begin configuring IPv6 OSPF, do the following:

- Make sure that you understand the IPv6 OSPF protocol.
- Install the IPv6PT license on the NetScaler appliance.
- Enable the IPv6 feature.

Enabling IPv6 OSPF

To enable IPv6 OSPF, you must use the VTYSH command line. When IPv6 OSPF is enabled, the NetScaler appliance starts the IPv6 OSPF daemon. When IPv6 OSPF is disabled, the appliance stops the IPv6 OSPF daemon.

To enable IPv6 OSPF by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
ns IPv6-routing	Start IPv6 dynamic routing process.
interface < vlan_name>	Enter the VLAN configuration mode.
ipv6 router OSPF area < area-id>	Start IPv6 OSPF routing process on a VLAN.

Example

```
>VTYSH
NS# configure terminal
NS(config)# ns IPv6-routing
NS(config)# interface vlan0
NS(config-if)# ipv6 router OSPF area 3
```

Advertising IPv6 Routes

IPv6 OSPF enables an upstream router to load balance traffic between two identical vservers hosted on two standalone NetScaler devices. Route advertising enables an upstream router to track network entities located behind the NetScaler.

To configure IPv6 OSPF to advertise IPv6 routes by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Commands	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
router ipv6 OSPF	Start IPv6 OSPF routing process and enter configuration mode for the routing process.
redistribute static	Redistribute static routes.
redistribute kernel	Redistribute kernel routes.

Example

```
>VTYSH
NS# configure terminal
NS(config)# router ipv6 OSPF
NS(config-router)# redistribute static
NS(config-router)# redistribute kernel
```

Limiting IPv6 OSPF Propagations

If you need to troubleshoot your configuration, you use VTYSH to configure listen-only mode on any given VLAN.

To limit IPv6 OSPF propagation by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Commands	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
router ipv6 OSPF	Start IPv6 OSPF routing process and enter configuration mode for the routing process.
passive-interface < vlan_name >	Suppress routing updates on interfaces bound to the specified VLAN.

Example

```
>VTYSH
NS# configure terminal
NS(config)# router ipv6 OSPF
NS(config-router)# passive-interface VLAN0
```

Verifying the IPv6 OSPF Configuration

You use VTYSH to display IPv6 OSPF current neighbors and IPv6 OSPF routes.

To view the IPv6 OSPF settings by using the VTYSH command line

At the NetScaler command prompt, type the following commands, in the order shown:

Command	Specifies
VTYSH	Display VTYSH command prompt.
sh ipv6 OSPF neighbor	Display current neighbors.
sh ipv6 OSPF route	Display IPv6 OSPF routes.

Example

```
>VTYSH
NS# sh ipv6 OSPF neighbor
NS# sh ipv6 OSPF route
```

Installing Routes to the NetScaler Routing Table

The NetScaler appliance can use routes learned by various routing protocols after you install the routes in the appliance's routing table.

To install various routes to the internal routing table by using the VTYSH command line

At the NetScaler command prompt, type the following commands as appropriate for the routes that you want to install:

Commands	Specifies
VTYSH	Display VTYSH command prompt.
configure terminal	Enter global configuration mode.
ns route-install Default	Install IPv4 default routes to the internal routing table.
ns route-install RIP	Install IPv4 RIP specific routes to the internal routing table.
ns route-install BGP	Install IPv4 BGP specific routes to the internal routing table.
ns route-install OSPF	Install IPv4 OSPF specific routes to the internal routing table.
ns route-install IPv6 Default	Install IPv6 default routes to the internal routing table.
ns route-install IPv6 RIP	Install IPv6 RIP specific routes to the internal routing table.
ns route-install IPv6 BGP	Install IPv6 BGP specific routes to the internal routing table.
ns route-install IPv6 OSPF	Install IPv6 OSPF specific routes to the internal routing table.

Example

```
>VTYSH
NS# configure terminal
NS# ns route-install Default
```

```
NS(config)# ns route-install RIP
NS(config)# ns route-install BGP
NS(config)# ns route-install OSPF
NS# ns route-install IPv6 Default
NS(config)# ns route-install IPv6 RIP
NS(config)# ns route-install IPv6 BGP
NS(config)# ns route-install IPv6 OSPF
```

Configuring Static Routes

Static routes are manually created to improve the performance of your network. You can monitor static routes to avoid service disruptions. Also, you can assign weights to ECMP routes, and you can create null routes to prevent routing loops.

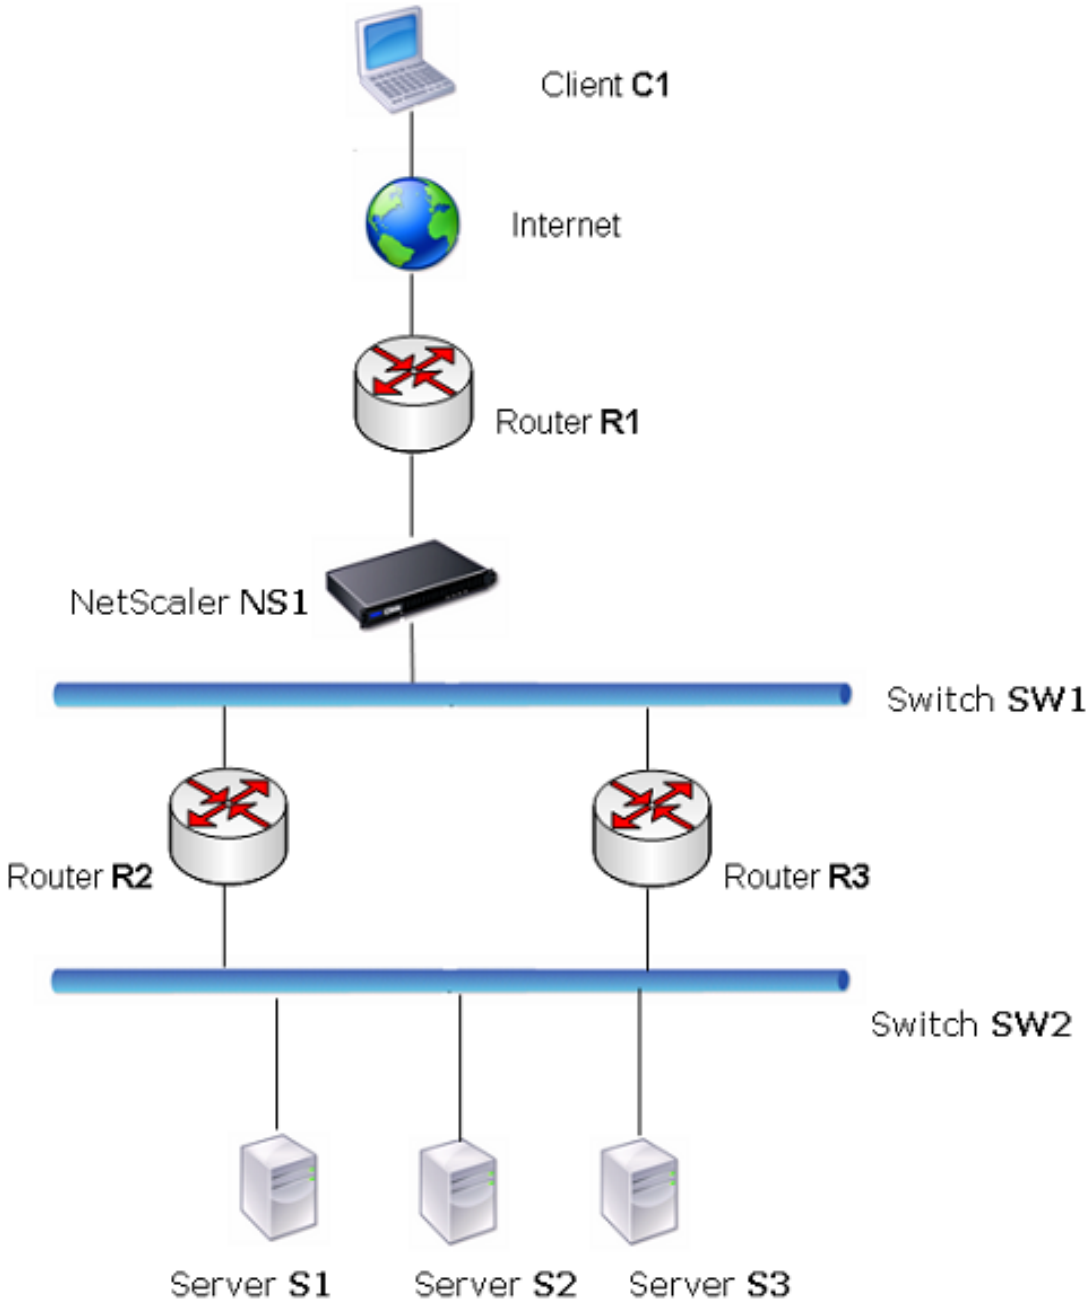
Monitored Static Routes

If a manually created (static) route goes down, a backup route is not automatically activated. You must manually delete the inactive primary static route. However, if you configure the static route as a monitored route, the NetScaler appliance can automatically activate a backup route.

Static route monitoring can also be based on the accessibility of the subnet. A subnet is usually connected to a single interface, but it can be logically accessed through other interfaces. Subnets bound to a VLAN are accessible only if the VLAN is up. VLANs are logical interfaces through which packets are transmitted and received by the NetScaler. A static route is marked as DOWN if the next hop resides on a subnet that is unreachable.

Note: In a high availability (HA) setup, the default value for monitored state routes (MSRs) on the secondary node is UP. The value is set to avoid a state transition gap upon failover, which could result in dropping packets on those routes.

Consider the following simple topology, in which a NetScaler is load balancing traffic to a site across multiple servers.



Router R1 moves traffic between the client and the NetScaler appliance. The appliance can reach servers S1 and S2 through routers R2 or R3. It has two static routes through which to reach the servers' subnet, one with R2 as the gateway and another with R3 as the gateway. Both these routes have monitoring enabled. The administrative distance of the static route with gateway R2 is lower than that of the static route with gateway R3. Therefore, R2 is preferred over R3 to forward traffic to the servers. Also, the default route on the NetScaler points to R1 so that all Internet traffic exits properly.

If R2 fails while monitoring is enabled on the static route, which uses R2 as the gateway, the NetScaler marks it as DOWN. The NetScaler now uses the static route with R3 as the gateway and forwards the traffic to the servers through R3.

The NetScaler supports monitoring of IPv4 and IPv6 static routes. You can configure the NetScaler to monitor an IPv4 static route either by creating a new ARP or PING monitor or by using existing ARP or PING monitors. You can configure the NetScaler to monitor an IPv6 static route either by creating a new Neighbor discovery for IPv6 (ND6) or PING monitor or by using the existing ND6 or PING monitors.

Weighted Static Routes

When the NetScaler appliance makes routing decisions involving routes with equal distance and cost, that is, Equal Cost Multi-Path (ECMP) routes, it balances the load between them by using a hashing mechanism based on the source and destination IP addresses. For an ECMP route, however, you can configure a weight value. The NetScaler then uses both the weight and the hashed value for balancing the load.

Null Routes

If the route chosen in a routing decision is inactive, the NetScaler appliance chooses a backup route. If all the backup routes become inaccessible, the appliance might reroute the packet to the sender, which could result in a routing loop leading to network congestion. To prevent this situation, you can create a null route, which adds a null interface as a gateway. The null route is never the preferred route, because it has a higher administrative distance than the other static routes. But it is selected if the other static routes become inaccessible. In that case, the appliance drops the packet and prevents a routing loop.

Configuring IPv4 Static Routes

You can add a simple static route or a null route by setting a few parameters, or you can set additional parameters to configure a monitored or monitored and weighted static route. You can change the parameters of a static route. For example, you might want to assign a weight to an unweighted route, or you might want to disable monitoring on a monitored route.

To create a static route by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create a static route and verify the configuration:

- add route <network> <netmask> <gateway>[**-cost** <positive_integer>] [**-advertise** (DISABLED | ENABLED)]
- show route [<network> <netmask> [<gateway>]] [<routeType>] [**-detail**]

Example

```
> add route 10.102.29.0 255.255.255.0 10.102.29.2 -cost 2 -advertise ENABLED
 Done
> show route 10.102.29.0 255.255.255.0 10.102.29.2
      Network         Netmask         Gateway/OwnedIP      State   Type
      -------         -------         ---------------      -----   ----
1)     10.102.29.0      255.255.255.0    10.102.29.2         UP      STATIC
      Distance:     1 Cost:     2     Weight:     1

 Done
```

To create a monitored static route by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create a monitored static route and verify the configuration:

- add route <network> <netmask> <gateway> [**-distance** <positive_integer>] [**-weight** <positive_integer>][**-msr** (ENABLED | DISABLED) [**-monitor** <string>]]
- show route [<network> <netmask> [<gateway>]] [<routeType>] [**-detail**]

Example

```
> add route 10.102.29.0 255.255.255.0 10.102.29.3 -distance 5 -weight 6 -msr ENBLED -monitor PING
 Done
> show route 10.102.29.0 255.255.255.0 10.102.29.3
      Network         Netmask         Gateway/OwnedIP     State   Type
      -------         -------         ---------------     -----   ----
1)     10.102.29.0     255.255.255.0   10.102.29.3         UP    STATIC
      Distance:     5 Cost:     0     Weight:     6
      MSR: ENABLED    Monitor: ping
          Probes:         3 Failed: [Total: 3 Current: 3]
          Last response: Failure - Probe timed out.
Done
```

To create a null route by using the NetScaler command line

At the NetScaler command prompt type:

- add route <network> <netmask> **null**
- show route <network> <netmask>

Example

```
> add route 10.102.29.0 255.255.255.0 null
 Done
> show route 10.102.29.0 255.255.255.0
      Network         Netmask         Gateway/OwnedIP     State   Type
      -------         -------         ---------------     -----   ----
1)     10.102.29.0     255.255.255.0   10.102.29.200       UP      DIRECT
2)     10.102.29.0     255.255.255.0   null                UP      STATIC
3)     10.102.29.0     255.255.255.0   10.102.29.1         UP      STATIC|ADV
4)     10.102.29.0     255.255.255.0   10.102.29.2         UP      STATIC
5)     10.102.29.0     255.255.255.0   10.102.29.3         DOWN    STATIC
 Done
```

To remove a static route by using the NetScaler command line

At the NetScaler command prompt, type:

rm route <network> <netmask> <gateway>

Example

```
> rm route 10.102.29.0 255.255.255.0 10.102.29.3
 Done
```

Parameters for configuring static routes

network

Network for which the route is being created.

netmask

Subnet mask for the network

null

Drop the packets this route receives. Possible values: Yes, No. Default: No. Null routes have a fixed distance of 255.

gateway

IP address of the gateway for this route.

distance

Administrative distance of this route. Possible values: 1 through 255. Default: 1.

cost

Value used by the routing algorithms to compare performance. Route having lowest cost is the most preferred route. Value that this parameter can take is from 0 through 65535.

weight

Value to facilitate balancing the load on ECMP routes. This value is compared with the hashed value of the packet and a route is chosen. Specific to ECMP routes. Possible values: 1 through 65535. Default: 1.

advertise

State of advertisement of this route. Possible values: Enabled or Disabled. Default: Enabled.

protocol

Routing protocols used for advertising routes. Possible values: OSPF, RIP, BGP.

msr

Monitor this route. Possible values: Enabled, Disabled. Default: Disabled.

monitor

Type of monitor. Determines the protocol used for monitoring the route (for example, PING or ARP).

To configure a static route by using the configuration utility

1. In the navigation pane, expand **Network**, expand **Routing**, and then click **Routes**.
2. In the details pane, on the **Basic** tab, do one of the following:
   - To create a new static route, click **Add**.
   - To modify an existing static route, click **Open**.
3. In the **Create Route** or **Configure Route** dialog box, specify values for the following parameters, which correspond to parameters described in “Parameters for configuring static routes” as shown:
   - **Network***-network
   - **Netmask***-netmask
   - **Null Route**-null
   - **Gateway***-gateway
   - **Distance**-distance
   - **Cost**-cost
   - **Weight**-weight
   - **Over-ride Global**-advertise
   - **Protocol**-protocol
   - **Monitored Static Route**-msr
   - **Monitor**-monitor

   * A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the route has been configured successfully.

To remove a route by using the configuration utility

1. In the navigation pane, expand **Network**, expand **Routing**, and then click **Routes**.
2. On the **Routes** pane, click the **Basic** tab, select the route you want to remove (for example, **192.168. 20.2**), and then click **Remove**.
3. In the **Remove** dialog box, click **Yes**. A message appears in the status bar, stating that the route has been successfully removed.

Configuring IPv6 Static Routes

You can configure a maximum of six default IPv6 static routes. IPv6 routes are selected on the basis of whether the MAC address of the destination device is reachable. This can be determined by using the IPv6 Neighbor Discovery feature. Routes are load balanced and only source/destination-based hash mechanisms are used. Therefore, route selection mechanisms such as round robin are not supported. The next hop address in the default route need not belong to the NSIP subnet.

To create an IPv6 route by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create an IPv6 route and verify the configuration:

- add route6 <network> <gateway> [**-vlan** <positive_integer>]
- show route6 [<network> [<gateway>]

Example

```
> add route6 ::/0 FE80::67 -vlan 5
 Done

> show route6
Flags: S - Static, C - Connected, R - RA Route, A - Active, O - OSPFV3, P – Permanent

Network                 Gateway                 Vlan      Flags
-------                 -------                 ----      -----

::1/128                   ::1                     1        PA
::/0                    fe80::67                  5        SA
fe80::/64                 fe80::2d0:68ff:fe15:fd36   1        CA

 Done
```

To create a monitored IPv6 static route by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create a monitored IPv6 static route and verify the configuration:

- add route6 <network> <gateway> [**-msr** (ENABLED | DISABLED) [**-monitor** <string>]]
- show route6 [<network> [<gateway>]

Example

```
> add route6 ::/0 2004::1 -msr ENABLED -monitor PING
 Done
> show route6
Flags: S - Static, C - Connected, R - RA Route, A - Active, O - OSPFV3, n - RIPng, B - BGP, P - Permanent
Network                 Gateway                 Vlan      Flags
-------                 -------                 ----      -----
::1/128                   ::1                     1        PA
fe80::/64                 fe80::2d0:68ff:fe17:33c  1        CA
::/0                    2004::1                   0        S
 Done
```

To remove an IPv6 route by using the NetScaler command line

At the NetScaler command prompt, type:

rm route6 <network> <gateway>

Example

```
> rm route6 ::/0 FE80::67
 Done
```

Parameters for configuring IPv6 static routes

network

Network for which the route is being created.

gateway

IP address of the gateway for this route.

vlan

Virtual LAN (VLAN) number associated with the route. Possible values: 1 through 4094. Default: 0. Required for link-local address type.

distance

Administrative distance of this route. Possible values: 1 through 255. Default: 1.

cost

Value used by the routing algorithms to compare performance. Route having lowest cost is the most preferred route. Possible values: 0 through 65535.

weight

Value for balancing the load on ECMP routes. This value is compared with the hashed value of the packet and a route is chosen. Specific to ECMP routes. Possible values: 1 through 65535. Default: 1.

advertise

Advertise this route. Possible values: Enabled, Disabled. Default: Enabled.

msr

Monitor this route. Possible values: Enabled, Disabled. Default: Disabled.

monitor

A ND6 or a PING monitor that will be used for monitoring the IPv6 static route.

To configure an IPv6 route by using the configuration utility

1. In the navigation pane, expand **Network**, expand **Routing**, and then click **Routes**.
2. In the details pane, on the **IPv6** tab, do one of the following:
   - To create a new route, click **Add**.
   - To modify an existing route, click **Open**.
3. In the **Create IPv6 Route** or **Configure IPv6 Route** dialog box, specify values for the following parameters, which correspond to parameters described in “Parameters for configuring IPv6 static routes” as shown:
   - **Network***-network
   - **Gateway***-gateway
   - **VLAN**-vlan
   - **Distance**-distance
   - **Cost**-cost
   - **Weight**-weight
   - **Advertise**-advertise
   - **Monitored Static Route**-msr
   - **Monitor**-monitor

   * A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the IPv6 route has been configured successfully.

To remove an IPv6 route by using the configuration utility

1. In the navigation pane, expand **Network**, expand **Routing**, and then click **Routes**.
2. On the **Routes** pane, click the **IPV6** tab.
3. Select the network, from which you want to remove the route (for example,**::/0**), and then click **Remove**.
4. In the **Remove** dialog box, click **Yes**. A message appears in the status bar, stating that the IPv6 route has been successfully removed.

Configuring Policy-Based Routes

Policy-based routing bases routing decisions on criteria that you specify. A policy-based route (PBR) specifies criteria for selecting packets and, typically, a next hop to which to send the selected packets. For example, you can configure the NetScaler appliance to route outgoing packets from a specific IP address or range to a particular next hop router. Each packet is matched against each configured PBR, in the order determined by the specified priorities, until a match is found. If no match is found, or if the matching PBR specifies a DENY action, the NetScaler applies the routing table for normal destination-based routing.

Instead of sending the selected packets to a next hop router, you can send them to a link load balancing virtual server to which you have bound multiple next hops. This configuration can provide a backup if a next hop link fails.

A PBR bases routing decisions for the data packets on parameters such as source IP address, source port, destination IP address, destination port, protocol, and source MAC address. A PBR defines the conditions that a packet must satisfy for the NetScaler to route the packet. These actions are known as "processing modes." The processing modes are:

- ALLOW - The NetScaler sends the packet to the designated next-hop router.
- DENY - The NetScaler applies the routing table for normal destination-based routing.

The NetScaler process PBRs before processing the RNAT rules.

Many users begin by creating PBRs and then modifying them. To activate a new PBR, you must apply it. To deactivate a PBR, you can either remove or disable it. You can change the priority number of a PBR to give it a higher or lower precedence.

Creating or Modifying a PBR

You cannot create two PBRs with the same parameters. If you attempt to create a duplicate, an error message appears.

You can configure the priority of a PBR. The priority (an integer value) defines the order in which the NetScaler appliance evaluates PBRs. When you create a PBR without specifying a priority, the NetScaler automatically assigns a priority that is a multiple of 10.

If a packet matches the condition defined by the PBR, the NetScaler performs an action. If the packet does not match the condition defined by the PBR, the NetScaler compares the packet against the PBR with the next highest priority.

Consider the following example. Two PBRs, p1 and p2, are configured on the NetScaler and automatically assigned priorities 20 and 30. You need to add a third PBR, p3, to be evaluated immediately after the first PBR, p1. The new PBR, p3, must have a priority between 20 and 30. In this case, you can specify the priority as 25.

To create a PBR by using the NetScaler command line

At the NetScaler command prompt, type:

- add ns pbr <name> <action> [**-srcIP** [<operator>] <srcIPVal>] [**-srcPort** [<operator>] <srcPortVal>] [**-destIP** [<operator>] <destIPVal>] [**-destPort** [<operator>] <destPortVal>] [**-nextHop** <nextHopVal>] [**-srcMac** <mac_addr>] [**-protocol** <protocol> |**-protocolNumber** <positive_integer>] [**-vlan** <positive_integer>] [**-interface** <interface_name>] [**-priority** <positive_integer>] [**-msr** (**ENABLED** | **DISABLED**) [**-monitor** <string>]] [**-state** (**ENABLED** | **DISABLED**)]

- sh ns pbr

Example

```
> add ns pbr pbr1  allow -srcip 10.102.37.252 -destip 10.10.10.2 -nexthop 10.102.29.77
 Done
> sh ns pbr pbr1
1)      Name: pbr1
        Action: ALLOW                   Hits: 0
        srcIP = 10.102.37.252
        destIP = 10.10.10.2
        srcMac:                      Protocol:
        Vlan:                       Interface:
        Active Status: ENABLED            Applied Status: NOTAPPLIED
        Priority: 10
        NextHop: 10.102.29.77
```

Done

To modify the priority of a PBR by using the NetScaler command line

At the NetScaler command prompt, type the following commands to modify the priority and verify the configuration:

- set ns pbr <name> [**-action** (ALLOW | DENY)] [**-srcIP** [<operator>] <srcIPVal>] [**-srcPort** [<operator>] <srcPortVal>] [**-destIP** [<operator>] <destIPVal>] [**-destPort** [<operator>] <destPortVal>] [**-nextHop** <nextHopVal>] [**-srcMac** <mac_addr>] [**-protocol** <protocol> | **-protocolNumber** <positive_integer>] [**-vlan** <positive_integer>] [**-interface** <interface_name>] [**-priority** <positive_integer>] [**-msr** (ENABLED | DISABLED) [**-monitor** <string>]] [**-state** (ENABLED | DISABLED)]
- show ns pbr [<name>]

Example

```
> set ns pbr pbr1 -priority 23
 Done
> show ns pbr pbr1
1)      Name: pbr1
        Action: ALLOW                   Hits: 0
        srcIP = 10.102.37.252
        destIP = 10.10.10.2
        srcMac:                      Protocol:
        Vlan:                       Interface:
        Active Status: DISABLED          Applied Status: NOTAPPLIED
        Priority: 23
        NextHop: 10.102.29.77
 Done
```

To remove one or all PBRs by using the NetScaler command line

At the NetScaler command prompt, type one of the following commands:

- rm ns pbr <name>
- clear ns PBRs

Example

```
> rm ns pbr pbr1
 Done
> clear ns PBRs
 Done
```

Parameters for configuring a PBR

name

The name (alphanumeric) of the PBR.

action

The action to perform on packets that match the PBR. Possible values: ALLOW, DENY.

nextHop

The IP address of the next hop router or the name of the link load balancing virtual server to which to send matching packets if action is set to ALLOW. If you specify a link load balancing virtual server, which can provide a backup if a next hop link fails, first make sure that the next hops bound to it are actually next hops that are directly connected to the NetScaler appliance. Otherwise, the NetScaler will throw an error when you attempt to create the PBR.

srcIP

IP address of the source machine. You can also specify a range of addresses, by enclosing the low and high addresses in brackets (for example, [10.102.29.50-10.102.29.100]).

operator

You can use the following operators while creating PBRs: = and !=

destIP

The IP address of the destination system. You can also specify a range of addresses, by enclosing the low and high addresses in brackets (for example, [10.102.33.31-10.102.33.100]).

srcPort

The port address of the source system. You also can specify a range of ports, by enclosing the low and high port numbers in brackets (for example [30-90]).

Note: The source port can be modified only for TCP and UDP.

destPort

The port address of the destination system. You also can specify a range of ports, by enclosing the low and high port numbers in brackets (for example [40-90]).

Note: The destination port can be modified only for TCP and UDP.

protocol

The protocol field in the IP header. Possible values: ICMP, IGMP, TCP, EGP, IGP, ARGUS, UDP, RDP, RSVP, EIGRP, L2TP, and ISIS.

protocolNumber

The IP protocol number (decimal). Minimum value: 1. Maximum value: 255.

srcMac

The MAC address of the source system. Only the last 32 bits are considered during a lookup.

vlan

The VLAN ID present in the VLAN tag of the packet. Possible values: 1 to 4094.

interface

This is the network interface on which the packet arrives.

priority

The priority of the ACL. Possible values: 0 to 10240.

state

The state of the PBR. Possible Values: ENABLED, DISABLED. Default: Enabled.

msr

Enable or disable Monitored Static Route(MSR) on this route. This parameter is not applicable if you specify an LLB virtual server name for the nextHop parameter. Possible values: ENABLED, DISABLED Default value: DISABLED.

monitor

The name of the monitor of type PING or ARP.

state

The state of the PBR. Possible values: ENABLED, DISABLED Default value: ENABLED

To create a PBR by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **PBRs**.
2. In the details pane, do one of the following:
   - To create a new PBR, click **Add**.
   - To modify an existing PBR, click **Open**.
3. In the **Create PBR** or **Configure PBR** dialog box, specify values for the following parameters, which correspond to parameters described in “Parameters for configuring a PBR” as shown:

   - **Name***-name
   - **Action**-action
   - **Next Hop**-nextHop
   - **Source, Operator**-operator
   - **Source, Low/High**-srcIP (To specify a specific IP address, type the same address in both text boxes.
   - **Destination, Operator**-operator
   - **Destination, Low/High**-destIP (To specify a specific IP address, type the same address in both text boxes.
   - **Protocol**-protocol (or protocolNumber)
   - **Source Port, Operator**-operator
   - **Source Port, Low/High**-srcPort
   - **Destination Port, Operator**-operator
   - **Destination Port, Low/High**-destPort
   - **Source Mac**-srcMac
   - **VLAN**-vlan
   - **Interface**-interface
   - **Priority**-priority
   - **Enable PBR**-state
   - **Monitored Static Route**-msr
   - **Monitor**-monitor

   * A required parameter

4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the PBR has been configured successfully.

To remove one or all PBRs by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **PBRs**.

2. To remove a single PBR, in the details pane, select the PBR that you want to remove (for example, **p1**), and then click **Remove**.

3. To remove all PBRs, click **Clear**.

Applying a PBR

You must apply a PBR to activate it. The following procedure reapplies all PBRs that you have not disabled. The PBRs constitute a memory tree (lookup table). For example, if you create 10 PBRs (p1 - p10), and then you create another PBR (p11) and apply it, all of the PBRs (p1 - p11) are freshly applied and a new lookup table is created. If a session has a DENY PBR related to it, the session is destroyed.

You must apply this procedure after every modification you make to any PBR. For example, you must follow this procedure after disabling a PBR.

Note: PBRs created on the NetScaler appliance do not work until they are applied.

To apply a PBR by using the NetScaler command line

At the NetScaler command prompt, type:

apply ns PBRs

To apply a PBR by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **PBRs**.
2. In the details pane, select the PBR that you want to apply (for example, **p1**).
3. Click **Commit**.
4. In the **Apply PBR(s)** dialog box, click **Yes**.

Enabling or Disabling PBRs

By default, the PBRs are enabled. This means that when PBRs are applied, the NetScaler appliance automatically compares incoming packets against the configured PBRs. If a PBR is not required in the lookup table, but it needs to be retained in the configuration, it must be disabled before the PBRs are applied. After the PBRs are applied, the NetScaler does not compare incoming packets against disabled PBRs.

To enable or disable a PBR by using the NetScaler command line

At the NetScaler command prompt, type one of the following commands:

- enable ns pbr <name>
- disable ns pbr <name>

Examples

```
> enable ns PBR pbr1
 Done
> show ns PBR pbr1
1)      Name: pbr1
        Action: ALLOW                   Hits: 0
        srcIP = 10.102.37.252
        destIP = 10.10.10.2
        srcMac:                      Protocol:
        Vlan:                       Interface:
        Active Status: ENABLED              Applied Status: APPLIED
        Priority: 10
        NextHop: 10.102.29.77

 Done

> disable ns PBR pbr1
Warning: PBR modified, use 'apply pbrs' to commit this operation
> apply pbrs
 Done
> show ns PBR pbr1
1)      Name: pbr1
        Action: ALLOW                   Hits: 0
        srcIP = 10.102.37.252
        destIP = 10.10.10.2
        srcMac:                      Protocol:
```

```
    Vlan:                       Interface:
    Active Status: DISABLED         Applied Status: NOTAPPLIED
    Priority: 10
    NextHop: 10.102.29.77
Done
```

To enable or disable a PBR by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **PBRs**.
2. In the details pane, select the PBR (for example, **p1**) and do one of the following:
   - To enable the PBR, click **Enable**.
   - To disable the PBR, click **Disable**.

   A message appears in the status bar, stating that the PBR has been successfully enabled or disabled.

Renumbering PBRs

You can automatically renumber the PBRs to set their priorities to multiples of 10.

To renumber PBRs by using the NetScaler command line

At the NetScaler command prompt, type:

renumber ns pbrs

To renumber PBRs by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **PBRs**.
2. In the details pane, click **Renumber Priority (s)**.
3. In the **Renumber Priority(s) PBR(s)** dialog box, click **Yes**.

Use Case - PBR with Multiple Hops

Consider a scenario in which two PBRs, PBR1 and PBR2, are configured on NetScaler appliance NS1. PBR1 routes all the outgoing packets, with source IP address as 10.102.29.30, to next hop router R1. PBR2 routes all the outgoing packets, with source IP address as 10.102.29.90, to next hop router R2. R3 is another next hop router connected to NS1.

If router R1 fails, all the outgoing packets that matched against PBR1 are dropped. To avoid this situation, you can specify a link load balancing (LLB) virtual server in the next hop field while creating or modifying a PBR. Multiple next hops are bound to the LLB virtual server as services (for example R1, R2, and R3). Now, if R1 fails, all the packets that matched against PBR1 are routed to R2 or R3 as determined by the LB method configured on the LLB virtual server.

The NetScaler appliance throws an error if you attempt to create a PBR with an LLB virtual server as the next hop in the following cases:

- Adding another PBR with the same LLB virtual server.
- Specifying a nonexistent LLB virtual server.
- Specifying an LLB virtual server for which the bound services are not next hops.
- Specifying an LLB virtual server for which the LB method is not set to one of the following:
    - LEASTPACKETS
    - LEASTBANDWIDTH
    - DESTIPHASH
    - SOURCEIPHASH
    - WEIGHTDRR
    - SRCIPDESTIP_HASH
    - LTRM
    - CUSTOM LOAD
- Specifying an LLB virtual server for which the LB persistence type is not set to one of the following:
    - DESTIP
    - SOURCEIP

- SRCDSTIP

The following table lists the names and values of the entities configured on the NetScaler appliance:

Table 1. Sample Values for Creating Entities

Entity Type	Name	IP Address
Link load balancing virtual server	LLB1	NA
Services (next hops)	Router1	1.1.1.1.254
	Router2	2.2.2.2.254
	Router3	3.3.3.3.254
PBRs	PBR1	NA
	PBR2	NA

To implement the configuration described above, you need to:

1. Create services Router1, Router2, and Router3 that represent next hop routers R1, R2, and R3.
2. Create link load balancing virtual server LLB1 and bind services Router1, Router2, and Router3 to it.
3. Create PBRs PBR1 and PBR2, with next hop fields set as LLB1 and 2.2.2.254 (IP address of the router R2), respectively.

To create a service by using the NetScaler command line

At the NetScaler command prompt, type:

- add service <name> <IP> <serviceType> <port>
- show service <name>

Example

```
> add service Router1 1.1.1.1.254 ANY *
 Done
> add service Router2 2.2.2.254 ANY *
 Done
> add service Router3 3.3.3.254 ANY *
 Done
```

Parameters for creating a service

name

The name of the service. Maximum length: 127

IP

The IP address of the physical router for which a service will be added.

serviceType

The type of connections that the service will handle. Specify a service type of ANY.

port

Port on which the service listens. Specify an asterisk (*) as the port number.

To create services by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Services**.
2. In the details pane, click **Add**.
3. 3. In the **Create Service** dialog box, specify values for the following parameters, which correspond to parameters described in “Parameters for creating a service, as shown:
   - **Service Name***—name
   - **Server**—IP
   - **Protocol***—serviceType (Select **ANY** from the drop-down list.)
   - **Port***—port

   * A required parameter
4. Click **Create**.
5. Repeat Steps 2-4 to create another service.
6. Click **Close**.
7. In the **Services** pane, select the services that you just configured and verify that the settings displayed at the bottom of the screen are correct.

To create a link load balancing virtual server and bind a service by using the NetScaler command line

At the NetScaler command prompt, type:

- add lb vserver <name> <serviceType>
- bind lb vserver < name> <serviceName>
- show lb vserver < name>

Example

```
> add lb vserver LLB1 ANY
 Done
> bind lb vserver LLB1 Router1 Router2 Router3
 Done
```

Parameters for creating an LLB virtual server

name

The name of the load balancing virtual server being added. Maximum length: 127

serviceType

The service type. Possible value: ANY.

Parameters for binding the service

name

The virtual server name to which the service is bound. Maximum length: 127

serviceName

The name of the service that is bound. Maximum Length: 127

To create a link load balancing virtual server and bind a service by using the configuration utility

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the **Load Balancing Virtual Servers** pane, click **Add**.
3. In the **Create Virtual Servers (Load Balancing)** dialog box, specify values for the following parameters, which correspond to parameters described in “Parameters for creating an LLB virtual server, as shown:
   - **Name***—name
   - **Protocol***—serviceType (Select **ANY**.)

   * A required parameter

   Note: Make sure **Directly Addressable** is unchecked.
4. Under the **Services** tab, in the **Active** column, select the check box for the service that you want to bind to the virtual server.
5. Click **Create**, and then click **Close**.
6. In the **Load Balancing Virtual Servers** tab, select the virtual server that you just created, and verify that the settings displayed in the **Details** pane are correct.

To create a PBR by using the NetScaler command line

At the NetScaler command prompt, type:

- add ns pbr <name> <action> [**-srcIP** [<operator>] <srcIPVal>] [**-nextHop** <nextHopVal>]
- sh ns pbr

Example

```
> add pbr PBR1 ALLOW -srcIP 10.102.29.30 -nextHop LLB1
 Done
> add pbr PBR2 ALLOW -srcIP 10.102.29.90 -nextHop 2.2.2.254
 Done
```

Parameters for configuring a PBR

name

The name (alphanumeric) of the PBR.

action

The action to perform on packets that match the PBR. Possible values: ALLOW, DENY.

nextHop

The IP address of the next hop router or the name of the link load balancing virtual server to which to send matching packets if action is set to ALLOW. If you specify a link load balancing virtual server, which can provide a backup if a next hop link fails, first make sure that the next hops bound to it are actually next hops that are directly connected to the NetScaler appliance. Otherwise, the NetScaler will throw an error when you attempt to create the PBR.

srcIP

IP address of the source machine. You can also specify a range of addresses, by enclosing the low and high addresses in brackets (for example, [10.102.29.50-10.102.29.100]).

To create a PBR by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **PBRs**.
2. In the details pane, do one of the following:
   - To create a new PBR, click **Add**.
   - To modify an existing PBR, click **Open**.
3. In the **Create PBR** or **Configure PBR** dialog box, specify values for the following parameters, which correspond to parameters described in “Parameters for configuring a PBR” as shown:
   - **Name***-name
   - **Action**-action
   - **Next Hop**-nextHop
   - **Source, Operator**-operator
   - **Source, Low/High**-srcIP (To specify a specific IP address, type the same address in both text boxes.

   * A required parameter
4. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the PBR has been configured successfully.

Troubleshooting Routing Issues

To make your troubleshooting process as efficient as possible, begin by gathering information about your network. You need to obtain the following information about the NetScaler appliance and other systems in the Network:

- Complete Topology diagram, including interface connectivity and intermediate switch details.
- Running Configuration. You can use the show running command to get the running configuration for ns.conf and ZebOS.conf.
- Output of the History command, to determine whether any configuration changes were made when the issue arose.
- Output of the Top and ps -ax commands, to determine whether any routing daemon is overutilizing the CPU or is misbehaving.
- Any routing related core files in /var/core - nsm, bgpd, ospfd, or ripd. Check the time stamp to see if they are relevant.
- dr_error.log and dr_info.log files from /var/log.
- Output of the date command and time details for all relevant systems. Print dates across all devices one after another, so that the times on the log messages can be correlated with various events.
- Relevant ns.log, newnslog files.
- Configuration files, log files and command history details from upstream and downstream routers.

Generic Routing FAQs

Users typically have the following questions about how to troubleshoot generic routing issues:

- How do I enable Health Monitoring for content switching virtual servers?

  By default, the states of content switching virtual servers are not updated. Therefore, these servers always remain up, which makes RHI ineffective. Use the nsapimgr knob to enable updating CS vserver states.

  root@ns# nsapimgr -y -s csw_state_update=1

- How do I save the config files?

  The write command from VTYSH saves only ZebOS.conf. Run the save config command from NetScaler CLI to save both ns.conf and ZebOS.conf files.

- If I have configured both a static default route and a dynamically learned default route, which is the preferred default route?

  The dynamically learned route is the preferred default route. This behavior is unique to default routes. However, in case of the Network Services Module (NSM), unless the administrative distances are modified, a statically configured route in the RIB is preferred over a dynamic route. The route that is downloaded to the NSM FIB is the static route.

- How do I block the advertisement of default routes?

  After release 7.0, the default route is not injected into ZebOS.

  However, if you are working with 7.0 or an earlier release, you must apply a suitable route map with the

  However, if you are working with 7.0 or an earlier release, you must apply a suitable route map with the redistribute kernel command for each protocol to block default route advertisement. For example:

  ns(config)#access-list 1 deny 0.0.0.0
  ns(config)#access-list 2 permit any
  ns(config)#route-map redist-kernel permit 5

```
ns(config-route-map)#match ip address 1
ns(config)#route-map redist-kernel permit 10
ns(config-route-map)#match ip address 2
ns(config-route-map)#q
ns(config)#router ospf 1
ns(config-router)#redistribute kernel route-map redist-kernel
ns(config-router)#q
ns(config)#q
ns#show route-map
route-map redist-kernel, permit, sequence 5
  Match clauses:
    ip address 1
  Set clauses:
route-map redist-kernel, permit, sequence 10
  Match clauses:
    ip address 2
  Set clauses:
ns#show access-list
Standard IP access list 1
    deny 0.0.0.0
Standard IP access list 2
    permit any
ns#
```

- How do I view the debug output of networking daemons?

  You can write debugging output from networking daemons to a file by entering the following log file command from the global configuration view in VTYSH:

  ```
  ns(config)#log file /var/ZebOS.log
  ```

  With release 8.1, you can direct debug output to the console by entering the terminal monitor command from VTYSH user view:

  ```
  ns#terminal monitor
  ```

- How do I collect cores of running daemons?

  You can use the gcore utility to collect cores of running daemons for processing by gdb. This might be helpful in debugging misbehaving daemons without bringing the whole routing operation to a standstill.

  ```
  gcore [-s] [-c core] [executable] pid
  ```

  The **-s** option temporarily stops the daemon while gathering the core image. This is a recommended option, because it guarantees that the resulting image shows the core in a consistent state.

root@ns#gcore -s -c nsm.core /netscaler/nsm 342

- How do I run a batch of ZebOS commands?

  You can run a batch of ZebOS commands from a file by entering the VTYSH -f <file-name> command. This does not replace the running configuration, but appends to it. However, by including commands to delete the existing configuration in the batch file and then add those for the new, desired configuration, you can use this mechanism to replace a specific configuration:

```
!
router bgp 234
network 1.1.1.1 255.255.255.0
!
route-map bgp-out2 permit 10
 set metric 9900
 set community 8602:300
!
```

Troubleshooting OSPF-Specific Issues

Before you start debugging any OSPF specific issue, you must collect information from the NetScaler appliance and all systems in the affected LAN, including upstream and downstream routers. To begin, enter the following commands:

1. show interface from both nscli and VTYSH
2. show ip ospf interface
3. show ip ospf neighbor detail
4. show ip route
5. show ip ospf route
6. show ip ospf database summary
    a. If there are only few LSAs in the database, then enter show ip ospf database router, show ip ospf database A. network, show ip ospf database external, and other commands to get the full details of LSAs.
    b. If there are a large number of LSAs in the database, enter the show ip ospf database self-originated command.
7. show ip ospf
8. show ns ip. This ensures that the details of all VIPs of interest are included.
9. Get the logs from peering devices and run the following command:

    gcore -s -c xyz.core /netscaler/ospfd <pid>

Note: The gcore command is non-disruptive.

Collect additional information from the NetScaler as follows:

1. Enable logging of error messages by entering the following command from the global configuration view in VTYSH:

    ns(config)#log file /var/ospf.log

2. Get the details of:

    ./nsconmsg -g ospf

3. For adjacency related defects, run the following command:

./nsapimgr -B "call nsospf_print_area"

Note: This command is not supported in NetScaler 9.3 nCore.

4. Enable debugging ospf events and log them by using the following command:

   ns(config)#log file /var/ospf.log

   Enable debug ospf lsa packet only if the number of LSAs in the database is relatively small (< 500).

Internet Protocol version 6 (IPv6)

A NetScaler appliance supports both server-side and client-side IPv6 and can therefore function as an IPv6 node. It can accept connections from IPv6 nodes (both hosts and routers) and from IPv4 nodes, and can perform Protocol Translation (RFC 2765) before sending traffic to the services. You have to license the IPv6 feature before you can implement it.

The following table lists some of the IPv6 features that the NetScaler appliance supports.

Table 1. Some Supported IPv6 Features

IPv6 features
IPv6 addresses for SNIPs (NSIP6, VIP6, and SNIP6)
Neighbor Discovery (Address Resolution, Duplicated Address Detection, Neighbor Unreachability Detection, Router Discovery)
Management Applications (ping6, telnet6, ssh6)
Static Routing and Dynamic routing (OSPF)
Port Based VLANs
Access Control Lists for IPv6 addresses (ACL6)
IPv6 Protocols (TCP6, UDP6, ICMP6)
Server Side Support (IPv6 addresses for vservers, services)
USIP (Use source IP) and DSR (Direct Server Return) for IPv6
SNMP and CVPN for IPv6
HA with native IPv6 node address
IPv6 addresses for MIPs
Path-MTU discovery for IPv6

The following table lists NetScaler components that support IPv6 addresses and provides references to the topics that document the components.

Table 2. NetScaler Components That Support IPv6 Addresses and the Corresponding Documentation

NetScaler component	Topic that documents IPv6 support
Network	Adding, Customizing, Removing, Removing all, and Viewing routes.
SSL Offload	Creating IPv6 vservers for SSL Offload
SSL Offload	Specifying IPv6 SSL Offload Monitors
SSL Offload	Creating IPv6 SSL Offload Servers

Load Balancing	Creating IPv6 vservers for Load Balancing
Load Balancing	Specifying IPv6 Load Balancing Monitors
Load Balancing	Creating IPv6 Load Balancing Servers
DNS	Creating AAAA Records

You can configure IPv6 support for the above features after implementing the IPv6 feature on your NetScaler appliance. You can configure both tagged and prefix-based VLANs for IPv6. You can also map IPv4 addresses to IPv6 addresses.

Implementing IPv6 Support

IPv6 support is a licensed feature, which you have to enable before you can use or configure it. If IPv6 is disabled, the NetScaler does not process IPv6 packets. It displays the following warning when you run an unsupported command:

"Warning: Feature(s) not enabled [IPv6PT]"

The following message appears if you attempt to run IPv6 commands without the appropriate license:

"ERROR: Feature(s) not licensed"

After licensing the feature, use either of the following procedures to enable or disable IPv6.

To enable or disable IPv6 by using the NetScaler command line

At the NetScaler command prompt, type one of the following commands:

- enable ns feature ipv6pt
- disable ns feature ipv6pt

To enable or disable IPv6 by using the configuration utility

1. In the navigation pane, expand **System** and click **Settings**.
2. On the **Settings** page, under **Modes and Features**, click **change advanced features**.
3. In the **Configure Advanced Features** dialog box, do one of the following:
   - To enable IPv6, select the **IPv6 Protocol Translation** check box.
   - To disable IPv6, clear the **IPv6 Protocol Translation** check box.
4. Click **OK**.
5. In the **Enable/Disable Feature(s)?** dialog box, click **Yes**.

VLAN Support

If you need to send broadcast or multicast packets without identifying the VLAN (for example, during DAD for NSIP, or ND6 for the next hop of the route), you can configure the NetScaler appliance to send the packet on all the interfaces with appropriate tagging. The VLAN is identified by ND6, and a data packet is sent only on the VLAN.

For more information about ND6 and VLANs, see Configuring Neighbor Discovery.

Port-based VLANs are common for IPv4 and IPv6. Prefix-based VLANs are supported for IPv6.

Simple Deployment Scenario

Following is an example of a simple load balancing set-up consisting of an IPv6 vserver and IPv4 services, as illustrated in the following topology diagram.

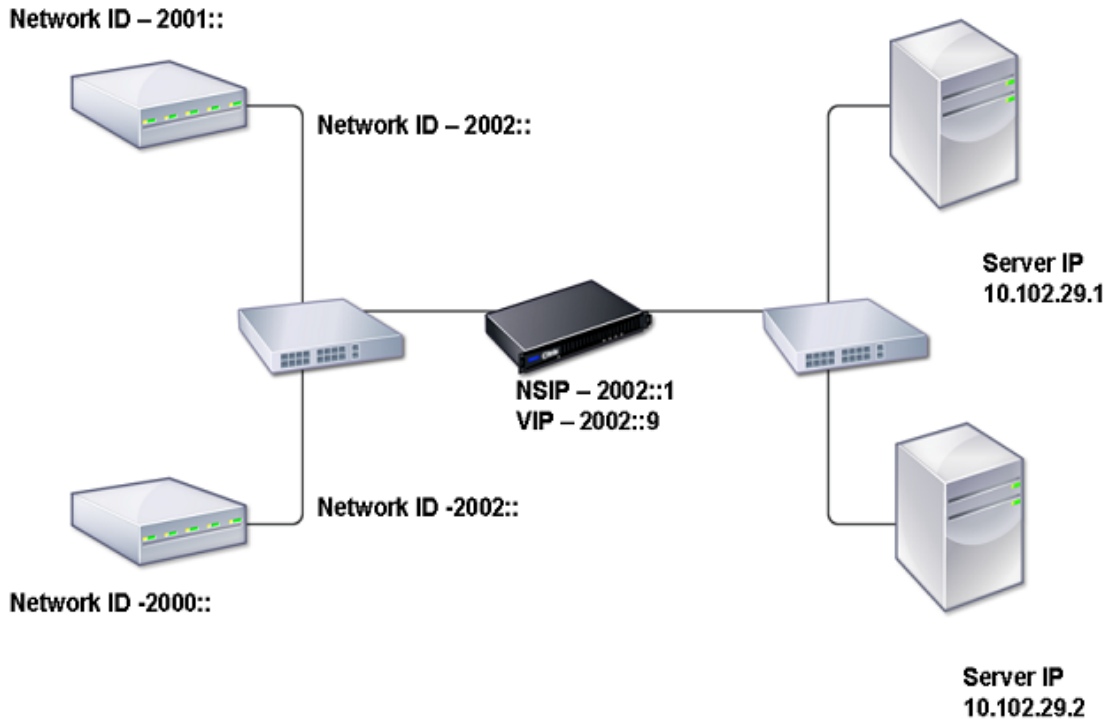


Figure 1. IPv6 Sample Topology

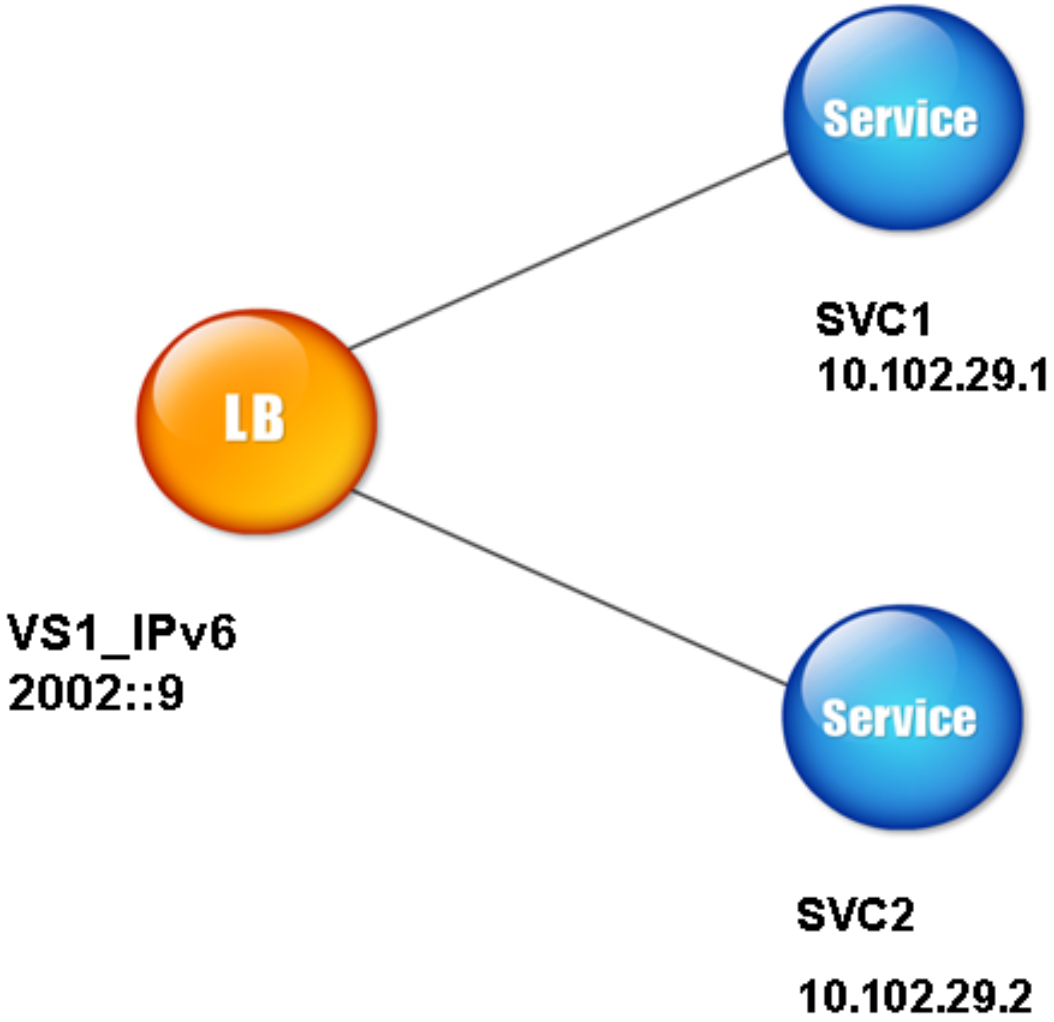
The following table summarizes the names and values of the entities that must be configured on the NetScaler.

Table 1. Sample Values for Creating Entities

Entity type	Name	Value
LB Vserver	VS1_IPv6	2002::9
Services	SVC1	10.102.29.1
	SVC2	10.102.29.2



The following figure shows the entities and values of the parameters to be configured on the NetScaler.Figure 2. IPv6 Entity Diagram

To configure this deployment scenario, you need to do the following:

1. Create an IPv6 service.
2. Create an IPv6 LB vserver.
3. Bind the services to the vserver.

To create IPv4 services by using the NetScaler command line

At the NetScaler command prompt, type:

add service <Name> <IPAddress> <Protocol> <Port>

Example

add service SVC1 10.102.29.1 HTTP 80
add service SVC2 10.102.29.2 HTTP 80

To create IPv4 services by using the configuration utility

1. In the navigation pane, expand **Load Balancing** and click **Services**.
2. On the **Services** page, click **Add.**
3. In the **Create Service** dialog box, in the **Service Name**, **Server**, and **Port** text boxes, type the name, IP address, and port of the service (for example, SVC1, 10.102.29.1, and 80).
4. In the **Protocol** drop-down list box, select the type of the service (for example, **HTTP**).
5. Click **Create** and click **Close.**
6. Repeat Steps 1-5 to create a service SVC2 with IP address 10.102.29.2 and port 80.

To create IPv6 vserver by using the NetScaler command line

At the NetScaler command prompt, type:

add lb vserver <Name> <IPAddress> <Protocol> <Port>

Example

add lb vserver VS1_IPv6 2002::9 HTTP 80

To create IPv6 vserver by using the configuration utility

1. In the navigation pane, expand **Load Balancing** and click **Virtual Servers**.
2. In the **Load Balancing Virtual Servers** page, click **Add.**
3. In the **Create Virtual Servers (Load Balancing)** dialog box, select the **IPv6** check box.
4. In the **Name**, **Port**, and **IP Addresses** text boxes, type the name, port, and IP address of the vserver (for example, VS1_IPv6, 80, and 2002::9).
5. Click **Create** and click **Close.**

To bind a service to an LB vserver by using the NetScaler command line

At the NetScaler command prompt, type:

bind lb vserver <name> <service>

Example

bind lb vserver VS1_IPv6 SVC1

The vservers receive IPv6 packets and the NetScaler performs Protocol Translation (RFC 2765) before sending traffic to the IPv4-based services.

To bind a service to an LB vserver by using the configuration utility

1. In the navigation pane, expand **Load Balancing** and click **Virtual Servers**.
2. In the **Load Balancing Virtual Servers** page, select the vserver for which you want to bind the service (for example, VS1_IPv6).
3. Click **Open.**
4. In the **Configure Virtual Server (Load Balancing)** dialog box, on the **Services** tab, select the **Active** check box corresponding to the service that you want to bind to the vserver (for example, SVC1).
5. Click **OK**.
6. Repeat Steps 1-4 to bind the service (for example, SVC2 to the vserver).

Host Header Modification

When an HTTP request has an IPv6 address in the host header, and the server does not understand the IPv6 address, you must map the IPv6 address to an IPv4 address. The IPv4 address is then used in the host header of the HTTP request sent to the vserver.

To change the IPv6 address in the host header to an IPv4 address by using the NetScaler command line

At the NetScaler command prompt, type:

set ns ip6 <IPv6Address> **-map** <IPAddress>

Example

set ns ip6 2002::9 -map 200.200.200.200

To change the IPv6 address in the host header to an IPv4 address by using the configuration utility

1. In the navigation pane, expand **Networks** and click **IPs**.
2. In the **IPs** page, click the **IPV6s** tab and select the IP address for which you want to configure a mapped IP address, for example, 2002:0:0:0:0:0:0:9.
3. Click **Open.**
4. In the **Configure IP6** dialog box, in the **Mapped IP** text box, type the mapped IP address that you want to configure, for example, 200.200.200.200.
5. Click **OK.**

VIP Insertion

If an IPv6 address is sent to an IPv4-based server, the server may not understand the IP address in the HTTP header, and may generate an error. To avoid this, you can map an IPv4 address to the IPv6 VIP and enable VIP insertion.

To configure a mapped IPv6 address by using the NetScaler command line

At the NetScaler command prompt, type:

set ns ip6 <IPv6Address> **-map** <IPAddress>

Example

```
> set ns ip6 2002::9 -map 200.200.200.200
 Done
```

To configure a mapped IPv6 address by using the configuration utility

1. In the navigation pane, expand **Networks** and click **IPs**.
2. In the **IPs** page, click the **IPV6s** tab and select the IP address for which you want to configure a mapped IP address (for example, 2002:0:0:0:0:0:0:9).
3. Click **Open**.
4. In the **Configure IP6** dialog box, in the **Mapped IP** text box, type the mapped IP address that you want to configure (for example, 200.200.200.200).
5. Click **OK.**

Use either of the following procedures to enable insertion of an Ipv4 VIP address and port number in the HTTP requests sent to the servers.

To enable VIP insertion by using the NetScaler command line

At the NetScaler command prompt, type:

set lb vserver <name> -insertVserverIPPort <Value>

Example

```
> set lb vserver VS1_IPv6 -insertVserverIPPort ON
 Done
```

To enable VIP insertion by using the configuration utility

1. In the navigation pane, expand **Load Balancing** and click **Virtual Servers**.
2. In the **Load Balancing Virtual Servers** page, in the **Load Balancing Virtual Servers** page, select the vserver that you want to enable port insertion (for example, VS1_IPv6).
3. Click **Open**.
4. In the **Configure Virtual Server (Load Balancing)** dialog box, click the **Advanced** tab.
5. In the **Vserver IP Port Insertion** drop-down list box, select **VIPADDR.**
6. In the **Vserver IP Port Insertion text box**, type the vip header.

Cloud Bridge

A fundamental part of the Citrix® Cloud framework, the Citrix NetScaler® Cloud Bridge™ feature is a tool used to build a cloud-extended data center. The Cloud Bridge enables you to connect one or more cloud computing instances—virtual servers in the cloud—to your network without reconfiguring your network. Cloud-hosted applications appear as though they are running on one contiguous enterprise network.

The primary purpose of the Cloud Bridge is to enable companies to move their applications to the cloud while reducing costs and the risk of application failure. In addition, the Cloud Bridge increases network security in cloud environments.

A Cloud Bridge is an extension of bridge (layer 2) that connects a NetScaler appliance or virtual appliance residing in a cloud to a NetScaler appliance or virtual appliance on your LAN. The connection is made through an IP tunnel that uses the Generic Routing Encapsulation (GRE) protocol. The GRE protocol provides a mechanism for encapsulating packets, from a wide variety of network protocols, to be forwarded over another protocol. GRE is used to:

- Connect networks running non-IP, non-routable protocols, such as Appletalk, Novell IPX, and NetBIOS.
- Bridge across a wide area network (WAN).
- Create a transport tunnel for any type of traffic that needs to be sent unchanged across a different network.

The GRE protocol encapsulates packets by adding a GRE and a GRE IP header to the packets.

Cloud Bridge supports use of the open-standard Internet Protocol security (IPSec) protocol suite to secure communications between peers in the Cloud Bridge.

In an Cloud Bridge, IPSec ensures:

- Data integrity
- Data origin authentication
- Data confidentiality (encryption)
- Protection against replay attacks

The IPSec use the transport mode in which only the payload of the GRE-encapsulated packet is encrypted. The encryption uses the Encapsulating Security Payload (ESP) protocol, which ensures the integrity of the packet by using a HMAC hash function and ensures confidentiality by using an encryption algorithm. The ESP protocol after encrypting the payload and calculating the HMAC, generates an ESP header and then inserts it after the GRE IP header. The ESP protocol also generates an ESP trailer and then inserts it at the end of the encrypted packets.

Before securing the communication between the peers in the Cloud Bridge, using the Internet Key Exchange (IKE) protocol in IPSec:

1. The two peers mutually authenticate with each other, using one of the following authentication methods:

    - **Pre-shared key authentication**. A text string called a pre-shared key, manually configured on each peer. The pre-shared keys of the peers are matched against each other for authentication. Therefore, for the authentication to be successful, you must configure the same pre-shared key on each of the peers.

    - **Digital certificates authentication.** For digital certificate authentication, a peer (sender) initiator signs message interchange data by using its private key, and the other peer(receiver) uses the peer(sender's) public key to verify the signature. Typically, the public key is exchanged in messages containing an X.509v3 certificate. This certificate provides a level of assurance that a peer's identity as represented in the certificate is associated with a particular public key.
2. The peers then negotiate to reach agreement on:

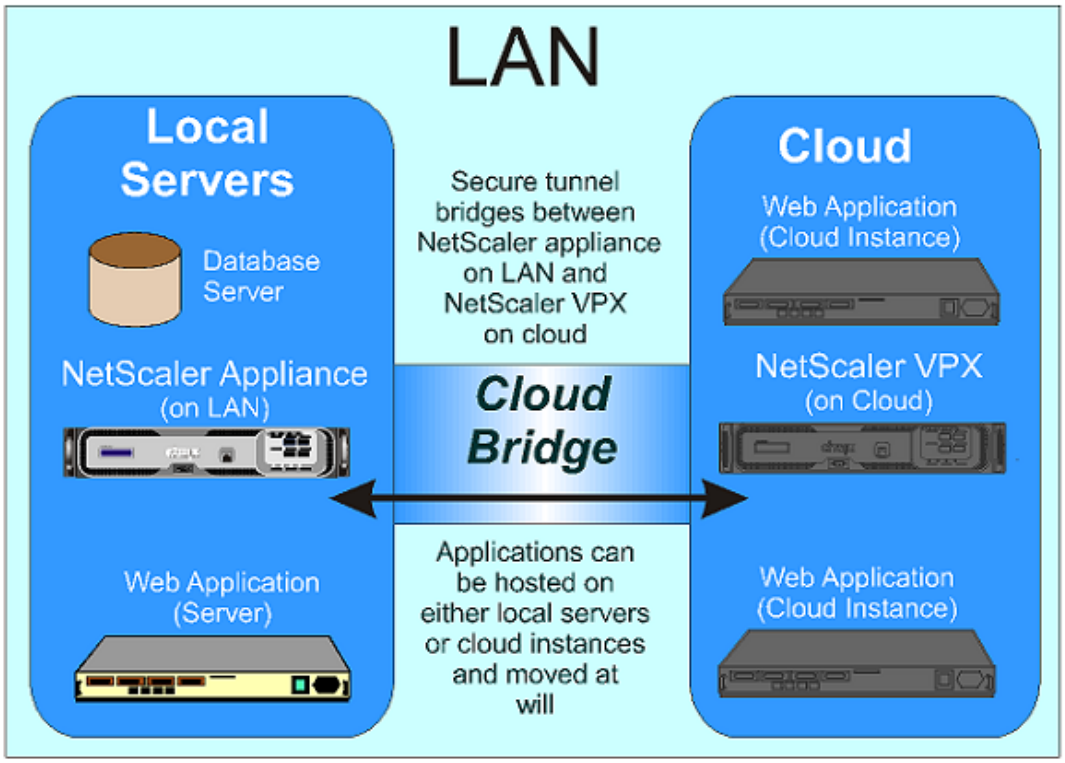
    - A security protocol to use, so that each one sends data in a format the other can understand

    - An encryption algorithm

    - Cryptographic keys for encrypting data in one peer and decrypting the data in the other

This agreement upon the security protocol, encryption algorithm and cryptographic keys is called a Security Association (SA). SAs are one way (simplex). For example, when two NetScaler appliances, NS1 and NS2, are communicating by means of IPSec over a Cloud Bridge, NS1 has two Security Associations. One SA is used for processing out-bound packets, and the other SA is used for processing inbound packets.

SAs expire after a specified interval of time, which is called the lifetime. The two peers then using the Internet Key Exchange (IKE) protocol (part of the IPSec protocol suite) negotiates new cryptographic keys and establishes new SAs. The purpose of the limited lifetime is to prevent attackers from cracking a key.



Following is a conceptual illustration of an Cloud Bridge.Figure 1. Conceptual Diagram-NetScaler Cloud Bridge

About the Cloud Bridge

A OpenCloud Bridge is a Layer-2 network bridge that connects a virtual appliance on a cloud instance to a NetScaler appliance on your LAN. The connection is made through a tunnel that uses the Generic Routing Encapsulation (GRE) protocol. The GRE protocol provides a mechanism for encapsulating packets from a wide variety of network protocols to be forwarded over another protocol. GRE is used to:

- Connect networks running non-IP, nonroutable protocols, such as Appletalk, Novell IPX, and NetBIOS.
- Bridge across a wide area network (WAN).
- Create a transport tunnel for any type of traffic that needs to be sent unchanged across a different network.

The GRE protocol encapsulates packets by adding a GRE and a GRE IP header to the packets.

OpenCloud Bridge supports the use of open standard Internet Protocol security (IPSec) protocol suite to secure the communication between the peers in the Cloud bridge.

In an OpenCloud bridge, IPSec ensures:

- Data integrity
- Data origin authentication
- Data confidentiality (encryption)
- Protection against replay attacks

The IPSec use the transport mode in which only the payload of the GRE encapsulates packet is encrypted. The encryption is done by the Encapsulating Security Payload (ESP) protocol. The ESP protocol ensures the integrity of the packet using a HMAC hash function and the confidentiality using a encryption algorithm. After encrypting the payload and calculating the HMAC, an ESP header is generated and is inserted after the GRE IP header and a ESP trailer is inserted at the end of the encrypted payload. An Authentication Header (AH) is also added before the ESP header for data origin authentication of the packet.

Cloud bridge also supports the NAT implementation of RFC 3947 and 3948 for the cloud bridge peers to communicate properly when any of the peer is behind a NAT device.

Before securing the communication between the peers in the OpenCloud bridge, using the IKE protocol in IPSec:

- The two peers mutually authenticate with each other. One of the following authentication methods is used:

- **Pre-shared key authentication**. A text string called pre-shared key is manually configured on each peer. The pre-shared keys of the peers are matched against each other for authentication. Therefore for the authentication to be successful, you must configure the same pre-shared key on each of peer.

- **Digitital certificates authentication**. For digital certificate authentication, a peer (sender) initiator signs message interchange data using his private key, and the other peer(receiver) uses the peer(sender's) public key to verify the signature. Typically, the public key is exchanged via messages containing an X.509v3 certificate. This certificate provides a level of assurance that a peer's identity-as represented in the certificate-is associated with a particular public key.

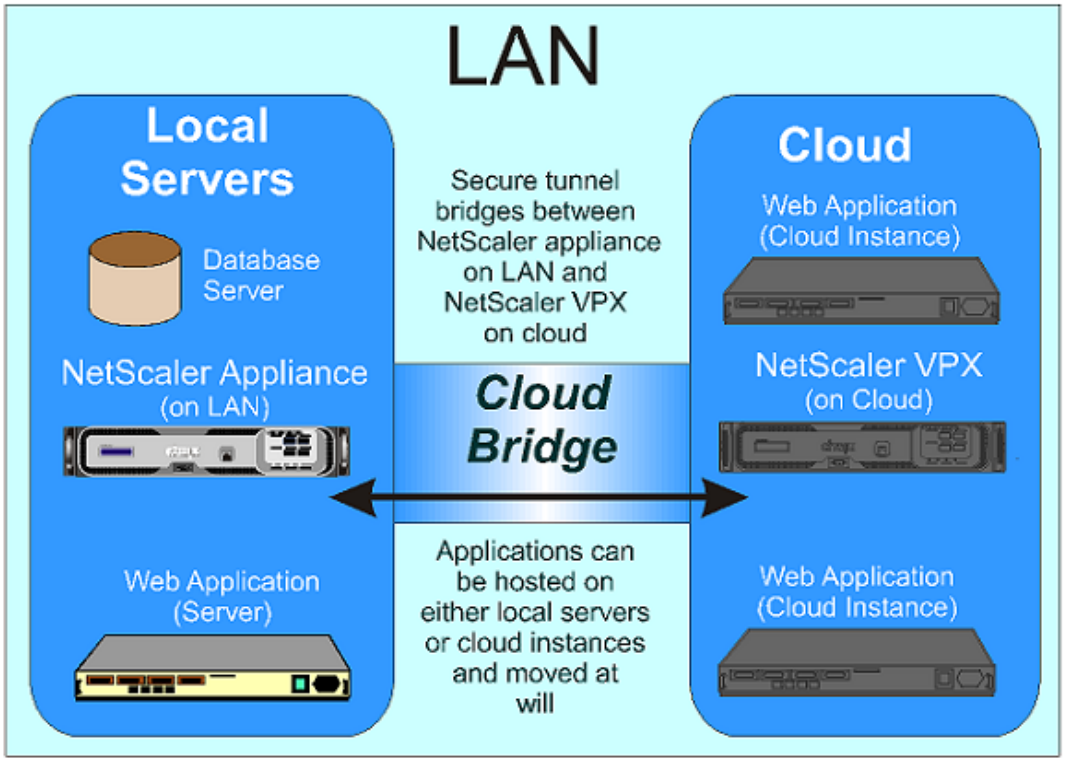
- The peers then agree on the:

  - security protocol to use, so that each one sends data in a format the other can understand.

  - encryption algorithm and negotiate cryptographic keys for encrypting data in one peer and decrypting the data in the other.

This agreement of the security protocol, encryption algorithm and cryptographic keys is called a Security Association (SA). SAs are one way (simplex). For example, when two NetScalers, NS1 and NS2, are communicating using IPSec in an OpenCloud Bridge, then the NS1 will have two Security Associations. One SA is used for processing out-bound packets and other SA is used for processing inbound packets.

SAs expire after a specified interval of time called the lifetime. Using the IKE protocol in IPSec, new SAs are established where new cryptographic keys were negotiated between the peers of the OCB. This prevents the cracking of the key by an attacker.



Following is a conceptual illustration of an OpenCloud Bridge.Figure 1. Conceptual Diagram of LAN That Uses the NetScaler OpenCloud Bridge

Setting Up a Cloud Bridge - Method 1

Before setting up a Cloud Bridge, you must configure the NetScaler appliance or VPX virtual appliance on the LAN and the appliance or virtual appliance on the Cloud.

To configure a new NetScaler appliance, see Getting Started with Citrix NetScaler. To configure a new virtual appliance, see Getting Started with Citrix NetScaler VPX.

You must then configure networking on both appliances. Each of the two configurations may include a VLAN that contains the servers or the cloud instances that will use the Cloud Bridge. To configure VLANs, see Configure a VLAN.

To set up a Cloud Bridge, on the NetScaler appliance or virtual appliance that anchors the LAN side of the Cloud Bridge:

1. Configure a GRE tunnel.
2. Configure IPSec on the GRE tunnel.
3. Configure a Cloud Bridge:
    - Create a logical representation of the Cloud Bridge by specifying a name.
    - Bind one or more GRE tunnels to the Cloud Bridge.
    - Bind VLANs and IP addresses to the Cloud Bridge (Optional.)

You then repeat these steps on the NetScaler appliance or virtual appliance that anchors the cloud side of the Cloud Bridge.

You can perform these tasks individually (Method 1), or you can configure everything in one dialog box in dialog box in the configuration utility (Method 2). For more information, see Setting Up a Cloud Bridge – Method 2.

Creating IP Tunnels

For enabling IP/IP (IP Tunneling) for a specific virtual IP (VIP) address you need to create an IP tunnel manually, known as configured tunnels. For Cloud Bridge, you need to create GRE tunnels.

To create an IP tunnel by using the NetScaler command line

At the NetScaler command prompt type:

- add iptunnel <name> <remoteIp> <remoteSubnetMask> <localIp> **-type** -**protocol** (ipoverip | GRE) -**secure** (YES | NO)

- show iptunnel

To modify or remove an IP tunnel by using the NetScaler command line

- To modify an IP tunnel, type the set iptunnel command, the name of the tunnel, and the parameters to be changed, with their new values.
- To remove an IP tunnel, type the rm iptunnel command and the name of the tunnel.

Parameters for creating an IP tunnel

name

Name of the IP Tunnel. This alphanumeric string is required and cannot be changed after the service group is created. The name must not exceed 127 characters, and the leading character must be a number or letter. The following characters are also allowed: @ _ - . (period) : (colon) # and space ( ).

remoteIp

A public IPv4 address of the remote NetScaler appliance used to set up the tunnel.

remoteSubnetMask

Subnet mask of the remote IP address of the tunnel.

localIp

A public IPv4 address of the local NetScaler appliance used to set up the tunnel. Possible values: Auto, MIP, SNIP, and VIP. Default: Auto.

protocol

The protocol to be used in setting up the IP tunnel. Select GRE for using the Generic Routing Encapsulation (GRE) protocol to set up a GRE tunnel.

secure

Enable or disable IPSec for securing communication in the GRE tunnel.

To create an IP Tunnel by using the configuration utility

1. In the navigation pane, expand **Network**, and click **IP Tunnels**.
2. In the details pane, click **Add**.
3. In the **Add IP Tunnel** dialog box, specify values for the following parameters:
   - **Name*—**name
   - **Remote IP*—**remoteIp
   - **Remote Mask*—**remoteSubnetMask
   - **Local IP Type***—localIp (in the **local IP Type** drop down list, select one of the IP type (Mapped IP, Subnet IP, and Virtual). All the configured IPs of the selected IP type will be populated in the **Local IP** drop down list. Select the desired IP from the list.)
   - **Protocol—**protocol
   - **Secure—**secure

   *A required parameter.
4. Click **Create**, and then click **Close.**

Configuring IPSec on a GRE tunnel

For configuring IPSec on a GRE tunnel:

- The **Secure** parameter should be enabled on the GRE tunnel.
- You need to specify the same local IP address and the remote IP address that you specified for the GRE tunnel.

To configure IPSec on a GRE tunnel by using the NetScaler command line

At the NetScaler command prompt, type:

add ipsec peer <name> <localIP> <peerIP> [**-encAlgo** (AES | 3DES) ...] [**-hashAlgo** <hashAlgo> ...] [**-lifetime** <positive_integer>] (**-psk** |(**-publickey** <string> **-privatekey** <string> **-peerPublicKey** <string>))

To modify or remove an IPSec config by using the NetScaler command line

- To modify an IPSec config, type the set ipsec peer command, the name of the IPSec config, and the parameters to be changed, with their new values.
- To remove an IPSec config, type the rm ipsec peer command and the name of the IPSec config.

Parameters for configuring IPSec on a GRE tunnel

name

A name for an IPSec configuration. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.

localIP

Local IPv4 address to be used for security association. This parameter should be same as the local IPv4 or IPv6 address that was used to set up a GRE tunnel.

peerIP

The IPv4 address of the peer for security association. This parameter should be same as the IPv4 address of the remote NetScaler appliance or VPX virtual appliance that was used to set up the GRE tunnel.

encAlgo

The encryption algorithm to be used in IPSec configuration for a Cloud Bridge. Possible values: AES, 3DES.

hashAlgo

The encryption algorithm to be used in IPSec configuration for a Cloud Bridge. Possible values: HMAC_SHA1, HMAC_SHA256, HMAC_MD5. Default: HMAC_SHA1.

lifetime

Time, in seconds, after which the security association expires. After expiration, new SAs are established, and new cryptographic keys are negotiated between the peers connected by the Cloud Bridge. Maximum value: 31536000. Default: 28800.

psk

A text string, called the pre-shared key, to be manually configured on each peer. The pre-shared keys of the peers are matched against each other for authentication before security associations are established. Therefore, for the authentication to be successful, you must configure the same pre-shared key on both of the peers of the Cloud Bridge. Maximum Length: 63 characters.

publickey

A local digital certificate to be used to authenticate the local NetScaler appliance to the remote peer before establishing IPSec security associations. The same certificate should be present and set for the Peer Public Key parameter in the remote peer.

privatekey

The private key of the local digital certificate.

peerPublicKey

A digital certificate of the remote peer. This certificate is used to authenticate the remote peer to the local peer before establishing IPSec security associations. The same certificate should be present and set for the Public key parameter in the remote peer.

To configure IPSec on a GRE tunnel by using the configuration utility

1. In the navigation pane, expand **Cloud Bridge**, and then click **IPSec Peer**.
2. In the details pane, click **Add**.
3. In the **Create IPSec Peer** dialog box, type or select values for the following parameters, which correspond to parameters described in "Parameters for configuring IPSec" as shown:
   - **Name***—name
   - **IP Address***—peerIP
   - **IP Address***—localIP
   - **Encryption Algorithm**—encAlgo
   - **Hash Algorithm**—hashAlgo
   - **Lifetime**—lifetime
   - **Pre-Shared key Exists**—psk
   - **Public Key**—publickey
   - **Private Key**—privatekey
   - **Peer Public Key**—peerPublicKey

   * A required parameter.
4. Click **Create**, and then click **Close**.

Configuring a Cloud Bridge

You can think of the Cloud Bridge as a group that holds a set of secure GRE tunnels. After configuring GRE tunnels secured with IPSec, you need to create a logical representation of the Cloud Bridge by assigning a name to a Cloud Bridge and binding one or more configured GRE tunnels to the Cloud Bridge. You can then bind VLANs and IP subnets to the new Cloud Bridge. The VLAN and IP subnet settings are common to all the GRE tunnels bound to the Cloud Bridge.

To create a cloud bridge by using the NetScaler command line

At the NetScaler command prompt, type:

add netbridge <name>

To bind GRE tunnels, VLANs, and IP Subnets to a Cloud Bridge by using the NetScaler command line

At the NetScaler command prompt, type:

bind netbridge <name> [**-tunnel** <name>] [**-vlan** <id>] [**-IPAddress** <ip_addr|ipv6_addr>]

To modify or remove an Cloud Bridge by using the NetScaler command line

- To modify a Cloud Bridge, type the set netbridge command, the name of the Cloud Bridge, and the parameters to be changed, with their new values.
- To remove a Cloud Bridge, type the rm netbridge command and the name of the Cloud Bridge.

Parameters for configuring a Cloud Bridge

name

The name of the Cloud Bridge that you are configuring. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols. You should choose a name that will make it easy for others to tell which NetScaler appliances the Cloud Bridge connects.

tunnel

The name of the GRE tunnel to be associated with the Cloud Bridge.

VLAN

The ID of the local VLAN that needs to be extended to the cloud.

IPAddress

The IPV4 subnet that needs to be extended to the cloud.

To configure a Cloud Bridge by using the configuration utility

1. In the navigation pane, expand **Cloud Bridge**, and then click **Network Bridge**.
2. In the details pane, do one of the following:
   - To create a new Cloud Bridge, click **Add**.
   - To modify an existing Cloud Bridge, select the Cloud Bridge, and then click **Open**.
3. In the **Create Network Bridge** dialog box, type a name for your new Cloud Bridge.
4. In the **Create Network Bridge** or **Configure Network Bridge** dialog box, on the **Tunnels** tab (selected by default), do one of the following to bind GRE tunnels to the Cloud Bridge:
   - If the GRE tunnels that you want are listed, select the corresponding check boxes.
   - If you want bind all the GRE tunnels listed, click **Activate All**.
   - If you want to create a new GRE tunnel, click **Add**.
5. In the **Create Network Bridge** or **Configure Network Bridge** dialog box, on the **VLANs** tab (selected by default), do one of the following to bind GRE tunnels to the Cloud Bridge:
   - If the VLANS that you want are listed, select the corresponding check boxes.
   - If you want bind all the VLANs listed, click **Activate All**.
   - If you want to create a new VLAN, click **Add**.
6. On the **IP Subnets** tab, do the following to bind IP subnets to the Cloud Bridge:
   - If you want to bind a new IP subnet, click **Add**.
   - If you want to modify an existing IP subnet, click **Open**.
7. Click **Create**, and then click **Close**.

Setting Up Cloud Bridge-Method 2

For configuring a Cloud Bridge, you need to perform the following steps on each of the appliances that is to a be peer of the Cloud Bridge.

1. Configure a GRE tunnel.
2. Configure IPSec on the GRE tunnel.
3. Create a logical representation of the Cloud Bridge by specifying a name.
4. Bind one or more GRE Tunnel to the Cloud Bridge.
5. Bind VLANs and IP addresses to the Cloud Bridge (Optional.)

The configuration utility provides a single dialog box on which you can perform all of these steps to configure a Cloud Bridge.

When you use this dialog box:

- A GRE tunnel, IPSec, and Cloud Bridge entities are created with the same name.
- The GRE tunnel created is configured with IPSec.

By using this method, you can configure a Cloud Bridge with only one GRE tunnel. You can later modify the Cloud Bridge to bind more GRE tunnels to it. For more information, see Configuring a Network Bridge.

Parameters for configuring a Cloud Bridge

name

The name of the Cloud Bridge that you are configuring. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols. You should choose a name that will make it easy for others to know which NetScaler appliances the Cloud Bridge connects.

Local IP

A public IPv4 address of the local NetScaler appliance or VPX virtual appliance. This address is used to set up a GRE tunnel, with IPSec configuration, to a public IP IPv4 address of the remote peer NetScaler appliance or virtual appliance.

Remote IP

A public IPv4 address of the remote peer NetScaler appliance or virtual appliance. This is the address that is used to at the remote peer to set up the GRE tunnel, with IPSec configuration, with the local peer.

Pre-Shared key

A text string, called the pre-shared key, to be manually configured on each peer. The pre-shared keys of the peers are matched against each other for authentication before security associations are established. Therefore, for the authentication to be successful, you must configure the same pre-shared key on both of the peers of the Cloud Bridge. Maximum Length: 63 characters.

Public key

A local digital certificate to be used to authenticate the local NetScaler appliance to the remote peer before establishing IPSec security associations. The same certificate should be present and set for the Peer Public Key parameter in the remote peer.

Private Key

The private key of the local digital certificate.

Peer Public Key

A digital certificate of the remote peer. This certificate is used to authenticate the remote peer to the local peer before establishing IPSec security associations. The same certificate should be present and set for the Public key parameter in the remote peer.

To configure a Cloud Bridge by using the configuration utility

1. In the navigation pane, click **Cloud Bridge**.
2. In the details pane, under Getting Started, click **Configure Cloud Bridge**.
3. In the **Configure Cloud Bridge** dialog box, specify values for the following parameters, which are described in "Parameters for configuring a Cloud Bridge":
   - **Name***
   - **Local IP***
   - **Remote IP***

   * A required parameter.
4. Do one of the following to select an IPSec authentication method between the peers for establishing IPSec security associations:
   - For pre-shared key authentication method, select **Pre-shared Key** and specify values for the following parameters, which are described in "Parameters for configuring a Cloud Bridge":
     - **Pre-Shared key**
     - **Confirm Key**

     * A required parameter.
   - For digital certificates authentication method, select **Certificate** and specify values for the following parameters, which are described in "Parameters for configuring a Cloud Bridge":
     - **Public Key**
     - **Private Key**
     - **Peer Public Key**

     * A required parameter.
5. Click **Create**, and then click **Close**.

Setting Up Cloud Bridge to SoftLayer Enterprise Cloud

The configuration utility includes a wizard that helps you to easily configure a Cloud Bridge between a NetScaler appliance on any network and NetScaler VPX instances on the SoftLayer enterprise cloud.

Note: This feature is supported only on NetScaler 9.3.e.

Using the wizard you can perform the following steps to configure a Cloud Bridge to a NetScaler VPX instance on the SoftLayer enterprise cloud.

1. Connect to the SoftLayer enterprise cloud by providing the user-login credentials.
2. Select the Citrix XenServer that is running the NetScaler VPX appliance.
3. Select the NetScaler VPX appliance.
4. Provide Cloud Bridge parameters for:
    - Configuring a GRE Tunnel.
    - Configuring IPSec on the GRE tunnel.
    - Creating a logical representation of the Cloud Bridge by specifying a name.
    - Binding the GRE Tunnel to the Cloud Bridge.

When you use this wizard, a GRE tunnel, IPSec, and Cloud Bridge entities are created each on both the peers.

To configure a Cloud Bridge by using the configuration utility

1. In the navigation pane, click **Cloud Bridge**.
2. In the details pane, click **SOFTLAYER**.
3. In the **Setup CloudBridge on SoftLayer wizard**, click **Next**, and then follow the instructions in the wizard.

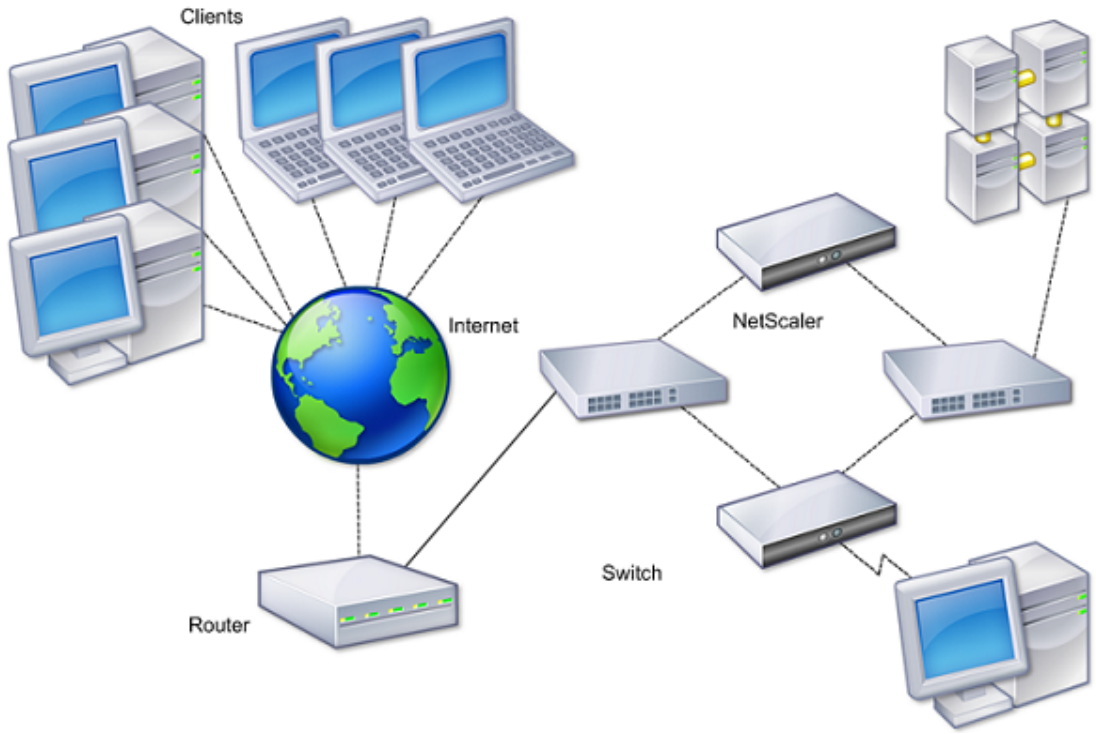
High Availability

A high availability (HA) deployment of two Citrix® NetScaler® appliances can provide uninterrupted operation in any transaction. With one appliance configured as the primary node and the other as the secondary node, the primary node accepts connections and manages servers while the secondary node monitors the primary. If, for any reason, the primary node is unable to accept connections, the secondary node takes over.

The secondary node monitors the primary by sending periodic messages (often called heartbeat messages or health checks) to determine whether the primary node is accepting connections. If a health check fails, the secondary node retries the connection for a specified period, after which it determines that the primary node is not functioning normally. The secondary node then takes over for the primary (a process called failover).

After a failover, all clients must reestablish their connections to the managed servers, but the session persistence rules are maintained as they were before the failover.

With Web server logging persistence enabled, no log data is lost due to the failover. For logging persistence to be enabled, the log server configuration must carry entries for both systems in the log.conf file.



The following figure shows a network configuration with an HA pair.Figure 1. NetScaler Appliances in a High Availability Configuration

To configure HA, you might want to begin by creating a basic setup, with both nodes in the same subnet. You can then customize the intervals at which the nodes communicate health-check information, the process by which nodes maintain synchronization, and the

propagation of commands from the primary to the secondary. You can configure fail-safe mode to prevent a situation in which neither node is primary. If your environment includes devices that do not accept NetScaler gratuitous ARP messages, you should configure virtual MAC addresses. When you are ready for a more complex configuration, you can configure HA nodes in different subnets.

To improve the reliability of your HA setup, you can configure route monitors and create redundant links. In some situations, such as when troubleshooting or performing maintenance tasks, you might want to force a node to fail over (assign primary status to the other node), or you might want to force the secondary node to stay secondary or the primary node to stay primary.

Considerations for a High Availability Setup

Note the following requirements for configuring systems in an HA setup:

- In an HA configuration, the primary and secondary NetScaler appliances should be of the same model. Different NetScaler models are not supported in an HA pair (for example, you cannot configure a 10010 model and a 7000 model as an HA pair).
- In an HA setup, both nodes must run the same version of NetScaler, for example, nCore/nCore or classic/classic. If the nodes are running NetScaler classic and you want to migrate to NetScaler nCore of the same NetScaler release, prop and sync are not supported during the migration process. Once migration is complete, prop and sync are auto-enabled. The same applies if you migrate from NetScaler nCore to NetScaler classic.
- Entries in the configuration file (ns.conf) on both the primary and the secondary system must match, with the following exceptions:
  - The primary and the secondary systems must each be configured with their own unique NetScaler IP addresses (NSIPs.)
  - In an HA pair, the node ID and associated IP address of one node must point to the other node. For example, if you have nodes NS1 and NS2, you must configure NS1 with a unique node ID and the IP address of NS2, and you must configure NS2 with a unique node ID and the IP address of NS1.
- If you create a configuration file on either node by using a method that does not go directly through the GUI or the CLI (for example, importing SSL certificates, or changing to startup scripts), you must copy the configuration file to the other node or create an identical file on that node.
- Initially, all NetScaler appliances are configured with the same RPC node password. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. For security, you should change the default RPC node passwords.

  One RPC node exists on each NetScaler. This node stores the password, which is checked against the password provided by the contacting system. To communicate with other systems, each NetScaler requires knowledge of those systems, including how to authenticate on those systems. RPC nodes maintain this information, which includes the IP addresses of the other systems, and the passwords they require for authentication.

  RPC nodes are implicitly created when adding a node or adding a Global Server Load Balancing (GSLB) site. You cannot create or delete RPC nodes manually.

  Note: If the NetScaler appliances in a high availability setup are configured in one-arm mode, you must disable all system interfaces except the one connected to the switch or hub.

- For an IPv6 HA configuration, the following considerations apply:
    - You must install the IPv6PT license on both NetScaler appliances.
    - After installing the IPv6PT license, enable the IPv6 feature by using the configuration utility or the NetScaler command line.
    - Both NetScaler appliances require a global NSIP IPv6 address. In addition, network entities (for example, switches and routers) between the two nodes must support IPv6.

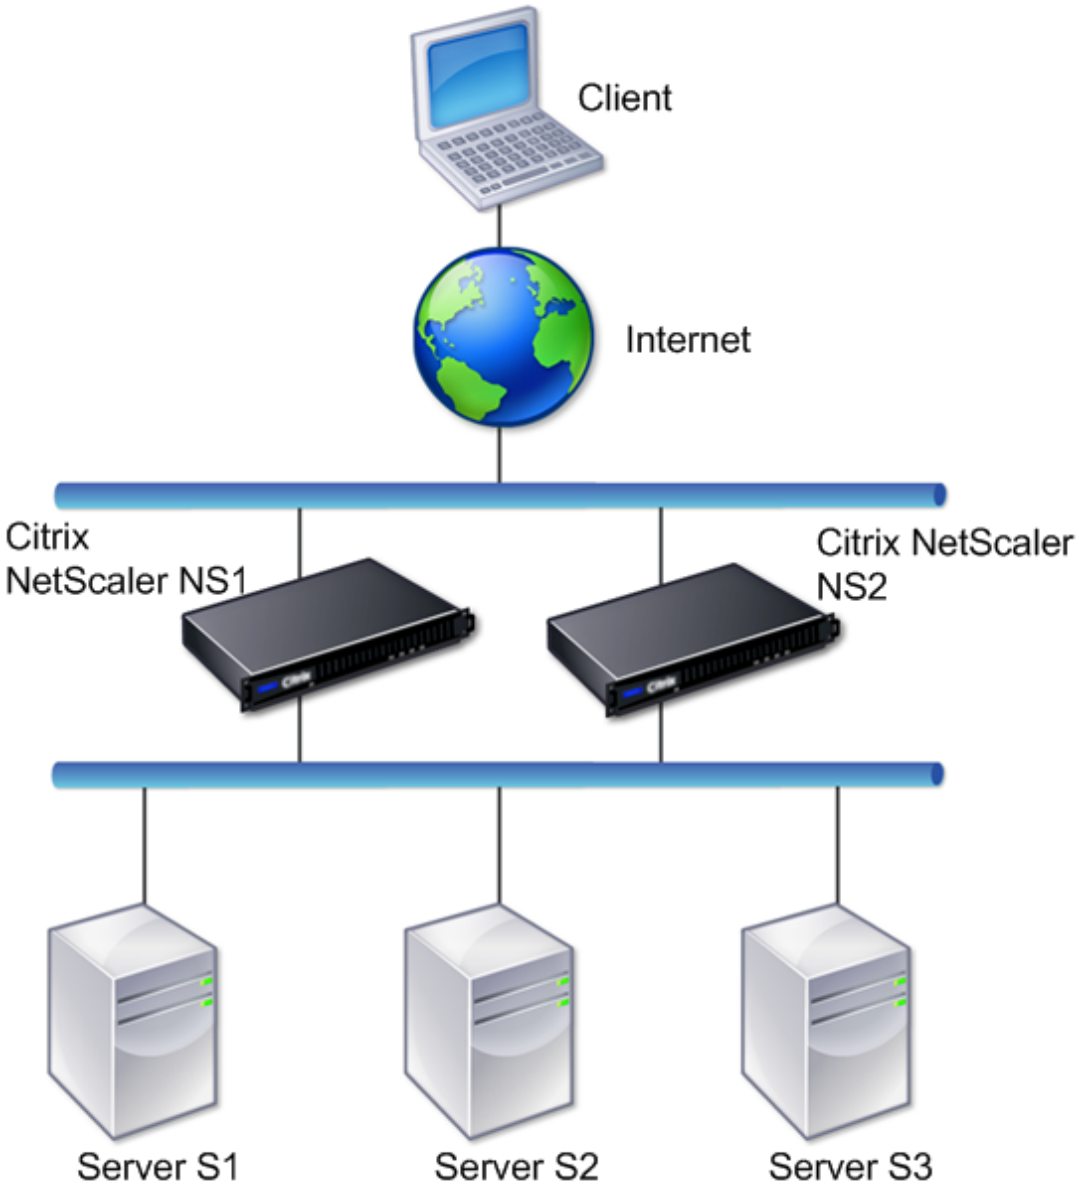
Configuring High Availability

To set up a high availability configuration, you create two nodes, each of which defines the other's NetScaler IP (NSIP) address as a remote node. Begin by logging on to one of the two NetScaler appliances that you want to configure for high availability, and add a node. Specify the other appliance's NetScaler IP (NSIP) address as the address of the new node. Then, log on to the other appliance and add a node that has the NSIP address of the first appliance. An algorithm determines which node becomes primary and which becomes secondary.

Note: The configuration utility provides an option that avoids having to log on to the second appliance.

The following figure shows a simple HA setup, in which both nodes are in same subnet.

Figure 1. Two NetScaler Appliances Connected in a High Availability Configuration



Client
Internet
Citrix
NetScaler NS1
Citrix NetScaler
NS2
Server S1
Server S2
Server S3

Adding a Remote Node

To add a remote NetScaler appliance as a node in a high availability setup, you specify a unique node ID and the appliance's NSIP. The maximum number of node IDs in an HA setup is 64. When you add an HA node, you must disable the HA monitor for each interface that is not connected or not being used for traffic. For CLI users, this is a separate procedure.

Note: To ensure that each node in the high availability configuration has the same settings, you should synchronize your SSL certificates, startup scripts, and other configuration files with those on the primary node.

To add a node by using the NetScaler command line

At the NetScaler command prompt, type:

- add ha node <id> <IPAddress>
- sh ha node

Example

```
> add ha node 3 1000:0000:0000:0000:0005:0600:700a:888b
> sh ha node
```

To disable an HA monitor by using the NetScaler command line

At the NetScaler command prompt, type:

- set interface <ifNum> [**-haMonitor** (**ON** | **OFF**)]
- show interface <ifNum>

Example

```
> set interface 1/3 -haMonitor OFF
 Done
> show interface 1/3
```

```
        Interface 1/3 (Fast Ethernet 10/100 MBits) #5
        flags=0x4000 [ENABLED, DOWN, down, autoneg, 802.1q]
        MTU=1514, native vlan=5, MAC=00:d0:68:0b:58:dc, downtime 332h55m50s
        Requested: media AUTO, speed AUTO, duplex AUTO, fctl ON,
              throughput 0

        RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
        TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
        NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0) Muted(0)
        Bandwidth thresholds are not set.
Done
```

Parameters for adding a remote node

node id

Unique number that identifies the node to be added. Possible values: 1 to 64.

IPAddress

IPv4 or IPv6 address of the node to be added.

id

Interface number, in slot/port notation.

haMonitor

Monitor the specified interface for failing events. Possible values: ON, OFF. Default: ON.

To add a remote node by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, select the **Nodes** tab, and then click **Add**.
3. In the **High Availability Setup** dialog box, in the **Remote Node IP Address** text box, type the NSIP address of the NetScaler that is to be added as the remote node. If the NSIP is an IPv6 address, select the **IPv6** check box before entering the address.
4. If you want to add the local node to the remote node automatically, select the **Configure remote system to participate in High Availability setup** check box. If you do not select this option, you will have to log in to the appliance represented by the remote node and add the node that you are currently configuring.
5. Make sure that the **Turn off HA monitor on interfaces/channels that are down** check box is selected.
6. Click **OK**. The **Nodes** page displays both of the nodes in your HA configuration (the local node and the remote node).

Disabling or Enabling a Node

You can disable or enable only a secondary node. When you disable a secondary node, it stops sending heartbeat messages to the primary node, and therefore the primary node can no longer check the status of the secondary. When you enable a node, the node takes part in the high availability configuration.

To disable or enable a node by using the NetScaler command line

At the NetScaler command prompt, type one of the following commands:

- set ha node -hastatus DISABLED
- set ha node -hastatus ENABLED

To disable or enable a node by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Nodes** tab, select the local node, and then click **Open.**
3. In the **Configure Node** dialog box, under **High Availability Status**, do one of the following:
   - To enable the node, select the **DISABLED (Do not participate in HA)** check box.
   - To enable the node, select the **ENABLED (Do not participate in HA)** check box.
4. Click **OK**. A message appears in the status bar, stating that the node has been configured successfully.

Removing a Node

If you remove a node, the nodes are no longer in high availability configuration.

To remove a node by using the NetScaler command line

At the NetScaler command prompt, type:

rm ha node <id>

Example

```
> rm ha node 2
  Done
```

To remove a node by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. On the **High Availability** page, select the **Nodes** tab.
3. On the **Nodes** page, select the node that you want to remove, and click **Remove**.
4. On the **Remove** dialog box, click **Yes.**

Note: You can use the Network Visualizer to view the NetScaler appliances that are configured as a high availability (HA) pair and perform high availability configuration tasks. For more information, see Using the Network Visualizer.

Configuring the Communication Intervals

The hello interval is the interval at which the heartbeat messages are sent to the peer node. The dead interval is the time interval after which the peer node is marked DOWN if heartbeat packets are not received. The heartbeat messages are UDP packets sent to port 3003 of the other node in an HA pair.

To set the hello and dead intervals by using the NetScaler command line

At the NetScaler command prompt, type:

- set HA node [-**helloInterval** <msecs>] [-**deadInterval** <secs>]
- show HA node [<id>]

Parameters for setting the hello and dead intervals

helloInterval

Interval between successive heartbeat messages, in milliseconds. Possible values: 200 to 1000. Default: 200.

deadInterval

Number of seconds after which a node is marked DOWN if there is no response to heartbeat messages. Possible values: 3 to 60. Default: 3.

To set the hello and dead intervals by using the configuration utility

1. In the navigation pane, expand **System** and click **High Availability**.
2. In the details pane, on the **Nodes** tab, select the local node, and then click **Open.**
3. In the **Configure Node** dialog box, under **Intervals**, specify values for the following parameters, which correspond to parameters described in “Parameters for setting the hello and dead intervals” as shown:
   - **Hello Interval (msecs)**—helloInterval
   - **Dead Interval (secs)**—deadInterval
4. Click **OK**. A message appears in the status bar, stating that the node has been configured successfully.

Configuring Synchronization

Synchronization is a process of duplicating the configuration of the primary node on the secondary node. The purpose of synchronization is to ensure that there is no loss of configuration information between the primary and the secondary nodes, regardless of the number of failovers that occur. Synchronization uses port 3010.

Synchronization is triggered by either of the following circumstances:

- The secondary node in an HA setup comes up after a restart.
- The primary node becomes secondary after a failover.

Automatic synchronization is enabled by default. You can also force synchronization.

Disabling or Enabling Synchronization

Automatic HA synchronization is enabled by default on each node in an HA pair. You can enable or disable it on either node.

To disable or enable automatic synchronization by using the NetScaler command line

At the NetScaler command prompt, type:

- set HA node -haSync DISABLED
- set HA node -haSync ENABLED

To disable or enable synchronization by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Nodes** tab, select the local node, and then click **Open**.
3. In the **Configure Node** dialog box, under **HA Synchronization**, do one of the following:
   - To disable HA synchronization, clear the **Secondary node will fetch the configuration from Primary** check box.
   - To enable HA synchronization, select the **Secondary node will fetch the configuration from Primary** check box.
4. Click **OK**. A message appears in the status bar, stating that the node has been configured successfully.

Forcing the Secondary Node to Synchronize with the Primary Node

In addition to automatic synchronization, the NetScaler supports forced synchronization. You can force the synchronization from either the primary or the secondary node. When you force synchronization from the secondary node, it starts synchronizing its configuration with the primary node.

However, if synchronization is already in progress, forced synchronization fails and the system displays a warning. Forced synchronization also fails in any of the following circumstances:

- You force synchronization on a standalone system.
- The secondary node is disabled.
- HA synchronization is disabled on the secondary node.

To force synchronization by using the NetScaler command line

At the NetScaler command prompt, type:

force HA sync

To force synchronization by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Nodes** tab, click **Force Synchronization**.

Synchronizing Configuration Files in a High Availability Setup

In a high availability setup, you can synchronize various configuration files from the primary node to the secondary node.

To perform the synchronization, you can use the NetScaler command line or the configuration utility at either the primary or the secondary node. Files located on the secondary that are specific to the secondary (not present on the primary) are not deleted during the synchronization.

To synchronize files in a high availability setup by using the NetScaler command line

At the NetScaler command prompt, type:

sync HA files <mode>

Example

```
> sync HA files all
 Done
```

Parameters for synchronizing files in a high availability setup

Mode

The type of synchronization to be performed. Following are descriptions of the available options. Each description includes, in parentheses, the command-line argument that specifies that option.

- **Everything except licenses and rc.conf** (all). Synchronizes files related to system configuration, Access Gateway bookmarks, SSL certificates, SSL CRL lists, HTML injection scripts, and Application Firewall XML objects. Synchronization paths:
  - /nsconfig/ssl/

    - /var/netscaler/ssl/
    - /var/vpn/bookmarks/
    - /nsconfig/htmlinjection/
    - /nsconfig/monitors/
    - /nsconfig/nstemplates/
    - /nsconfig/rc.netscaler
    - /nsconfig/inetd.conf
    - /nsconfig/sshd_config
    - /nsconfig/hosts
    - /nsconfig/snmpd.conf
    - /nsconfig/ntp.conf
    - /nsconfig/resolv.conf
    - /nsconfig/syslog.conf
- **Bookmarks** (bookmarks). Synchronizes all Access Gateway bookmarks. Synchronization path:
    - /var/vpn/bookmark/
- **SSL certificates and keys** (ssl). Synchronizes all certificates, keys, and CRLs for the SSL feature. Synchronization paths:
    - /nsconfig/ssl/
    - /var/netscaler/ssl/
- **EdgeSight Monitoring (HTML injection) scripts** (htmlinjection). Synchronizes all scripts configured for the HTML injection feature. Synchronization path:
    - /nsconfig/htmlinjection/
- **Imported XML objects** (imports). Synchronizes all XML objects (for example, WSDLs, schemas, error pages) configured for the Application Firewall. Synchronization path:
    - /var/download/
- **Licenses and rc.conf** (misc). Synchronizes all license files and the rc.conf file. Synchronization paths:
    - /nsconfig/license/
    - /nsconfig/rc.conf
- **Everything including licenses and rc.conf** (all_plus_misc). Synchronizes files related to system configuration, Access Gateway bookmarks, SSL certificates, SSL CRL lists, HTML injection scripts, Application Firewall XML objects, licenses, and the rc.conf file. Synchronization paths:
    - /nsconfig/ssl/

- /var/netscaler/ssl/
- /var/vpn/bookmarks/
- /nsconfig/htmlinjection/
- /nsconfig/monitors/
- /nsconfig/nstemplates/
- /nsconfig/rc.netscaler
- /nsconfig/inetd.conf
- /nsconfig/sshd_config
- /nsconfig/hosts
- /nsconfig/snmpd.conf
- /nsconfig/ntp.conf
- /nsconfig/resolv.conf
- /nsconfig/syslog.conf
- /nsconfig/license/
- /nsconfig/rc.conf

To synchronize files in a high availability setup by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Diagnostics**.
2. In the details pane, under **Utilities**, click **Start file synchronization**.
3. In the **Start file synchronization** dialog box, in the **Mode** drop-down list, select the appropriate type of synchronization (for example, **Everything except licenses and rc.conf**), and then click **OK**.

Configuring Command Propagation

In an HA setup, any command issued on the primary node propagates automatically to, and is executed on, the secondary before it is executed on the primary. If command propagation fails, or if command execution fails on the secondary, the primary node executes the command and logs an error. Command propagation uses port 3011.

In an HA pair configuration, command propagation is enabled by default on both the primary and secondary nodes. You can enable or disable command propagation on either node in an HA pair. If you disable command propagation on the primary node, commands are not propagated to the secondary node. If you disable command propagation on the secondary node, commands propagated from the primary are not executed on the secondary node.

Note: After reenabling propagation, remember to force synchronization.

If synchronization occurs while you are disabling propagation, any configuration-related changes that you make before the disabling of propagation takes effect are synchronized with the secondary node. This is also true for cases where propagation is disabled while synchronization is in progress.

To disable or enable command propagation by using the NetScaler command line

At the NetScaler command prompt, type:

- set HA node -haProp ENABLED
- set HA node -haProp ENABLED

To disable or enable command propagation by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Nodes** tab, select the local node, and then click **Open**.
3. In the **Configure Node** dialog box, under **HA Propagation**, do one of the following:
   - To disable HA Propagation, clear the **Primary node will propagate configuration to the Secondary** check box.
   - To enable HA Propagation, select the **Primary node will propagate configuration to the Secondary** check box.
4. Click **OK**. A message appears in the status bar, stating that the node has been configured successfully.

Configuring Fail-Safe Mode

In an HA configuration, fail-safe mode ensures that one node is always primary when both nodes fail the health check. This is to ensure that when a node is only partially available, backup methods are enabled to handle traffic as best as possible. The HA fail-safe mode is configured independently on each node.

The following table shows some of the fail-safe cases. The NOT_UP state means that the node failed the health check yet it is partially available. The UP state means that the node passed the health check.

Table 1. Fail-Safe Mode Cases

Node A (Primary) Health State	Node B (Secondary) Health State	Default HA Behavior	Fail-Safe Enabled HA Behavior	Description
NOT_UP(failed last)	NOT_UP (failed first)	A (Secondary), B (Secondary)	A (Primary), B (Secondary)	If both nodes fail, one after the other, the node that was the last primary remains primary.
NOT_UP (failed first)	NOT_UP(failed last)	A (Secondary), B (Secondary)	A(Secondary), B(Primary)	If both nodes fail, one after the other, the node that was the last primary remains primary.
UP	UP	A (Primary), B (Secondary)	A (Primary), B (Secondary)	If both nodes pass the health check, no change in behavior with fail-safe enabled.
UP	NOT_UP	A(Primary), B(Secondary)	A (Primary), B (Secondary)	If only the secondary node fails, no change in behavior with fail-safe enabled.
NOT_UP	UP	A(Secondary), B(Primary)	A(Secondary), B(Primary)	If only the primary fails, no change in behavior with fail-safe enabled.
NOT_UP	UP (STAYSECONDARY)	A (Secondary), B (Secondary)	A (Primary), B (Secondary)	If the secondary is configured as STAYSECONDARY, the primary remains primary even if it fails.

To enable fail-safe mode by by using the NetScaler command line

At the NetScaler command prompt, type:

set HA node [**-failSafe** (**ON** | **OFF**)]

Example

set ha node -failsafe ON

To enable fail-safe mode by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Nodes** tab, select the local node, and then click **Open.**
3. In the **Configure Node** dialog box, under **Fail-Safe Mode**, select the **Maintain one Primary node even when both nodes are unhealthy** check box.
4. Click **OK**. A message appears in the status bar, stating that the node has been configured successfully.

Configuring Virtual MAC Addresses

A Virtual MAC address (VMAC) is a floating entity shared by the primary and the secondary nodes in an HA setup.

In an HA setup, the primary node owns all of the floating IP addresses, such as the MIPs, SNIPs, and VIPs. The primary node responds to Address Resolution Protocol (ARP) requests for these IP addresses with its own MAC address. As a result, the ARP table of an external device (for example, an upstream router) is updated with the floating IP address and the primary node's MAC address.

When a failover occurs, the secondary node takes over as the new primary node. It then uses Gratuitous ARP (GARP) to advertise the floating IP addresses that it acquired from the primary. However, the MAC address that the new primary advertises is the MAC address of its own interface.

Some devices (notably a few routers) do not accept the GARP messages generated by the NetScaler appliance. As a result, some external devices retain the old IP to MAC mapping advertised by the old primary node. This can result in a site going down.

You can overcome this problem by configuring a VMAC on both nodes of an HA pair. Both nodes then possess identical MAC addresses. Therefore, when failover occurs, the MAC address of the secondary node remains unchanged, and the ARP tables on the external devices do not need to be updated.

To create a VMAC, you need to first create a Virtual Router ID (VRID) and bind it to an interface. (In an HA setup, you need to bind the VRID to the interfaces on both nodes.) Once the VRID is bound to an interface, the system generates a VMAC with the VRID as the last octet.

Configuring IPv4 VMACs

When you create a IPv4 VMAC address and bind it a interface, any IPv4 packet sent from the interface uses the VMAC address that is bound to the interface. If there is no IPv4 VMAC bound to an interface, the interface's physical MAC address is used.

The generic VMAC is of the form 00:00:5e:00:01:<VRID>. For example, if you create a VRID with a value of 60 and bind it to an interface, the resulting VMAC is 00:00:5e:00:01:3c, where 3c is the hex representation of the VRID. You can create 255 VRIDs with values from 1 to 255.

Creating or Modifying an IPv4 VMAC

You create an IPv4 virtual MAC by assigning it a virtual router ID. You can then you bind the VMAC to an interface. You cannot bind multiple VRIDs to the same interface. To verify the VMAC configuration, you should display and examine the VMACs and the interfaces bound to the VMACs.

To add a VMAC by using the NetScaler command line

At the NetScaler command prompt, type:

- add vrID <id>
- bind vrid <id> **-ifnum** <interface_name>
- sh vrID

Example

```
add vrID 100
bind vrid 100 -ifnum 1/1 1/2 1/3
sh vrID 100
```

To unbind interfaces from a VMAC by using the NetScaler command line

At the NetScaler command prompt, type:

- unbind vrid <id> **-ifnum** <interface_name>
- sh vrID

Parameters for configuring a VMAC

VrID

The VRID that identifies the VMAC. Possible values: 1 to 255.

ifnum

The interface number (slot/port notation) to be bound to the VMAC.

To configure a VMAC by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **VMAC**.
2. In the details pane, on the **VMAC** tab, do one of the following:
   - To create a new VMAC, click **Add**.
   - To modify an existing VMAC, click **Open**.
3. In the **Create VMAC** or **Configure VMAC** dialog box, specify values for the following parameter, which correspond to parameter described in “Parameters for configuring a VMAC” as shown:
   - **Virtual Router ID***—VrID
4. Under **Associate Interfaces**, do one of the following:
   - To bind interfaces to the VMAC, select the desired interfaces from the **Available Interfaces** table, and click **Add**.
   - To unbind interfaces from the VMAC, select the desired interfaces from the **Configured Interfaces** table, and click **Remove**.
5. Click **OK**. A message appears in the status bar, stating that the VMAC has been configured successfully.

Removing an IPv4 VMAC

To remove an IPv4 virtual MAC, you delete its virtual router ID.

To remove an IPv4 VMAC by using the NetScaler command line

At the NetScaler command prompt, type:

rm vrid <id>

Example

rm vrid 100s

To remove an IPv4 VMAC by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **VMAC.**
2. In the details pane, on the **VMAC** tab, select the virtual router ID that you want to remove, and then click **Remove**. A message appears in the status bar, stating that the VMAC has been successfully removed.

Configuring IPv6 VMAC6s

The NetScaler supports VMAC6 for IPv6 packets. You can bind any interface to a VMAC6, even if an IPv4 VMAC is bound to the interface. Any IPv6 packet sent from the interface uses the VMAC6 bound to that interface. If there is no VMAC6 bound to an interface, an IPv6 packet uses the physical MAC.

Creating or Modifying a VMAC6

You create an IPv6 virtual MAC by assigning it an IPv6 virtual router ID. You can then you bind the VMAC to an interface. You cannot bind multiple IPv6 VRIDs to an interface. To verify the VMAC6 configuration, you should display and examine the VMAC6s and the interfaces bound to the VMAC6s.

To add a VMAC6 by using the NetScaler command line

At the NetScaler command prompt, type:

- add vrID6 <id>
- bind vrID6 <id> **-ifnum** <interface_name>
- sh vrID6

Example

```
add vrID6 100
bind vrID6 100 -ifnum 1/1 1/2 1/3
sh vrID6 100
```

To unbind interfaces from a VMAC6 by using the NetScaler command line

At the NetScaler command prompt, type:

- unbind vrID6 <id> **-ifnum** <interface_name>
- sh vrID6

Parameters for configuring a VMAC6

vrID6

The VRID that identifies the VMAC6. Possible values: 1 to 255.

ifnum

The interface number (slot/port notation) to be bound to the VMAC6.

To configure a VMAC6 by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **VMAC**.
2. In the details pane, on the **VMAC6** tab, do one of the following:
   - To create a new VMAC6, click **Add**.
   - To modify an existing VMAC6, click **Open**.
3. In the **Create VMAC6** or **Configure VMAC6** dialog box, specify values for the following parameter, which correspond to parameter described in “Parameters for configuring a VMAC6” as shown:
   - **Virtual Router ID6***—vrID6
4. Under **Associate Interfaces**, do one of the following:
   - To bind interfaces to the VMAC6, select the desired interfaces from the **Available Interfaces** table, and click **Add**.
   - To unbind interfaces from the VMAC6, select the desired interfaces from the **Configured Interfaces** table, and click **Remove**.
5. Click **OK**. A message appears in the status bar, stating that the VMAC6 has been configured successfully.

Removing a VMAC6

To remove an IPv4 virtual MAC, you delete its virtual router ID.

To remove a VMAC6 by using the NetScaler command line

At the NetScaler command prompt, type:

rm vrid6 <id>

Example

rm vrid6 100s

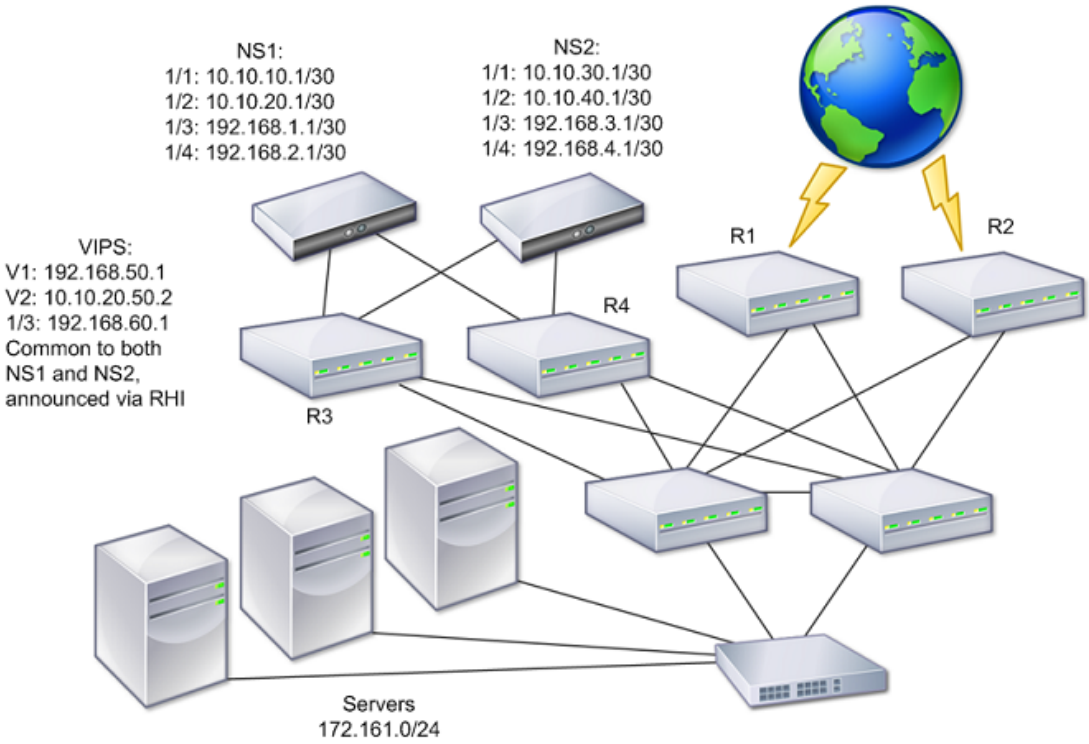
To remove a VMAC6 by using the configuration utility

1. In the navigation pane, expand **Network**, and then click **VMAC.**
2. In the details pane, on the **VMAC6** tab, select the virtual router ID that you want to remove, and then click **Remove**. A message appears in the status bar, stating that the VMAC6 has been successfully removed.

Configuring High Availability Nodes in Different Subnets

The following figure shows an HA deployment with the two systems located in different subnets:

Figure 1. High Availability over a Routed Network



In the figure, the systems NS1 and NS2 are connected to two separate routers, R3 and R4, on two different subnets. The NetScaler appliances exchange heartbeat packets through the routers. This configuration could be expanded to accommodate deployments involving any number of interfaces.

Note: If you use static routing on your network, you must add static routes between all the systems to ensure that heartbeat packets are sent and received successfully. (If you use dynamic routing on your systems, static routes are unnecessary.)

If the nodes in an HA pair reside on two separate networks, the primary and secondary node must have independent network configurations. This means that nodes on different networks cannot share entities such as MIPs, SNIPs, VLANs, and routes. This type of configuration, where the nodes in an HA pair have different configurable parameters, is known as Independent Network Configuration (INC) or Symmetric Network Configuration (SNC).

The following table summarizes the configurable entities and options for an INC, and shows how they must be set on each node.

Table 1. Behavior of NetScaler Entities and Options in an Independent Network Configuration

NetScaler entities	Options
IPs (NSIP/MIP/SNIPs)	Node-specific. Active only on that node.
VIPs	Floating.
VLANs	Node-specific. Active only on that node.
Routes	Node-specific. Active only on that node. Link load balancing routes are floating.
ACLs	Floating (Common). Active on both nodes.
Dynamic routing	Node-specific. Active only on that node. The secondary node should also run the routing protocols and peer with upstream routers.
L2 mode	Floating (Common). Active on both nodes.
L3 mode	Floating (Common). Active on both nodes.
Reverse NAT (RNAT)	Node-specific. RNAT with VIP, because NATIP is floating.

As in configuring HA nodes in the same subnet, to configure HA nodes in different subnets, you log on to each of the two NetScaler appliances and add a remote node representing the other appliance.

Adding a Remote Node

When two nodes of an HA pair reside on different subnets, each node must have a different network configuration. Therefore, to configure two independent systems to function as an HA pair, you must specify INC mode during the configuration process.

When you add an HA node, you must disable the HA monitor for each interface that is not connected or not being used for traffic. For CLI users, this is a separate procedure.

To add a node by using the NetScaler command line

At the NetScaler command prompt, type:

- add ha node <id> <IPAddress> **-inc** ENABLED
- sh ha node

Example

```
add ha node 3 10.102.29.170 -inc ENABLED
add ha node 3 1000:0000:0000:0000:0005:0600:700a:888b
sh ha node
```

To disable an HA monitor by using the NetScaler command line

At the NetScaler command prompt, type:

- set interface <ifNum> [**-haMonitor** (**ON** | **OFF**)]
- show interface <ifNum>

Example

```
> set interface 1/3 -haMonitor OFF
 Done
> show interface 1/3
        Interface 1/3 (Fast Ethernet 10/100 MBits) #5
        flags=0x4000 (ENABLED, DOWN, down, autoneg, 802.1q)
```

```
        MTU=1514, native vlan=5, MAC=00:d0:68:0b:58:dc, downtime 332h55m50s
        Requested: media AUTO, speed AUTO, duplex AUTO, fctl ON,
              throughput 0

        RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
        TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
        NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0) Muted(0)
        Bandwidth thresholds are not set.
Done
```

Parameters for adding a remote node

node id

Unique number that identifies the node to be added. Possible values: 1 to 64.

IPAddress

IPv4 or IPv6 address of the node to be added.

inc

Option to be enabled when the nodes that you want to configure for high availability are in different subnets.

id

Interface number, in slot/port notation.

haMonitor

Monitor the specified interface for failing events. Possible values: ON, OFF. Default: ON.

To add a remote node by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, select the **Nodes** tab, and then click **Add**.
3. In the **High Availability Setup** dialog box, in the **Remote Node IP Address** text box, type the NSIP address of the NetScaler that is to be added as the remote node. If the NSIP is an IPv6 address, select the **IPv6** check box before entering the address.
4. If you want to add the local node to the remote node automatically, select the **Configure remote system to participate in High Availability setup** check box. If you do not select this option, you will have to log in to the appliance represented by the remote node and add the node that you are currently configuring.
5. Make sure that the **Turn off HA monitor on interfaces/channels that are down** check box is selected.
6. Select the **Turn on INC (Independent Network Configuration) mode on self mode** check box.
7. Click **OK**. The **Nodes** page displays both of the nodes in your HA configuration (the local node and the remote node).

Removing a Node

If you remove a node, the nodes are no longer in high availability configuration.

To remove a node by using the NetScaler command line

At the NetScaler command prompt, type:

rm ha node <id>

Example

```
> rm ha node 2
  Done
```

To remove a node by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. On the **High Availability** page, select the **Nodes** tab.
3. On the **Nodes** page, select the node that you want to remove, and click **Remove**.
4. On the **Remove** dialog box, click **Yes.**

Note: You can use the Network Visualizer to view the NetScaler appliances that are configured as a high availability (HA) pair and perform high availability configuration tasks. For more information, see Using the Network Visualizer.

Configuring Route Monitors

You can use route monitors to make the HA state dependent on the internal routing table, whether or not the table contains any dynamically learned or static routes. In an HA configuration, a route monitor on each node watches the internal routing table to make sure that a route entry for reaching a particular network is always present. If the route entry is not present, the state of the route monitor changes to DOWN.

When a NetScaler appliance has only static routes for reaching a network, and you want to create a route monitor for the network, you must enable monitored static routes (MSR) for the static routes. MSR removes unreachable static routes from the internal routing table. If MSR is disabled on static routes, an unreachable static route can remain in the internal routing table, defeating the purpose of having the route monitor.

Route Monitors are supported both in non-INC and INC mode.

Note: Route Monitors in non-INC HA is supported only on NetScaler 9.3.e.

Route Monitors in HA in non-INC mode	Route Monitors in HA in INC mode
Route monitors are propagated by nodes and exchanged during synchronization.	Route monitors are neither propagated by nodes nor exchanged during synchronization.
Route monitors are active only in the current primary node.	Route monitors are active on both the primary and the secondary node.
The NetScaler appliance always displays the state of a route monitor as UP irrespective of the whether the route entry is present or not in the internal routing table.	The NetScaler appliance displays the state of the route monitor as DOWN if the corresponding route entry is not present in the internal routing table.

A route monitor starts monitoring its route after 180 seconds in the following cases [This is done to allow dynamic routes to get learnt, which may take 180 secs]: • reboot • failover • set route6 command for v6 routes • set route msr enable/disable command for v4 routes. • adding a new route monitor	-

Route monitors are useful in a non-INC mode HA configuration where you want the non-reachability of a gateway from a primary node to be one of the conditions for HA failover.

Consider an example of a non-Inc mode HA setup in a two-arm topology that has NetScaler appliances NS1 and NS2 in the same subnet, with router R1 and switches SW1, SW2, and SW3.

Because R1 is the only router in this setup, you want the HA setup to failover whenever R1 is not reachable from the current primary node. You can configure a route monitor (say, RM1 and RM2, respectively) on each of the nodes to monitor the reachability of R1 from that node.

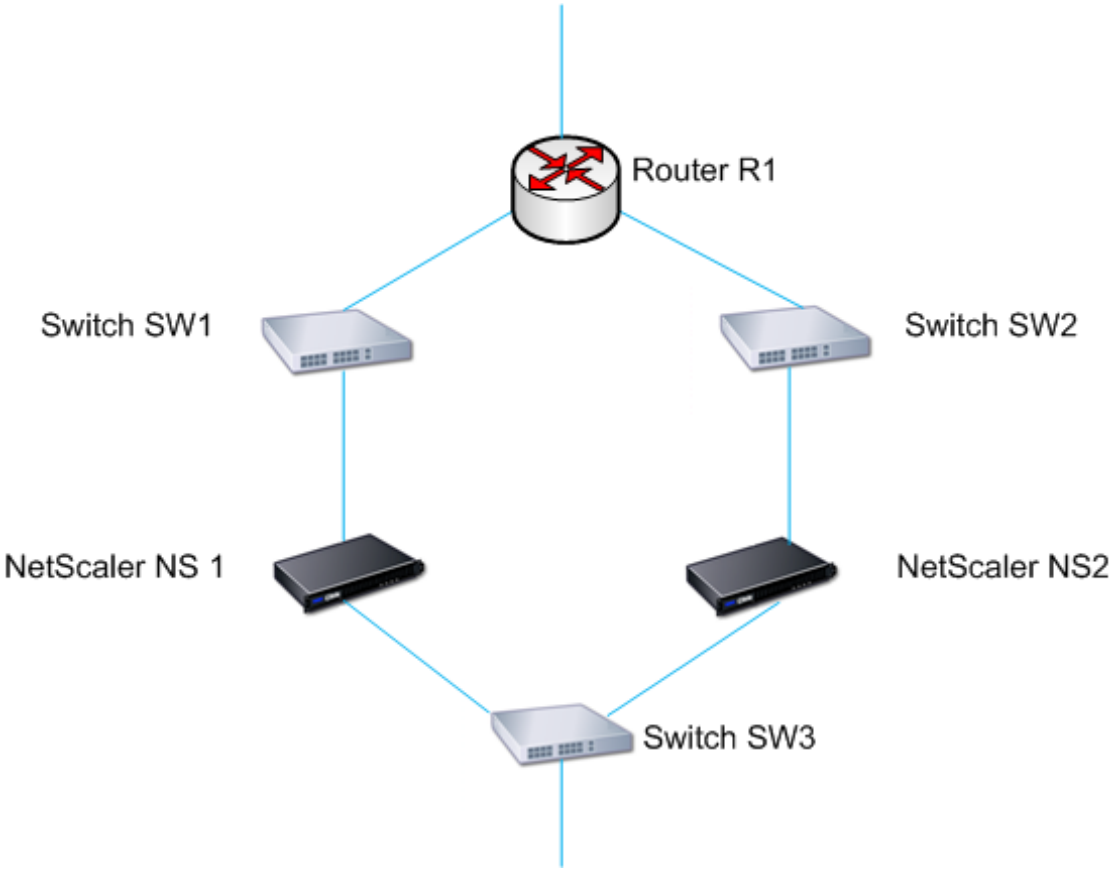


Figure 1.

With NS1 as the current primary node, the execution flow is as follows:

1. Route monitor RM1 on NS1 monitors NS1's internal routing table for the presence of a route entry for router R1. NS1 and NS2 exchange heartbeat messages through switch SW1 or SW3 at regular intervals.

2. If switch SW1 goes down, the routing protocol on NS1 detects that R1 is not reachable and therefore removes the route entry for R1 from the internal routing table. NS1 and NS2 exchanges heartbeat messages through switch SW3 at regular intervals.

3. Detecting that the route entry for R1 is not present in the internal routing table, RM1 initiates a failover. If route to R1 is down from both NS1 and NS2, failover happens every 180 seconds till one of the appliances is able to reach R1 and restore the connectivity.

Adding a Route Monitor to a High Availability Node

A single procedure creates a route monitor and binds it to an HA node.

To add a route monitor by using the NetScaler command line

At the NetScaler command prompt, type:

- bind HA node <id> (**-routeMonitor** <ip_addr|ipv6_addr> [<netmask>])
- sh HA node

Example

bind HA node 3 -routeMonitor 10.102.71.0 255.255.255.0
bind HA node 3 -routeMonitor 1000:0000:0000:0000:0005:0600:700a:888b

Parameters for adding a route monitor

id

The ID of the node to which the monitor is to be bound.

routeMonitor

IPv4 or IPv6 address of the route to be monitored.

netmask

Subnet mask for the IPv4 address.

To add a route monitor by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Route Monitors** tab, click **Configure.**
3. In **Bind / Unbind Route Monitor(s)** dialog box, in the **Network** text box, do one of the following:
   - For a IPv4 network, type an IPv4 network address (for example, 10.102.29.30) and in the **Netmask** text box, type a subnet mask (for example, 255.255.255.0).
   - For a IPv6 network, select the **IPv6** check box and type a IPv6 network address (for example, 1000:0000:0000:0000:0005:0600:700a:888b).
4. Click **Add**. The Route Monitor is added and appears in the **Configured Route Monitors** table.
5. Click **OK.**

Removing Route Monitors

To remove a route monitor by using the NetScaler command line

At the NetScaler command prompt, type:

- unbind HA node <id> (**-routeMonitor** <ip_addr|ipv6_addr> [<netmask>])
- sh HA node

Example

unbind HA node 3 -routeMonitor 10.102.71.0 255.255.255.0
unbind HA node 3 -routeMonitor 1000:0000:0000:0000:0005:0600:700a:888b

To remove a route monitor by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Route Monitors** tab, click **Configure.**
3. In the **Bind / Unbind Route Monitor(s)** dialog box, under **Configured Route Monitors**, select a route monitor to remove and click **Remove.**
4. Click **OK.**

Configuring FIS

Link redundancy is a way to prevent failover by grouping interfaces so that, when one interface fails, other functioning interfaces are still available. The link redundancy feature allows you to group the two interfaces into a failover interface set (FIS), which prevents the failure of a single link from causing failover to the secondary system unless all of the interfaces on the primary system are nonfunctional.

Each interface in an FIS maintains independent bridge entries. HA MON interfaces that are not bound to an FIS are known as critical interfaces (CI) because if any of them fails, failover is triggered.

Creating or Modifying an FIS

To add an FIS and bind interfaces to it by by using the NetScaler command line

At the NetScaler command prompt, type:

- add fis <name>
- bind fis <name> <ifnum> ...
- sh fis <name>

Example

```
> add fis fis1
 Done
> bind fis fis1 1/3 1/5
 Done
> show fis fis1
1)      FIS: fis1
       Member Interfaces : 1/3 1/5
 Done
```

An unbound interface becomes a critical interface (CI) if it is enabled and HA MON is on.

To unbind an interface from an FIS by using the NetScaler command line

At the NetScaler command prompt, type:

- unbind fis <name> <ifnum> ...
- sh fis <name>

Example

```
> unbind fis fis1 1/3
 Done
> show FIS fis1
```

```
1)      FIS: fis1
        Member Interfaces : 1/5
 Done
```

Parameters for configuring an FIS

name

Name of the FIS to which interfaces are to be bound.

ifnum

Interface number (slot/port notation) to be bound to the FIS.

To configure an FIS by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Failover Interface Set** tab, do one of the following:
   - To create a new FIS, click **Add.**
   - To modify an existing FIS, click **Open.**
3. In the **Create FIS** or **Configure FIS** dialog box, in the **Name** text box, type the name of the FIS.
4. Select an available interface and click **Add** to bind it to the FIS. Repeat to bind additional interfaces.
5. Click **OK**. A message appears in the status bar, stating that the FIS has been configured successfully.

Removing an FIS

When the FIS is removed, its interfaces are marked as critical interfaces.

To remove an FIS by using the NetScaler command line

At the NetScaler command prompt, type:

rm fis <name>

Example

```
> rm fis fis1
  Done
```

To remove an FIS by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Failover Interface Set** tab, select the FIS that you want to remove and click **Remove**.
3. In the **Remove** dialog box, click **Yes.**

Forcing a Node to Fail Over

You might want to force a failover if, for example, you need to replace or upgrade the primary node. You can force failover from either the primary or the secondary node. A forced failover is not propagated or synchronized. To view the synchronization status after a forced failover, you can view the status of the node.

A forced failover fails in any of the following circumstances:

- You force failover on a standalone system.
- The secondary node is disabled.
- The secondary node is configured to remain secondary.

The NetScaler appliance displays a warning message if it detects a potential issue when you run the force failover command. The message includes the information that triggered the warning, and requests confirmation before proceeding.

Forcing Failover on the Primary Node

If you force failover on the primary node, the primary becomes the secondary and the secondary becomes the primary. Forced failover is possible only when the primary node can determine that the secondary node is UP.

If the secondary node is DOWN, the force failover command returns the following error message: "Operation not possible due to invalid peer state. Rectify and retry."

If the secondary system is in the claiming state or inactive, it returns the following error message: "Operation not possible now. Please wait for system to stabilize before retrying."

To force failover on the primary node by using the NetScaler command line

At the NetScaler command prompt, type:

force HA failover

To force failover on the primary node by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Nodes** tab, click **Force Failover.**
3. In the **Warning** dialog box, click **Yes.**

Forcing Failover on the Secondary Node

If you run the force failover command from the secondary node, the secondary node becomes primary and the primary node becomes secondary. A force failover can occur only if the secondary node's health is good and it is not configured to stay secondary.

If the secondary node cannot become the primary node, or if secondary node was configured to stay secondary (using the STAYSECONDARY option), the node displays the following error message: "Operation not possible as my state is invalid. View the node for more information."

To force failover on the secondary node by using the NetScaler command line

At the NetScaler command prompt, type:

force HA failover

To force failover on the secondary node by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Nodes** tab, click **Force Failover.**
3. In the **Warning** dialog box, click **Yes.**

Forcing Failover When Nodes Are in Listen Mode

When the two nodes of an HA pair are running different versions of the system software, the node running the higher version switches to the listen mode. In this mode, neither command propagation nor synchronization works.

Before upgrading the system software on both nodes, you should test the new version on one of the nodes. To do this, you need to force a failover on the system that has already been upgraded. The upgraded system then takes over as the primary node, but neither command propagation or synchronization occurs. Also, all connections need to be re-established.

To force failover when nodes are in listen mode by using the NetScaler command line

At the NetScaler command prompt, type:

force HA failover

To force failover when nodes are in listen mode by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Nodes** tab, click **Force Failover.**
3. In the **Warning** dialog box, click **Yes.**

Forcing the Secondary Node to Stay Secondary

In an HA setup, the secondary node can be forced to stay secondary regardless of the state of the primary node.

For example, suppose the primary node needs to be upgraded and the process will take a few seconds. During the upgrade, the primary node may go down for a few seconds, but you do not want the secondary node to take over; you want it to remain the secondary node even if it detects a failure in the primary node.

When you force the secondary node to stay secondary, it will remain secondary even if the primary node goes down. Also, when you force the status of a node in an HA pair to stay secondary, it does not participate in HA state machine transitions. The status of the node is displayed as STAYSECONDARY.

Forcing the node to stay secondary works on both standalone and secondary nodes. On a standalone node, you must use this option before you can add a node to create an HA pair. When you add the new node, the existing node continues to function as the primary node, and the new node becomes the secondary node.

Note: When you force a system to remain secondary, the forcing process is not propagated or synchronized. It affects only the node on which you run the command.

To force the secondary node to stay secondary by using the NetScaler command line

At the NetScaler command prompt, type:

set node -**hastatus** STAYSECONDARY

To force the secondary node to stay secondary by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Nodes** tab, select the local node, and then click **Open.**
3. In the **Configure Node** dialog box, under **High Availability Status**, select **STAY SECONDARY**.
4. Click **OK.**

Forcing the Primary Node to Stay Primary

In an HA setup, you can force the primary node to remain primary even after a failover. You can enable this option either on a primary node in an HA pair or on a standalone system.

On a standalone system, you must run this command before you can add a node to create an HA pair. When you add the new node, it becomes the primary node. The existing node stops processing traffic and becomes the secondary node in the HA pair.

To force the primary node to stay primary by using the NetScaler command line

At the NetScaler command prompt, type:

set node -**hastatus** STAYPRIMARY

To force the primary node to stay primary by using the configuration utility

1. In the navigation pane, expand **System**, and then click **High Availability**.
2. In the details pane, on the **Nodes** tab, select the local node, and then click **Open.**
3. In the **Configure Node** dialog box, under **High Availability Status**, select **STAY PRIMARY**.
4. Click **OK.**

Understanding the High Availability Health Check Computation

The following table summarizes the factors examined in a health check computation:

- State of the CIs
- State of the FISs
- State of the route monitors

The following table summarizes the health check computation.

Table 1. High Availability Health Check Computation

FIS	CI	Route monitor	Condition
N	Y	N	If the system has any CIs, all of those CIs must be UP.
Y	Y	N	If the system has any FISs, all of those FISs must be UP.
Y	Y	Y	If the system has any route monitors configured, all monitored routes must be present in the FIS.

Troubleshooting High Availability Issues

Certain conditions can cause improper synchronization between nodes or incorrect configuration on the secondary node.

- **Improper synchronization of VLAN configuration in high availability systems**. In HA pairs, synchronization does not work properly if only one node has a VLAN configured. To prevent this problem, configure your VLANs after you configure your appliances as an HA pair, and be sure to configure them both.

- **Retrieving a lost configuration**. If the primary node is unable to send the configuration to the secondary node due to a network error, the secondary node may not have an accurate configuration and may not behave correctly if a failover occurs. If this happens, you can retrieve the current configuration from the configuration backup on the hard disk of the primary appliance. The operating system saves the last four copies of the ns.conf file in the /nsconfig directory as ns.conf.0, ns.conf.1, ns.conf.2, and ns.conf.3. The ns.conf.0 file contains the current configuration.

To retrieve the current system configuration

1. Exit the CLI to FreeBSD by typing the following command and pressing the Enter key:

   > shell

   The FreeBSD shell prompt appears, as shown below.

   #

2. Copy the latest backup file to /nsconfig/ns.conf by using the following command:

   # cp ‘ls -t /nsconfig/ns.conf.? | head -1` /nsconfig/ns.conf

If you perform a configuration using the NSConfig utility, it is not propagated. If you create a configuration using NSconfig, you must repeat the configuration steps separately for each node in an HA pair.

AAA Application Traffic

Many companies restrict web site access to valid users only, and control the level of access permitted to each user. The AAA feature allows a site administrator to manage access controls with the NetScaler appliance instead of managing these controls separately for each application. Doing authentication on the appliance also permits sharing this information across all web sites within the same domain that are protected by the appliance.

The AAA feature supports authentication, authorization, and auditing for all application traffic. To use AAA, you must configure authentication virtual servers to handle the authentication process and traffic management virtual servers to handle the traffic to web applications that require authentication. You also configure your DNS to assign FQDNs to each virtual server. After configuring the virtual servers, you configure a user account for each user that will authenticate via the NetScaler appliance, and optionally you create groups and assign user accounts to groups. After creating user accounts and groups, you configure policies that tell the appliance how to authenticate users, which resources to allow users to access, and how to log user sessions. To put the policies into effect, you bind each policy globally, to a specific virtual server, or to the appropriate user accounts or groups. After configuring your policies, you customize user sessions by configuring session settings and binding your session policies to the traffic management virtual server. Finally, if your intranet uses client certs, you set up the client certificate configuration.

Before configuring AAA, you should be familiar with and understand how to configure load balancing, content switching, and SSL on the NetScaler appliance. For more information about load balancing, content switching, and SSL, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

How AAA Works

AAA provides security for a distributed Internet environment by allowing any client with the proper credentials to connect securely to protected application servers from anywhere on the Internet. This feature incorporates the three security features of authentication, authorization, and auditing. Authentication enables the NetScaler appliance to verify the client's credentials, either locally or with a third-party authentication server, and allow only approved users to access protected servers. Authorization enables the appliance to verify which content on a protected server it should allow each user to access. Auditing enables the appliance to keep a record of each user's activity on a protected server.

To understand how AAA works in a distributed environment, consider an organization with an intranet that its employees access in the office, at home, and when traveling. The content on the intranet is confidential and requires secure access. Any user who wants to access the intranet must have a valid user name and password. To meet these requirements, the NetScaler appliance does the following:

- Redirects the user to the login page if the user accesses the intranet without having logged in.
- Collects the user's credentials, delivers them to the authentication server, and caches them in a directory that is accessible through LDAP.
- Verifies that the user is authorized to access specific intranet content before delivering the user's request to the application server.
- Maintains a session timeout after which users must authenticate again to regain access to the intranet. (You can configure the timeout.)
- Logs the user accesses, including invalid login attempts, in an audit log.

Authentication requires that several entities—the client, the NetScaler appliance, the external authentication server if one is used, and the application server—respond to each other when prompted by performing a complex series of tasks in the correct order. If you are using an external authentication server, this process can be broken down into the following fifteen steps.

- The client sends a GET request for a URL on the application server.
- The NetScaler appliance's traffic management virtual server redirects the request to the application server.
- The application server determines that the client has not been authenticated, and therefore sends an HTTP 200 OK response via the TM vserver to the client. The response contains a hidden script that causes the client to issue a POST request for /cgi/tm.
- The client sends a POST request for /cgi/tm.
- The NetScaler appliance's authentication virtual server redirects the request to the authentication server.

- The authentication server creates an authentication session, sets and caches a cookie that consists of the initial URL and the domain of the traffic management virtual server, and then sends an HTTP 302 response via the authentication virtual server, redirecting the client to /vpn/index.html.
- The client sends a GET request for /vpn/index.html.
- The authentication virtual server redirects the client to the authentication server login page.
- The client sends a GET request for the login page, enters credentials, and then sends a POST request with the credentials back to the login page.
- The authentication virtual server redirects the POST request to the authentication server.
- If the credentials are correct, the authentication server tells the authentication virtual server to log the client in and redirect the client to the URL that was in the initial GET request.
- The authentication virtual server logs the client in and sends an HTTP 302 response that redirects the client to the initially requested URL.
- The client sends a GET request for their initial URL.
- The traffic management virtual server redirects the GET request to the application server.
- The application server responds via the traffic management virtual server with the initial URL.

If you use local authentication, the process is similar, but the authentication virtual server handles all authentication tasks instead of forwarding connections to an external authentication server. The following figure illustrates the authentication process.

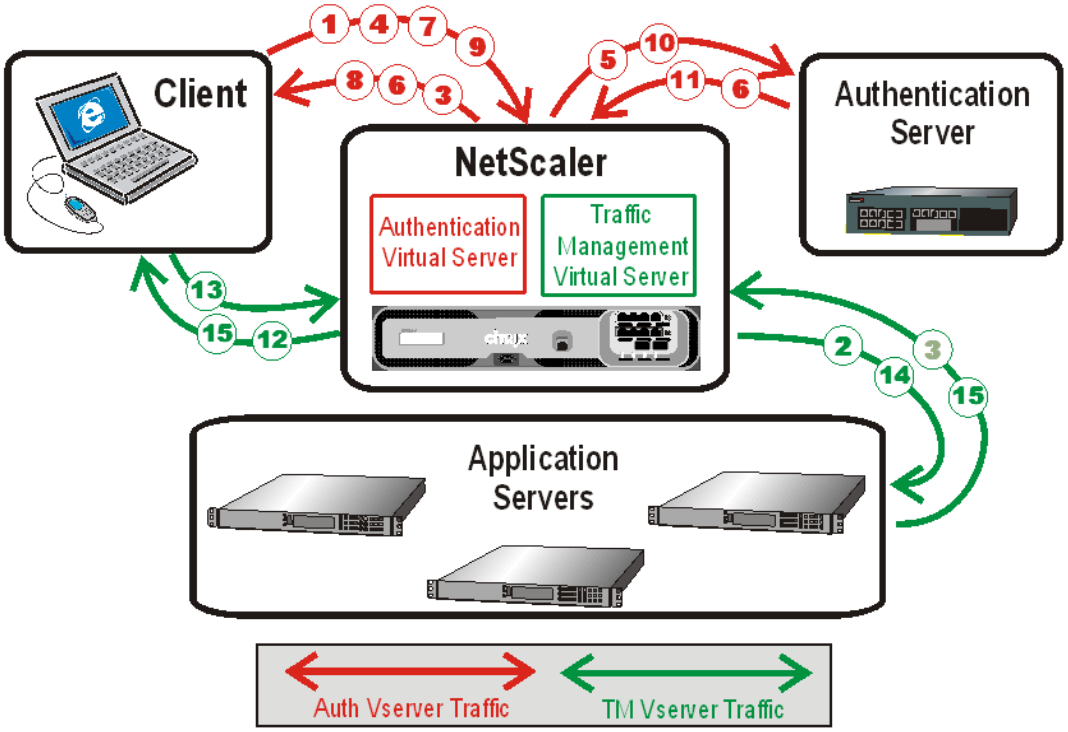

Figure 1. Authentication Process Traffic Flow

When an authenticated client requests a resource, the NetScaler appliance, before sending the request to the application server, checks the user and group policies associated with the client account, to verify that the client is authorized to access that resource. The appliance handles all authorization on protected application servers. You do not need to do any special configuration of your protected application servers.

The NetScaler appliance supports auditing of all states and status information, so you can see the details of what each user did while logged on, in chronological order. To provide this information, the appliance logs each event, as it occurs, either to a designated audit log file on the appliance or to a syslog server. Auditing requires configuring the appliance and any syslog server that you use.

How AAA Works

AAA provides security for a distributed Internet environment by allowing any client with the proper credentials to connect securely to protected application servers from anywhere on the Internet. This feature incorporates the three security features of authentication, authorization, and auditing. Authentication enables the NetScaler appliance to verify the client's credentials, either locally or with a third-party authentication server, and allow only approved users to access protected servers. Authorization enables the appliance to verify which content on a protected server it should allow each user to access. Auditing enables the appliance to keep a record of each user's activity on a protected server.

To understand how AAA works in a distributed environment, consider an organization with an intranet that its employees access in the office, at home, and when traveling. The content on the intranet is confidential and requires secure access. Any user who wants to access the intranet must have a valid user name and password. To meet these requirements, the NetScaler appliance does the following:

- Redirects the user to the login page if the user accesses the intranet without having logged in.
- Collects the user's credentials, delivers them to the authentication server, and caches them in a directory that is accessible through LDAP.
- Verifies that the user is authorized to access specific intranet content before delivering the user's request to the application server.
- Maintains a session timeout after which users must authenticate again to regain access to the intranet. (You can configure the timeout.)
- Logs the user accesses, including invalid login attempts, in an audit log.

Authentication requires that several entities—the client, the NetScaler appliance, the external authentication server if one is used, and the application server—respond to each other when prompted by performing a complex series of tasks in the correct order. If you are using an external authentication server, this process can be broken down into the following fifteen steps.

- The client sends a GET request for a URL on the application server.
- The NetScaler appliance's traffic management virtual server redirects the request to the application server.
- The application server determines that the client has not been authenticated, and therefore sends an HTTP 200 OK response via the TM vserver to the client. The response contains a hidden script that causes the client to issue a POST request for /cgi/tm.
- The client sends a POST request for /cgi/tm.
- The NetScaler appliance's authentication virtual server redirects the request to the authentication server.

- The authentication server creates an authentication session, sets and caches a cookie that consists of the initial URL and the domain of the traffic management virtual server, and then sends an HTTP 302 response via the authentication virtual server, redirecting the client to /vpn/index.html.
- The client sends a GET request for /vpn/index.html.
- The authentication virtual server redirects the client to the authentication server login page.
- The client sends a GET request for the login page, enters credentials, and then sends a POST request with the credentials back to the login page.
- The authentication virtual server redirects the POST request to the authentication server.
- If the credentials are correct, the authentication server tells the authentication virtual server to log the client in and redirect the client to the URL that was in the initial GET request.
- The authentication virtual server logs the client in and sends an HTTP 302 response that redirects the client to the initially requested URL.
- The client sends a GET request for their initial URL.
- The traffic management virtual server redirects the GET request to the application server.
- The application server responds via the traffic management virtual server with the initial URL.

If you use local authentication, the process is similar, but the authentication virtual server handles all authentication tasks instead of forwarding connections to an external authentication server. The following figure illustrates the authentication process.

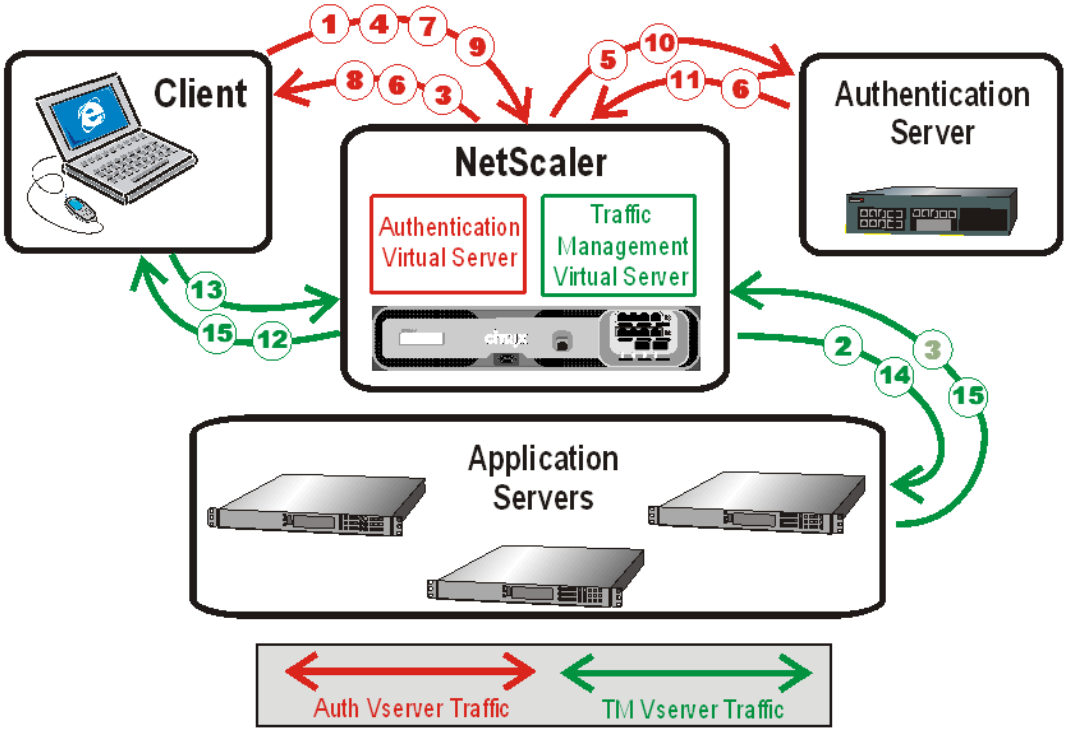

Figure 1. Authentication Process Traffic Flow

When an authenticated client requests a resource, the NetScaler appliance, before sending the request to the application server, checks the user and group policies associated with the client account, to verify that the client is authorized to access that resource. The appliance handles all authorization on protected application servers. You do not need to do any special configuration of your protected application servers.

The NetScaler appliance supports auditing of all states and status information, so you can see the details of what each user did while logged on, in chronological order. To provide this information, the appliance logs each event, as it occurs, either to a designated audit log file on the appliance or to a syslog server. Auditing requires configuring the appliance and any syslog server that you use.

Enabling AAA

To use the AAA feature, you must enable it. You can configure AAA entities—such as the authentication and traffic management virtual servers—before you enable the AAA feature, but the entities will not function until the feature is enabled.

To enable AAA by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable AAA and verify the configuration:

- enable feature AAA
- show ns feature

Example

```
> enable feature AAA
 Done

> show ns feature

      Feature                 Acronym           Status
      -------                 -------           ------
 1)   Web Logging               WL                OFF
 2)   Surge Protection          SP                ON
 .
 .
 .
 15)  AAA                     AAA               ON
 .
 .
 .
 23)  HTML Injection          HTMLInjection     ON
 24)  NetScaler Push          push              OFF
Done
```

To enable AAA by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Change basic features**.
3. In the **Configure Basic Features** dialog box, select the **Authentication, Authorization and Auditing** check box.
4. Click **OK**.
5. In the **Enable/Disable Feature(s)?** message box, click **Yes**. A message appears in the status bar, stating that the feature has been enabled.

Setting up AAA Virtual Servers and DNS

You can configure AAA by using the built-in wizard, or manually. To use the wizard, in the main AAA pane of the configuration utility, you click **AAA - Application Traffic wizard** and follow the prompts.

To configure AAA manually, you first configure an authentication virtual server, which involves binding an SSL certificate-key pair. You then associate the authentication virtual server with a new or existing traffic management virtual server. (Either a load balancing virtual server or a content switching virtual server can serve as a traffic management virtual server.) To complete the initial configuration, you configure DNS to assign hostnames to both the authentication virtual server and the traffic management virtual server, and verify that your virtual servers are UP and configured correctly.

Caution: Both virtual servers must have hostnames in the same domain, or the AAA configuration will not work.

Configuring the Authentication Virtual Server

To configure AAA, you first configure an authentication virtual server to handle authentication traffic. You must bind an SSL certificate-key pair to the virtual server to enable it to handle SSL connections. For additional information about configuring SSL and creating a certificate-key pair, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To configure an authentication virtual server by using the NetScaler command line

At a NetScaler command prompt, to configure an authentication virtual server and verify the configuration, type the following commands in the order shown:

- add authentication vserver <name> ssl <ipaddress>
- show authentication vserver <name>
- bind ssl certkey <sslkeyname> <name>
- show authentication vserver <name>
- set authentication vserver <name> **-authenticationDomain** <FQDN>
- show authentication vserver <name>

Example

```
> add authentication vserver Auth-Vserver-2 SSL 10.102.29.77 443
 Done
> show authentication vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
      State: DOWN[Certkey not bound]
      Client Idle Timeout: 180 sec
      Down state flush: DISABLED
      Disable Primary Vserver On Down : DISABLED
      Authentication : ON
      Current AAA Users: 0
 Done
> bind ssl certkey Auth-Vserver-2 Auth-Cert-1
 Done
> show authentication vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
      State: UP
```

```
        Client Idle Timeout: 180 sec
        Down state flush: DISABLED
        Disable Primary Vserver On Down : DISABLED
        Authentication : ON
        Current AAA Users: 0
        Authentication Domain: myCompany.employee.com
 Done
> set authentication vserver Auth-Vserver-2 -AuthenticationDomain myCompany.employee.com
 Done
> show authentication vserver Auth-Vserver-2
        Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
        State: DOWN[Certkey not bound]
        Client Idle Timeout: 180 sec
        Down state flush: DISABLED
        Disable Primary Vserver On Down : DISABLED
        Authentication : ON
        Current AAA Users: 0
        Authentication Domain: myCompany.employee.com
 Done
```

Parameters for configuring the authentication virtual server

name

A name for your new authentication virtual server, or the name of an existing authentication virtual server. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed after the virtual server is created.)

ipaddress

IP address assigned to the authentication virtual server in DNS.

sslkeyname

Name of the SSL certificate-key pair to associate with the virtual server.

authenticationDomain

The fully qualified domain name to be assigned to the authentication virtual server in your DNS. Must match the domain name in the SSL certificate-key pair.

To configure an authentication virtual server by using the configuration utility

1. In the navigation pane, expand **AAA - Application Traffic** and click **Virtual Servers**.
2. In the details pane, do one of the following:
   - To create a new authentication virtual server, click **Add**.
   - To modify an existing authentication virtual server, select the virtual server, and then click **Open**.
3. In the **Create Virtual Server (Authentication) or Configure Virtual Server (Authentication)** dialog box, specify values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring the authentication virtual server" as follows (asterisk indicates a required parameter):
   - Name*—name (Cannot be changed for a previously created virtual server)
   - IP Address*—ipaddress
   - Domain*—authenticationDomain

   Note: The authentication virtual server uses only the SSL protocol and port 443, so those options are greyed out.
4. On the **Certificates** tab, in the **Available** list, select the SSL certificate you want to associate with this authentication virtual server, and click the **Add** button. If your configuration requires CA certs and you will use this SSL certificate as the CA server certificate, you click the **Add as CA** button instead. The certificate moves from the **Available** to the **Configured** list.
5. Click **Create** or **OK**, and then click **Close**. If you created a new authentication virtual server, it now appears in the **Authentication Virtual Servers** pane.

Configuring a Traffic Management Virtual Server

After you have created and configured your authentication virtual server, you next create or configure a traffic management virtual server and associate your authentication virtual sever with it. You can use either a load balancing or content switching virtual server for a traffic management virtual server. For more information about creating and configuring either type of virtual server, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Note: The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly.

You configure a traffic management virtual server for AAA by enabling authentication and then assigning the FQDN of the authentication server to the traffic management virtual server. You can also configure the authentication domain on the traffic management virtual server at this time. If you do not configure this option, the NetScaler appliance assigns the traffic management virtual server an FQDN that consists of the FQDN of the authentication virtual server without the hostname portion. For example, if domain name of the authentication vserver is `tm.xyz.bar.com`, the appliance assigns `xyz.bar.com`. as the authentication domain.

To configure a TM virtual server for AAA by using the NetScaler command line

At the NetScaler command prompt, type one of the following sets of commands to configure a TM virtual server and verify the configuration:

- set lb vserver <name> **-authentication** ON **-authenticationhost** <FQDN> [**-authenticationdomain** <authdomain>]
- show lb vserver <name>
- set cs vserver <name> **-authentication** ON **-authenticationhost** <FQDN> [**-authenticationdomain** <authdomain>]
- show cs vserver <name>

Example

```
> set lb vserver vs-cont-sw -Authentication ON -AuthenticationHost mywiki.index.com
 Done
```

```
> show lb vserver vs-cont-sw
        vs-cont-sw (0.0.0.0:0) - TCP    Type: ADDRESS
        State: DOWN
        Last state change was at Wed Aug 19 10:03:15 2009 (+410 ms)
        Time since last state change: 5 days, 20:00:40.290
        Effective State: DOWN
        Client Idle Timeout: 9000 sec
        Down state flush: ENABLED
        Disable Primary Vserver On Down : DISABLED
        No. of Bound Services :  0 (Total)       0 (Active)
        Configured Method: LEASTCONNECTION
        Mode: IP
        Persistence: NONE
        Connection Failover: DISABLED
        Authentication: ON      Host: mywiki.index.com
 Done
```

Parameters for configuring a traffic management virtual server

name

The name of the load balancing or content switching virtual server being configured as a traffic management virtual server.

authentication

Toggle authentication of application traffic on the traffic management virtual server. Possible values: ON, OFF. Default: OFF.

authenticationhost

FQDN assigned to the authentication virtual server.

authenticationdomain

The common domain in the FQDNs of both the authentication virtual server and the traffic management virtual server.

To configure a TM virtual server for AAA by using the configuration utility

1. In the navigation pane, do one of the following.
   - Expand **Load Balancing**, and then click **Virtual Servers**.
   - Expand **Content Switching**, and then click **Virtual Servers**.

   The AAA configuration process for either type of virtual server is identical.
2. In the details pane, select the virtual server on which you want to enable authentication, and then click **Open**.
3. In the **Domain** text box, type the authentication domain. See `authenticationdomain`, in "Parameters for configuring a traffic management virtual server," for information about this parameter.
4. On the **Advanced** tab, select the **Authentication** check box.
5. In the **Authentication Host** text box, type the fully qualified domain name of the authentication virtual server. See authenticationhost in the table above for information about this parameter.
6. Click **OK**. A message appears in the status bar, stating that the vserver has been configured successfully.

Configuring DNS

For the domain session cookie used in the authentication process to function correctly, you must configure DNS to assign both the authentication and the traffic management virtual servers to FQDNs in the same domain. For information about how to the configure DNS address records, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Verifying Your Setup for AAA

After you configure authentication and traffic management virtual servers and before you create user accounts, you should verify that both virtual servers are configured correctly and are in the UP state. For information about verifying the setup on your traffic management server, see the appropriate chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

To verify authentication virtual server setup by using the NetScaler command line

At the NetScaler command prompt, type the following command:

show authentication vserver <name>

Example

```
> show authentication vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
      State: UP
      Client Idle Timeout: 180 sec
      Down state flush: DISABLED
      Disable Primary Vserver On Down : DISABLED
      Authentication : ON
      Current AAA Users: 0
      Authentication Domain: myCompany.employee.com
 Done
```

Parameters for Verifying your Setup for AAA

State

Current state of the service or virtual server. Possible values:

UP – The virtual server can respond to requests. Your authentication virtual server should be UP.

OUT OF SERVICE – The virtual server has been manually disabled. New requests received by this virtual server are dropped unless a backup virtual server or HTTP redirection is configured.

DOWN – The virtual server cannot respond to requests. An authentication virtual server is DOWN when a valid SSL certificate-key pair is not bound to it.

Client Idle Timeout

Idle time (in seconds) after which client connections are terminated. Default value for HTTP/SSL-based services: 180.

Down state flush

Perform delayed cleanup of connections on this virtual server. Possible values: ENABLED, DISABLED. Default: ENABLED.

Disable Primary Vserver On Down

Keep the primary virtual server secondary, when it comes back up, until manually forced to take over as primary. If enabled, preserves database updates on the backup, enabling you to synchronize the databases before restoring the primary. Possible values: ENABLED, DISABLED. Default: DISABLED.

Authentication

Authenticate application traffic for the traffic management virtual server. Possible values: ON, OFF. Default: OFF. This value must be ON for AAA to function.

Current AAA Users

Number of AAA users configured. This number should be zero if you have just started to create a AAA configuration.

Authentication Domain

Authentication domain configured for the authentication virtual server.

Beneath this information are listed any policies bound globally or to this authentication virtual server, and their priorities.

To verify your AAA virtual server setup by using the configuration utility

1. In the navigation pane, expand **AAA - Application Traffic**, and then click **Virtual Servers**.
2. Review the information in the **AAA Virtual Servers** pane to verify that your configuration is correct and your authentication virtual server is accepting traffic. You can select a specific virtual server to view detailed information in the details pane.

   Note: For descriptions of what the information signifies, see the list above.

Configuring Users and Groups

After configuring the AAA basic setup, you create users and groups. You first create a user account for each person who will authenticate via the NetScaler appliance. If you are using local authentication controlled by the NetScaler appliance itself, you create local user accounts and assign passwords to each of those accounts.

You also create user accounts on the NetScaler appliance if you are using an external authentication server. In this case, however, each user account must exactly match an account for that user on the external authentication server, and you do not assign passwords to the user accounts that you create on the NetScaler. The external authentication server manages the passwords for users that authenticate with the external authentication server.

If you are using an external authentication server, you can still create local user accounts on the NetScaler appliance if, for example, you want to allow temporary users (such as visitors) to log in but do not want to create entries for those users on the authentication server. You assign a password to each local user account, just as you would if you were using local authentication for all user accounts.

Each user account must be bound to policies for authentication and authorization. To simplify this task, you can create one or more groups and assign user accounts to them. You can then bind policies to groups instead of individual user accounts.

To create a local AAA user account by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create a local AAA user account and verify the configuration:

- add aaa user <username> [-password <password>]
- `show aaa user`

Example

```
> add aaa user user-2 -password emptybag
 Done
> show aaa user
1)      UserName: user-1
2)      UserName: user-2
 Done
```

To change the password for an existing AAA local user account by using the NetScaler command line

At the NetScaler command prompt, type the following command and, when prompted, type the new password:

set aaa user <username>

Example

```
> set aaa user user-2
Enter password:
Done
```

Parameters for Configuring AAA Local Users

username

A name for the user. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for an existing user.)

password

A password that the user uses to log in. This parameter is required for all user accounts if you are not using an external authentication server. If you are using an external authentication server, you provide a password only for local user accounts that do not exist on the authentication server.

To configure AAA local users by using the configuration utility

1. In the navigation pane, expand **AAA - Application Traffic**, and then click **Users**.
2. In the details pane, do one of the following:
   - To create a new user account, click **Add**.
   - To modify an existing user account, select the user account, and then click **Open**.
3. In the **Create AAA User** dialog box, in the **User Name** text box, type a name for the user. For rules for user names, see the list above.
4. If creating a locally authenticated user account, clear the **External Authentication** check box and provide a local password that the user will use to log on.
5. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the user has been configured successfully.

To create AAA local groups and add users to them by using the NetScaler command line

At the NetScaler command prompt, type the following commands. Type the first command one time, and type the second command once for each user:

- add aaa group <groupname>
- show aaa group

  Example

  ```
  > add aaa group group-2
  Done
  > show aaa group
  1)      GroupName: group-1
  2)      GroupName: group-2
  Done
  ```

- bind aaa group <groupname> -username <username>

  Example

  ```
  > bind aaa group group-2 -username user-2
   Done
  > show aaa group group-2
        GroupName: group-2

                UserName: user-2
   Done
  ```

To remove users from an AAA group by using the NetScaler command line

At the NetScaler command prompt, unbind users from the group by typing the following command once for each user account that is bound to the group:

unbind aaa group <groupname> -username <username>

Example

```
> unbind aaa group group-hr -username user-hr-1
 Done
```

To remove an AAA group by using the NetScaler command line

First remove all users from the group. Then, at the NetScaler command prompt, type the following command to remove an AAA group and verify the configuration:

- rm aaa group <groupname>
- show aaa group

Example

```
> rm aaa group group-hr
 Done
> show aaa group
1)      GroupName: group-1
2)      GroupName: group-finance
 Done
```

Parameters for Configuring AAA Local Groups

groupname

A name for the group you are creating. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing groups.)

username

The name of a user account to be added to the new group.

To configure AAA local groups and add users to them by using the configuration utility

1. In the navigation pane, expand **AAA - Application Traffic**, and then click **Groups**.
2. In the details pane, do one of the following:
   - To create a new group, click **Add**.
   - To modify an existing group, select the group, and then click **Open**.
3. If you are creating a new group, in the **Create AAA Group** dialog box, in the **Group Name** text box, type a name for the group. For information about group names, see the list above, under groupname.
4. On the **Users** tab, configure the users assigned to the group.
   a. To add a user to the group, in the **Available Users** list, select the user, and then click **Add**.
   b. To remove a user from the group, in the **Configured Users** list, select the user, and then click **Remove**.
   c. To create a new user account and add it to the group, click **New**, and then follow the instructions in “To configure AAA local users by using the configuration utility.”
5. Click **Create** or **OK**, and then click **Close**. The group that you created appears in the **AAA Groups** page.

Configuring AAA Policies

After you set up your users and groups, you next configure authentication policies, authorization policies, and audit policies to define which users are allowed to access your intranet, which resources each user or group is allowed to access, and what level of detail AAA will preserve in the audit logs. An authentication policy defines the type of authentication to apply when a user attempts to log on. If external authentication is used, the policy also specifies the external authentication server. Authorization policies specify the network resources that users and groups can access after they log on. Auditing policies define the audit log type and location.

You must bind each policy to put it into effect. You bind authentication policies to authentication virtual servers, authorization policies to one or more user accounts or groups, and auditing policies both globally and to one or more user accounts or groups.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the NetScaler operating system, policy priorities work in reverse order: the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The AAA feature implements only the first of each type of policy that a request matches, not any additional policies of that type that a request might also match, so policy priority is important for getting the results you intend.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you bind the policies. You can then add additional policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the NetScaler, see the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX128670.

Authentication Policies

The NetScaler appliance can authenticate users with local user accounts or by using an external authentication server. The appliance supports the following authentication types:

LOCAL

Authenticates to the NetScaler by using a password, without reference to an external authentication server. User data is stored locally on the NetScaler appliance.

RADIUS

Authenticate to an external Radius server.

LDAP

Authenticates to an external LDAP authentication server.

TACACS

Authenticates to an external Terminal Access Controller Access-Control System (TACACS) authentication server.

NT4

Authenticates to an external Windows NT 4.0 server.

CERT

Authenticates to the NetScaler by using a client certificate, without reference to an external authentication server.

NEGOTIATE

Authenticates to a Kerberos authentication server. If there is an error in Kerberos authentication, NetScaler uses NTLM authentication. For more information on Kerberos authentication, see Handling Authentication, Authorization and Auditing (AAA) with Kerberos.

An authentication policy is comprised of an expression and an action. Authentication policies use NetScaler expressions, which are described in detail in the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

After creating an authentication policy, bind it to an authentication virtual server and assign a priority to it. When binding it, also designate it as either a primary or a secondary policy. Primary policies are evaluated before secondary policies. In configurations that use both types of policy, primary policies are normally more specific policies while secondary policies are normally more general policies intended to handle authentication for any user accounts that do not meet the more specific criteria.

To create and bind an authentication policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands in the order shown to create and bind an authentication policy and verify the configuration:

- add authentication negotiatePolicy <name> <rule> <reqAction>
- show authorization policy <policyname>
- bind authentication vserver <authvsname> -**policy** <policyname> [-**priority** <priority>] [-secondary]]
- show authentication Vserver <name>

Example

```
> add authentication localPolicy Authn-Pol-1 ns_true
 Done

> show authentication localPolicy
1)      Name: Authn-Pol-1       Rule: ns_true
       Request action: LOCAL
 Done
> bind authentication Vserver Auth-Vserver-2 -policy Authn-Pol-1
 Done
> show authentication Vserver Auth-Vserver-2
       Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
       State: UP
       Client Idle Timeout: 180 sec
       Down state flush: DISABLED
       Disable Primary Vserver On Down : DISABLED
       Authentication : ON
       Current AAA Users: 0
       Authentication Domain: myCompany.employee.com

1)            Primary authentication policy name: Authn-Pol-1 Priority: 0
 Done
```

To modify an existing authentication policy

At the NetScaler command prompt, type the following commands to modify an existing authentication policy:

set authentication <authtype> <policyname> <rule> [**-reqaction** <action>]

Example

```
> set authentication localPolicy Authn-Pol-1 'ns_true'
Done
```

To remove an authentication policy

At the NetScaler command prompt, type the following command to remove an authentication policy:

rm authentication <authtype> <policyname>

Example

```
> rm authentication localPolicy Authn-Pol-1
Done
```

Parameters for configuring authentication policies

authType

Type of authentication. Possible values: LOCAL, RADIUS, LDAP, TACACS, NT4, CERT, NEGOTIATE. Default value: LOCAL

policyName

A name for the policy you are creating. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing policies.)

rule

An expression that defines the requests to be authenticated. For a complete description of NetScaler expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

reqAction

The action associated with your policy. Leave this blank unless you are using an external authentication server that requires an action.

authVsName

The name of the authentication virtual server to which you are binding this policy.

priority

The priority assigned to this authentication policy.

secondary

Designate this policy as a secondary authentication policy.

To configure and bind authentication policies by using the configuration utility

1. In the navigation pane, expand **AAA - Application Traffic**, expand **Policies**, and then click **Authentication**.
2. In the details pane, on the **Policies** tab, do one of the following:
   - To create a new policy, click **Add**.
   - To modify an existing policy, select the action, and then click **Open**.
3. In the **Create Authentication Policy** or **Configure Authentication Policy** dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring authentication policies" as follows (asterisk indicates a required parameter):
   - **Name***—policyname(Cannot be changed for a previously configured action)
   - **Authentication Type***—authtype
   - **Server***—action
   - **Expression***—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the **Expression** window, and then by typing your expression directly into the expression text area, or by clicking **Add** to open **Add Expression** dialog box and using the drop-down lists in it to construct your expression.)
4. Click **Create** or **OK**, and then click **Close**. The policy that you created appears in the **Authentication Policies and Servers** page.
5. Click the **Servers** tab.
6. In the details pane, select the appropriate virtual server, and then click **Open**.
7. If you want to designate this policy as a secondary authentication policy, on the **Authentication** tab, click **Secondary**. If you want to designate this policy as a primary authentication policy, skip this step.
8. Click **Insert Policy**.
9. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
10. In the **Priority** column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
11. Click **OK**. A message appears in the status bar, stating that the policy has been configured successfully.

Authorization Policies

After you create authentication policies, you next create any authorization policies you need. Authorization policies, like other policies, consist of an expression and action. There are only two actions for authorization policies: ALLOW and DENY. ALLOW permits users to access the specified resource; DENY blocks access. The default setting for authorization when no specific policy exists is to deny access to network resources. This means that a user or group can access a particular resource only if an authorization policy explicitly allows access. For optimum security, the best practice is not to change the default setting and to create specific authorization policies for users who need access to specific resources.

Authorization use both default syntax expressions and classic expressions. These expressions are described in detail in the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

After you create an authorization policy, you bind it to the appropriate user accounts or groups to put it into effect.

To create an authorization policy

At the NetScaler command prompt, type the following commands to create an authorization policy and verify the configuration:

- add authorization policy <policyname> <rule> **-action** <action>
- show authorization policy <name>

Example

```
> add authorization policy authz-pol-1 "HTTP.REQ.URL.SUFFIX.EQ(\"gif\")" DENY
 Done
> show authorization policy authz-pol-1
1)      Name: authz-pol-1    Rule: HTTP.REQ.URL.SUFFIX.EQ("gif")
       Action: DENY
 Done
>
```

For the classic syntax equivalent of the above example, see To create an authorization policy.

To modify an authorization policy

At the NetScaler command prompt, type the following command to modify an authorization policy:

set authorization policy <policyname> [**-rule** <expression>] **-action** <action>

Example

```
> set authorization policy authz-pol-1 -rule "HTTP.REQ.URL.SUFFIX.EQ(\"gif\")" -action ALLOW
 Done
> show authorization policy authz-pol-1
1)      Name: authz-pol-1    Rule: HTTP.REQ.URL.SUFFIX.EQ("gif")
       Action: ALLOW
 Done
>
```

For the classic syntax equivalent of the above example, see To modify an authorization policy.

To bind an authorization policy to a user account or group

At the NetScaler command prompt, type one of the following commands to bind an authorization policy to a user account or group and verify the configuration:

- bind aaa user <userName> [**-policy** <policyname> [**-priority** <priority]] [**-intranetApplication** <appname>] [**-urlName** <urlname>] [**-intranetIP** <intranetip> [<netmask>]]
- show aaa user <name>
- bind aaa group <groupName> [**-policy** <policyname> [**-priority** <priority]] [**-intranetApplication** <appname>] [**-urlName** <urlname>] [**-intranetIP** <intranetip> [<netmask>]]
- show aaa group <name>

Example

```
> bind aaa user user-hr-1 -policy authz-pol-1
  Done
> show aaa user user-hr-1
       UserName: user-hr-1

              Policy: authz-pol-1, Priority: 0
```

```
 Done
> bind aaa group group-1 -policy authz-pol-1
 Done
> show aaa group group-1
      GroupName: group-1

            UserName: user-2
            UserName: user-1

            Policy: authz-pol-1, Priority: 0
 Done
```

To unbind an authorization policy from a user account or group

At the NetScaler command prompt, type one of the following commands to unbind an authorization policy from a user account or group:

- unbind aaa user <userName> **-policy** <policyname>
- unbind aaa group <groupName> **-policy** <policyname>

Example

```
> unbind aaa user aaa-user-1 -policy auth-pol-1
Done
```

To remove an authorization policy

First unbind the policy from all user accounts and groups, and then, at the NetScaler command prompt, type the following command to remove an authorization policy:

rm authorization policy <policyname>

Parameters for configuring authorization policies

policyname

A name for the authorization policy you are creating. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing policies.)

rule

A NetScaler default syntax or classic syntax expression that defines which requests to allow or deny. For a complete description of NetScaler default syntax and classic syntax expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

action

The action to perform when a connection matches the policy. Possible values: ALLOW, DENY. Default: ALLOW.

username or groupname

The name of the user account or the group to which you are binding the authorization policy.

priority

The priority you are assigning to the policy.

internetApplication

The name of the intranet application to which you are binding the authorization policy.

urlname

The URL of the intranet application to which you are binding the authorization policy.

intranetip

The intranet IP of the intranet application to which you are binding the authorization policy.

netmask

If the intranet application to which you are binding the authorization policy resides on an IP range, the subnet mask of that intranet range.

To configure and bind authorization policies by using the configuration utility

1. In the navigation pane, expand **AAA - Application Traffic**, and then click **Authorization**.

2. In the details pane, do one of the following:

   - To create a new authorization policy, click **Add**.

   - To modify an existing authorization policy, select the policy, and then click **Open**.

3. In the **Create Authorization Policy** or **Configure Authorization Policy** dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring authorization policies" as follows (asterisk indicates a required parameter):

   - Name*—policyname(Cannot be changed for a previously configured policy.)

   - Action*— action

   - Expression*—rule (By default, the **Expression** box accepts default syntax policies. To switch to the classic syntax view, click **Switch to Classic Syntax**.)

4. Click **Create** or **OK**, and then click **Close**. The policy that you created appears on the **Authorization Policies** page.

5. To bind an authorization policy to a user account or group, in the navigation pane, under **AAA - Application Traffic**, click either **Users** or **Groups**, as appropriate, and then add that policy to the user account list:

   a. In the details pane, select the appropriate user account, and then click **Open**.

   b. Click the **Authorization** tab.

   c. Click **Insert Policy**.

   d. Choose the policy you want to bind to the group from the drop-down list.

   e. In the **Priority** column, modify the default priority as needed to ensure that the policy is evaluated in the proper order.

   f. Click **OK**.

   A message appears in the status bar, stating that the policy has been configured successfully.

Auditing Policies

After you create authentication policies, you next create any auditing policies you need. The NetScaler appliance allows auditing of all states and status information, so you can see the event history for any user in chronological order. When you configure auditing on the NetScaler appliance, you can choose to store the log files locally on the NetScaler appliance or to send them to a syslog server.

To put your auditing policies into effect, you bind them globally, to a specific authentication virtual server, or to specific user accounts or groups.

To create an auditing policy by using the NetScaler command line

At the NetScaler command prompt, type the following commnads to create an auditing policy and verify the configuration:

- add audit <logtype> <policyname> [**-rule** <rule>] [**-action** <action>]
- show audit nslogPolicy

Example

```
> add audit nslogPolicy audit-1 ns_true audit_server
 Done
> show audit nslogPolicy
1)      Name: audit-pol Rule: ns_true
       Action: audit_server
2)      Name: audit-1   Rule: ns_true
       Action: audit_server
 Done
```

To modify an auditing policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands to modify an auditing policy and verify the configuration:

- set audit <logtype> <policyname> **-rule** [<rule>] [**-action** <action>]
- show audit nslogPolicy

Example

```
> set audit nslogPolicy audit-1 ns_true audit_server
 Done
> show audit nslogPolicy
1)      Name: audit-pol Rule: ns_true
       Action: audit_server
2)      Name: audit-1   Rule: ns_true
       Action: audit_server
 Done
```

To globally bind an auditing policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands to globally bind an auditing policy:

bind audit <logtype> global **-policy** <policyname> [**-priority** <priority]

Example

```
> bind tm global -policyName Audit-Pol-1 -priority 1000
Done
```

To bind an auditing policy to an authentication virtual server by using the NetScaler command line

At the NetScaler command prompt, type the following commands to bind an auditing policy to an authentication virtual server and verify the configuration:

- bind authentication vserver <authvsname> **-policy** <policyname> [**-priority** <priority>]
- show authentication verserver <name>

Example

```
> bind authentication Vserver Auth-Vserver-2 -policy Authn-Pol-1
 Done
> show authentication Vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
      State: UP
      Client Idle Timeout: 180 sec
```

```
        Down state flush: DISABLED
        Disable Primary Vserver On Down : DISABLED
        Authentication : ON
        Current AAA Users: 0
        Authentication Domain: myCompany.employee.com

1)          Primary authentication policy name: Authn-Pol-1 Priority: 0
 Done
```

To bind an auditing policy to a user account or a group by using the NetScaler command line

At the NetScaler command prompt, type one of the following commands to bind an auditing policy to a user account or a group:

- bind audit <logtype> user <userName> **-policy** <policyname> [**-priority** <priority]
- bind audit <logtype> group <groupName> **-policy** <policyname> [**-priority** <priority]

Example

```
> bind audit nslogPolicy user aaa-user-1 -policyName Audit-Pol-1 -priority 1000
Done
```

To unbind a globally bound auditing policy by using the NetScaler command line

At the NetScaler command prompt, type the following commmands to unbind a globally-bound auditing policy:

unbind audit <logtype> global **-policy** <policyname>

Example

```
> unbind audit nslogPolicy global -policy Audit-Pol-1
Done
```

To unbind an auditing policy from an authentication virtual server by using the NetScaler command line

At the NetScaler command prompt, type the following commands to unbind an auditing policy from an authentication virtual server:

unbind authentication vserver <authvsname> **-policy** <policyname>

Example

```
> unbind authentication vserver auth-vserver-1 -policyName Audit-Pol-1
Done
```

To unbind an auditing policy from a user account or a group by using the NetScaler command line

At the NetScaler command prompt, type one of the following commands to unbind an auditing policy from a user account or a group:

- unbind audit <logtype> user <userName> **-policy** <policyname>
- unbind audit <logtype> group <groupName> **-policy** <policyname>

Example

```
> unbind audit nslogPolicy group aaa-group-1 -policyName Audit-Pol-1
Done
```

To remove an auditing policy by using the NetScaler command line

First unbind the policy from all users and groups, and then, at the NetScaler command prompt, type the following command to remove an auditing policy:

rm audit <logtype> <policyname>

Parameters for configuring auditing policies

logtype

Which type of log your policy uses. If your policy logs to nslog, type nslogPolicy. If your policy logs to an external syslog server, type syslogPolicy.

policyname

A name for the policy you are creating. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing policies.)

rule

A NetScaler classic expression that defines which requests to audit. If you do not specify a rule, audit policies default to ns_true, which logs all connections. For a complete description of NetScaler classic expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

action

The action associated with this policy. For auditing policies, the action is the name of the nslog or syslog server to which you want to direct connections that match the audit log policy. If you do not specify a server, the default nslog server or syslog server is used.

authvsname

The name of the authentication virtual server to which you are binding the policy.

username

The name of the user account to which you are binding the policy.

groupname

The name of the group to which you are binding the policy.

priority

The priority assigned to this auditing policy.

To configure and bind auditing policies by using the configuration utility

1. In the navigation pane, expand **AAA - Application Traffic**, expand **Policies**, and then click **Auditing**.
2. In the details pane, do one of the following:
   - To create a new auditing policy, click **Add**.
   - To modify an existing auditing policy, select the policy, and then click **Open**.
3. In the **Create Auditing Policy** or **Configure Auditing Policy** dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring auditing policies" as follows (asterisk indicates a required parameter):
   - Name*—policyname (Cannot be changed for a previously configured policy.)
   - Auditing type*—logtype (When creating auditing policies by using the configuration utility, you cannot specify a rule.)
   - Server*—action
4. Click **Create**, and then click **Close**. The policy that you created appears in the **Auditing Policies and Servers** page.
5. Click **OK**.
6. To globally bind an auditing policy, in the details pane, click **Global Bindings** and fill in the **Bind/Unbind Audit Policies to Global** dialog box.
   a. Select the name of the audit policy you want to globally bind.
   b. Click **OK**.

   A message appears in the status bar, stating that the policy has been configured successfully.
7. To bind an auditing policy to an authentication virtual server, in the navigation pane, click **Virtual Servers**, and add that policy to the authentication policies list.
   a. In the details pane, select the appropriate virtual server, and then click **Open**.
   b. Click the **Policies** tab.
   c. Click **Insert Policy**.
   d. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
   e. In the **Priority** column, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
   f. Click **OK**.
8. To bind an auditing policy to a user account or group, in the navigation pane, click **Users** or **Groups**, and add that policy to the user account list.

a. In the details pane, select the appropriate user account, and then click **Open**.

b. Click the **Policies** tab.

c. Click **Insert Policy**.

d. Choose the policy you want to bind to the group from the drop-down list.

e. In the **Priority** column, modify the default priority as needed to ensure that the policy is evaluated in the proper order.

f. Click **OK**.

A message appears in the status bar, stating that the policy has been configured successfully.

Session Settings

After you configure your authentication, authorization, and auditing profiles, you configure session settings to customize your user sessions. The session settings are:

The session timeout.

Controls the period after which the user is automatically disconnected and must authenticate again to access your intranet.

The default authorization setting.

Determines whether the NetScaler appliance will by default allow or deny access to content for which there is no specific authorization policy.

The single sign-on setting.

Determines whether the NetScaler appliance will log users onto all web applications automatically after they authenticate, or will pass users to the web application logon page to authenticate for each application.

The credential index setting.

Determines whether the NetScaler appliance will use primary or the secondary authentication credentials for single signon.

To configure the session settings, you can take one of two approaches. If you want different settings for different user accounts or groups, you create a profile for each user account or group for which you want to configure custom sessions settings. You also create policies to select the connections to which to apply particular profiles, and you bind the policies to users or groups. You can also bind a policy to the authentication virtual server that handles the traffic to which you want to apply the profile.

If you want the same settings for all sessions, or if you want to customize the default settings for sessions that do not have specific profiles and policies configured, you can simply configure the global session settings.

Session Profiles

To customize your user sessions, you first create a session profile. The session profile allows you to override global settings for any of the session parameters.

Note: The terms “session profile” and “session action” mean the same thing.

To create a session profile by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create a session profile and verify the configuration:

- add tm sessionAction <actionname> **-sessTimeout** <timeout> **-defaultAuthorizationAction** <defaultaction> [**-SSO** (ON | OFF)] [**-ssoCredential** (PRIMARY | SECONDARY)]
- show tm sessionAction <name>

Example

```
> add tm sessionAction session-profile -sessTimeout 30 -defaultAuthorization ALLOW
 Done
> show tm sessionAction session-profile
1)      Name: session-profile
       Authorization action : ALLOW
       Session timeout: 30 minutes
 Done
```

To modify a session profile by using the NetScaler command line

At the NetScaler command prompt, type the following commands to modify a session profile and verify the configuration:

- set tm sessionAction <actionname> **-sessTimeout** <timeout> **-defaultAuthorizationAction** <defaultaction> [**-SSO** (ON | OFF)] [**-ssoCredential** (PRIMARY | SECONDARY)]
- show tm sessionAction

Example

```
> set tm sessionAction session-profile -sessTimeout 30 -defaultAuthorization ALLOW
 Done
> show tm sessionAction session-profile
1)      Name: session-profile
       Authorization action : ALLOW
       Session timeout: 30 minutes
 Done
```

To remove a session profile by using the NetScaler command line

At the NetScaler command prompt, type the following command to remove a session profile:

rm tm sessionAction <actionname>

Parameters for configuring session profiles

actionname

A name for the session action, or the name of the existing session action you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing session actions.)

sesstimeout

The session timeout in minutes. Possible values: 1-65536. Default: 30.

defaultAuthorizationAction

Whether to allow or deny access to resources by default when no specific policy overrides this setting. Possible values: ALLOW, DENY. Default: DENY

sso

Whether to use single sign-on or not for all web applications. Possible values: YES, NO. Default: NO.

ssocredential

Whether to use the primary or secondary authentication server for single sign-on credentials. Possible values: PRIMARY, SECONDARY. Default: PRIMARY.

To configure session profiles by using the configuration utility

1. In the navigation pane, expand **AAA - Application Traffic**, and then click **Session**.
2. In the details pane, click the **Profiles** tab.
3. On the **Profiles** tab, do one of the following:
   - To create a new session profile, click **Add**.
   - To modify an existing session profile, select the profile, and then click **Open**.
4. In the **Create TM Session Profile** dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring session profiles" as follows (asterisk indicates a required parameter):
   - Name*—actionname (Cannot be changed for a previously configured session action.)
   - Session Time-out—sesstimeout
   - Default Authorization Action—defaultAuthorizationAction
   - Single Signon to Web Applications—sso
   - Credential Index—ssocredential
5. Click **Create** or **OK**, and then click **Close**. The session profile that you created appears in the **Session Policies and Profiles** pane.

Session Policies

After you create one or more session profiles, you create session policies and then bind the policies globally or to an authentication virtual server to put them into effect.

To create a session policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands to create a session policy and verify the configuration:

- add tm sessionPolicy <policyname> <rule> <actionname>
- show tm sessionPolicy <name>

Example

```
> add tm sessionPolicy session-pol "URL == /*.gif" session-profile
 Done
> show tm sessionPolicy session-pol
1)      Name: session-pol       Rule: URL == '/*.gif'
       Action: session-profile
 Done
```

To modify a session policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands to modify a session policy and verify the configuration:

- set tm sessionPolicy <policyname> [**-rule** <expression>] [**-action** <action>]
- show tm sessionPolicy <name>

Example

```
> set tm sessionPolicy session-pol "URL == /*.gif" session-profile
 Done
> show tm sessionPolicy session-pol
1)      Name: session-pol       Rule: URL == '/*.gif'
```

```
      Action: session-profile
Done
```

To globally bind a session policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands to globally bind a session policy and verify the configuration:

bind tm global **-policyName** <policyname> [**-priority** <priority>]

Example

```
> bind tm global -policyName session-pol
 Done

> show tm sessionPolicy session-pol
1)      Name: session-pol       Rule: URL == '/*.gif'
       Action: session-profile
       Policy is bound to following entities
       1) TM GLOBAL    PRIORITY : 0
 Done
```

To bind a session policy to an authentication virtual server by using the NetScaler command line

At the NetScaler command prompt, type the following command to bind a session policy to an authentication virtual and verify the configuration:

bind authentication vserver <authvsname> **-policy** <policyname> [**-priority** <priority>]

Example

```
> bind authentication vserver auth-vserver-1 -policyName Session-Pol-1 -priority 1000
Done
```

To unbind a session policy from an authentication virtual server by using the NetScaler command line

At the NetScaler command prompt, type the following commands to unbind a session policy from an authentication virtual server and verify the configuration:

unbind authentication vserver <authvsname> **-policy** <policyname>

Example

```
> unbind authentication vserver auth-vserver-1 -policyName Session-Pol-1
Done
```

To unbind a globally bound session policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands to unbind a globally-bound session policy:

unbind tm global **-policyName** <policyname>

Example

```
> unbind tm global -policyName Session-Pol-1
Done
```

To remove a session policy by using the NetScaler command line

First unbind the session policy from global, and then, at the NetScaler command prompt, type the following commands to remove a session policy and verify the configuration:

rm tm sessionPolicy <policyname>

Example

```
> rm tm sessionPolicy Session-Pol-1
Done
```

Parameters for configuring session policies

policyname

A name for the session policy, or the name of the existing session policy you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing session policies.)

rule

A NetScaler classic expression that defines the requests to select. If you do not specify a rule, session profiles default to ns_true, which selects all connections. For a complete description of NetScaler classic expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX128673.

actionname

The name of the session profile to apply to connections that match this policy.

priority

The priority assigned to this session policy.

authvsname

The name of the authentication virtual server to which you are binding this session policy.

To configure and bind session policies by using the configuration utility

1. In the navigation pane, expand **AAA - Application Traffic**, and then click **Session**.
2. In the details pane, on the **Policies** tab, do one of the following:
   - To create a new session policy, click **Add**.
   - To modify an existing session policy, select the policy, and then click **Open**.
3. In the Create Session Policy or Configure Session Policy dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring session policies" as follows (asterisk indicates a required parameter):
   - Name*—policyname (Cannot be changed for a previously configured session policy.)
   - Request Profile*—actionname
   - Expression*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
4. Click **Create** or **OK**, and then click **Close**. The policy that you created appears in the details pane of the **Session Policies and Profiles** page.
5. To globally bind an auditing policy, in the details pane, click **Global Bindings** and fill in the **Bind/Unbind Session Policies to Global** dialog box.
   a. Select the name of the session policy you want to globally bind.
   b. Click **OK**.
6. To bind a session policy to an authentication virtual server, in the navigation pane, click Virtual Servers, and add that policy to the policies list.
   a. In the details pane, select the appropriate virtual server, and then click **Open**.
   b. Click the **Policies** tab.
   c. Click **Insert Policy**.
   d. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
   e. In the **Priority** column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
   f. Click **OK**.

A message appears in the status bar, stating that the policy has been configured successfully.

Global Session Settings

In addition to or instead of creating session profiles and policies, you can configure global session settings. These settings control the session configuration when there is no explicit policy overriding them.

To configure the session settings by using the NetScaler command line

At the NetScaler command prompt, type the following commands to configure the global session settings and verify the configuration:

set tm sessionParameter [**-sessTimeout** <timeout>] [**-defaultAuthorizationAction** <defaultaction>] [**-SSO** <sso>] [**-ssoCredential** <ssocredentials>]

Example

```
> set tm sessionParameter -sessTimeout 30
  Done
> set tm sessionParameter -defaultAuthorizationAction DENY
  Done
> set tm sessionParameter -SSO ON
  Done
> set tm sessionParameter -ssoCredential PRIMARY
  Done
```

Parameters for configuring global session settings

sessTimeout

The timeout for user sessions, as an integer value representing a number of minutes.

defaultAuthorizationAction

The default authorization action for a user request, when no specific policy is available. Possible values: ALLOW, DENY. Default: DENY.

sso

Whether to allow a user to authenticate once and then have access to all web applications on your intranet, or to require authentication for each application. Possible values: ON, OFF. Default: OFF.

ssoCredential

If single signon is enabled, which group of credentials to use for authentication. Possible values: Primary, Secondary. Default: Primary.

To configure the session settings by using the configuration utility

1. In the navigation pane, click **AAA - Application Traffic** to display the top-level details pane.
2. In the details pane, under **Settings**, click **Change global settings**.
3. In the **Global Session Settings** dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring global session settings" as follows
   - Session Time-out—sessTimeout
   - Default Authorization Action—defaultAuthorizationAction
   - Single Sign-on to Web Applications—sso
   - Credential Index—ssoCredential
4. Click **OK**, and then click **Close**. A message appears in the status bar, stating that the settings have been configured successfully.

Traffic Settings

To use forms-based single sign-on (SSO) for your protected applications, you configure that feature in the Traffic settings. SSO enables your users to log on once to access all protected applications on your LAN, rather than requiring them to log on separately to access each one. Forms-based SSO allows you to use a web form of your own design as the sign-on method instead of a generic pop-up window. You can therefore put you company logo and other information you might want your users to see on the logon form.

To configure forms-based SSO, you first create a form SSO profile. Next, you create a traffic profile and link it to the form SSO profile you created. Next, you create a policy, link it to the traffic profile. Finally, you bind the policy globally or to an authentication virtual server to put your configuration into effect.

Form SSO Profiles

To enable and configure forms-based SSO, you first create an SSO profile.

Note: In this feature, the terms “profile” and “action” mean the same thing.

To create a form SSO profile by using the NetScaler command line

At the NetScaler command prompt, type:

add tm formSSOAction <name> **-actionURL** <URL> **-userField** <string> **-passwdField** <string> **-ssoSuccessRule** <expression> [**-nameValuePair** <string>] [**-responsesize** <positive_integer>] [**-nvtype** (STATIC | DYNAMIC)] [**-submitMethod** (GET | POST)

Example

```
add tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
-userField "loginID" -passwdField "passwd"
-nameValuePair "loginID passwd" -responsesize "9096"
-ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
-nvtype STATIC -submitMethod GET
-sessTimeout 10 -defaultAuthorizationAction ALLOW
```

To modify a form SSO by using the NetScaler command line

At the NetScaler command prompt, type:

set tm formSSOAction <name> **-actionURL** <URL> **-userField** <string> **-passwdField** <string> **-ssoSuccessRule** <expression> [**-nameValuePair** <string>] [**-responsesize** <positive_integer>] [**-nvtype** (STATIC | DYNAMIC)] [**-submitMethod** (GET | POST)

Example

```
set tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
-userField "loginID" -passwdField "passwd"
-ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
```

-nameValuePair "loginID passwd" -responsesize "9096"
-nvtype STATIC -submitMethod GET
–sessTimeout 10 -defaultAuthorizationAction ALLOW

To remove a form SSO profile by using the NetScaler command line

At the NetScaler command prompt, type:

rm tm formSSOAction <name>

Example

rm tm sessionAction SSO-Prof-1

Parameters for configuring form SSO profiles

name

A name for the SSO action, or the name of the existing SSO action you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing SSO actions.)

actionURL

The URL where the SSO logon form is located.

userField

The form field where the user types in the user ID or login.

passwdField

The form field where the user types in the password.

ssoSuccessRule

An expression that describes the action that this profile should take when invoked by a policy.

responsesize

The number of bytes to allow for the complete response size. Responses that exceed this value are blocked.

nameValuePair

The userField value, followed by a space, followed by the passwdField value. When typing this at the NetScaler command line, you should enclose the nameValuePair in straight double quotes.

nvtype

Whether the name/value pair is static or dynamic. Possible values: STATIC, DYNAMIC. Default: STATIC.

submitMethod

HTTP method used by the SSO logon form to send the logon credentials to the logon server. Possible values: GET, POST. Default: POST.

To configure form SSO profiles by using the configuration utility

1. In the navigation pane, expand **AAA - Application Traffic**, and then click **Traffic**.
2. In the details pane, click the **Form SSO Profiles** tab.
3. On the **Form SSO Profiles** tab, do one of the following:
   - To create a new form SSO profile, click **Add**.
   - To modify an existing form SSO profile, select the profile, and then click **Open**.
4. In the **Create Form SSO Profile** dialog box, specify values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring form SSO profiles” as follows (an asterisk indicates a required parameter):
   - **Name***—name (Cannot be changed for a previously configured session action.)
   - **Action URL***—actionURL
   - **User Name Field***—userField
   - **Password Field***—passField
   - **SSO Success Rule***—ssoSuccessRule
   - **Name Value Pair**—nameValuePair
   - **Response Size**—responsesize
   - **Extraction**—nvtype
   - **Submit Method**—submitMethod
5. Click **Create** or **OK**, and then click **Close**. The form SSO profile that you created appears in the **Traffic Policies**, **Profiles**, and **Form SSO Profiles** pane.

Traffic Profiles

After creating at least one form sso profile, you must next create a traffic profile.

Note: In this feature, the terms “profile” and “action” mean the same thing.

To create a traffic profile by using the NetScaler command line

At the NetScaler command prompt, type:

add tm trafficAction <name> [**-appTimeout** <mins>] [**-SSO** (ON | OFF) [**-formSSOAction** <string>]]

Example

add tm trafficAction Traffic-Prof-1 -appTimeout 10 -SSO ON -formSSOAction SSO-Prof-1

To modify a session profile by using the NetScaler command line

At the NetScaler command prompt, type:

set tm trafficAction <name> [**-appTimeout** <mins>] [**-SSO** (ON | OFF) [**-formSSOAction** <string>]]

Example

set tm trafficAction Traffic-Prof-1 -appTimeout 10 -SSO ON -formSSOAction SSO-Prof-1

To remove a session profile by using the NetScaler command line

At the NetScaler command prompt, type:

rm tm trafficAction <actionname>

Example

rm tm trafficAction Traffic-Prof-1

Parameters for configuring form traffic profiles

name

A name for the traffic action, or the name of the existing traffic action you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing SSO actions.)

appTimeout

The application timeout in minutes. Possible values: 1-65536. Default: 30.

SSO

Whether to enable or disable SSO. Possible values: ON, OFF. Default: OFF.

formSSOAction

The name of the form SSO profile to use.

To configure traffic profiles by using the configuration utility

1. In the navigation pane, expand **AAA - Application Traffic**, and then click **Traffic**.
2. In the details pane, click the **Profiles** tab.
3. On the **Profiles** tab, do one of the following:
   - To create a new traffic profile, click **Add**.
   - To modify an existing traffic profile, select the profile, and then click **Open**.
4. In the **Create Traffic Profile** or **Configure Traffic Profile** dialog box, specify values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring form traffic profiles” as follows (an asterisk indicates a required parameter):
   - **Name***—name (Cannot be changed for a previously configured session action.)
   - **AppTimeout**—appTimeout
   - **Single Sign-On**—SSO
   - **Form SSO Action**—formSSOAction
5. Click **Create** or **OK**, and then click **Close**. The traffic profile that you created appears in the **Traffic Policies**, **Profiles**, and **Form SSO Profiles** pane.

Traffic Policies

After you create one or more form SSO and traffic profiles, you create traffic policies and then bind the policies, either globally or to an authentication virtual server, to put them into effect.

To create a traffic policy by using the NetScaler command line

At the NetScaler command prompt, type:

add tm trafficPolicy <policyName> "<rule>" <action>

Example

add tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS("login=true")" Traffic-Prof-1

To modify a traffic policy by using the NetScaler command line

At the NetScaler command prompt, type:

set tm trafficPolicy <policyName> "<rule>" <action>

Example

set tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS("login=true")" Traffic-Prof-1

To globally bind a traffic policy by using the NetScaler command line

At the NetScaler command prompt, type:

bind tm global **-policyName** <policyName> [**-priority** <priority>]

Example

bind tm global -policyName Traffic-Pol-1

To bind a traffic policy to an authentication virtual server by using the NetScaler command line

At the NetScaler command prompt, type:

bind authentication vserver <authvsname> **-policy** <policyName> [**-priority** <priority>]

Example

bind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1 -priority 1000

To unbind a globally bound traffic policy by using the NetScaler command line

At the NetScaler command prompt, type:

unbind tm global **-policyName** <policyname>

Example

unbind tm global -policyName Traffic-Pol-1

To unbind a traffic policy from an authentication virtual server by using the NetScaler command line

At the NetScaler command prompt, type:

unbind authentication vserver <authvsname> **-policy** <policyname>

Example

unbind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1

To remove a traffic policy by using the NetScaler command line

First unbind the session policy from global, and then, at the NetScaler command prompt, type:

rm tm trafficPolicy <policyname>

Example

rm tm trafficPolicy Traffic-Pol-1

Parameters for configuring form traffic profiles

policyName

A name for the traffic policy, or the name of the existing traffic policy you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing SSO actions.)

rule

A NetScaler advanced expression that defines the requests to select. For a complete description of NetScaler advanced expressions, see the *Citrix NetScaler Policy Configuration & Reference Guide* at http://support.citrix.com/article/CTX128673

actionname

The name of the traffic profile to apply to connections that match this policy.

priority

The priority assigned to this traffic policy.

authvsname

The name of the authentication virtual server to which you are binding this traffic policy.

To configure and bind traffic policies by using the configuration utility

1. In the navigation pane, expand **AAA - Application Traffic**, then expand **Policies**, and then click **Traffic**.
2. In the details pane, do one of the following:
   - To create a new session policy, click **Add**.
   - To modify an existing session policy, select the policy, and then click **Open**.
3. In the Create Traffic Policy or Configure Traffic Policy dialog box, specify values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for configuring form traffic profiles" as follows (an asterisk indicates a required parameter):
   - **Name***—policyName (Cannot be changed for a previously configured session policy.)
   - **Profile***—actionName
   - **Expression**—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
4. Click **Create** or **OK**, and then click **Close**. The policy that you created appears in the details pane of the **Session Policies and Profiles** page.
5. To globally bind a traffic policy, in the details pane, click **Global Bindings** and fill in the **Bind/Unbind Session Policies to Global** dialog box.
   a. Select the name of the traffic policy you want to globally bind.
   b. Click **OK**.
6. To bind a traffic policy to an authentication virtual server, in the navigation pane, click **Virtual Servers**, and add that policy to the policies list.
   a. In the details pane, select the appropriate virtual server, and then click **Open**.
   b. Click the **Policies** tab
   c. Click Insert **Policy**.
   d. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
   e. In the **Priority** column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
   f. Click **OK**.

Authenticating with Client Certificates

Web sites that contain sensitive content, such as online banking web sites or Web sites with employee personal information, sometimes require client certificates for authentication. To configure AAA to authenticate users on the basis of client-side certificate attributes, you first enable client authentication on the traffic management virtual server and bind the root certificate to the authentication virtual server. Then, you implement one of two options. You can configure the default authentication type on the authentication virtual server as CERT, or you can create a certificate action that defines what the NetScaler appliance must do to authenticate users on the basis of a client certificate. In either case, your authentication server must support CRLs. You configure the NetScaler appliance to extract the user name from the SubjectCN field or another specified field in the client certificate.

When the user tries to log in to an authentication virtual server for which an authentication policy is not configured, and a global cascade is not configured, the user name information is extracted from the specified field of the certificate. If the required field is extracted, the authentication succeeds. If the user does not provide a valid certificate during the SSL handshake, or if the user name extraction fails, authentication fails. After it validates the client certificate, the NetScaler appliance presents a login page to the user.

The following procedures assume that you have already created a functioning AAA configuration, and therefore they explain only how to enable authentication by using client certificates. These procedures also assume that you have obtained your root certificate and client certificates and have placed them on the NetScaler appliance in the /nsconfig/ssl directory.

To configure the AAA client certificate parameters by using the NetScaler command line

At the NetScaler command prompt, type the following commands in the order shown and verify the configuration:

- add ssl certKey <certkeyName> **-cert** <certFile> **-key** <keyFile> **-password -inform** <inform> **-expiryMonitor** <expiryMonitor> **-notificationPeriod** <notificationPeriod>
- bind ssl certKey <vservername>@ **-vServer** <certkeyName> **-CA -crlCheck** Mandatory
- set aaa parameter **-defaultAuthType** CERT
- set aaa certParams **-userNameField** "Subject:CN"

Parameters for authentication with client certificates

certkeyName

The name of the certificate-key pair.

certFile

The name of the file containing the certificate.

keyFile

The name of the file containing the private key.

password

The password to the private key. If you are entering this at the NetScaler command line, you simply include the -password parameter, and then, after entering the command, enter the actual password when prompted. If you are using the configuration utility, you type the password in the appropriate text box.

inform

The format of the certificate-key pair. Possible values: DER, PEM. Default: PEM.

expiryMonitor

Whether to monitor the certificate-key pair for expiration. Possible values: ENABLED, DISABLED. Default: ENABLED.

notificationPeriod

The period, in days before the certificate-key pair expires, during which the NetScaler appliance should notify the administrator of the impending expiration.

vservername

The name of the authentication virtual server to which to bind the root certificate.

To configure the AAA client certificate parameters by using the configuration utility

1. In the navigation pane, expand **AAA - Application Traffic**, and then click **Virtual Servers**.
2. In the details pane, select the virtual server that you want to configure to handle client certificate authentication, and then click **Open**.
3. In the **Configure Virtual Server (Authentication)** dialog box, in the **Certificates** tab, click **Install**.
4. In the **Install Certificate** dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in "Parameters for authentication with client certificates" as follows (asterisk indicates a required parameter):
   - Certificate-Key Pair Name*—certkeyName
   - Certificate File Name—certFile
   - Private Key File Name—keyFile
   - Password—password
   - Certificate Format—inform
   - Notify When Expires—expiryMonitor
   - Notification Period—notificationPeriod
5. Click **Install**, and then click **Close**.
6. In the **Configure Virtual Server (Authentication)** dialog box, in the **Available** list, select the root certificate.
7. Click **Add as CA**.
8. Click **OK**.
9. In the navigation pane, expand **Policies**, and then click **Authentication**.
10. In the details pane, select the policy you want to configure to handle client certificate authentication, and then click **Open**.
11. In the **Authentication Type** drop-down list, select **CERT**.
12. In the **Server** drop-down list, select the virtual server you just configured to handle client certificate authentication.
13. Click **OK**. A message appears in the status bar, stating that the configuration completed successfully.

Configuring AAA with Commonly Used Protocols

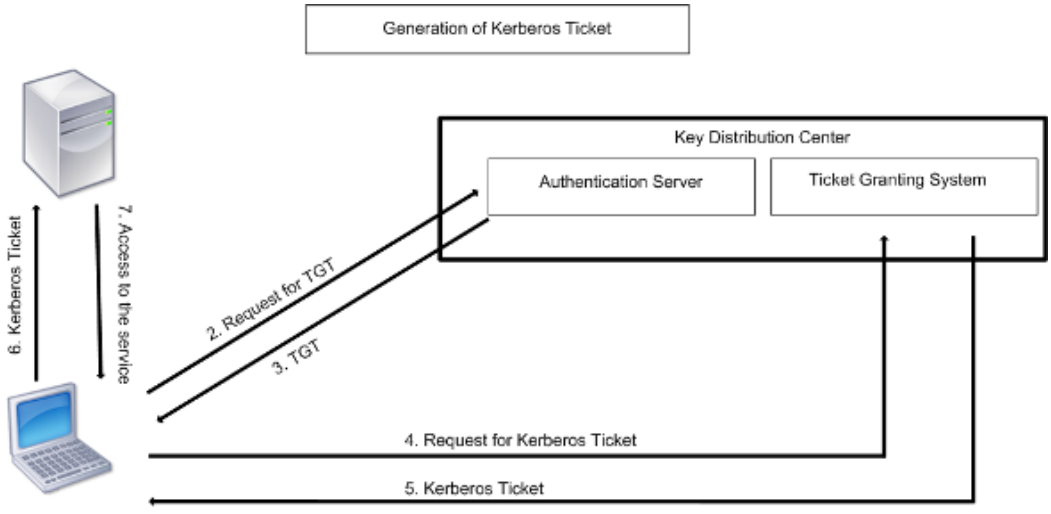
Configuring the NetScaler for Authentication, Authorization, and Auditing (AAA) needs a specific setup on the NetScaler and client's browsers. The configuration varies with the protocol used for AAA.

For more information about configuring the NetScaler for Kerberos authentication, see Handling Authentication, Authorization and Auditing with Kerberos/NTLM.

Handling Authentication, Authorization and Auditing with Kerberos/NTLM

Kerberos, a computer network authentication protocol, provides secure communication over the Internet. Designed primarily for client-server applications, it provides for mutual authentication by which the client and server can each ensure the other's authenticity. Kerberos uses a trusted third party, referred to as Key Distribution Center (KDC). A KDC consists of an Authentication Server (AS), which authenticates a user, and a Ticket Granting Server (TGS).

Each entity on the network (client or server) has a secret key that is known only to itself and the KDC. The knowledge of this key implies authenticity of the entity. For communication between two entities on the network, the KDC generates a session key, referred to as the *Kerberos ticket* or *service ticket*. The client makes a request to the AS for credentials for a specific server. The client then receives a ticket, referred to as Ticket Granting Ticket (TGT). The client then contacts the TGS, using the TGT it received from the AS to prove its identity, and asks for a service. If the client is eligible for the service, the TGS issues a Kerberos ticket to the client. The client then contacts the server hosting the service (referred to as the service server), using the Kerberos ticket to prove that it is authorized to receive the service. The Kerberos ticket has a configurable lifetime. The client authenticates itself with the AS only once. If it contacts the physical server multiple times, it reuses the AS ticket.



The following figure shows the basic functioning of the Kerberos protocol.Figure 1. **Functioning of Kerberos**

See

- Implementation of Kerberos authentication on the NetScaler
- Configuration of Kerberos authentication on the NetScaler

- Configuration of Kerberos from the command line
- Configuration of Kerberos from the configuration utility
- Configuration of Kerberos authentication on the client

Kerberos authentication has the following advantages:

- Faster authentication. When a physical server gets a Kerberos ticket from a client, the server has enough information to authenticate the client directly. It does not have to contact a domain controller for client authentication, and therefore the authentication process is faster.
- Mutual authentication. When the KDC issues a Kerberos ticket to a client and the client uses the ticket to access a service, only authenticated servers can decrypt the Kerberos ticket. If the virtual server on the NetScaler is able to decrypt the Kerberos ticket, you can conclude that both the virtual server and client are authenticated. Thus, the authentication of the server happens along with the authentication of the client.
- Single sign-on between Windows and other operating systems that support Kerberos.

Kerberos authentication may have the following disadvantages:

- Kerberos has strict time requirements; the clocks of the involved hosts must be synchronized with the Kerberos server clock to ensure that the authentication does not fail. You can mitigate this disadvantage by using the Network Time Protocol daemons to keep the host clocks synchronized. Kerberos tickets have an availability period, which you can configure.
- Kerberos needs the central server to be available continuously. When the Kerberos server is down, no one can log in. You can mitigate this risk by using multiple Kerberos servers and fallback authentication mechanisms.
- Because all the authentication is controlled by a centralized KDC, any compromise in this infrastructure, such as the user's password for a local workstation being stolen, can allow an attacker to impersonate any user. You can mitigate this risk to some extent by using only a desktop machine or laptop that you trust, or by enforcing preauthentication by using a hardware-token.

How NetScaler Implements Kerberos Authentication

Note: Kerberos/NTLM authentication is supported only in the NetScaler 9.3 nCore release or later, and it can be used only for AAA traffic management (AAA-TM) virtual servers.

NetScaler handles the components involved in Kerberos authentication in the following way:

Key Distribution Center (KDC)

In the Windows 2000 Server or later versions, the Domain Controller and KDC are part of the Windows Server. If the Windows Server is UP and running, it indicates that the Domain Controller and KDC are configured. The KDC is also the Active Directory server.

Note: All Kerberos interactions are validated with the Windows Kerberos Domain Controller.

Authentication Service and Protocol Negotiation

NetScaler supports Kerberos authentication on the AAA-TM authentication virtual servers. If the Kerberos authentication fails, the NetScaler uses the NTLM authentication.

By default, Windows 2000 Server and later Windows Server versions use Kerberos for AAA. If you create an authentication policy with NEGOTIATE as the authentication type, the NetScaler tries to use the Kerberos protocol for AAA and if the client's browser fails to receive a Kerberos ticket, the NetScaler uses the NTLM authentication. This process is referred to as *negotiation*.

The client may fail to receive a Kerberos ticket in any of the following cases:

- Kerberos is not supported on the client.
- Kerberos is not enabled on the client.
- The client is in a domain other than that of the KDC.
- The Access Directory on the KDC is not accessible to the client.

For Kerberos/NTLM authentication, the NetScaler does not use the data that is present locally on the NetScaler appliance.

Authorization

The traffic management virtual server can be a load balancing virtual server or a content switching virtual server.

Auditing

The NetScaler appliance supports auditing of Kerberos authentication with the following audit logging:

- Complete audit trail of the traffic management end-user activity
- SYSLOG and high performance TCP logging
- Complete audit trail of system administrators
- All system events
- Scriptable log format

Supported Environment

Kerberos authentication does not need any specific environment on the NetScaler. The client (browser) should have the support for Kerberos authentication.

High Availability

In a high availability setup, only the active NetScaler joins the domain. In case of a failover, the NetScaler lwagent daemon joins the secondary NetScaler appliance to the domain. No specific configuration is required for this functionality.

Kerberos Authentication Process

The following figure shows a typical process followed for Kerberos authentication in the NetScaler environment.

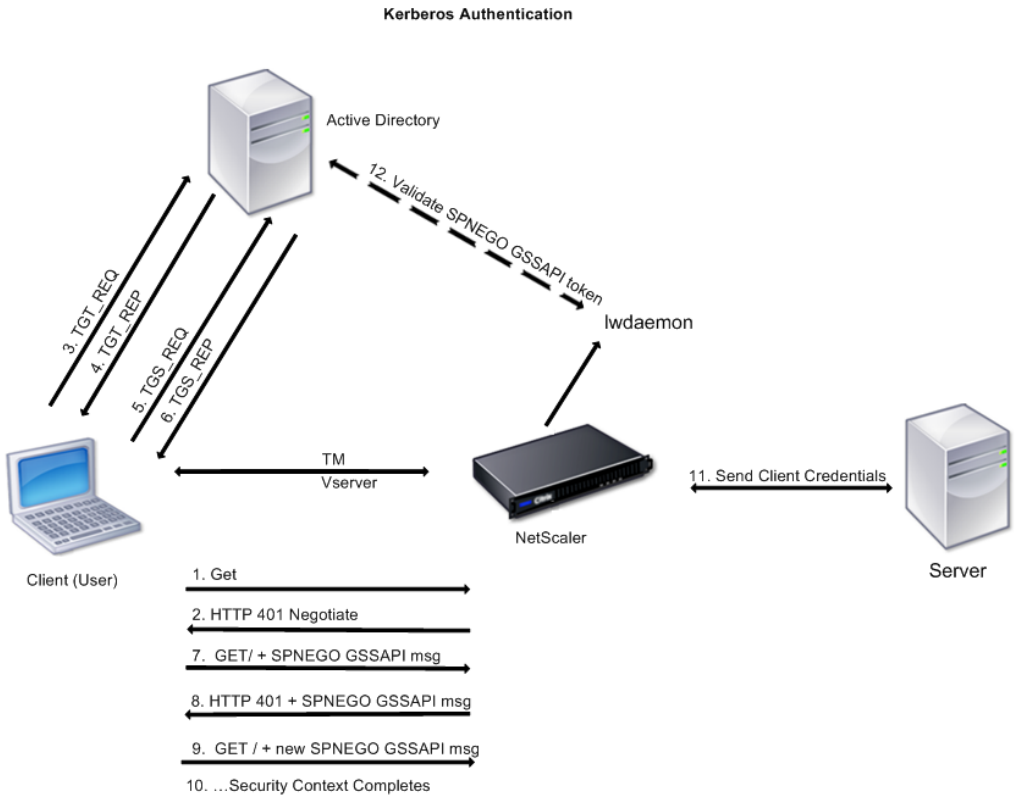


Figure 2. Kerberos Authentication Process on NetScaler

The Kerberos authentication occurs in the following stages:

Client authenticates itself to the KDC.

1. The NetScaler appliance receives a request from a client.
2. The traffic management (load balancing or content switching) virtual server on the NetScaler sends a challenge to the client.
3. To respond to the challenge, the client gets a Kerberos ticket.
    - The client requests the Authentication Server of the KDC for a ticket-granting ticket (TGT) and receives it. (See 3, 4 in the figure, Kerberos Authentication Process.)
    - The client sends the TGT to the Ticket Granting Server of the KDC and receives a Kerberos ticket. (See 5, 6 in the figure, Kerberos Authentication Process.)

Note: The above authentication process is not necessary if the client already has a Kerberos ticket whose lifetime has not expired. In addition, clients such as Web Services, .NET, or J2EE which support SPNEGO get a Kerberos ticket for the target server, create

an SPNEGO token, and insert it in the HTTP header when they send an HTTP request. They do not go through the client authentication process.

Client requests a service.

1. The client sends Kerberos ticket containing the SPNEGO token and the HTTP request to the traffic management virtual server on the NetScaler. The SPNEGO token has the necessary GSSAPI data.

2. The NetScaler establishes a security context between the client and the NetScaler. If the NetScaler cannot accept the data provided in the Kerberos ticket, the client is asked to get a different ticket. This cycle repeats till the GSSAPI data is acceptable and the security context is established. The traffic management virtual server on the NetScaler acts as an HTTP proxy between the client and the physical server.

NetScaler completes the authentication.

1. After the security context is complete, the traffic management virtual server validates the SPNEGO token.

2. From the valid SPNEGO token, the virtual server extracts the user ID and GSS credentials, and passes them to the authentication daemon.

3. A successful authentication completes the Kerberos authentication.

Configuring Kerberos Authentication on the NetScaler

To configure Kerberos authentication, the NetScaler and the client browser should have some specific configuration.

Configuration on the NetScaler

1. Enable the **Authentication, Authorization, and Auditing (AAA)** feature on the NetScaler appliance.

2. On the Active Directory, add a user for Kerberos authentication, map the HTTP service to this user, and generate a keytab file and import it to the NetScaler appliance. You can map more than one service if the Kerberos authentication is required for more than one service. The keytab file should contain entries for every service that is bound to the traffic management virtual server on the NetScaler. The keytab file is necessary for decrypting the secret received from the client during Kerberos authentication. The authentication details of all the services are stored in a single keytab file on the NetScaler.

3. Add a DNS server.

   Note: It is necessary that the NetScaler obtains the IP address of the domain controller from the fully qualified domain name (FQDN). Therefore, it is recommended to configure the NetScaler with a DNS server. A less preferred alternative is to create a static DNS entry.

4. Create an authentication negotiation policy with a negotiation action.
5. Configure an authentication server and bind the authentication policy to the authentication virtual server.
6. Configure an authentication service and a traffic management virtual server, and bind the service to the virtual server. You can use a load balancing or content switching virtual server.
7. Verify the configuration.

Configuration of Kerberos from the command line

The following sections give instructions to configure Kerberos from the command line.

To enable Authentication, Authorization, and Auditing (AAA) by using the NetScaler command line

At the NetScaler command prompt, type the following commands to enable AAA and verify the configuration:

- enable feature **AAA**
- show ns feature

Example

```
> enable feature aaa
 Done
> show ns feature
 Feature Acronym Status
 ------- ------- ------
1) Web Logging WL ON
 …
3) Load Balancing LB ON
4) Content Switching CS ON
5) Cache Redirection CR ON
 …
14) SSL VPN SSLVPN ON
15) AAA AAA ON
 …
26) CloudBridge CloudBridge OFF
 Done
```

To generate a keytab file and import it to the NetScaler by using the NetScaler command line

To generate the keytab file and import it onto the NetScaler, follow the procedure given below:

1. In the Active Directory, create a user for Kerberos authentication. For example,

   net user Kerb-SVC-Account **freebsd!@#456 /add**

   In the User Properties section, ensure the following settings:

   a. The **Change password at next logon option** is not selected.

   b. The **Password does not expire** option is selected.

   Map the HTTP service to the above user and export the keytab file.

   For example, run the following command from the NetScaler command line interface:

   ktpass **/out keytabfile /princ** HTTP/owa.newacp.com@NEWACP.COM **/pass** freebsd!@#456 **/mapuser** newacp\dummy **/ptype** KRB5_NT_PRINCIPAL

   If you want to map more services, repeat the above command for every service. You can give the same name or different names for the output file.

3. Get the keytab file on the NetScaler through FTP or any other means.

   Run the ktutil utility on the NetScaler and verify the keytab file. The keytab file has the entry for the HTTP service after it is imported.

   Example

   ```
   root@ns# ktutil
   ktutil: rkt /var/keytabfile
   ktutil: list
   slot KVNO Principal
   ----------------------------------------------------------------------

   ktutil: wkt /etc/ krb5.keytab
   ktutil: list
   slot KVNO Principal
   ---- ---- ---------------------------------------------------------------
   1 2 HTTP/owa.newacp.com@NEWACP.COM
   ktutil: quit
   ```

To add a DNS server by using the NetScaler command line

At the NetScaler command prompt, type the following command:

add dns nameserver <dnsIpAddress>

Note: Alternatively, you can add static host entries or use any other means so that the NetScaler can resolve the FQDN name of the domain controller to an IP address.

Example

add dns nameserver 1.2.3.4

To create a negotiation policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands:

- add authentication negotiateAction <negotiateActionName> **-domain** <domainName> **-domainUser** <domainUsername> **-domainUserPasswd** <domainUserPassword> **-encrypted**
- add authentication negotiatePolicy <negotiatePolicyName> <negotiatePolicyExpression> <negotiateActionName>

Example

add authentication negotiateAction negact -domain newacp.com -domainUser Administrator -domainUserPas
add authentication negotiatePolicy negopol ns_true negact

To create an authentication virtual server and bind the negotiation policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands:

- add authentication vserver <authVserverName> **SSL** <ipAuthVserver> **443** **-authenticationDomain** <domainName>
- bind authentication vserver <authVserverName> **-policy** <negotiatePolicyName>

Example

add authentication vserver authen1 SSL 10.102.113.166 443 -authenticationDomain newacp.com
add ssl certKey cert1 -cert "/nsconfig/ssl/complete/server/server_rsa_2048.pem" -key "/nsconfig/ssl/compl
bind ssl vserver authen1 -certkeyName cert1
bind authentication vserver authen1 -policy negopol

To create a traffic management virtual server and service, and bind the service by using the NetScaler command line

At the NetScaler command prompt, type the following commands:

- add service <serviceName> <ipBackendWebserver> HTTP 80
- add lb vserver <lbVserverName> **SSL** <ipAddressLbVserver> **443 -authn401** ON **-authnVsName** <authVserverName>
- bind lb vserver <lbVserverName> <serviceName>

Note: Use a similar procedure for using a content switching virtual server as the traffic management virtual server.

Example

```
add service svc1 10.217.28.92 HTTP 80
 add lb vserver v2 HTTP 10.102.113.164 80 -persistenceType NONE -cltTimeout 180 -authn401 ON -authnVsNa
bind lb vserver v2 svc1
```

To verify the configuration from command line

1. Access the load balancing virtual server, using the FQDN. For example, http://owa.newacp.com.
2. View the AAA session on the NetScaler. show aaa session

Example

```
ClientIp (ClientPort) ->ServerIp(ServerPort)
 ---------------------------------------------
 PE id : 4
 User name: john.smith@NEWACP.COM Session Type: TM
Done
```

Parameters for configuring Kerberos authentication

For configuring negotiation policy

For configuring the DNS server

dnsIpAddress

The IP address of the name server that is used to resolve domain names to IP addresses.

negotiateActionName

The name of the negotiate action associated with the negotiate policy.

domainName

The fully qualified domain name in which the client and KDC are present.

domainUsername

The user name of the user who can access the domain.

domainUserPassword

The password of the user who can access the domain.

negotiatePolicyName

A name for the policy you are creating. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing policies.)

negotiatePolicyExpression

A policy expression that defines the requests to be authenticated.

For configuring authentication virtual server

authVserverName

A name for the new authentication virtual server. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed after the virtual server is created.)

ipAuthVserver

The IP address of the authentication virtual server.

domainName

The fully qualified domain name in which the client and KDC are present. This domain is assigned to the authentication virtual server.

negotiatePolicyName

A name for the policy you are creating. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. (Cannot be changed for existing policies.)

For configuring traffic management virtual server and service

serviceName

Name of the service. The name must not exceed 127 characters, and the leading character must be a number or letter. The following characters are also allowed: @ _ - . (period) : (colon) # and space ( ).

ipBackendWebServer

IP address of the Web server used in backend communication.

lbVserverName

Name of the load balancing virtual server used as the traffic management virtual server.

csVserverName

Name of the content switching virtual server used as the traffic management virtual server.

ipAddressLbVserver

IP address of the load balancing virtual server.

ipAddressCsVserver

IP address of the content switching virtual server.

authVserverName

Name of the authentication virtual server associated with the traffic management virtual server.

Configuration of Kerberos from the configuration utility

The following sections give instructions to configure Kerberos from the configuration utility.

To enable Authentication, Authorization, and Auditing (AAA) on NetScaler by using the configuration utility

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features**, click **Configure basic features**.
3. In the **Configure Basic Features** dialog box, select the **Authentication, Authorization and Auditing** check box.
4. Click **OK**.
5. In the confirmation dialog box, click **Yes**. A message appears in the status bar to indicate that the feature is enabled.

To generate a keytab file and import it to the NetScaler

You can generate the keytab file and import it onto the NetScaler only from the command line. See To generate a keytab file and import it to the NetScaler by using the command line.

To add a DNS server by using the NetScaler configuration utility

1. In the navigation pane, expand **DNS**, and then click **Name Servers**.
2. In the details pane, click **Add**.
3. In the **IP Address** box, type the IP address.
4. Click **Create**, and then **Close**.
5. Verify that the details pane shows the newly added DNS server.

To create a negotiation policy by using the NetScaler configuration utility

1. In the navigation pane, expand **AAA-Application Traffic**, expand **Policies**, and then click **Authentication**.
2. In the details pane, on the **Policies** tab, click **Add**.
3. In the **Create Authentication Policy** dialog box, set the following parameters:
   - **Name**
   - **Authentication Type** - Select **NEGOTIATE**.
   - **Server** - Select an existing server from the dropdown list. To add a new authentication server, click **New…**, and in the **Create Authentication Server** dialog box, set the following parameters:
     - **Domain Name**
     - **User Name**
     - **Password**
     - **Confirm Password** - Retype the password.
   - **Expression** - In the **Named Expression** list, select **General** and select **True Value** from the dropdown list, and then click **Add Expression**.
4. Click **Create**, and then click **Close**.
5. Verify that the policy you created appears in the **Authentication Policies and Servers** pane.

To create an authentication virtual server and bind the negotiation policy by using the NetScaler configuration utility

1. In the navigation pane, expand **AAA - Application Traffic** and click **Virtual Servers**.
2. In the details pane, click **Add**.
3. In the **Create Virtual Server (Authentication)** dialog box, set the following parameters:
   - **Name**
   - **IP Address**
   - **Protocol** - Select **SSL**
   - **Domain** - Type the fully qualified domain name added while creating the keytab file.

   Note: For AAA, the protocol must be SSL protocol and port must be 443. Therefore, these options are not provided.
4. On the **Authentication** tab, click **Insert Policy**. In the **Authentication Policies** group, from the **Policy Name** dropdown list, select the negotiate authentication policy you added for Kerberos authentication.
5. On the **Certificates** tab, select an SSL certificate from the list of available certificates, and then click **Add**. If the certificate you want to bind is not displayed in the **Available Certificates** list, click **Install...**, and then select the certificate file.
6. Click **Create**, and then click **Close**. The new authentication virtual server appears in the **Authentication Virtual Servers** pane.

To create a traffic management virtual server and service, and bind the service by using the NetScaler configuration utility

1. In the navigation pane, expand **Load Balancing** and click **Services**.
2. In the details pane, click **Add**.
3. In the **Create Service** dialog box, set the following parameters:
   - **Service Name**
   - **Server**
   - **Protocol** - Select **HTTP**.
   - **Port** - Select **80**.
4. In the navigation pane, expand **Load Balancing** and click **Virtual Servers**.
5. In the details pane, click **Add**.
6. In the **Create Virtual Server (Load balancing)** dialog box, set values for the following parameters:
   - **Name**
   - **IP Address**
   - **Protocol**
   - **Port**
7. In the **Create Virtual Server (Load balancing)** dialog box, on the **Services** tab, select the service you created in Step 3 to Step 5.
8. In the **Create Virtual Server (Load balancing)** dialog box, on the **Advanced** tab, expand **Authentication Settings**, and then select the **401 Based Authentication** check box.
9. Click **Create**, and then click **Close**. The new load balancing virtual server appears in the **Load Balancing Virtual Servers** pane.
10. In the details pane, verify the settings of the virtual server.

    Note: Use a similar procedure to create a content switching virtual server.

    Note: For more information, see *Citrix NetScaler Traffic Management Guide* available at http://support.citrix.com/article/CTX128670.see *Setting up basic load balancing.*

To verify the configuration

1. Access the load balancing virtual server, using the FQDN. For example, http://owa.newacp.com.

2. View the AAA session on the NetScaler. show aaa session

Example

```
ClientIp (ClientPort) ->ServerIp(ServerPort)
 ---------------------------------------------
 PE id : 4

Configuring Kerberos Authentication on the Client

Kerberos support must be configured on the browser to use Kerberos for authentication. You can use any Kerberos-compliant browser. Instructions for configuring Kerberos support on Internet Explorer and Mozilla Firefox are given below. For other browsers, see the documentation of the browser.

To configure Internet Explorer for Kerberos authentication

1. In the **Tools** menu select **Internet Options**.

2. On the **Security** tab, click **Local Intranet**, and then click **Sites.**

3. In the **Local Intranet** dialog box, make sure that the **Automatically detect intranet network** option is checked and click **Advanced.**

4. In the **Local Intranet** dialog box, add the Web sites of the domains of the traffic management virtual server on the NetScaler. The specified sites will be considered as local intranet sites.

5. Click **Close** or **OK** to close the dialog boxes.

To configure Mozilla Firefox for Kerberos authentication

1. Make sure that you have Kerberos properly configured on your computer.
2. Type `about:config` in the URL bar.
3. In the filter text box, type `network.negotiate`.
4. Change network.negotiate-auth.delegation-uris to the domain that you want to add.
5. Change network.negotiate-auth.trusted-uris to the domain that you want to add.

   Note: If you are running Windows, you also need to enter `sspi` in the filter text box and change the network.auth.use-sspi option to `False`.

AppExpert

The following topics provide a conceptual reference and configuration instructions for the AppExpert feature, which simplifies configuration steps for the Citrix® NetScaler® appliance by using applications, application templates, Access Gateway applications, and entity templates.

AppExpert Applications and Templates	Simplify configuration steps for the Citrix® NetScaler® appliance by using applications, application templates, Access Gateway applications, and entity templates.
Access Gateway Applications	Describes how to configure Access Gateway policies for AppExpert applications, file shares, intranet subnets, and other network resources.
Entity Templates	Describes how to use entity templates to set up and configure individual NetScaler entities, such as a policy or virtual server. An entity template provides a specification and a set of defaults for the object.

AppExpert Applications and Templates

An AppExpert application is a collection of configuration information that you set up on the Citrix® NetScaler® appliance for securing and optimizing traffic for a Web application, such as Microsoft SharePoint. Managing AppExpert applications is simplified by a graphical user interface (GUI) that allows you to specify application traffic subsets and a distinct set of security and optimization policies for processing each traffic subset. Additionally, it consolidates all deployment tasks in one view, so you can quickly configure target IP addresses for clients and specify host servers.

Prebuilt application templates for widely used Web applications, such as Microsoft Outlook Web Access and Microsoft SharePoint, are available on the AppExpert Templates page of the Citrix Community Web site at http://community.citrix.com/display/ns/AppExpert+Templates.

Each prebuilt template provides you with an initial configuration for managing the associated Web application. You can customize prebuilt application templates for your organization. If a prebuilt application template does not suit your requirements, you can create a custom application without using a template.

Regardless of whether you use a prebuilt application template or you create a custom application, you can export the configuration to a template file. You can then share the template with other administrators or import the template to other NetScaler appliances that require a similar AppExpert application configuration.

To get started with an AppExpert application, you must first obtain the appropriate application template and import the template to the NetScaler appliance. After the AppExpert application is set up, you must verify that the application is working correctly. If required, you can customize the configuration to suit your requirements.

Periodically, you can verify and monitor the configuration by viewing the hit counters for various application components, statistics, and the Application Visualizer. You can also configure authentication, authorization, and auditing (AAA) policies for the application.

AppExpert Applications and Templates

An AppExpert application is a collection of configuration information that you set up on the Citrix® NetScaler® appliance for securing and optimizing traffic for a Web application, such as Microsoft SharePoint. Managing AppExpert applications is simplified by a graphical user interface (GUI) that allows you to specify application traffic subsets and a distinct set of security and optimization policies for processing each traffic subset. Additionally, it consolidates all deployment tasks in one view, so you can quickly configure target IP addresses for clients and specify host servers.

Prebuilt application templates for widely used Web applications, such as Microsoft Outlook Web Access and Microsoft SharePoint, are available on the AppExpert Templates page of the Citrix Community Web site at http://community.citrix.com/display/ns/AppExpert+Templates.

Each prebuilt template provides you with an initial configuration for managing the associated Web application. You can customize prebuilt application templates for your organization. If a prebuilt application template does not suit your requirements, you can create a custom application without using a template.

Regardless of whether you use a prebuilt application template or you create a custom application, you can export the configuration to a template file. You can then share the template with other administrators or import the template to other NetScaler appliances that require a similar AppExpert application configuration.

To get started with an AppExpert application, you must first obtain the appropriate application template and import the template to the NetScaler appliance. After the AppExpert application is set up, you must verify that the application is working correctly. If required, you can customize the configuration to suit your requirements.

Periodically, you can verify and monitor the configuration by viewing the hit counters for various application components, statistics, and the Application Visualizer. You can also configure authentication, authorization, and auditing (AAA) policies for the application.

AppExpert Application Terminology

Following are the terms used in the AppExpert applications feature and the descriptions of the entities for which the terms are used:

Public Endpoint. The IP address and port combination at which the NetScaler appliance receives client requests for the associated web application. A public endpoint can be configured to receive either HTTP or secure HTTP (HTTPS) traffic. All client requests for the web application must be sent to a public endpoint. An AppExpert application can be assigned multiple endpoints. You configure public endpoints after you import a template.

Application Unit. An AppExpert application entity that processes a subset of web application traffic and load balances a set of services that host the associated content. The subset of traffic that an application unit must manage is defined by a rule. Each application unit also defines its own set of traffic optimization and security policies for the requests and responses that it manages. The NetScaler services associated with these policies are Compression, Caching, Rewrite, Filter, Responder, and Application Firewall.

By default, every AppExpert application with at least one application unit includes a default application unit, which cannot be deleted. The default application unit is not associated with a rule for identifying requests and is always placed last in the order of application units. It defines a set of policies for processing any request that does not match the rules that are configured for the other application units, thereby ensuring that all client requests are processed.

Application units and their associated rules, policies, and actions are included in AppExpert application templates.

Service. The combination of the IP address of the server that hosts the web application instance and the port to which the application is mapped on the server, in the format <IP address>:<Port>. A web application that serves a large number of requests is usually hosted on multiple servers. Each server is said to host an instance of the web application, and each such instance of the web application is represented by a service on the NetScaler appliance. Services are deployment-specific, and are therefore not included in templates. You must configure services after you import a template.

Application Unit Rule. Either a classic expression or a default syntax expression that defines the characteristics of a traffic subset for an application unit. The following example rule is a default syntax expression that identifies a traffic subset that consists of four image types:

```
HTTP.REQ.URL.SUFFIX.EQ("bmp") || HTTP.REQ.URL.SUFFIX.EQ("gif") ||
HTTP.REQ.URL.SUFFIX.EQ("png") || HTTP.REQ.URL.SUFFIX.EQ("jpg")
```

For more information about default syntax expressions and classic policy expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX123868.

Traffic Subset. A set of client requests that require a common set of traffic optimization and security policies. A traffic subset is managed by an application unit and is defined by a rule.

How an AppExpert Application Works

When the endpoint receives a client request, the NetScaler appliance evaluates the request against the rule that is configured for the topmost application unit. If the request satisfies this rule, the request is processed by the policies that are configured for the application unit, and then forwarded to a service. The choice of service depends on which services are configured for the application, and on settings such as the load balancing algorithm and persistence method configured for the application unit.

If the request does not satisfy the rule, the request is evaluated against the rule for the next topmost application unit. In this order, the request is evaluated against each application unit rule until the request satisfies a rule. If the request does not satisfy any of the configured rules, it is processed by the default application unit, which is always the last application unit.

You can configure multiple public endpoints for an AppExpert application. In such a configuration, by default, each application unit processes requests received by all the public endpoints and load balances all the services that are configured for the application. However, you can specify that an application unit processes traffic from only a subset of the public endpoints and load balances only a subset of the services that are configured for the AppExpert application.

Getting Started with an AppExpert Application

The process of setting up an AppExpert application begins with downloading the appropriate AppExpert application template from the Citrix Community Web site at http://community.citrix.com/display/ns/AppExpert+Templates. The template that you need depends on the NetScaler release running on your appliance.

After you download the template, you must import the template to the NetScaler appliance, configure deployment settings, and then verify the configuration to make sure that the AppExpert application is working as expected.

Importing an AppExpert Application Template

You can either import the template file directly from your local computer or upload the template to the appliance and then import it. For more information about uploading a template to the NetScaler appliance, see Uploading and Downloading Template Files.

During import, along with the template file that you specify in the AppExpert Template Wizard, you can include a deployment file that contains deployment details. If you choose to include a deployment file, you do not have to provide any additional information. All application-configuration information is imported from the template file and all deployment-specific information for the application is imported from the deployment file. The NetScaler appliance imports all configuration settings from the deployment file through the NITRO API and the wizard displays the configuration summary screen for your verification. If you do not include a deployment file, the wizard displays screens on which you can specify deployment information. During import, if an error occurs, the configuration changes that were made during the import process are automatically rolled back. During import, if an error occurs, any changes are automatically rolled back, preserving the configuration that was in place before you attempted to import the AppExpert application. For more information about the format of application templates and deployment files, see Understanding NetScaler Application Templates and Deployment Files. For more information about how the template and deployment files are imported through the NITRO API, see the *Citrix NetScaler NITRO SDK for C# Getting Started Guide*, the *Citrix NetScaler NITRO Getting Started Guide for REST API*, and the *Citrix NetScaler NITRO SDK for Java Getting Started Guide*.

Note: The deployment file must contain information about only one public endpoint. Additionally, the application template file and the deployment file must be valid XML files. You cannot import a template file that is in GZIP format.

During import, you can configure deployment settings such as a public endpoint, services, and service groups. During import, you configure only one public endpoint, but you can specify as many services and service groups as you want the AppExpert application to manage. After you import the template, you can specify additional endpoints, services, and service groups for the configuration. If the public endpoint that you configure during import

uses the HTTPS protocol, you must also specify a server certificate for the public endpoint. Additionally, if variables have been configured for the template, a **Specify Variable Values** page appears in the wizard. On this page, you can choose to specify new values for the variables. For more information about configuring endpoints after you import a template, see Configuring Public Endpoints. For more information about configuring services and service groups after you import a template, see Configuring Services and Service Groups. For more information about configuring variables for a NetScaler application, see Creating Variables in Application Templates.

To import an AppExpert application template to the NetScaler appliance

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, click **Applications**, and then click **Import**.
3. Follow the instructions in the **AppExpert Template Wizard**.

Verifying and Testing the Configuration

Verification is an important step in the process of setting up the NetScaler application. Before you proceed with other configuration tasks, you must verify that the state of the entities, such as endpoints and application units, are UP and then test the entities for correct processing.

Verifying the Configuration

The graphical user interface (GUI) includes icons that indicate the states of the entities in the AppExpert application. These icons are displayed for applications and application units and are based on the health checks that the NetScaler appliance performs periodically on services and entities. The following table lists the icons and describes their meanings.

Table 1. Descriptions of State Indictor Icons

Icon	Entity	Indicates that

	Application	At least one public endpoint is up. The application will accept client requests from the public endpoints that are up.
	Application unit	The application unit is up. The application unit is up when at least one service or service group is up.
	Application	The public endpoint is out of service (disabled). This indicator is displayed when only one public endpoint is configured for the AppExpert application.
	Application	All the endpoints that are configured for the application are out of service. This indicator is displayed only when multiple endpoints are configured for the application.
	Application unit	All the services configured for the application unit are down.

You must ensure that the icons for each application and its application units are green at all times. If the icon that is displayed for an application is not green, verify that you have configured the public endpoints correctly. If the icon that is displayed for an application unit is not green, verify that the services are configured correctly. However, note that a green indicator does not mean that the state of all associated entities is UP. This only means that the application has sufficient resources (endpoints and services) to serve client requests. To verify that the state of all associated entities is UP, check the health of all the entities on the statistics page for the application. For more information about viewing the application statistics page, see Viewing Application Statistics.

Testing the Configuration by Using Hit Counters

You can test the configuration by sending test HTTP requests for web application content through the NetScaler appliance, and then verifying that the requests are being processed by the right application units by viewing the hit counters for the various AppExpert application entities. For example, to verify that the endpoint is receiving requests, you view the hit counter for the AppExpert application. To verify that the configured application unit rules are being matched as expected, you view the hit counters for the AppExpert application units.

Note: To view hit counters for policies and actions that are configured for AppExpert applications, you must go to the associated feature node. For example, to view the hit counter for a Rewrite policy that is configured for an AppExpert application, you must go to the Rewrite feature node in the NetScaler configuration utility.

For a test example, consider an AppExpert application that includes an application unit called "WebPages" for processing web page content, and an application unit called "Images" for processing images. In this example, the rule that is configured for the application unit "WebPages" includes an expression that checks whether an HTML file is being requested. The "Images" application unit includes an expression that checks whether an image file is being requested.

Consider an HTML file called "sitehome.html," located at "/var/www/html/myapplicationpages/," on a backend server with an IP address of 192.0.2.10. In addition to HTML content, the HTML file also references images stored on the server. An HTTP request for the HTML file, sent directly to the server, would be as follows:

```
http://192.0.2.10/myapplicationpages/sitehome.html
```

To send a test request for this file through the NetScaler appliance, in the URL, replace the IP address of the server with the IP address of the public endpoint that is configured for the AppExpert application. For example, if the IP address of the public endpoint is 192.0.2.11, your test URL would be as follows:

```
http://192.0.2.11/myapplicationpages/sitehome.html
```

After you send the request, you must view the hit counter for the application to verify that the public endpoint received the request, view the hit counter for the application unit "webpages" to verify that the request for the HTML file matched the rule configured for the application unit, and view the hit counter for the application unit "images" to verify that the requests for the images matched the rule configured for the application unit.

For the application, the **Hits** dialog box displays the total number of requests received by each configured public endpoint. For an application unit, the **Hits** dialog box displays the

number of requests that the application unit processed from each of the public endpoints and the total hit count.

To view the hit counter for an application or application unit

1. In the navigation pane of the configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, click the application or application unit for which you want to view the hit counter.
3. Click **Hits**.

Customizing the Configuration

After you verify that the AppExpert application is working correctly, you can customize the configuration to suit your requirements.

You can configure public endpoints and services for the AppExpert application and specify only a subset of the endpoints and services for each application unit. When you want the AppExpert application to manage a traffic subset that is not included in the template, you can either add an application unit for the new traffic subset or modify an existing application unit rule. You can also specify the order of evaluation of the traffic subsets that the AppExpert application manages.

Finally, you can modify the policies that the template provided. If the AppExpert application template does not include policies for a particular NetScaler feature, such as Rewrite or Application Firewall, you can configure your own policies.

The order in which you perform these tasks depends on your requirement. However, before you configure a service for an application, you must configure the service for the parent application.

Configuring Public Endpoints

When importing the AppExpert application template, the AppExpert Template Wizard allows you to specify only one public endpoint. After you import the AppExpert application template, you can specify additional public endpoints for the AppExpert application and then bind them to application units. A public endpoint can be configured to recieve either HTTP or secure HTTP (HTTPS) traffic.

If endpoints are already configured for the application, you can also dissociate endpoints from the AppExpert application and delete any endpoints that you no longer need. Note that when you dissociate a public endpoint from the AppExpert application, the endpoint is automatically unbound from the associated application unit, but it is not deleted from the system.

To configure public endpoints for an AppExpert application

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click **Configure Public Endpoints**.
3. In the **Choose Public Endpoints** dialog box for the application, do one of the following:
   - If the endpoints you want are listed in the dialog box, click the corresponding check boxes.
   - If you want to specify all the public endpoints, click **Activate All**.
   - If you want to dissociate endpoints from the AppExpert application, clear the corresponding check boxes.

     If you want to create a new public endpoint, click **Add**. Then, in the **Create public endpoint** dialog box, configure endpoint settings, and then click **OK**.

     In the **Create public endpoint** dialog box, you can specify only the name, IP address, port, and protocol for the endpoint. You can specify additional endpoint settings after you create the public endpoint. To specify additional endpoint settings, after you create the endpoint, in the **Choose Public Endpoints** dialog box, click the endpoint, and then click **Open**. Then, in the **Configure Public Endpoint** dialog box, provide additional settings, and then click **OK**.

     For more information about the parameters in the **Create public endpoint** and **Configure Public Endpoint** dialog boxes, see the "Content Switching" chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX123869.

     If you want to modify a public endpoint, click the endpoint, and then click **Open**. Then, in the **Configure Public Endpoint** dialog box, modify settings for the endpoint, and then click **OK**.

     For more information about the parameters in the **Configure Public Endpoint** dialog box, see the "Content Switching" chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX123869.
4. Click **Close**.

Configuring Endpoints for an Application Unit

When you configure multiple public endpoints for an AppExpert application, by default, all endpoints are bound to each application unit, and each application unit processes the requests received by all the endpoints. However, you can specify that a given application unit manages the traffic that is received by only a subset of the endpoints that are configured for the AppExpert application.

To configure endpoints for an application unit

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click **Configure Public Endpoints**.
3. In the **Choose Public Endpoints** dialog box for the application unit, do one of the following:
   - If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
   - If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.
4. Click **OK**.

Configuring Services and Service Groups

When you configure a service or service group, you either modify an existing service or service group, or add new services to the AppExpert application. You add services or service groups if you did not specify them when you imported the application template. You also add services and service groups when you increase the number of servers that host instances of the application. You can configure a service and service group for an application unit only after you configure the service or service group for the AppExpert application.

To configure a service or service group for the AppExpert application

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application for which you want to configure services or service groups, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
   - To configure services, click the **Services** tab.
   - To configure service groups, click the **Service Groups** tab.
4. On the **Service** or **Service Groups** tab, do one of the following:
   - If the services or service groups that you want are listed on the tab, click the corresponding check boxes.
   - If you want to specify all the services or service groups, click **Activate All**.
   - If you want to create a new service or service group, click **Add**. Then, in the **Create Service** dialog box or **Create Service Group** dialog box, configure settings for the service or service group, respectively, and then click **Create**.
   - If you want to modify a service, click the service, and then click **Open**. Then, in the **Configure Service** dialog box or **Create Service Group** dialog box, configure settings for the service or service group, respectively, and then click **OK**.

For information about the settings in the **Create Service**, **Configure Service**, and **Create Service Group** dialog boxes, see the "Load Balancing" chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX123869.

Configuring Services, Service Groups, and Load Balancing Parameters for an Application Unit

When you configure services and service groups for an AppExpert application, by default, all the services and service groups are bound to each application unit. However, depending on how you have configured your web application, the application resources that are managed by an application unit might be hosted on only some of the servers that are configured as services for the AppExpert application. Or, a set of servers might host content that is meant for the requests received at one or more specific public endpoints. In such scenarios, if all the services and service groups that are configured for the AppExpert application are associated with the application unit, a request that is forwarded to a server that does not host the requested content might not be served or might be served incorrect content. Therefore, you must ensure that each application unit is configured to manage only those services that can serve the requested content.

When configuring services and service groups for an application unit, you might choose to specify load balancing settings such as the weights that services must be assigned and the desired load balancing, persistence, and spillover methods. For more information about these settings, see the "Load Balancing" chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX123869.

To configure services or service groups for an application unit

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
   - To configure services, click the **Services** tab.
   - To configure service groups, click the **Service Groups** tab.
4. In the **Services** or **Service Groups** tab, do one of the following:
   - Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the **Weight** column, specify the weight that you want to assign to each configured service.
   - To specify all services or service groups, click **Activate All**.
5. On the **Method and Persistence** and **Advanced** tabs, specify the desired parameters.
6. Click **OK**.

Creating Application Units

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Create Application Unit** dialog box, specify values for the following parameters:
   - **Name***—The name that you want to assign to the application unit.
   - **Rule***—The rule that identifies the traffic subset that the application unit will manage.
   - **Classic Syntax**—To specify that you want to configure a classic expression in the **Rule** box, click this option button.
   - **Default Syntax**—To specify that you want to configure a default syntax expression in the **Rule** box, click this option button.

   *A required parameter
4. Click **Create**.

Configuring Application Unit Rules

You might want to configure an application unit rule to include or exclude certain types of traffic. When you configure the rule, you can also define the syntax of the expression.

To configure an application unit rule

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application unit for which you want to modify the rule, and then click **Open**.
3. In the **Configure Application Unit** dialog box, do the following:
   a. To specify the format of the new expression, do one of the following:
      - To specify that you want to configure a classic expression in the **Rule** box, click **Classic Syntax**.
      - To specify that you want to configure an advanced expression in the **Rule** box, click **Default Syntax**.
   b. In the **Rule** box, configure the expression.

      For more information, see the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX123868.
4. Click **OK**.

Specifying the Order of Evaluation of Application Units

Application unit rules are evaluated in the order in which they are placed in the graphical user interface (GUI). The rule that is configured for the topmost application unit is always configured first, followed by the rule that is configured for the second topmost application unit, and so on. The default application unit is always evaluated last.

When a request matches the rule that is configured for an application unit, the request is processed by the application unit, and no further matching is performed. Therefore, the order of evaluation of application units becomes an important factor if the traffic subsets for two or more application units overlap. If the traffic subsets for two or more application units overlap, you must specify the order in which an incoming request is matched against the application unit rules.

To specify the order of evaluation of application units

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, do the following:
   - To move an application unit up by one step, right-click the application unit, and then click **Move Up**.
   - To move an application unit down by one step, right-click the application unit, and then click **Move Down**.

Configuring Policies for Application Units

For an AppExpert application, you can configure policies for Compression, Caching, Rewrite, Filter, Responder, and Application Firewall. The templates that you download from the Citrix Community web site provide you with a set of policies that fulfill the most common application management requirements. You might want to fine-tune or customize these policies. If the set of policies provided for a given application unit does not include policies for a particular feature, you can create and bind your own policies for that feature.

If you create an AppExpert application without using a template, you must configure all the policies that the web application needs.

The GUI uses various icons to indicate whether or not policies are configured for a feature. For an application unit, if a policy is configured for a given feature, an icon that represents the feature is displayed. For example, if a compression policy is configured for an application unit, a compression icon is displayed in the **Compression** column for the application unit. For features for which no policy is configured, an icon depicting a plus sign (+) is displayed.

Note: When configuring policies for application units, you might need to configure policies and expressions that are either in the classic or default syntax. Additionally, when you configure default syntax policies, you might need to specify parameters such as Goto expressions and invoke policy banks. For information about configuring policies and expressions in both formats, see the *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX123868.

Configuring Compression Policies

You can use either classic policies or advanced policies to configure compression, but you cannot bind compression policies of both types to the same application unit.

To configure a compression policy for an application unit

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.

2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the **Compression** column.

3. In the **Configure Compression Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

   - Click **Switch to Default Syntax** if you want to configure a default syntax compression policy. If you want to bind or configure classic compression policies, and if you are in the default syntax view, you can click **Switch to Classic Syntax** to return to the classic policy view and begin modifying bound classic policies or create and bind new classic compression policies.

     Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you are in the default syntax view, when you click **Insert Policy**, the list that appears in the **Policy Name** column will include only default syntax policies. You cannot bind policies of both types to an application unit.

   - If you want to configure classic policies, click either **Request** or **Response**, depending on whether you want the policy to be evaluated at request-time or at response-time.

     You can configure both request-time and response-time classic compression policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.

   - To modify a compression policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the **Configure Compression Policy** dialog box, modify the policy, and then click **OK**.

     For information about modifying a compression policy, see the "Compression" chapter in the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX123870.

   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.

   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.

   - To regenerate assigned priorities, click **Regenerate Priorities**.

   - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Compression Policy** dialog box, configure the policy, and then click **Create**.

For more information about creating a compression policy, see the "Compression" chapter in the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX123870.

- If you are configuring a default syntax expression, do the following:

  - In the **Goto Expression** column, select a **Goto expression**.
  - In the **Invoke** column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

Configuring Caching Policies

You can use only default syntax policies and expressions to configure Caching policies.

To configure Caching policies for an application unit

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.

2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the **Caching** column.

3. In the **Configure Cache Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

   Click either **Request** or **Response**, depending on whether you want the policy to be evaluated at request-time or at response-time.

   You can configure both request-time and response-time Caching policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.

   To modify a Caching policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the **Configure Cache Policy** dialog box, modify the policy, and then click **OK**.

   For information about modifying a Caching policy, see the "Integrated Caching" chapter in the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX123870.

   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.

   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.

   - To regenerate assigned priorities, click **Regenerate Priorities**.

     To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Cache Policy** dialog box, configure the policy, and then click **Create**.

     For information about creating a Caching policy, see the "Integrated Caching" chapter in the *Citrix NetScaler Application Optimization Guide* at http://support.citrix.com/article/CTX123870.

   - In the **Goto Expression** column, select a **Goto expression**.

   - In the **Invoke** column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

Configuring Rewrite Policies

You can use only default syntax policies and expressions to configure Rewrite policies.

To configure Rewrite policies for an application unit

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the **Rewrite** column.
3. In the **Configure Rewrite Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

   Click either **Request** or **Response**, depending on whether you want the policy to be evaluated at request-time or at response-time.

   You can configure both request-time and response-time Rewrite policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.

   To modify a Rewrite policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the **Configure Rewrite Policy** dialog box, modify the policy, and then click **OK**.

   For information about modifying a Rewrite policy, see Rewrite.

   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click **Regenerate Priorities**.

     To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Rewrite Policy** dialog box, configure the policy, and then click **Create**.

     For information about creating a Rewrite policy, see Rewrite.

   - In the **Goto Expression** column, select a **Goto expression**.
   - In the **Invoke** column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

Configuring Filter Policies

You can use only classic policies and expressions to configure Filter policies.

To configure Filter policies for an application unit

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the **Filter** column.
3. In the **Configure Filter Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

   To modify a Filter policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the **Configure Filter Policy** dialog box, modify the policy, and then click **OK**.

   For information about modifying a Filter policy, see Content Filtering.

   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click **Regenerate Priorities**.

   To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Filter Policy** dialog box, configure the policy, and then click **Create**.

   For information about creating a Filter policy, see Content Filtering.
4. Click **Apply Changes**, and then click **Close**.

Configuring Responder Policies

You can use only default syntax policies and expressions to configure Responder policies.

To configure Responder policies for an application unit

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the **Responder** column.
3. In the **Configure Responder Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

   To modify a Filter policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the **Configure Responder Policy** dialog box, modify the policy, and then click **OK**.

   For information about modifying a Responder policy, see Responder.

   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click **Regenerate Priorities**.

     To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Responder Policy** dialog box, configure the policy, and then click **Create**.

     For information about creating a Responder policy, see Responder.

   - In the **Goto Expression** column, select a **Goto expression**.
   - In the **Invoke** column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

Configuring Application Firewall Policies

You can configure both classic and default syntax policies and expressions for Application Firewall. However, if a policy of one type is already bound globally or to a virtual server that is configured on the appliance, you cannot bind a policy of the other type to an application unit. For example, if a default syntax policy is already bound either globally or to a virtual server, you cannot bind a classic policy to an application unit.

To configure Application Firewall policies for an application unit

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.

2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the **Application Firewall** column.

3. In the **Configure Application Firewall Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

   Click either **Classic Expression** or **Advanced Expression** depending on the type of expression you want to configure for the Application Firewall policy.

   Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you select **Advanced Expression**, when you click **Insert Policy**, the list that appears in the **Policy Name** column will include only default syntax policies. You cannot bind policies of both types to an application unit. This option is not available if a policy of either type is already bound either globally or to a virtual server.

   To modify a compression policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the **Configure Application Firewall Policy** dialog box, modify the policy, and then click **OK**.

   For information about modifying a Application Firewall policy, see the "Policies" chapter in the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX123855.

   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.

   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.

   - To regenerate assigned priorities, click **Regenerate Priorities**.

     To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Application Firewall Policy** dialog box, configure the policy, and then click **Create**.

     For information about creating an Application Firewall policy, see the "Policies" chapter in the *Citrix Application Firewall Guide* at http://support.citrix.com/article/CTX123855.

4. Click **Apply Changes**, and then click **Close**.

Viewing AppExpert Applications and Configuring Entities by Using the Application Visualizer

The Application Visualizer is a graphical representation of an AppExpert application. The Visualizer displays the public endpoints, application units, backend services, and policies that are configured for the application. You can use the Visualizer to obtain a visual overview of an AppExpert application's configuration and configure some of the displayed entities. By default, the Visualizer displays application units, services, and monitors for the selected application.

On NetScaler 9.3 nCore, you can also use the Application Visualizer to monitor some AppExpert application parameters. For more information about monitoring application parameters by using the Application Visualizer, see "Monitoring an Application by Using the Application Visualizer".

To view an AppExpert application by using the Application Visualizer

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.

2. In the details pane, click the name of the application that you want to view, and then click **Visualizer**.

3. Do one or more of the following:

   - To optimize the display area, choose **Best Fit**, **Zoom In**, or **Zoom out**. If an item that you want to see disappears from view after zooming in, you can click and drag the viewable area.
   - To save the graph as an image file, click **Save Image**.
   - To find a particular entity, in the **Search in** field, type an entity name. In the view area, the entity names that begin with the search string are highlighted. To restrict the search, click the drop-down menu and select the specific entity that you want to search for.
   - To view the policies that an application uses, click one or more icons to display feature-specific policies. The policy types are Compression, Filter, Rewrite, Responder, Cache, Application Firewall, Authorization, Auditing, HTML Injection, SureConnect, Priority Queuing, and Traffic.
   - To view the rule that is configured for an application unit, click the curve that connects the public endpoint to the application unit. The rule is displayed on the **Related Tasks** tab.
   - To view the binding information for an application unit, policy, or monitor, click the displayed icon, click the **Related Tasks** tab, and then click **Show Bindings**
   - To view member services, click the icon for the service, click the **Related Tasks** tab, and then click **Show Member Services**.
   - To view detailed statistics for a public endpoint or application unit, click the icon that is displayed, click the **Related Tasks** tab, and then click **Statistics**.
   - To view the **Load Balancing Visualizer** for an application unit, click the application unit, click **Related Tasks**, and then click **Visualizer**.

To configure and view entities in an AppExpert application by using the Application Visualizer

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.

2. In the details pane, click the name of the application that you want to configure or view, and then click **Visualizer**.

3. Do one or more of the following:

   - To configure an entity that is displayed in the viewing area, click the icon for the entity, click the **Related Tasks** tab, and then click **Modify public endpoint**.

     In the Application Visualizer, you can modify only public endpoints and services.
   - To bind additional monitors to a service, click the **Available Resources** tab, select **Monitors** from the drop-down list, and then click and drag a monitor to a service.
   - To unbind a service from an application unit, click the curve that connects the application unit and the service, click **Related Tasks**, and then click **Unbind**.
   - To unbind a monitor from a service, click the curve that connects the service and the monitor, click **Related Tasks**, and then click **Unbind**.
   - To modify a monitor, click the monitor, click **Related Tasks**, and then click **Open**.
   - To modify the binding parameters for a monitor, click the curve that connects the monitor to the associated service, click **Related Tasks**, and then click **Modify Parameters**.
   - To apply a common service configuration across multiple service containers that are displayed when the services bound to a vserver do not have the same configuration, click the service container whose configuration you want to apply to all the containers, and then, in **Related Tasks**, click **Apply Configuration**.
   - To view a comparative list of the parameters whose values differ across service containers, click the icon for a container, click the **Related Tasks** tab, and then click **Service Attributes Diff**. The comparative list helps you determine which service container has the service configuration that you want to apply to all the containers. After you determine which service container has the configuration you want, right-click the container, and then click **Apply this Configuration**.
   - To copy the configuration of an entity (other than the configuration of the AppExpert application) to the local computer's clipboard, click the entity, click the **Related Tasks** tab, and then click **Copy Properties**. You can then paste the configuration information in a word processing document or spreadsheet.

Monitoring a NetScaler Application

After you customize the AppExpert application, you can view application statistics to make sure that the application and all its entities are working correctly. On NetScaler 9.3 nCore, you can also use the Application Visualizer to monitor statistics associated with certain entities such as policies and virtual servers.

You can also view the hit counters for various entities at regular intervals to make sure that counters are being updated.

Viewing Application Statistics

In the **Applications** node, you can select an application and view the **Statistics** page for the application. On the **Statistics** page, you can monitor the health and states of public endpoints and application units, and view the following statistical information:

- Requests and responses per second for each of the public endpoints and application units.
- Bytes per second, at each endpoint, for incoming and outgoing traffic.
- Application unit hit counters and the number of client and server connections for each application unit.
- Statistics for the services that are bound to the application units.

On the **Statistics** page, you can also view CPU usage, memory usage, and system logs.

To view statistics for an application

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, click the application for which you want to view statistics, and then click **Statistics**.

Monitoring an Application by Using the Application Visualizer

On NetScaler 9.3 nCore, you can use the Application Visualizer to monitor the number of requests received per second at a given point in time by the vservers and the number of hits per second at a given point in time for Rewrite, Responder, and Cache policies.

To view statistical information for vservers, Rewrite policies, Responder policies, and Cache policies in the Visualizer

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, select the application for which you want to view statistical information, and then click **Visualizer**.
3. In the **Application Visualizer** window, do the following:

   To view the statistics, click **Show Stats**.

   The statistical information is displayed on the respective nodes in the Visualizer. This information is not updated in real time and has to be refreshed manually.

   - To refresh the statistical information, click **Refresh Stats**.

Viewing Hits

The hit counters that are provided for various AppExpert application entities enable you to monitor the functioning of public endpoints and application units. For an application, the Hits dialog box displays the total number of requests received by each configured public endpoint. For an application unit, the Hits dialog box displays the number of requests that the application unit processed from each of the public endpoints and the total hit count. For instructions on viewing hit counters, see Verifying and Testing the Configuration.

Deleting an Application

If you no longer need an application and its application units, you can delete it. When you delete an AppExpert application, backend services are not deleted, and any public endpoints that the application used become available for use by other applications.

When deleting an application, you are also prompted to specify whether you want to delete any bound policies and actions that are not used elsewhere.

To delete an application

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, click the name of the application that you want to delete, and then click **Remove**.

Configuring Authentication, Authorization, and Auditing

You can configure Authentication, Authorization, and Auditing (AAA) for the applications that you configure on the appliance. An authentication policy that is configured for an application defines the type of authentication to apply when a user or group attempts to access the application. If external authentication is used, the policy also specifies the external authentication server. Authorization policies configured for an application specify whether a particular user or group can access the application. Auditing policies define the audit log type, the level at which logging is performed, and other audit server settings. Authentication and auditing policies use the classic policy format.

Authentication policies, authorization policies, and auditing policies can be configured in any order. However, before you configure AAA for an application, you must configure a public endpoint for the application.

Configuring Authentication

Configuring authentication for an application involves specifying an authentication FQDN, an authentication virtual server, a server certificate, and authentication and session policies. Authentication policies are automatically bound to the authentication virtual server specified for the application.

To configure authentication for an AppExpert application

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, click the name of the application for which you want to configure authentication, and then click **Authentication**.
3. In the **Authentication Wizard**, on the **Introduction** page, click **Next**.
4. Follow the instructions in the **Authentication Wizard**.

Configuring Authorization

You can configure authorization for users and groups to enable then to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure permissions for a AAA user or group to access an AppExpert application

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, click the AppExpert application for which you want to configure user or group access, and then click **Authorization**.
3. Do one of the following:
   - If the AAA user or group for which you want to configure permissions is already in the **Groups/Users** tree, drag the user or group from the **Groups/Users** tree to the **Users** or **Groups** node in the application tree. Then, right-click the user or group and click **Allow**.

     If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the application tree, right-click **Users** or **Groups**, and then click **Add**. In the **Create AAA Group** or **Create AAA User** dialog box, fill in the values, click **Create**, and then click **Close**.

     The user or group is created with the permission set to **Allow**. To change the permission setting, right-click the group or user, and then click the permission setting.
4. Click **Close**.

Configuring Auditing

When you configure auditing policies for an application, you must specify the server to which the log messages must be directed, the format of the messages logged, and the log level. Optionally, you can configure other settings, such as the log facility and date format. Auditing policies are automatically bound to all the AppExpert application’s public endpoints.

To configure auditing policies for an application

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.

2. In the details pane, click the application for which you want to configure auditing policies, and then click **Auditing**.

3. In the **Configure Auditing Policies** dialog box, click **Insert Policy**.

   To specify an existing auditing policy, under **Policy Name**, click the name of the policy, and then do the following:

   - To modify the priority that is assigned to the policy by default, under **Priority**, double-click the priority, and then type a new priority value.

   - To modify the settings of the audit server, under **Server**, double-click the name of the server, and then, in the **Configure Auditing Server** dialog box, modify the settings as appropriate. You can modify all the settings in this dialog box except the name of the audit server and the audit type. For more information about the settings in the **Configure Auditing Server** dialog box, see Auditing Policies.

   To create a new auditing policy, under **Policy Name**, click **New Policy**, and then, in the **Create Auditing Policy** dialog box, do the following:

   - In the **Name** box, type a name for the policy.

   - The **Name** box already contains the string that is required at the beginning of the server name. You cannot modify the string.

   - From the **Auditing Type** list, select the auditing type (either **SYSLOG** or **NSLOG**).

   - If the audit server you want to specify is already listed in the **Server** list, select the server from the list, and then, if you want to modify the server settings, click **Modify**. In the **Configure Auditing Server** dialog box, modify the settings as appropriate, and then click **OK**. For more information about the settings in the **Configure Auditing Server** dialog box, see Auditing Policies.

   - If you want to configure a new audit server, click **New**, and then, in the **Create Auditing Server** dialog box, type a name for the server, specify the server IP address, port number, and other settings as appropriate. When finished, click **OK**.

   - Click **Create**.

   - To change the priorities for the new auditing policies you created, under **Priority**, for each policy for which you want to change the priority, double-click the priority value and type new priority value.

   - To regenerate priorities, click **Regenerate Priorities**.

   - To unbind a policy, click the policy, and then click **Unbind Policy**.

   - To modify a policy, click the policy, and then click **Modify Policy**.

4. Click **Apply Changes**, and then click **Close**.

Disabling AAA for an Application

After you configure AAA for an application, you can disable the AAA configuration for that application. When you disable AAA for an application, the configuration is not lost. You can enable AAA for the application when you want to reapply the configuration.

To enable or disable AAA for an application

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, click the application for which you want to enable or disable AAA, and then do one of the following:
   - To disable AAA for the application, click **Turn Off AAA**.
   - To enable AAA for the application, click **Turn On AAA**.

Setting Up a Custom NetScaler Application

If an AppExpert application template is not available for the Web application that you want to manage through the NetScaler appliance, or if available AppExpert application templates do not suit your requirements, you can create an AppExpert application without a template.

To create an AppExpert application without a template, you must first create an application and application units. Then, you configure public endpoints, services, and service groups. Finally, you configure the policies that determine how application traffic is evaluated and processed.

After you create the application and application units and configure policies, you must verify the configuration and test it to make sure that it is working correctly, just as you would when you configure an application by using a prebuilt AppExpert application template. Then, you must monitor the application to make sure that the application and its entities are working correctly.

Creating an Application

When you create an AppExpert application, the appliance creates a container to which you can add application units. The *default* application unit is not created until you create the first application unit.

To create an AppExpert application

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click **Applications**, and then click **Add**.
3. In the **Create Application** dialog box, in **Name**, enter a name for the application, and then click **OK**.

Creating Application Units

For each subset of traffic associated with your web application, you must create an application unit.

To create an application unit for the AppExpert application

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Create Application Unit** dialog box, specify values for the following parameters:
   - **Name***—The name that you want to assign to the application unit.
   - **Rule***—The rule that identifies the traffic subset that the application unit will manage.
   - **Classic Syntax**—To specify that you want to configure a classic expression in the **Rule** box, click this option button.
   - **Default Syntax**—To specify that you want to configure a default syntax expression in the **Rule** box, click this option button.

   *A required parameter
4. Click **Create**.

Configuring Public Endpoints for an AppExpert Application

After you have created all the application units that you require, you must configure one or more public endpoints to enable clients to access the web application through the NetScaler appliance.

To configure public endpoints for an AppExpert application

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click **Configure Public Endpoints**.
3. In the **Choose Public Endpoints** dialog box for the application, do one of the following:
   - If the endpoints you want are listed in the dialog box, click the corresponding check boxes.
   - If you want to specify all the public endpoints, click **Activate All**.
   - If you want to dissociate endpoints from the AppExpert application, clear the corresponding check boxes.

     If you want to create a new public endpoint, click **Add**. Then, in the **Create public endpoint** dialog box, configure endpoint settings, and then click **OK**.

     In the **Create public endpoint** dialog box, you can specify only the name, IP address, port, and protocol for the endpoint. You can specify additional endpoint settings after you create the public endpoint. To specify additional endpoint settings, after you create the endpoint, in the **Choose Public Endpoints** dialog box, click the endpoint, and then click **Open**. Then, in the **Configure Public Endpoint** dialog box, provide additional settings, and then click **OK**.

     For more information about the parameters in the **Create public endpoint** and **Configure Public Endpoint** dialog boxes, see the "Content Switching" chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX123869.

     If you want to modify a public endpoint, click the endpoint, and then click **Open**. Then, in the **Configure Public Endpoint** dialog box, modify settings for the endpoint, and then click **OK**.

     For more information about the parameters in the **Configure Public Endpoint** dialog box, see the "Content Switching" chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX123869.
4. Click **Close**.

Configuring Public Endpoints for an Application Unit

For an application unit, you specify public endpoints in the same way as you would specify public endpoints for an application that is created from an AppExpert application template. For more information about specifying a subset of the endpoints for an application unit, see "Configuring Endpoints for an Application Unit".

To configure endpoints for an application unit

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click **Configure Public Endpoints**.
3. In the **Choose Public Endpoints** dialog box for the application unit, do one of the following:
   - If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
   - If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.
4. Click **OK**.

Configuring Services and Service Groups for an AppExpert Application

Services and service groups are available for application units only after you configure the services and service groups for the AppExpert application. Therefore, you must configure services and service groups for the AppExpert application before you configure the services for the application units. All the services and service groups that you configure for an AppExpert application must use the same protocol (either HTTP or HTTPS). The procedure for configuring services and service groups for an AppExpert application that is not created from a template is the same as that for an application created from a template.

To configure a service or service group for the AppExpert application

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application for which you want to configure services or service groups, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
   - To configure services, click the **Services** tab.
   - To configure service groups, click the **Service Groups** tab.
4. On the **Service** or **Service Groups** tab, do one of the following:
   - If the services or service groups that you want are listed on the tab, click the corresponding check boxes.
   - If you want to specify all the services or service groups, click **Activate All**.
   - If you want to create a new service or service group, click **Add**. Then, in the **Create Service** dialog box or **Create Service Group** dialog box, configure settings for the service or service group, respectively, and then click **Create**.
   - If you want to modify a service, click the service, and then click **Open**. Then, in the **Configure Service** dialog box or **Create Service Group** dialog box, configure settings for the service or service group, respectively, and then click **OK**.

For information about the settings in the **Create Service**, **Configure Service**, and **Create Service Group** dialog boxes, see the "Load Balancing" chapter in the *Citrix NetScaler Traffic Management Guide* at http://support.citrix.com/article/CTX123869.

Configuring Services and Service Groups for an Application Unit

After you configure services and service groups, you must configure services and service groups for each application unit. However, this step is not necessary if each backend service hosts all the content associated with the web application. You configure services and service groups for an application unit if the content associated with the application unit is hosted on only a subset of the backend servers.

To configure services or service groups for an application unit

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
   - To configure services, click the **Services** tab.
   - To configure service groups, click the **Service Groups** tab.
4. In the **Services** or **Service Groups** tab, do one of the following:
   - Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the **Weight** column, specify the weight that you want to assign to each configured service.
   - To specify all services or service groups, click **Activate All**.
5. On the **Method and Persistence** and **Advanced** tabs, specify the desired parameters.
6. Click **OK**.

Configuring Policies

The procedures for configuring policies for an AppExpert application that is created without using a template are the same as those for an AppExpert application that was created from a template. For more information, see "Configuring Policies for Application Units".

Creating and Managing Template Files

After you set up an AppExpert application and customize it to suit your requirements, you can create a template from the application and then share the template with other administrators. Or, you can create a template and then import the template to other NetScaler appliances that require a similar AppExpert application configuration. This simplifies and expedites the process of setting up similar applications on other appliances.You can also export a content switching configuration to a template file. When creating a template file, you can configure variables in the policy expressions and actions that are configured for an application.

AppExpert application template files can be exported either to the template directory on the NetScaler appliance or to a folder on your local computer. You can then upload and download the templates to and from the NetScaler appliance and rename the templates that are stored in the AppExpert application templates directory on your appliance.

Exporting an AppExpert Application to a Template File

When you export an AppExpert application, all application-configuration information is exported to a template file and all deployment-specific information is exported to a deployment file. The string "_deployment" is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the NetScaler appliance, the template file is stored in the /nsconfig/nstemplates/applications directory on the NetScaler appliance and the deployment file is stored in the /nsconfig/nstemplates/applications/deployment_files/ directory. For more information about the format of application templates and deployment files, see "Understanding NetScaler Application Templates and Deployment Files". If you have configured Access Gateway policies for the NetScaler application, when you export the AppExpert configuration, you can choose to include the Access Gateway policies in the template. For information about configuring Access Gateway policies for an AppExpert application, see "Access Gateway Applications".

To export an AppExpert application to a template file

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.

2. In the details pane, click the name of the application that you want to export as a template file, and then click **Export**.

3. In the **Export...as Template** dialog box, do the following:

   a. In the **Name** box, modify the name of the template, if necessary.

   b. If you want to configure variables for the template, click **Configure Variables**, and then, in the **Configure Variables** dialog box, configure the variables that you want.

      For more information about configuring variables in application templates, see "Creating Variables in Application Templates".

   c. If you want to export the template file to the application templates directory on the appliance, make sure that **Browse (Appliance)** is displayed.

   d. If you want to export the template file to your computer, click the **Browse (Appliance)** drop-down menu, click **Local**, browse to the location to which you want to save the file, and then click **Save**.

   e. Provide the following information:

      - **Introduction Description**—Any text that introduces the AppExpert application template during import. This text is displayed on the **Specify Application Name** page of the **AppExpert Template Wizard** when the template is imported.

      - **Summary Description**—Any summary that you might want to display on the **Summary** page of the **AppExpert Template Wizard** when the template is imported.

      - **Author**—The name of the author of the template.

      - **Major**—The major version number of the template.

      - **Minor**—The minor version number of the template. This number is appended to the major version number and displayed on the **Summary** page of the **AppExpert Template Wizard**, during import, in the format Major.Minor.

   f. Click **OK**.

      If Access Gateway policies have been configured for the application, you will be prompted to include the Access Gateway configuration in the application template. If you want to include the Access Gateway configuration in the template, at the prompt, click **Yes**.

Exporting a Content Switching Virtual Server Configuration to a Template File

You can also export a content switching configuration as an application template. You can export a content switching virtual server configuration to an application template either from the Content Switching Virtual Servers pane or from the Content Switching Visualizer. Configuration information, which includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies, is exported to a template file and all deployment-specific information is exported to a deployment file. The string "_deployment" is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the NetScaler appliance, the template file is stored in the /nsconfig/nstemplates/applications directory on the NetScaler appliance and the deployment file is stored in the /nsconfig/nstemplates/applications/deployment_files/ directory. For more information about the format of application templates and deployment files, see "Understanding NetScaler Application Templates and Deployment Files".The configuration information that is exported includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies.

However, if the content switching virtual server is already configured as the public endpoint for an AppExpert application, you cannot export the configuration to a template file. In this scenario, you must export the associated AppExpert application to a template. For more information about exporting an AppExpert application to a template file, see "Exporting an AppExpert Application to a Template File".

To export a content switching configuration to an application template file from the Content Switching Virtual Servers pane

1. In the navigation pane of the NetScaler configuration utility, expand **Content Switching**, and then click **Virtual Servers**.
2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click **Create AppExpert Template**.
3. Perform steps 4 through 6 described in To export a content switching configuration to an application template file from the Content Switching Visualizer.

To export a content switching configuration to an application template file from the Content Switching Visualizer

1. In the navigation pane of the NetScaler configuration utility, expand **Content Switching**, and then click **Virtual Servers**.

2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click **Visualizer**.

3. In the **Content Switching Visualizer**, click the icon for the content switching vserver, click **Related Tasks**, and then click **Create Template**.

4. In the **Export...as Template** dialog box, enter a name for the template file, and then do one of the following:

   - To export the template file to the appliance, make sure that **Browse (Appliance)** is displayed.

   - To export the template file to your computer, click the **Browse (Appliance)** drop-down menu, click **Local**, browse to the location to which you want to save the file, and then click **Save**.
5. Provide the following information:

   - **Introduction Description**—Any text that introduces the AppExpert application template during import. This text is displayed on the **Specify Application Name** page of the **AppExpert Template Wizard** when the template is imported.

   - **Summary Description**—Any summary that you might want to display on the **Summary** page of the **AppExpert Template Wizard** when the template is imported.

   - **Author**—The name of the author of the template.

   - **Major**—The major version number of the template.

   - **Minor**—The minor version number of the template. This number is appended to the major version number and displayed on the **Summary** page of the **AppExpert Template Wizard**, during import, in the format `Major.Minor`.
6. Click **OK**.

Creating Variables in Application Templates

Application templates support the declaration of variables in the policy expressions and actions that are configured for an application. The ability to declare variables in policy expressions and actions enables you to replace preconfigured values in expressions (for example, configurable parameters such as the host name of a server or the target for a Rewrite action) with values that suit the environment into which you are importing the template. If variables have been configured for an AppExpert application template, the AppExpert Template Wizard, which appears when you import an AppExpert application template, includes a **Specify Variable Values** page on which you can specify appropriate values for the variables that are configured for the template.

As an example, consider the following policy expression that is configured to evaluate the value of the Host header in an HTTP request:

```
HTTP.REQ.HEADER("Host").CONTAINS("server1")
```

If you want the server name to be configurable at import time, you can specify the string "server1" as a variable. When importing the template, you can specify a new value for the variable on the **Variables** tab.

After you create a variable, you can do the following:

- Assign additional strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable.

 In the export application template wizard, you can define variables in certain fields (fields with an adjacent button) for the following entities:

- Cache policies
- Rewrite policies
- Rewrite actions
- Responder policies
- Responder actions

To configure a variable in a policy expression or action

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application that you want to export to a template file, and then click **Export**.
3. In the **Export...as Template** dialog box, modify the default template file name if required, specify the location where you want to save the template, and then click **Configure Variables**.
4. In the **Configure Variables** dialog box, click the tab that lists the policy expression or action for which you want to configure a variable, select the expression, and then click **Configure Variables**.
5.  In the **Variables** dialog box, click the button next to the expression or value in which you want to create a variable.
6. In the **Variables** dialog box, do the following:

   To create a variable, in the text box that displays the configured expression or value, select the string that you want to be configurable at import time, and then click **Add**. In the **Add Variable** dialog box, specify a name and a description for the variable, and then click **Create**.

   - The name of the variable, its value, and the description you provided appear in the **Available Variables** listing in the dialog box. The name you provide will be the name of the associated field in the template import wizard, and the description will appear as alt text when the user positions the mouse pointer over the field.
   - To modify a variable, in the **Available Variables** list, click the variable, and then click **Open**. In the **Add Variable** dialog box, modify the value and the description, and then click **OK**.
   - To view all the strings that are assigned to a given variable, in the **Available Variables** listing, click the name of the variable. The strings that are assigned to the variable are highlighted.
   - To view a list of all the entities and parameters in which the variable is used, in the **Available Variables** listing, click the variable whose references you want to view, and then click **Show References**.

     To assign a string to an existing variable, in the text box that displays the expression you configured, select the string you want to assign to an existing variable, right-click the selection, click **Use Existing Selection**, and then click the name of the variable to which you want to assign the string.

     If a variable has multiple strings assigned to it, when you specify a new value for the variable during import, all strings assigned to the variable are replaced with the new value.
7. Click **Close**.

Uploading and Downloading Template Files

Template files can be uploaded from your local computer to the NetScaler appliance or downloaded from the appliance to your local computer. On the appliance, AppExpert application templates are always stored in the AppExpert application templates directory, which is /nsconfig/nstemplates/applications/.

To upload an AppExpert application template from your local computer to the NetScaler appliance

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Templates**.
2. In the details pane, click **Manage Templates**.
3. In the **Manage Application Templates** dialog box, click **Application Templates**, and then click **Upload**.
4. In the **Upload Application Template** dialog box, browse to the directory in which the template file is stored, click the template file, and then click **Select**.

   The template file is uploaded to the AppExpert application template directory on the appliance.

To download an AppExpert application template from the NetScaler appliance to your local computer

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Templates**.
2. In the details pane, click **Manage Templates**.
3. In the **Manage Application Templates** dialog box, click the **AppExpert** application template that you want to download, and click **Download**.
4. In the **Download Application Template** dialog box, browse to the location to which you want to save the file, and then click **Save**.

Renaming an Application Template

You can rename an application template that is stored in the AppExpert application templates folder on the appliance.

To rename an AppExpert applications template

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Templates**.
2. In the details pane, click **Manage Templates**.
3. In the **Manage Application Templates** dialog box, click the AppExpert application template that you want to rename, and then click **Rename**.
4. Enter a new name for the template, and then click **Close**.

Deleting an AppExpert Application Template

You can delete an application template that you no longer need.

To delete an AppExpert application template

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Templates**.
2. In the details pane, click the template that you want to delete, and then click **Remove**.

Understanding NetScaler Application Templates and Deployment Files

When you export a NetScaler application, the following two files are automatically created:

- **NetScaler application template file.** Contains application-configuration information such as application units, rules, and configured policies.
- **Deployment file.** Contains deployment-specific information such as public endpoints, services, associated IP addresses, and configured variables.

In the application template and deployment file, each unit of application-configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, each public endpoint and associated endpoint details are encapsulated within the `<appendpoint>` and `</appendpoint>` tags, and all the endpoint elements are encapsulated within the `<appendpoint_list>` and `</appendpoint_list>` tags.

Note: After you export a NetScaler application, you can add elements, remove elements, and modify existing elements before importing the application to a NetScaler appliance.

Example of a NetScaler Application Template

Following is an example of a template file that was created from a NetScaler application called "SharePoint_Team_Site":

```
<?xml version="1.0" encoding="UTF-8" ?>
<template>
<template_info>
  <application_name>SharePoint_Team_Site</application_name>
  <templateversion_major>1</templateversion_major>
  <templateversion_minor>1</templateversion_minor>
  <author>Ed</author>
  <introduction>An application for managing a SharePoint team site with images, reports, and, XML content.
  <summary>This template includes variables</summary>
  <version_major>9</version_major>
  <version_minor>3</version_minor>
  <build_number>38</build_number>
</template_info>
<apptemplate>
  <rewrite>
    <rewriteaction_list>
      <rewriteaction>
        <name>Rw_name</name>
        <type>replace</type>
        <target>HTTP.REQ.BODY(10000).AFTER_REGEX(re/number/).BEFORE_REGEX(re/address/)</target>
        <stringbuilderexpr>"NA"</stringbuilderexpr>
```

```
            <allow_unsafe_pi1>NO</allow_unsafe_pi1>
          </rewriteaction>
          <rewriteaction>
            .
            .
            .
          </rewriteaction>
          .
          .
          .
        </rewriteaction_list>
        <rewritepolicy_list>
          <rewritepolicy>
            <name>Rw_number_NA</name>
            <rule>HTTP.REQ.BODY(100000).CONTAINS("admin")</rule>
            <action>Rw_name</action>
          </rewritepolicy>
          <rewritepolicy>
            .
            .
            .
          </rewritepolicy>
          .
          .
          .
        </rewritepolicy_list>
      </rewrite>
      <appunit_list>
        <appunit>
          <name>SharePoint_Team_Sitedefault</name>
          <rule />
          <expressiontype>PE</expressiontype>
          <servicetype>HTTP</servicetype>
          <ipv46>0.0.0.0</ipv46>
          <ipmask>*</ipmask>
          <port>0</port>
          <range>1</range>
          <persistencetype>NONE</persistencetype>
          <timeout>2</timeout>
          <persistencebackup>NONE</persistencebackup>
          <backuppersistencetimeout>2</backuppersistencetimeout>
          <lbmethod>LEASTCONNECTION</lbmethod>
          <persistmask>255.255.255.255</persistmask>
          <v6persistmasklen>128</v6persistmasklen>
          <pq>OFF</pq>
          <sc>OFF</sc>
          <m>IP</m>
          <datalength>0</datalength>
          <dataoffset>0</dataoffset>
          <sessionless>DISABLED</sessionless>
          <state>ENABLED</state>
          <connfailover>DISABLED</connfailover>
          <clttimeout>180</clttimeout>
          <somethod>NONE</somethod>
          <sopersistence>DISABLED</sopersistence>
          <redirectportrewrite>DISABLED</redirectportrewrite>
```

```
        <downstateflush>DISABLED</downstateflush>
        <gt2gb>DISABLED</gt2gb>
        <ipmapping>0.0.0.0</ipmapping>
        <disableprimaryondown>DISABLED</disableprimaryondown>
        <insertvserveripport>OFF</insertvserveripport>
        <authentication>OFF</authentication>
        <authn401>OFF</authn401>
        <push>DISABLED</push>
        <pushlabel>none</pushlabel>
        <l2conn>OFF</l2conn>
      </appunit>
      <appunit>
        .
        .
        .
      </appunit>
      .
      .
      .
    </appunit_list>
    </apptemplate>
    <parameters>
      <property_list>
        <property>
          <variable_definition_list>
            <variable_definition>
              <name>body_size</name>
              <defaultvalue>10000</defaultvalue>
              <description>Evaluation Scope</description>
              <startindex>14</startindex>
              <length>5</length>
            </variable_definition>
            .
            .
            .
          </variable_definition_list>
          <object_type>rewriteaction</object_type>
          <object_name>Rw_name</object_name>
          <name>target</name>
        </property>
        .
        .
        .
      </property_list>
    </parameters>
</template>
```

Example of a Deployment File

Following is the deployment file associated with the "SharePoint_Team_Site" application in the preceding example:

```
<?xml version="1.0" encoding="UTF8" ?>
<template_deployment>
  <template_info>
    <application_name>SharePoint_Team_Site</application_name>
    <templateversion_major>1</templateversion_major>
    <templateversion_minor>1</templateversion_minor>
    <author>Ed</author>
    <introduction>An application for managing a SharePoint team site with images, reports, and, XML conter
    <summary>This template includes variables</summary>
    <version_major>9</version_major>
    <version_minor>3</version_minor>
    <build_number>38</build_number>
  </template_info>
  <appendpoint_list>
    <appendpoint>
      <ipv46>10.111.111.1</ipv46>
      <port>80</port>
      <servicetype>HTTP</servicetype>
    </appendpoint>
  </appendpoint_list>
  <service_list>
    <service>
      <ip>10.102.29.5</ip>
      <port>80</port>
      <servicetype>HTTP</servicetype>
    </service>
    <service>
      .
      .
      .
    </service>
    .
    .
    .
  </service_list>
  <variable_list>
    <variable>
      <name>body_size</name>
      <description>Evaluation Scope</description>
      <value>10000</value>
    </variable>
    <variable>
      .
      .
      .
    </variable>
    .
    .
    .
  </variable_list>
</template_deployment>
```

Access Gateway Applications

When you configure an AppExpert application to manage a web application through the Citrix® NetScaler® appliance, you also create a set of application units and configure a set of traffic optimization and security policies for each unit. The policies that you configure for each application unit (policies for features such as Compression, Caching, and Rewrite) evaluate traffic that is meant only for that unit. In addition to these policies, you might want to configure Access Gateway policies for the application as a whole to optimize the application traffic when accessed through the Access Gateway. The Access Gateway Applications feature enables you to configure Access Gateway policies (Authorization, Traffic, Clientless Access, and TCP Compression) for an AppExpert application. After you configure Access Gateway policies for AppExpert applications, you can include the policy configuration in the AppExpert application templates that you create.

You can also configure Access Gateway policies for intranet subnets, file shares, and other network resources.

Finally, you can create bookmarks for AppExpert applications and certain resources if you want users to be able to access them from the Access Gateway home page.

You can configure the entities in the Access Gateway Applications feature only by using the configuration utility.

How an Access Gateway Application Works

When you create an AppExpert application in the Applications node in the configuration utility, a corresponding Access Gateway application is automatically created in the Access Gateway Applications node. Additionally, a rule that uses the AppExpert application's configured public endpoint is automatically created for the Access Gateway application entry. If multiple endpoints are configured for the AppExpert application, the rule includes all the configured public endpoints. The NetScaler appliance uses this rule to apply any configured Access Gateway policies to the traffic received at the AppExpert application's public endpoint. Traffic received at the AppExpert application's public endpoint is first evaluated against the Access Gateway policies and then evaluated against the policies configured for AppExpert application's application units.

The rule that is automatically created for the Authorization, Traffic, and TCP Compression policies for an Access Gateway application is a classic expression that uses the public endpoint that is configured for the AppExpert application. The rule that is created for the Clientless Access policies for an Access Gateway application is an advanced expression that also uses the public endpoint that is configured for the AppExpert application. Therefore, before you configure Access Gateway policies for an AppExpert application, you must configure public endpoints for the AppExpert application.

When you include the Access Gateway configuration in an application template, deployment-specific information, such as IP address and port information, and the rule that is created from this information are not included in the template.

How a NetScaler Configuration for a File Share Works

On the NetScaler appliance, you can configure Authorization policies for a file share that is hosted on your organization's network.

When you create a file share, you specify a name for the file share and the network path to the file share. In the network path, you can specify either the name of the server or the server IP address. A rule that uses the components of the file share path is automatically created for the file share. This rule enables the appliance to identify requests for files hosted on the file share server. Any Authorization policies that are configured for the file share are applied to incoming requests.

The NetScaler configuration for a file share cannot be saved in AppExpert application templates.

How a NetScaler Configuration for an Intranet Subnet Works

For the intranet subnets that form a part of your network, you can configure policies for Authorization, Traffic, and TCP Compression on the NetScaler appliance. When adding an intranet subnet, you specify the IP address and the netmask of the intranet subnet. A rule that uses these two parameters is automatically created for the intranet subnet. The appliance applies the configured policies to any request that has a destination IP address and netmask set to the subnet's IP address and netmask, respectively.

The NetScaler configuration for an intranet subnet cannot be saved in AppExpert application templates.

How the Other Resources Category Works

The Other Resources category enables you to configure Access Gateway policies for any network resource by using a rule of your choice. When you configure the NetScaler appliance to process requests for the network resource, you configure a classic expression to identify the requests that are associated with the network resource. You can configure Authorization, Traffic, Clientless Access, and TCP Compression policies for a network resource in Other Resources. The NetScaler appliance applies the configured Access Gateway policies to any requests that match the configured rule.

The NetScaler configuration for a network resource in Other Resources cannot be saved in AppExpert application templates.

Entity Naming Conventions

The Access Gateway Applications feature enforces a naming convention for some of the entities that you create in this feature. For example, the names of the profiles that you create for Traffic policies for an intranet subnet always begin with a string that consists of the name of the intranet subnet followed by an underscore (_). The name that you provide for the entity is appended to this string. If the name of a subnet is "subnet1," the name of the profile begins with "subnet1_." When such a naming convention is required (in the text box in which you type the name of an entity, for example), the user interface automatically inserts the string with which the name of the entity must begin and does not allow you to modify it.

Adding File Shares

When creating a file share, you provide the network path to the file share. Any policies that you configure for a file share use the rule that is automatically created when you created the file share.

To configure a file share

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, click **File Shares**, and then do one of the following:
   - To add a file share, click **File Shares**, and then click **Add**.
   - To modify a file share, click **File Shares**, and then click **Open**.
3. In the **Create File Share** or **Configure File Share** dialog box, do the following:
   a. In the **Name** box, type a name for the file share you are adding. This parameter cannot be changed for an existing file share.
   b. In the **Path** box, type the path to the file share.

      The path to the file share may use either the name of the server or the IP address of the server.
   c. In **Bookmark**, in the **Text to Display** box, type a name for the file share as you would want it to appear on the Access Gateway home page.
   d. Click **Create** or **OK**, and then click **Close**.

Adding Intranet Subnets

You can specify authorization and Traffic policies for traffic that is bound for the intranet subnets that are configured in your network. The rules for these policies are automatically created by using the parameters you specify for the subnet.

To configure an intranet subnet

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, do one of the following:
   - To add an intranet subnet, click **Intranet Subnets**, and then click **Add**.
   - To modify an intranet subnet, click an intranet subnet, and then click **Open**.
3. In the **Create Intranet Subnet** or **Configure Intranet Subnet** dialog box, do the following:
   a. In the **Name** box, type a name for the intranet subnet you are adding. This parameter cannot be changed for an existing intranet subnet.
   b. In the **IP Address** box, type the IP address of the intranet subnet.
   c. In the **Netmask** box, type the netmask that will be used for the intranet subnet.
   d. Click **Create** or **OK**, and then click **Close**.

Adding Other Resources

For a network resource that you add to Other Resources, you must configure a classic expression that identifies the subset of traffic associated with the resource. For more information about configuring a classic expression, see *Citrix NetScaler Policy Configuration and Reference Guide* at http://support.citrix.com/article/CTX123868.

To configure a resource in Other Resources

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, do one of the following:
   - To add a resource, click **Other Resources**, and then click **Add**.
   - To modify a resource, click a resource, and then click **Open**.
3. In the **Create Resource** or **Configure Resource** dialog box, do the following:
   a. In the **Name** box, type a name for the resource you are adding. This parameter cannot be changed for an existing resource.
   b. In the **Rule** box, type the rule that will identify the subset of traffic that is associated with the resource you are adding.

      Alternatively, click **Configure**, and then create the rule in the **Create Expression** dialog box.
   c. Click **Create** or **OK**, and then click **Close**.

Configuring Authorization Policies

You can configure Access Gateway authorization policies for AAA users and groups to access a resource.

To configure permissions for a AAA user or group to access a resource

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, in the **Authorization** column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure authorization policies for AAA users and groups.
3. Do one of the following:
   - If the AAA user or group for which you want to configure permissions is already in the **Groups/Users** tree, drag the user or group from the **Groups/Users** tree to the **Users or Groups** node in the <application name> tree. Then, right-click the user or group and click **Allow**.

     If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the <application name> tree, right-click **Users or Groups**, and then click **Add**. In the **Create AAA Group** or **Create AAA User** dialog box, fill in the values, click **Create**, and then click **Close**.

     The user or group is created with the permission set to **Allow**. To change the permission setting, right-click the group or user, and then click the permission setting.
4. Click **Close**.

Configuring Traffic Policies

The traffic policies that you configure for the resources in the Access Gateway Applications node control client connections to the application. You do not have to configure a rule for the resource. The rule created automatically when you create the resource. You only need to associate a request profile with the traffic policy. In the traffic profile, you specify parameters such as the protocol, application time-out, and file type association.

To configure traffic policies for a resource

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, in the **Traffic** column, click the icon provided for the application, file share, intranet subnet, or resource for which you want to configure traffic policies.
3. In the **Configure Traffic Policies** dialog box, do the following:
   - To specify an existing traffic policy, click **Insert Policy**, and then, in the **Policy Name** column, click the name of the policy.

     To configure a new policy, click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**. In the **Create Traffic Policy** dialog box, in the **Name** box, after the underscore (_), type a name for the policy. Then, in **Request Profile**, either select an existing request profile or click **New** to configure a new request profile. You can also select an existing profile and then click **Modify** to modify the profile.

     For more information about configuring a traffic policy or profile, see Access Gateway 9.3, Enterprise Edition at http://edocs.citrix.com/.
   - To modify a policy that you have inserted, in the **Policy Name** column, click the policy name, and then click **Modify Policy**. To modify only the associated profile, in the **Profile** column, click the name of the profile, and then click **Modify Profile**.
   - To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.
   - To specify a new priority value for a policy, in the **Priority** column, double-click the assigned priority, and then enter the value you want.
   - To unbind a policy, click the policy, and then click **Unbind Policy**.
4. Click **Apply Changes**, and then click **Close**.

Configuring Clientless Access Policies

Clientless access, when configured for a resource on the NetScaler appliance, allows end-users to access the resource without using the Access Gateway client software. Users can use web browsers to access resources such as Outlook Web Access. You configure clientless access for a resource by configuring a clientless access policy that is associated with a clientless access profile.

To configure a clientless access policy for a resource in the Access Gateway Applications node

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Access Gateway Applications**.

2. In the details pane, in the **Clientless Access** column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a clientless access policy.

3. In the **Configure Clientless Access Policies** dialog box, do the following:

   - To specify an existing clientless access policy, click **Insert Policy**, and then, in the **Policy Name** column, click the name of the policy.

     To configure a new clientless access policy, click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**. In the **Create Clientless Access Policy** dialog box, in the **Name** box, after the underscore (_), type a name for the policy. Then, in Profile, either select an existing profile or click **New** to configure a new profile. You can also select an existing profile and then click **Modify** to modify the profile.

     For more information about configuring a clientless access policy or profile, see Access Gateway 9.3, Enterprise Edition at http://edocs.citrix.com/.

   - To modify a policy that you have inserted, in the **Policy Name** column, click the policy name, and then click **Modify Policy**. To modify only the associated profile, in the **Profile** column, click the name of the profile, and then click **Modify Profile**.

   - To specify a new priority value for a policy, in the **Priority** column, double-click the assigned priority, and then enter the value you want.

   - To unbind a policy, click the policy, and then click **Unbind Policy**.
4. Click **Apply Changes**, and then click **Close**.

Configuring TCP Compression Policies

You can configure TCP compression policies for an application to increase the performance of the application. TCP compression reduces network latency, reduces bandwidth requirements, and increases the speed of transmission. When configuring a TCP compression policy, you associate a compression action with the policy. The compression action specifies either Compress, GZIP, Deflate, or NoCompress as the compression type. For more information about the compression policies, and compression actions, see Access Gateway 9.3, Enterprise Edition at http://edocs.citrix.com/.

To configure a TCP compression policy for a resource in the Access Gateway Applications node

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Access Gateway Applications**.

2. In the details pane, in the **TCP Compression** column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a TCP compression policy.

3. In the **Configure TCP Compression Policies** dialog box, do the following:

   - To specify an existing TCP compression policy, click **Insert Policy**, and then, in the **Policy Name** column, click the name of the policy.

     To create a new TCP compression policy, click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**. In the **Create TCP Compression Policy** dialog box, in the **Policy Name** box, after the underscore ("_"), type a name for the policy. Then, in **Action**, either select an existing action or click **New** and configure a new action. You can also click **View** to view the configured compression type.

     For more information about configuring a TCP compression policy or action, see Access Gateway 9.3, Enterprise Edition at http://edocs.citrix.com/.

   - To modify a policy that you have inserted, in the **Policy Name** column, click the policy name, and then click **Modify Policy**.

   - To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.

   - To specify a new priority value for a policy, in the **Priority** column, double-click the assigned priority, and then enter the value you want.

   - To unbind a policy, click the policy, and then click **Unbind Policy**.

4. Click **Apply Changes**, and then click **Close**.

Configuring Bookmarks

You can configure bookmarks for an application or for a resource that you configure in the Other Resources category if you want the application or resource to be accessible from the Access Gateway home page.

To configure a bookmark for an Access Gateway application or a resource in the Other Resources category

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, click the application or resource for which you want to configure a bookmark, and then click **Configure Bookmark**.
3. In the **Create Bookmark** dialog box, configure values for the parameters.

   For more information about the parameters in the **Create Bookmark** dialog box, see Access Gateway 9.3, Enterprise Edition at http://edocs.citrix.com/.
4. Click **Create**, and then click **Close**.

Entity Templates

An entity template is a collection of configuration information for an individual entity on a Citrix® NetScaler® appliance. It provides a specification and a set of defaults for a configurable NetScaler entity, such as a policy, virtual server, service, or action. By using a template that defines a set of defaults, you can quickly configure multiple entities that require a similar configuration while eliminating several configuration steps.

Entity templates are available only in the configuration utility. You use the NetScaler configuration utility to create, manage, and use any type of entity template. You can share entity templates with other administrators and manage local folders that contain the templates. You can also import entity templates from and export entity templates to your local computer.

Before creating a template, you should be familiar with the configuration of the entity.

Note: You use entity templates to configure individual entities. To configure multiple entities related to a particular Web application, you must use an application template. For more information, see "AppExpert Applications and Templates".

How Entity Templates Work

When you create a template for a NetScaler entity, you specify default values for the entity. You specify what values must be read-only, what values must not be displayed, and what values users can configure. You also configure the pages that compose the template import wizard.

When a user imports the entity template to a NetScaler appliance, a wizard guides the user through the various pages that you configured for the template. The wizard displays the read-only parameter values and prompts the user to specify values for the configurable parameters. After the user follows the instructions in the wizard, the appliance creates the entity with the configured values.

For example, you can create an entity template for HTTP services that provides a text box for a service name and assigns preset values for the service protocol, timeouts, thresholds, and monitors. Later, when you use the template to create new HTTP services, a wizard prompts you for a service name and supplies the preset values that you would otherwise have configured manually.

The procedure for creating entity templates for load balancing virtual servers is different than the AppExpert procedure for creating other entity templates. For more information, see "Creating an Entity Template".

In addition, the procedure for using the template to create the load balancing virtual server entity is different. For more information, see "Creating an Entity from a Template".

Configuring an Entity Template

You can create or modify an entity template either from the AppExpert feature node in the NetScaler configuration utility or from the associated NetScaler feature node for the entity. For example, you can create a content switching virtual server entity template in either the AppExpert feature node or the content switching feature node in the configuration utility.

If you create a template that is not based on an existing entity, you can specify the following options and settings for the template:

- The default value of a parameter.
- Whether the default values are visible to users.
- Whether the default values can be changed by users.
- The number of pages in the entity import wizard, including the page names, text, and available parameters.

  The entities that must be bound to the entity for which the template is being created.

  For example, when you are creating a cache redirection virtual server template, you can specify the policies that you want to bind to the cache redirection virtual servers that you create from the template. However, only binding information is included in the template. The bound entities are not included. If the entity template is imported to another NetScaler appliance, the bound entities must exist on the appliance at import time for the binding to succeed. If none of the bound entities exist on the target appliance, the entity (for which the template was configured) is created without any bindings. If only a subset of the bound entities exist on the target appliance, they are bound to the entity that is created from the template.

When you create a template based on an existing entity, the configuration settings of the entity appear in the template. All bound entities are selected by default, but you can modify bindings as necessary. As in the case of a template that is not based on an existing entity, only binding information is included and not the entities. You can either save the template with the existing configuration settings or use the settings as a basis for creating a new configuration for a template.

However, when you create a template based on an existing load balancing virtual server, all bound entities (services, service groups, policies, actions, and other associated entities) are included in the template. If the bound entities that are included in the template are already configured on the NetScaler appliance to which the template is imported, duplicates are created with names that are generated automatically in a particular format. The duplicate entities are based on the parameter information stored in the entity template.

Creating an Entity Template

The NetScaler AppExpert feature node offers a single location in the configuration utility for creating templates for all types of entities except load balancing virtual servers. Entity templates can also be created in the NetScaler feature node that corresponds to the entity. For example, you can create a content switching virtual server template in the content switching feature node in the configuration utility. Load balancing virtual server templates can be created only from within the NetScaler load balancing feature node. Additionally, you can create a load balancing virtual server template only from an existing load balancing virtual server.

To create an entity template by using the AppExpert feature node

1. In the navigation pane of the NetScaler configuration utility, click **AppExpert**, and then click **Templates**.

2. In the details pane, on the **Entity Templates** tab, do one of the following:

   - To create a new template, click **Add**. In the **Select the Template Type** dialog box, select the template type, and then click **OK**.

   - To create a duplicate of an existing entity template, in the details pane, select the entity template, and then click **Add**.

3. In the **Create...Template** dialog box, follow the instructions to create a template.

   If you are creating a duplicate of an existing entity template, in the **Create...Template** dialog box, on the **Specify Template Name** page, you must change the name of the entity template.

4. Click **Finish**, and then click **Exit**.

To create a load balancing virtual server template

1. In the navigation pane of the NetScaler configuration utility, click **Load balancing**, and then click **Virtual Servers**.
2. In the details pane, select the virtual server, and then click **Create Template**.
3. In the **Create Template** dialog box, provide the following information:
   - **Name.** The name of the template.
   - **Folder.** The location of the template on the appliance. Click **Browse** if you want to change the location.
   - **Configure Variables.** Configure variables for the load balancing template. For more information, see "Configuring Variables in Load Balancing Virtual Server Templates".
   - **Introduction Description.** A description of the configuration of the entity, such as a load balancing virtual server, for which you are creating a template.
   - **Summary Description.** A summary of the configuration or additional instructions for other administrators, such as a description of any additonal steps that need to be followed after the entity is successfully created.
   - **Author.** The creator of the template.
   - **Major.** Major template version.
   - **Minor.** Minor template version.
4. Click **OK**.

To create an entity template by using its corresponding feature node

1. In the navigation pane of the NetScaler configuration utility, select the feature (for example, Content Switching), and then select the entity (for example, Virtual Servers), for which you want to create the entity template.
2. At the top of the details pane, click **Entity Templates**, and then click **Create Template**.
3. In the **Create...Template** dialog box, follow the instructions to create a template.
4. Click **Finish**, and then click **Exit**.

Configuring Variables in Load Balancing Virtual Server Templates

Load balancing virtual server templates support the declaration of variables in the configured load balancing parameters and in bound policies and actions. The ability to declare variables enables you to replace preconfigured values with values that suit the environment into which you are importing the template. The Entity Template Wizard, which appears when you import a template, includes a **Specify Variable Values** page on which you can specify appropriate values for the variables that are configured for the entity template. This wizard page appears only when you import a template that is configured with existing variables.

As an example, consider the following expression configured for a policy that is bound to a load balancing virtual server for which you are creating a template. The expression evaluates the value of the Accept-Language header in an HTTP request.

HTTP.REQ.HEADER("Accept-Language").CONTAINS("en-us")

If you want the value of the header to be configurable at import time, you can specify the string "en-us" as a variable. When importing the template, you can specify a new value for the variable on the **Specify Variable Values** page.

After you create a variable, you can do the following:

- Assign additional strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable.

To configure variables in a load balancing virtual server template

1. In the navigation pane of the NetScaler configuration utility, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, right-click the virtual server that you want to export to a template file, and then click **Create Template**.
3. In the **Create Template** dialog box, modify the default template file name if required, specify the location where you want to save the template, and then click **Configure Variables**.
4. In the **Configure Variables** dialog box, click the tab that lists the entity for which you want to configure a variable, select the entity, and then click **Configure Variables**.
5.  In the **Variables for <Entity Type>: <Entity Name>** dialog box, click the button next to the parameter value or expression in which you want to create a variable.
6. In the **Variables for <Field Name>** dialog box, do the following:

   - To create a variable, in the text box that displays the configured expression or value, select the string that you want to be configurable at import time, and then click **Add**. In the **Create Variable** dialog box, specify a name and a description for the variable, and then click **Create**.

     The name of the variable, its value, and the description you provided appear in the **Available Variables** listing in the dialog box. The name you provide will be the name of the associated field in the template import wizard, and the description will appear as alt text when the user positions the mouse pointer over the field.

   - To modify a variable, in the **Available Variables** list, click the variable, and then click **Open**. In the **Create Variable** dialog box, modify the value and the description, and then click **OK**.

     The new value that you specify will not replace the text selected in the text box that displays the configured expression or value. However, when you import the template, the new value will be displayed as the default value for the variable in the template import wizard.

   - To view all the strings that are assigned to a given variable, in the **Available Variables** listing, click the name of the variable. The strings that are assigned to the variable are highlighted.
   - To view a list of all the parameters, expressions, and actions in which the variable is used, in the **Available Variables** listing, click the variable whose references you want to view, and then click **Show References**.
   - To assign a string to an existing variable, in the text box that displays the expression you configured, select the string you want to assign to an existing variable, right-click the selection, click **Use existing Variable**, and then click the

name of the variable to which you want to assign the string.

If a variable has multiple strings assigned to it, when you specify a new value for the variable during import, all strings assigned to the variable are replaced with the new value.

7. Click **Close**.

Modifying an Entity Template

You can modify only the parameters, bindings, and pages configured for a template. The name and location of the template specified when the template was created cannot be changed. In load balancing virtual server templates, since the load balancing virtual server configuration is saved in the load balancing virtual server template, there is no option to modify the load balancing virtual server template.

To modify an entity template by using the AppExpert feature node

1. In the navigation pane, expand **AppExpert**, and then click **Templates**.
2. In the details pane, on the **Entity Templates** tab, select the template you want to change, and then click **Open**.
3. In the **Modify...Template** dialog box, follow the instructions to modify a template.
4. Click **Finish**, and then click **Exit**.

To modify an entity template by using its corresponding feature node

1. In the navigation pane, select the feature (for example, Content Switching), and then select the entity (for example, Virtual Servers) for which you want to modify the entity template.
2. At the top of the details pane, click **Entity Templates**, and then click **Manage Template**.
3. In the **Manage <feature entity name> Entity Templates** dialog box, select the template that you want to modify, and then click **Modify**.
4. In the **Modify <template name> Template** dialog box, follow the instructions to modify a template.
5. Click **Finish**, and then click **Exit**.
6. Click **Close**.

Deleting an Entity Template

Deleting an entity template does not affect any objects that have been created by using the template. You can delete a load balancing virtual server template only from the AppExpert feature node.

To delete an entity template by using the AppExpert feature node

1. In the navigation pane of the NetScaler configuration utility, expand **AppExpert**, and then click **Templates**.
2. In the details pane, on the **Entity Templates** tab, click the template you want to delete, and then click **Remove**.

To delete an entity template by using its corresponding feature node

1. In the navigation pane of the NetScaler configuration utility, select the feature (for example, Content Switching) and then select the entity (for example, Virtual Servers), for which you want to delete the entity template.
2. At the top of the details pane, click **Entity Templates**, and then click **Manage Template**.
3. In the **Manage...Entity Templates** dialog box, select the template that you want to delete, and then click **Delete**.

Creating an Entity from a Template

You can create an entity from an entity template either from the AppExpert feature node in the NetScaler configuration utility or from the NetScaler feature node that corresponds to the type of entity that you want to create. For example, you can create a content switching virtual server from a template with either the AppExpert feature node or the content switching feature node in the configuration utility.

The procedure for creating a load balancing virtual server from a template is different than the AppExpert procedure for creating other entities from templates.

After you create an instance of an entity using an entity template, you can configure it in the same way that you would any other object of that type, such as by using the configuration utility or the command line.

To create an entity from a template by using the AppExpert feature node

1. In the navigation pane, expand **AppExpert**, and then click **Templates**.
2. In the details pane, on the **Entity Templates** tab, click the template that you want to use, and then click **Use Template**.
3. In the <Entity Template Name> wizard, follow the instructions to create the entity on the NetScaler.
4. Click **Finish**, and then click **Exit**.

To create an entity from a template by using its corresponding feature node

1. In the navigation pane, expand a feature node (for example, **Content Switching**), and then click an entity subnode (for example, **Virtual Servers**).
2. At the top of the details pane, click **Entity Templates**, and then click **Use Template**.
3. Click the name of the template that you want to use.
4. In the Use <template name> Template wizard, follow the instructions to create the entity.

   Only templates that match the current context are displayed. For example, in the details pane for content switching virtual servers, only entity templates for content switching virtual servers appear, if configured.
5. Click **Finish**, and then click **Exit**.

To create a load balancing virtual server by using a load balancing virtual server template

1. In the navigation pane, expand **Load Balancing**, and then click **Virtual Servers**.
2. In the details pane, click **Use Template**.
3. In the Entity Template Wizard, follow the instructions to create a load balancing virtual server on the NetScaler.

   Only templates that match the current context are displayed. For example, when you click **Browse (Appliance)**, only entity templates for load balancing virtual servers appear, if configured.
4. Click **Finish**, and then click **Exit**.

   Note: The Entity Template Wizard includes a Specify Variable Values page on which you can specify new values for variables. For more information about configuring variables in load balancing virtual server templates, see "Configuring Variables in Load Balancing Virtual Server Templates".

Managing Entity Template Folders

You can create, rename, and rearrange local folders for organizing and storing templates for all entities except load balancing virtual servers. Load balancing virtual server templates are stored in the /nsconfig/nstemplates/entities/lb vserver folder.

To organize entity template folders

1. In the navigation pane of the NetScaler configuration utility, expand a feature node (for example, **Content Switching**), and then click a subnode (for example, **Virtual Servers**) that corresponds to the entity template that you want to manage.

2. At the top of the details pane, click **Entity Templates**, and then click **Manage Templates**.

3. In the **Manage...Entity Templates** dialog box, do one of the following:

   - To create a new folder under the selected folder in the folder tree, click **Create Folder**.

     To change the name of a folder, select the folder and click **Rename**.

     You can also click the folder that you want to rename, and then press F2. You cannot rename the top-level default folder.

     To remove the folder, select the folder and click **Delete**.

     You can also click the folder that you want to remove, and then press the Delete key. You cannot remove the top-level default folder.
4. Click **Close.**

Uploading and Downloading Entity Templates

You can import the entity templates that are stored on your local computer. You can also download entity templates from the NetScaler appliance to your local computer and then import them to other NetScaler appliances.

Note: You cannot upload or download load balancing virtual server templates.

To upload an entity template to the NetScaler appliance

1. In the navigation pane of the NetScaler configuration utility, expand a feature node (for example, **Content Switching**), and then click a subnode (for example, **Virtual Servers**) for which you want to upload an entity template.
2. At the top of the details pane, click **Entity Templates**, and then click **Manage Template**.
3. In the **Manage...Entity Templates** dialog box, click the top-level folder, and then click **Upload**.
4. In the **Upload Entity Template** dialog box, navigate to the template file that you want to upload, and then click **Select**.
5. Click **Close**.

To download an entity template from the NetScaler appliance

1. In the navigation pane of the NetScaler configuration utility, expand a feature node (for example, **Content Switching**), and then click a subnode (for example, **Virtual Servers**) for which you want to upload an entity template.

2. At the top of the details pane, click **Entity Templates**, and then click **Manage Template**.

3. In the **Manage...Entity Templates** dialog box, click the template that you want to download, and then click **Download.**

4. In the **Download Entity Template** dialog box, navigate to the location at which you want to save the template on your local computer, enter a file name, and then click **Save**.

5. Click **Close.**

Citrix Application Firewall

The following topics cover installation and configuration of the Citrix Application Firewall feature.

Introduction	An overview of web application security and how the application firewall works.
Configuration	How to configure the application firewall to protect a web site, a web service, or a web 2.0 site.
Signatures	A detailed description of the signatures feature and how to configure the signatures, add signatures from a supported vulnerability scanning tool, and define your own signatures, with examples.
Advanced Protections	A detailed description of all of the application firewall security checks, with configuration information and examples.
Policies	A description of how policies are used when configuring the application firewall, with examples of useful policies.
Imports	A description of how the application firewall uses different types of imported files, and how to import and export files.
Global Configuration	A description of application firewall features that apply to all profiles, and how to configure them.
Use Cases	Extended examples that demonstrate how to set up the application firewall to best protect specific types of more complex web sites and web services.
Logs, Statistics, and Reports	How to access and use the application firewall logs, the statistics, and the reports to assist in configuring the application firewall.

Introduction

The Citrix® Application Firewall™ prevents security breaches, data loss, and possible unauthorized modifications to web sites that access sensitive business or customer information. It does so by filtering both requests and responses, examining them for evidence of malicious activity, and blocking those that exhibit such activity. Your site is protected not only from common types of attacks, but also from new, as yet unknown attacks. In addition to protecting web servers and web sites from unauthorized access and misuse by hackers and malicious programs, the application firewall provides protection against security vulnerabilities in legacy CGI code or scripts, other web frameworks, web server software, and the underlying operating systems.

The Citrix Application Firewall is available as a stand-alone appliance, or as a feature on a Citrix NetScaler® appliance or NetScaler VPX™ virtual appliance. In the application firewall documentation, the term *application firewall appliance* refers to the platform on which the application firewall is running, regardless of whether that platform is a dedicated firewall appliance, a NetScaler appliance on which other features have also been configured, or a NetScaler VPX virtual appliance,

To use the application firewall, you must create at least one security configuration to block connections that violate the rules that you set for your protected web sites. The number of security configurations that you might want to create depends on the complexity of your web site. In many cases, one is sufficient. You can probably use the defaults for the global settings, which affect all security configurations, but you can change the global settings if necessary.

Introduction

The Citrix® Application Firewall™ prevents security breaches, data loss, and possible unauthorized modifications to web sites that access sensitive business or customer information. It does so by filtering both requests and responses, examining them for evidence of malicious activity, and blocking those that exhibit such activity. Your site is protected not only from common types of attacks, but also from new, as yet unknown attacks. In addition to protecting web servers and web sites from unauthorized access and misuse by hackers and malicious programs, the application firewall provides protection against security vulnerabilities in legacy CGI code or scripts, other web frameworks, web server software, and the underlying operating systems.

The Citrix Application Firewall is available as a stand-alone appliance, or as a feature on a Citrix NetScaler® appliance or NetScaler VPX™ virtual appliance. In the application firewall documentation, the term *application firewall appliance* refers to the platform on which the application firewall is running, regardless of whether that platform is a dedicated firewall appliance, a NetScaler appliance on which other features have also been configured, or a NetScaler VPX virtual appliance,

To use the application firewall, you must create at least one security configuration to block connections that violate the rules that you set for your protected web sites. The number of security configurations that you might want to create depends on the complexity of your web site. In many cases, one is sufficient. You can probably use the defaults for the global settings, which affect all security configurations, but you can change the global settings if necessary.

Web Application Security

Web application security is that part of network security that covers computers and programs that communicate by using the HTTP and HTTPS protocols. This is an extremely broad area in which security flaws and weaknesses abound. Operating systems on both servers and clients have security issues and are vulnerable to attack. Web server software and web site enabling technologies such as CGI, Java and JavaScript have underlying vulnerabilities. Browsers and other client applications that communicate with web-enabled applications also have vulnerabilities. Web sites that use any technology but the simplest of HTML, including any site that allows interaction with visitors, often have vulnerabilities of their own.

In the past, a breach in security was often just an annoyance, but today that is seldom the case. For example, attacks in which a hacker gained access to a web server and made unauthorized modifications to (*defaced*) a web site used to be common. They were usually launched by hackers who had no motivation beyond demonstrating their skills to fellow hackers. Most current security breaches, however, are motivated by a desire for money. The majority attempt to accomplish one or both of the following goals: to obtain sensitive and potentially valuable private information, or to obtain unauthorized access to and control of a web site or web server.

Certain forms of web attacks focus on obtaining private information. These attacks are often possible even against web sites that are secure enough to prevent an attacker from taking full control. The information that an attacker can obtain from a web site can include customer names, addresses, phone numbers, social security numbers, credit card numbers, medical records, and other private information. The attacker can then use this information or sell it to others. Much of the information obtained by such attacks is protected by law, and all of it by custom and expectation. A breach of this type can have extremely serious consequences for customers whose private information is compromised. At best, these customers will have to exercise vigilance to prevent others from abusing their credit cards, opening unauthorized credit accounts in their name, or appropriating their identities outright (identity theft). At worst, the customers may face ruined credit ratings or even be blamed for criminal activities in which they had no part.

Other web attacks are aimed at obtaining control of (or *compromising*) your web site or the server on which it operates, or both. A hacker who gains control of a web site or server can use it to host unauthorized content, act as a proxy for content hosted on another web server, provide SMTP services to send unsolicited bulk email, or provide DNS services to support such activities on other compromised web servers. Most web sites that are hosted on compromised web servers promote questionable or outright fraudulent businesses. For example, the majority of phishing web sites and child pornography web sites are hosted on compromised web servers.

Protecting your web sites and web services against these attacks requires a multilayered defense capable of both blocking known attacks with identifiable characteristics and protecting against unknown attacks, which can often be detected because they look different from the normal traffic to your web sites and web services.

Known Web Attacks

The first line of defense for your web sites is protection against the large number of attacks that are known to exist and have been observed and analyzed by web security experts. Common types of attacks against HTML-based web sites include:

- **Buffer overflow attacks.** Sending an extremely long URL, extremely long cookie, or other extremely long bit of information to a web server in hopes of causing it or the underlying operating system to hang, crash, or provide the attacker with access to the underlying operating system. A buffer overflow attack can be used to gain access to unauthorized information, to compromise a web server, or both.

- **Cookie security attacks.** Sending a modified cookie to a web server, usually in hopes of obtaining access to unauthorized content by using falsified credentials.

- **Forceful browsing.** Accessing URLs on a web site directly, without navigating to the URLs by means of hyperlinks on the home page or other common start URLs on the web site. Individual instances of forceful browsing may simply indicate a user who bookmarked a page on your web site, but repeated attempts to access nonexistent content, or content that users should never access directly, often represent an attack on web site security. Forceful browsing is normally used to gain access to unauthorized information, but can also be combined with a buffer overflow attack in an attempt to compromise your server.

- **Web form security attacks.** Sending inappropriate content to your web site in a web form. Inappropriate content can include modified hidden fields, HTML or code in a field intended for alphanumeric data only, an overly long string in a field that accepts only a short string, an alphanumeric string in a field that accepts only an integer, and a wide variety of other data that your web site does not expect to receive in that web form. A web form security attack can be used either to obtain unauthorized information from your web site or to compromise the web site outright, usually when combined with a buffer overflow attack.

Two specialized types of attacks on web form security deserve special mention:

- **SQL injection attacks.** Sending an active SQL command or commands in a web form or as part of a URL, with the goal of causing an SQL database to execute the command or commands. SQL injection attacks are normally used to obtain unauthorized information.

- **Cross-site scripting attacks.** Using a URL or a script on a web page to violate the same-origin policy, which forbids any script from obtaining properties from or modifying any content on a different web site. Since scripts can obtain information and modify files on your web site, allowing a script access to content on a different web site can provide an attacker the means to obtain unauthorized information, to compromise a web server, or both.

Attacks against XML-based web services normally fall into at least one of the following two categories: attempts to send inappropriate content to a web service, or attempts to breach security on a web service. Common types of attacks against XML-based web services include:

- **Malicious code or objects.** XML requests that contain code or objects that can either directly obtain sensitive information or can give an attacker control of the web service or underlying server.

- **Badly-formed XML requests.** XML requests that do not conform to the W3C XML specification, and that can therefore breach security on an insecure web service.

- **Denial of service (DoS) attacks.** XML requests that are sent repeatedly and in high volume, with the intent of overwhelming the targeted web service and denying legitimate users access to it.

In addition to standard XML-based attacks, XML web services and Web 2.0 sites are also vulnerable to SQL injection and cross-site scripting attacks, as described below:

- **SQL injection attacks.** Sending an active SQL command or commands in an XML-based request, with the goal of causing an SQL database to execute that command or commands. As with HTML SQL injection attacks, XML SQL injection attacks are normally used to obtain unauthorized information.

- **Cross-site scripting attacks.** Using a script included in an XML based application to violate the same-origin policy, which does not allow any script to obtain properties from or modify any content on a different application. Since scripts can obtain information and modify files by using your XML application, allowing a script access to content belonging to a different application can give an attacker the means to obtain unauthorized information, to compromise the application, or both.

Known web attacks can usually be stopped by filtering web site traffic for specific characteristics (*signatures*) that always appear for a specific attack and should never appear in legitimate traffic. This approach has the advantages of requiring relatively few resources and posing relatively little risk of false positives. It is therefore a valuable tool in fighting attacks on web sites and web services, and configuring basic signature protections that intercept most known web attacks is easy to do.

Unknown Web Attacks

The greatest threat against web sites and applications does not come from known attacks, but from unknown attacks. Most unknown attacks fall into one of two categories: newly-launched attacks for which security firms have not yet developed an effective defense (*zero day* attacks), and carefully-targeted attacks on a specific web site or web service rather than many web sites or web services (*spear* attacks). These attacks, like known attacks, are usually intended to obtain sensitive private information, compromise the web site or web service and allow it to be used for further attacks, or both of those goals.

Zero-day attacks are a major threat to all users. These attacks are usually of the same types as known attacks; zero-day attacks often involve injected SQL, a cross-site script, a cross-site request forgery, or another type of attack similar to known attacks. In most cases, they target vulnerabilities that the developers of the targeted software, web site, or web service either are unaware of or have just learned about. Security firms have therefore usually not developed defenses against these attacks, and even if they have, users have usually not obtained and installed the patches or performed the workarounds necessary to protect against these attacks. The time between discovery of a zero-day attack and availability of a defense (the *vulnerability window*) is shrinking, but perpetrators can still count on hours or even days in which many web sites and web services lack any specific protection against the attack.

Spear attacks are a major threat, but to a more select group of users. A common type of spear attack, a spear phish, is usually targeted at customers of a specific bank or financial institution, or (less commonly) at employees of a specific company or organization. Unlike other phishes, which are often crudely written forgeries that a user with any familiarity with the actual communications of that bank or financial institution can recognize, spear phishes are letter perfect and extremely convincing. They can contain information specific to the individual that, at first look, no stranger should know or be able to obtain. The spear phisher is therefore able to convince his or her target to provide the requested information, which the phisher can then use to loot accounts, to process illegitimately obtained money from other sources, or to gain access to other, even more sensitive information.

Both of these types of attack have certain characteristics that can usually be detected, although not by using static patterns that look for specific characteristics, as do standard signatures. Detecting these types of attacks requires more sophisticated and more resource-intensive approaches, such as heuristic filtering and positive security model systems. Heuristic filtering looks, not for specific patterns, but for patterns of behaviors. Positive security model systems model the normal behavior of the web site or web service that they are protecting, and then block connections that do not fit within that model of normal use. URL based and web-form based security checks profile normal use of your web sites, and then control how users interact with your web sites, using both heuristics and positive security to block anomalous or unexpected traffic. Both heuristic and positive security, properly designed and deployed, can catch most attacks that signatures miss. However, they require considerably more resources than do signatures, and you must spend some time configuring them properly to avoid false positives. They are therefore usually used, not as the primary line of defense, but as backups to signatures or other less resource-intensive approaches.

By configuring these advanced protections in addition to signatures, you create a hybrid security model, which enables the application firewall to provide comprehensive protection against both known and unknown attacks.

How The Application Firewall Works

When you install the application firewall, you create an initial *security configuration*, which consists of a *policy*, a *profile*, and a *signatures object*. The policy is a rule that identifies the traffic to be filtered, and the profile identifies the patterns and types of behavior to allow or block when the traffic is filtered. The simplest patterns, which are called *signatures*, are not specified within the profile, but in a signatures object that is associated with the profile.

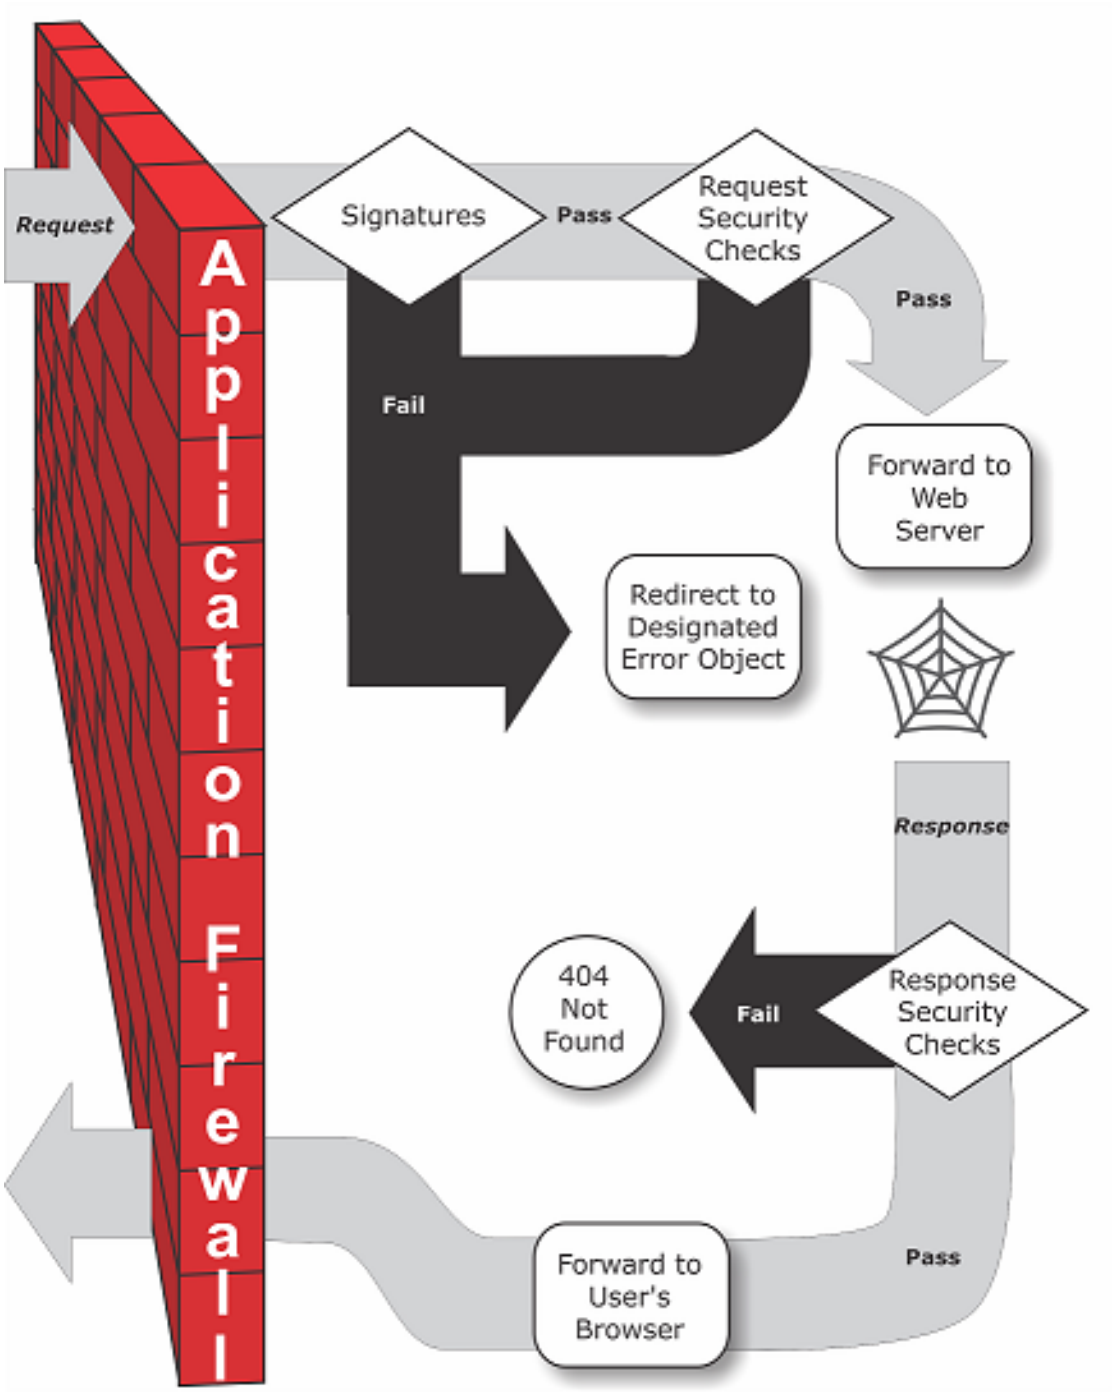
A signature is a string or pattern that matches a known type of attack. The application firewall contains over a thousand signatures in seven categories, each directed at attacks on specific types of web servers and web content. Citrix updates the list with new signatures as new threats are identified. During configuration, you specify the signature categories that are appropriate for the web servers and content that you need to protect. Signatures provide good basic protection with low processing overhead. If your applications have special vulnerabilities or you detect an attack against them for which no signature exists, you can add your own signatures.

The more advanced protections are called *security checks*. A security check is a more rigorous, algorithmic inspection of a request for specific patterns or types of behavior that might indicate an attack or constitute a threat to your protected web sites and web services. It can, for example, identify a request that attempts to perform a certain type of operation that might breach security, or a response that includes sensitive private information such as a social security number or credit card number. During configuration, you specify the security checks that are appropriate for the web servers and content that you need to protect. The security checks are restrictive. Many of them can block legitimate requests and responses if you do not add the appropriate exceptions (*relaxations*) when configuring them. Identifying the needed exceptions is not difficult if you use the adaptive learning feature, which observes normal use of your web site and creates recommended exceptions.

The application firewall can be installed as either a Layer 3 network device or a Layer 2 network bridge between your servers and your users, usually behind your company's router or firewall. It must be installed in a location where it can intercept traffic between the web servers that you want to protect and the hub or switch through which users access those web servers. You then configure the network to send requests to the application firewall instead of directly to your web servers, and responses to the application firewall instead of directly to your users. The application firewall filters that traffic before forwarding it to its final destination, using both its internal rule set and your additions and modifications. It blocks or renders harmless any activity that it detects as harmful, and then forwards the remaining traffic to the web server. The following figure provides an overview of the filtering process.

Note: The figure omits the application of a policy to incoming traffic. It illustrates a security configuration in which the policy is to process all requests. Also, in this configuration, a signatures object has been configured and associated with the profile, and security checks have been configured in the profile.

Figure 1. A Flowchart of Application Firewall Filtering



As the figure shows, when a user requests a URL on a protected web site, the application firewall first examines the request to ensure that it does not match a signature. If the request matches a signature, the application firewall either displays the *error object* (a web page that is located on the application firewall appliance and which you can configure by using the imports feature) or forwards the request to the designated error URL (the *error page*). Signatures do not require as many resources as do security checks, so detecting and stopping attacks that are detected by a signature before running any of the security checks reduces the load on the server.

If a request passes signature inspection, the application firewall applies the request security checks that have been enabled. The request security checks verify that the request is appropriate for your web site or web service and does not contain material that might

pose a threat. For example, security checks examine the request for signs indicating that it might be of an unexpected type, request unexpected content, or contain unexpected and possibly malicious web form data, SQL commands, or scripts. If the request fails a security check, the application firewall either sanitizes the request and then sends it back to the NetScaler appliance (or NetScaler VPX virtual appliance), or displays the error object. If the request passes the security checks, it is sent back to the NetScaler appliance, which completes any other processing and forwards the request to the protected web server.

When the web site or web service sends a response to the user, the application firewall applies the response security checks that have been enabled. The response security checks examine the response for leaks of sensitive private information, signs of web site defacement, or other content that should not be present. If the response fails a security check, the application firewall either removes the content that should not be present or blocks the response. If the response passes the security checks, it is sent back to the NetScaler appliance, which forwards it to the user.

Application Firewall Features

The basic application firewall features are policies, profiles, and signatures, which provide a hybrid security model as described in Known Web Attacks, Unknown Web Attacks, and How the Application Firewall Works. Of special note is the learning feature, which observes traffic to your protected applications and recommends appropriate configuration settings for certain security checks.

The imports feature manages files that you upload to the application firewall. These files are then used by the application firewall in various security checks, or when responding to a connection that matches a security check.

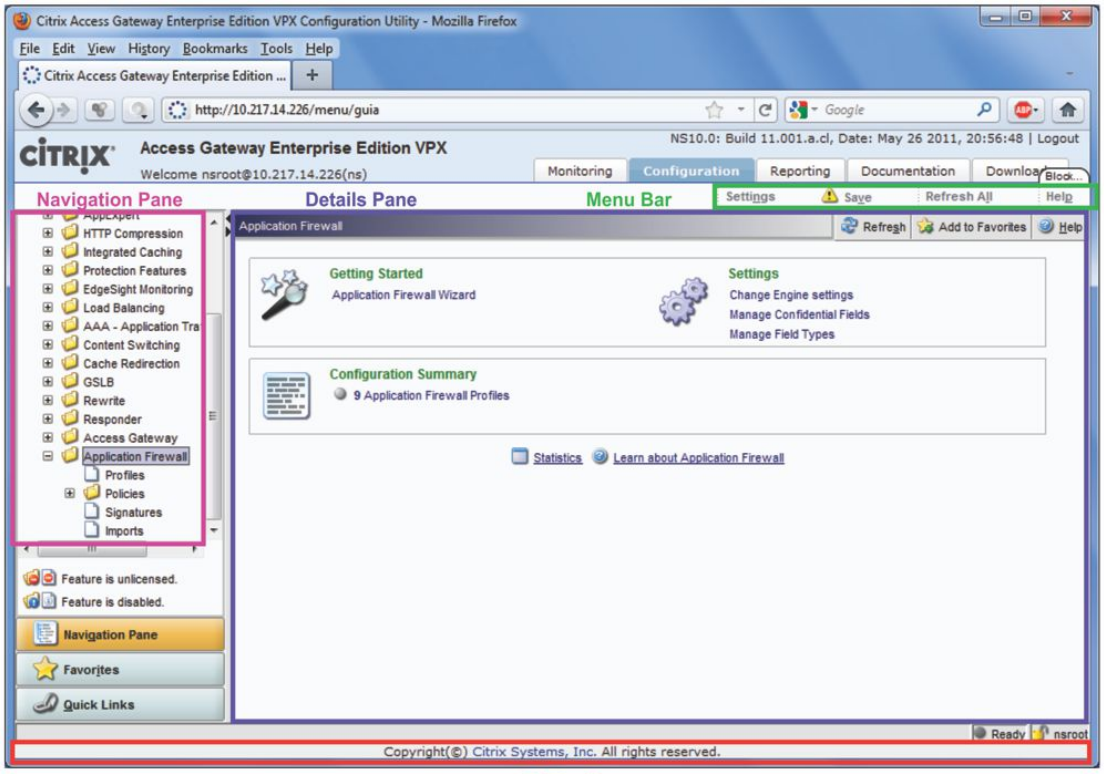
You can use the logs, statistics, and reports features to evaluate the performance of the application firewall and identify possible needs for additional protections.

The Application Firewall User Interfaces

All models in the Citrix NetScaler Application Delivery product line can be configured and managed from the Citrix NetScaler command line interface or the web-based configuration utility. However, the configuration utility provides a more complete interface. Not all application firewall configuration tasks can be performed at the command line. Also, the configuration utility provides access to a wizard that reduces the complexity of configuring the applicaton firewall. Unlike most wizards, the application firewall wizard can serve as your primay interface to the application firewall.

The command line interface is a modified UNIX shell based on the FreeBSD `bash` shell. To configure the Application Firewall from the command line interface, you type commands at the prompt and press the Enter key, just as you do with any other Unix shell. For instructions for using the command line inerface, see the *Citrix NetScaler Command Reference Guide*

Figure 1 shows the configuration utility's System Overview screen.



The screen has two main areas. The panel on the left, called the *navigation pane*, contains a navigation tree, with which you navigate to the screens on which you configure the features that are installed on your appliance. The screens to which you navigate appear to the right of the navigation pane, in the *details pane*.

When you access the configuration utility, the details pane displays the System Overview screen, as shown in Figure 1. If, in the navigation pane, you click plus sign next to the Application Firewall folder, the **Application Firewall** node *expands* to include the main

application firewall elements that you can configure. If you click the first element, **Profiles**, the details pane displays the configured profiles, if any profiles have been configured. At the bottom of the details pane, you can click **Add** to configure a new profile. Other buttons at the bottom of the details pane are grayed out until you select an existing profile. Screens for the other elements work in the same way.

If, instead of expanding the application firewall node, you click the node itself, the details pane displays different options, one of which is the application firewall wizard. Citrix recommends that you use the wizard for initial configuration, and many users use it almost exclusively. It includes most of the functionality that is available elsewhere in the configuration utility.

For information and instructions on accessing the configuration utility, see the *Citrix NetScaler Getting Started Guide*.

Configuring the Application Firewall

To configure the Citrix Application Firewall™, Citrix recommends that you use a browser to connect to the configuration utility. When the connection is established, verify that the application firewall is enabled, and then run the application firewall wizard, which prompts you for configuration information. You do not have to provide all of the requested information the first time you use the wizard. Instead, you can accept default settings, perform a few relatively straightforward configuration tasks to enable important features, and then allow the application firewall to collect important information to help you complete the configuration.

For example, when the wizard prompts you to specify a rule for selecting the traffic to be processed, you can accept the default, which selects all traffic. When it presents you with a list of signatures, you can enable the appropriate categories of signatures and turn on the collection of statistics for those signatures. For this initial configuration, you can skip the advanced protections (*security checks*). The wizard automatically creates the appropriate policy, signatures object, and profile (collectively, the *security configuration*) , and binds the policy to global. The application firewall then begins filtering connections to your protected web sites, logging any connections that match one or more of the signatures that you enabled, and collecting statistics about the connections that each signature matches. After the application firewall processes some traffic, you can run the wizard again and examine the logs and statistics to see if any of the signatures that you have enabled are matching legitimate traffic. After determining which signatures are identifying the traffic that you want to block, you can enable blocking for those signatures. If your web site or web service is not complex, does not use SQL, and does not have access to sensitive private information, this basic security configuration will probably provide adequate protection.

You may need additional protection if, for example, your web site is dynamic. Content that uses scripts may need protection against cross-site scripting attacks. Web content that uses SQL—such as shopping carts, many blogs, and most content management systems—may need protection against SQL injection attacks. Web sites and web services that collect sensitive private information such as social security numbers or credit card numbers may require protection against unintentional exposure of that information. Certain types of web-server or XML-server software may require protection from types of attacks tailored to that software. Another consideration is that specific elements of your web sites or web services may require different protection than do other elements. Examining the application firewall logs and statistics can help you identify the additional protections that you might need.

After deciding which advanced protections are needed for your web sites and web services, you can run the wizard again to configure those protections. Certain security checks require that you enter exceptions (*relaxations*) to prevent the check from blocking legitimate traffic. You can do so manually, but it is usually easier to enable the adaptive learning feature and allow it to recommend the necessary relaxations. You can use the wizard as many times as necessary to enhance your basic security configuration and/or create additional security configurations.

The wizard automates some tasks that you would have to perform manually if you did not use the wizard. It automatically creates a policy, a signatures object, and a profile, and assigns them the name that you provided when you were prompted for the name of your configuration. The wizard also adds your advanced-protection settings to the profile, binds

the signatures object to the profile, associates the profile with the policy, and puts the policy into effect by binding it to Global.

A few tasks cannot be performed in the wizard. You cannot use the wizard to bind a profile to a bind point other than Global. If you want the profile to apply to only a specific part of your configuration, you must manually configure the binding. You cannot configure the engine settings or certain other global configuration options in the wizard. While you can configure any of the advanced protection settings in the wizard, if you want to modify a specific setting in a single security check, it may be easier to do so on the manual configuration screens in the configuration utility.

Enabling the Application Firewall

Before you can create an application firewall security configuration, you must make sure that the application firewall feature is enabled.

- If you are configuring a dedicated Citrix Application Firewall appliance, the feature is already enabled. You do not have to perform either of the procedures described here.
- If you have a Citrix NetScaler appliance but have not previously configured the application firewall, you need to enable the application firewall feature before you configure it.
- If you are upgrading a NetScaler appliance from a previous version of the NetScaler operating system to the current version, you may need to enable the application firewall feature before you configure it.
- If you are installing a new application firewall appliance or NetScaler appliance, you do not need to perform this procedure.

Note: If you are upgrading a NetScaler appliance or NetScaler VPX virtual appliance from a previous version, you may need to update the licenses on your appliance before you can enable this feature.

You can enable the application firewall by using the NetScaler command line or the configuration utility.

To enable the application firewall by using the NetScaler command line

At the NetScaler command prompt, type:

enable ns feature **AppFW**

To enable the application firewall by using the configuration utility

1. In the navigation pane, expand **System** and click **Settings**.
2. In the **Settings** pane, under Modes & Features, click **basic features**.
3. In the **Configure Basic Features** dialog box, select the **Application Firewall** check box.
4. Click **OK**.

The Application Firewall Wizard

Unlike most wizards, the Application Firewall wizard is designed not just to simplify the initial configuration process, but also to modify previously created configurations and to maintain your Application Firewall setup. A typical user runs the wizard multiple times, skipping some of the screens each time.

Opening the Wizard

To run the Application Firewall wizard, first open the configuration utility. Next, in the navigation pane, expand Application Firewall, and then in the details pane click Application Firewall Wizard. (For more information about the configuration utility, see The NetScaler Configuration Utility.) Then:

1. In the navigation pane, click the **Application Firewall** folder icon.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**. The first screen of the wizard appears.
3. To advance to the next screen, click **Next**.

The Wizard Screens

The Application Firewall wizard displays the following screens, in the following order:

1. **Introduction screen.** Provides an introduction to the Application Firewall wizard. There is nothing that you can configure on this screen.
2. **Specify Name screen.** On this screen, when creating a new security configuration, you specify the name that the wizard is to assign to the configuration. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols. Choose a name that makes it easy for others to tell what content your new security configuration protects.

   Note: Because the wizard uses this name for both the policy and the profile, it is limited to 31 characters. Manually created policies can have names up to 127 characters in length.

   When creating an existing configuration, you select **Modify Existing Configuration** and then, in the **Name** drop-down list, select the name of the existing configuration that you want to modify.

Note: Only policies that are bound to global or to a bind point appear in this list; you cannot modify an unbound policy by using the Application Firewall wizard. You must either manually bind it to Global or a bind point, or modify it manually. (For manual modification, in the configuration utility's **Application Firewall --> Policies --> Firewall** pane, select the policy and click **Open**).

You also select a profile type on this screen. The profile type determines the types of advanced protection (*security checks*) that can be configured. Because certain kinds of content are not vulnerable to certain types of security threats, restricting the list of available checks saves time during configuration. The types of Application Firewall profiles are:

- **Web Application (HTML).** Any HTML-based Web site that does not use XML or Web 2.0 technologies.
- **XML Application (XML, SOAP).** Any XML-based Web service.
- **Web 2.0 Application (HTML, XML, REST).** Any Web 2.0 site that combines HTML and XML-based content, such as an ATOM-based site, a blog, an RSS feed, or a wiki.

Note: If you are unsure which type of content is used on your Web site, you can choose Web 2.0 Application to ensure that you protect all types of Web application content.

3. **Specify Rule screen.** On this screen, you specify the policy rule that defines the traffic to be examined by this security configuration. If you are creating an initial configuration to protect your Web sites and Web services, you can simply accept the default value, `true`, which selects all web traffic .

   If you want this security configuration to examine, not all HTTP traffic that is routed through the appliance, but specific traffic, you can write a policy rule specifying the traffic that you want it to examine. Rules are written in Citrix NetScaler expressions language, which is a fully functional object-oriented programming language.

   - For a simple description of using the NetScaler expressions syntax to create Application Firewall rules, and a list of useful rules, see Firewall Policies.
   - For a detailed explanation of how to create policy rules in NetScaler expressions syntax, see the *Citrix Policy Configuration and Reference Guide*.

4. **Select Signature Protections screen.** On this screen, you select the categories of signatures that you want to use to protect your web sites and web services. The default categories are:

   - **CGI.** Protection against attacks on web sites that use CGI scripts in any language, including PERL scripts, Unix shell scripts, and Python scripts.
   - **Cold Fusion.** Protection against attacks on web sites that use the Adobe Systems® ColdFusion® Web development platform.
   -

FrontPage. Protection against attacks on web sites that use the Microsoft® FrontPage® Web development platform.

- **PHP.** Protection against attacks on web sites that use the PHP open-source Web development scripting language.
- **Client side.** Protection against attacks on client-side tools used to access your protected web sites, such as Microsoft Internet Explorer, Mozilla Firefox, the Opera browser, and the Adobe Acrobat Reader.
- **Microsoft IIS.** Protection against attacks on Web sites that run the Microsoft Internet Information Server (IIS).
- **Miscellaneous.** Protection against attacks on other server-side tools, such as Web servers and database servers.

If you are creating a new security configuration, the signature categories that you select are enabled, and by default they are recorded in a new signatures object. The new signatures object is assigned the same name that you entered on the **Specify name** screen as the name of the security configuration.

If you have previously configured signatures objects and want to use one of them as the signatures object associated with the security configuration that you are creating, click **Select Existing Signature** and select a signatures object from the **Signatures** list.

If you are modifying an existing security configuration, you can click **Select Existing Signature** and assign a different signatures object to the security configuration.

5. **Select Signature Actions screen.**On this screen, you select the actions associated with the signature categories that you selected on the **Select signature protections** screen. If you are creating an initial configuration, you might want to accept the defaults, which enable the Log and Stats actions but not the Block action. You can decide later, after reviewing the collected logs and statistics, which signatures you should use to block traffic, and then enable the Block action for those signatures. Signatures are designed to catch specific known attacks on your web sites, and therefore they have extremely low false positive rates. However, with any new configuration, you should probably observe how the settings you chose are working before you use them to block traffic.

   If you select **More** for one of the signature categories, the **Configure Actions for Signatures** dialog box appears. Its contents are the same as the contents of the **Modify Signatures Object** dialog box, as described in To Configure a Signatures Object.

   If the signatures object has already logged connections, you can click **Logs** to display the syslogs for the category, as described in Logs, Statistics, and Reports.

6. **Select Advanced Protections screen.** On this screen, you choose the advanced protections (also called *security checks* or simply *checks*) that you want to use to protect your web sites and web services. The checks are divided into categories. Which categories are available (and which checks are available within a category) depends on

the profile type that you chose on the **Specify Name** screen. All checks are available for Web 2.0 Application profiles. If you chose that profile type, the **Select advanced protections** screen displays the following categories of security checks:

- Top--level protections (Some checks appear at the top level, not in any category.)
- Data Leak Prevention Protections
- Advanced Form Protections
- URL Protections
- XML Protections

To display the individual checks in a category, click the icon to the left of the category. To apply a security check to your filtered data, select the check box next to the name of the security check. For descriptions of the security checks see Advanced Protections and its subtopics.

7. **Select Advanced Actions screen.** On this screen, you configure the actions for the advanced protections that you have enabled.

   Note: If no advanced protections are enabled, the Wizard skips the **Advanced Actions** screen and goes directly to the **Summary** screen.

   The actions that you can configure are:

   - **Block.** Block connections that match the signature. Disabled by default.
   - **Log.** Log connections that match the signature for later analysis. Enabled by default.
   - **Stats.** Maintain statistics, for each signature, that show how many connections it matched and provide certain other information about the types of connections that were blocked. Disabled by default.
   - **Learn.** Observe traffic to this Web site or Web service, and use connections that repeatedly violate this check to generate recommended exceptions to the check, or new rules for the check. Available only for some checks.

   To enable or disable an action for a check, in the list, select or clear the check box for that action to the right of that check.

   To configure other parameters for those checks that have them, in the list, click the blue chevron to the far right of that check. In the dialog box that appears, configure the parameters. These vary from check to check. You can also select a check and, at the bottom of the dialog box, click **Open** to display a dialog box for modifying any of the options for that check. These dialog boxes also vary from check to check. Most of them include a **Checks** tab and a **General** tab. If the check supports relaxations, the **Checks** tab includes an **Add** button, which opens yet another dialog box, in which you can specify a relaxation for the check. A relaxation is a rule for exempting specified traffic from the check.

   For information about the settings available for a check, see the detailed description of that check.

   To review the recommendations generated by the learning engine for a specific check, select that check and then click **Learned Violations** to open the **Manage Learned Rules**

dialog box for that check. For more information on how learning works and how to configure exceptions (relaxations) or deploy learned rules for a check, see Manual Configuration By Using the Configuration Utility under To configure and use the learning feature

To view all logs for a specific check, select that check, and then click **Logs**.

8. **Summary screen.** On this screen, you review your configuration choices to verify that they are what you want. If you want to make changes, you click **Back** until you have returned to the appropriate screen, and make your changes. If the configuration is as you want it, you click **Finish** to save it , and then click **Exit** to close the Application Firewall wizard.

Following are four procedures that show how to perform specific types of configuration by using the Application Firewall wizard.

To configure the Application Firewall: Initial Configuration

1. In the navigation pane, click **Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**.
3. On the Application Firewall wizard, **Introduction** screen, in the lower right-hand corner, click **Next**.
4. On the **Specify Name** screen, in the **Name** text box, type a name for your new security configuration, and from the **Type** drop-down list, select the type of security configuration. Then, click **Next**.
5. On the **Specify Rule** screen, click **Next** again.

   Note: The default rule, `true`, protects all Web traffic that is sent via your NetScaler appliance or VPX. You can create specific security configurations to protect specific parts of your Web sties or Web applications later.
6. On the **Select Signature Protections** screen, select check boxes to specify the groups of signatures that are appropriate for protecting the content on your protected web sites, and then click **Next**.

   For more information about signatures, see Signatures
7. On the **Select Signature Actions** screen, select or clear the associated check boxes to choose the signature actions that you want for each signature category that you selected in the previous step, and then click **Next**.
8. On the **Select Advanced Protections** screen, click **Next** again.

   You typically do not need to configure the security checks during initial configuration.
9. On the **Summary** screen, review your choices to verify that they are what you want. Then, click **Finish**, or click **Back** to return to a previous screen and make changes. When you are finished, click **Exit** to close the Application Firewall wizard.

To configure the Application Firewall: Enabling Blocking for Signatures

1. In the navigation pane, click **Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**.
3. On the Application Firewall wizard, **Introduction** screen, in the lower right-hand corner, click **Next**.
4. On the **Specify Name** screen, select **Modify Existing Configuration** and, in the Name drop-down list, choose the security configuration that you created during simple configuration, and then click **Next**.
5. In the **Specify Rule** screen, click **Next** again.
6. In the **Select Signature Protections** screen, click **Next** again.
7. In the **Select Signature Actions** screen, enable blocking for your chosen signatures by selecting the **Block** check box to the left of each of those signature.

   For more information about which signatures to consider for blocking and how to determine when you can safely enable blocking for a signature, see Signatures
8. In the **Select advanced protections** screen, click **Next**.
9. On the **Summary** screen, review your choices to verify that they appear correct. Then, click **Finish**, or click **Back** to return to the**Select Signature Actions** screen and make changes. When you are finished, click **Exit** to close the Application Firewall wizard.

To configure the Application Firewall: Enabling and Configuring advanced protection

1. In the navigation pane, click **Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**.
3. On the Application Firewall wizard, **Introduction** screen, in the lower right-hand corner, click **Next**.
4. On the **Specify Name** screen, select **Modify Existing Configuration** and, in the Name drop-down list, choose the security configuration that you created during simple configuration. Then, click **Next**.
5. On the **Specify Rule** screen, click **Next** again.
6. On the **Select Signature Protections** screen, click **Next**.
7. On the **Select Signature Actions** screen, click **Next** again.
8. On the **Select advanced protections** screen, select the check box beside each security check that you want to enable, and then click **Next**.

   For information about the security checks, see Advanced Protections and its subtopics.
9. On the **Select Deep Actions** screen, select check boxes to specify the actions that you want the Application Firewall to perform for each security check, and then click **Next**.

   For general information about the actions, see Advanced Protections and its subtopics. For information about the learning feature, which is available for some security checks, see To configure and use the Learning feature.
10. On the **Summary** screen, review your choices to verify that they appear correct. Then, click **Finish**, or click **Back** to return to the**Select Signature Actions** screen and make changes. When you are finished, click **Exit** to close the Application Firewall wizard.

To configure the Application Firewall: Creating A Policy

The following procedure describes how to use the Application Firewall wizard to create a specialized security configuration to protect only specific content. In this case, you create a new security configuration instead of modifying the initial configuration. This type of security configuration requires a custom rule, so that the policy applies the configuration to only the selected Web traffic.

1. In the navigation pane, click **Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**.
3. On the Application Firewall wizard, **Introduction** screen, in the lower right-hand corner, click **Next**.

4. On the **Specify Name** screen, type a name for your new security configuration in the **Name** text box, select the type of security configuration from the **Type** drop-down list, and then click **Next**.

5. On the **Specify Rule** screen, enter a rule that matches only that content that you want this Web application to protect, and then click **Next**.

   For a description of policies and policy rules, see Policies.

6. On the **Select Signature Protections** screen, choose the appropriate groups of signatures to protect the content on your protected web sites by selecting the check box beside each group of signatures, and then click **Next**.

   For detailed information about signatures, see Signatures.

7. On the **Select Signature Actions** screen, select or clear the associated check boxes to choose the signature actions that you want for each signature category that you selected in the previous step, and then click **Next**. For a detailed description of actions, see , see Signatures.

8. In the **Select Advanced Protections** screen, select the check box beside each security check that you want to enable, and then click **Next**.

   For detailed information about the security checks, see Advanced Protections and its subtopics.

9. In the **Select Advanced Actions** screen, select check boxes to specify the actions that you want the Application Firewall to perform for each security check. Then, click **Next**.

   For information about each security check to help you determine which actions to enable, see the Advanced Protections section.

10. On the **Summary** screen, review your choices to verify that they appear correct. Then, click **Finish**, or click **Back** to return to the**Select Signature Actions** screen and make changes. When you are finished, click **Exit** to close the wizard.

Manual Configuration

If you want to bind a profile to a bind point other than Global, you must manually configure the binding. Also, certain security checks require that you either manually enter the necessary exceptions or enable the learning feature to generate the exceptions that your Web sites and Web services need. Some of these tasks cannot be performed by using the application firewall wizard.

If you are familiar with how the application firewall works and prefer manual configuration, you can manually configure a signatures object and a profile, associate the signatures object with the profile, create a policy with a rule that matches the web traffic that you want to configure, and associate the policy with the profile. You then bind the policy to Global, or to a bind point, to put it into effect, and you have created a complete security configuration.

For manual configuration, you can use the configuration utility (a graphical interface) or the command line. Citrix recommends that you use the configuration utility. Not all configuration tasks can be performed at the command line. Certain tasks, such as enabling signatures and reviewing learned data, must be done in the configuration utility. Most other tasks are easier to perform in the configuration utility.

Manual Configuration By Using the Configuration Utility

If you need to configure the Application Firewall feature manually, Citrix recommends that you use the configuration utility. For a description of the configuration utility, see The Application Firewall User Interfaces .

To create and configure a signatures object

Before you can configure the signatures, you must create a new signatures object from the appropriate default signatures object template. Assign the copy a new name, and then configure the copy. You cannot configure or modify the default signatures objects directly. The following procedure provides basic instructions for configuring a signatures object. For more detailed instructions, see Manually Configuring the Signatures Feature If you need to create your own, user defined signatures, see The Signatures Editor.

1. In the navigation pane, expand **Application Firewall**, and then select **Signatures**.
2. In the details pane, select the signatures object that you want to use as a template, and then click **Add**.

   Your choices are:

   - *** Default Signatures.** Contains the signatures rules, the SQL injection rules, and the cross-site scripting rules.
   - *** XPath Injection.** Contains all of the items in the * Default Signatures, and in addition contains the XPath injection rules.
3. In the **Add Signatures Object** dialog box, type a name for your new signatures object, click **OK**, and then click **Close**. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), and underscore (_) symbols.
4. Select the signatures object that you created, and then click **Open**.
5. In the **Modify Signatures Object** dialog box, set the **Display Filter Criteria** options at the left to display the filter items that you want to configure.

   As you modify these options, the results that you specify are displayed in the **Filtered Results** window at the right. For more information about the categories of signatures, see Signatures.
6. In the **Filtered Results** area, configure the settings for a signature by selecting and clearing the appropriate check boxes.
7. When finished, finished, click **Close**.

To create and configure a profile

The main task in configuring a profile is configuring the security checks. If you need additional information before completing some of the steps in this procedure, see Advanced Protections and its subtopics.

1. In the navigation pane, expand **Application Firewall**, and then select **Profiles**.
2. In the details pane, click **Add**.
3. In the **Create Application Firewall Profile** dialog box, type a name for your profile.

   The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.
4. Choose the profile type from the drop-down list.

   The profile types are HTML (for HTML-based Web sites), XML (for XML-based Web services) and Web 2.0 (for blogs, RSS feeds, wikis, and other sites that contain both HTML and XML).

   Note: If you are unsure what types of content your profile will protect, you can choose Web 2.0 to make the full range of Application Firewall security checks available to protect your Web site.
5. If you plan to use the learning feature or to enable and configure a large number of advanced protections, select **Advanced**. Otherwise, select **Basic**.

   You probably should use the learning feature if you plan to configure either of the SQL injection checks, either of the cross-site scripting checks, any check that provides protection against Web form attacks, or the cookie consistency check. Unless you include the proper exceptions for your protected Web sites when configuring these checks, they can block legitimate traffic. Anticipating all of the necessary exceptions without creating any that are too broad is difficult. The learning feature makes this task much easier.
6. Click **Create**, and then click **Close**.
7. In the **Profiles** pane, select the profile, and then click **Open**.
8. In the **Configure Application Firewall Profile** dialog box, on the **Security Checks** tab, configure the security checks.

   - To enable or disable an action for a check, in the list, select or clear the check box for that action.
   - To configure other parameters for those checks that have them, in the list, click the blue chevron to the far right of that check. In the dialog box that appears, configure the parameters. These vary from check to check. You can also select a check and, at the bottom of the dialog box, click **Open** to display a dialog box for modifying any of the options for that check. These dialog boxes also vary from check to check. Most of them include a **Checks** tab and a **General** tab. If the check supports relaxations or user-defined rules, the **Checks** tab includes an **Add** button,

which opens yet another dialog box, in which you can specify a relaxation or rule for the check. (A relaxation is a rule for exempting specified traffic from the check.)

If relaxations have already been configured, you can select one and click **Open** to modify it.

- To review learned exceptions or rules for a check, select the check, and then click **Learned Violations**. In the **Manage Learned Rules** dialog box, select each learned exception or rule in turn.
  - To edit the exception or rule, and then add it to the list, click **Edit & Deploy**.
  - To accept the exception or rule without modification, click **Deploy**.
  - To remove the exception or rule from the list, click **Skip**.
- To refresh the list of exceptions or rules to be reviewed, click **Refresh**.
- To open the Learning Visualizer and use it to review learned rules, click **Visualizer**.
- To review the log entries for connections that matched a check, select the check, and then click **Logs**. You can use this information to determine which checks are matching attacks, so that you can enable blocking for those checks. You can also use this information to determine which checks are matching legitimate traffic, so that you can configure an appropriate exemption to allow those legitimate connections. For more information about the logs, see Logs, Statistics, and Reports
- To completely disable a check, in the list, clear all of the check boxes to the right of that check.

9. On the **Settings** tab, configure the profile settings.
   - To associate the profile with the set of signatures that you previously created and configured, under **Common Settings**, choose that set of signatures in the **Signatures** drop-down list.

     Note: You may need to use the scroll bar on the right of the dialog box to scroll down to display the Common Settings section.
   - To configure an HTML or XML Error Object, select the object from the appropriate drop-down list.

     Note: You must first upload the error object that you want to use in the **Imports** pane. For more information about importing error objects, see Imports.
10. If you want to use the learning feature, click **Learning**, and configure the learning settings for the profile, as described in To configure and use the Learning feature.
11. Click **OK** to save your changes and return to the **Profiles** pane.

To configure a relaxation or rule

The following procedure describes how to manually configure a relaxation or rule for a security check that supports user-configured relaxations or rules.

1. Click the **Checks** tab. The **Checks** tab contains a list of relaxations or rules for the security check that you are configuring. The list may be empty, or may have entries, depending on the defaults chosen when you created this profile and whether you have previously added relaxations or rules. Beneath the list is a row of buttons that allow you to add, modify, delete, enable, or disable relaxations or rules.

2. To add a relaxation or rule, click **Add**, flll in the elements in the dialog box that appears, and then click **OK** to save your changes.

   The elements can differ significantly depending upon the specific security check. Following is a complete list of all elements that may appear, and information about each.

   - **Enabled check box.** Select to place this relaxation or rule in active use; clear to deactivate it.
   - **Attachment Content Type.** The Content-Type attribute of an XML attachment. In the text area, enter a regular expression that matches the Content-Type attribute of the XML attachments to allow.
   - **Cookie.** In the text area, enter a PCRE-format regular expression that defines the cookie.
   - **Field Name.** A web form field name element may be labeled Field Name, Form Field, or another similar name. In the text area, enter a PCRE-format regular expression that defines the name of the form field.
   - **Name.** An XML element or attribute name. In the text area, enter a PCRE-format regular expression that defines the name of the element or attribute.
   - **URL.** A URL element may be labeled Action URL, Deny URL, Form Action URL, Form Origin URL, Start URL, or simply URL. In the text area, enter a PCRE-format regular expression that defines the URL.
   - **Format.** The format section contains multiple settings that include list boxes and text boxes. Any of the following can appear:

     - **Type.** Select a field type in the **Type** drop-down list. To add a new field type definition, click **Manage**.
     - **Minimum Length.** Type a positive integer that represents the minimum length in characters if you want to force users to fill in this field. Default: 0 (Allows field to be left blank.)
     - **Maximum length.** To limit the length of data in this field, type a positive integer that represents the maximum length in characters. Default: 65535

Location. Choose the element of the request that your relaxation will apply to from the drop-down list. For HTML security checks, the choices are:

- `FORMFIELD`. Form fields in web forms.
- `HEADER`. Request headers.
- `COOKIE`. Set-Cookie headers.

For XML security checks, the choices are:

- `ELEMENT`. XML element.
- `ATTRIBUE`. XML attribute.

- **Maximum Attachment Size.** The maximum size in bytes allowed for an XML attachment.
- **Comments.** In the text area, type a comment. Optional.

Note: For any element that requires a regular expression, you can type the regular expression, use the **Regex Tokens** menu to insert regular expression elements and symbols directly into the text box, or click **Regex Editor** to open the **Add Regular Expression** dialog box, and use it to construct the expression.

3. To modify a relaxation or rule, select it, and then click **Open**, configure the elements in the dialog box that appears, and then click **OK** to save your changes. See the previous step for a list of elements that may appear in this dialog box.
4. To remove a relaxation or rule, select it, and then click **Remove**.
5. To enable a relaxation or rule, select it, and then click **Enable**.
6. To disable a relaxation or rule, select it, and then click **Disable**.
7. To review learned rules for this check, click **Learning** and perform the steps in To configure and use the Learning feature.
8. Click **OK**.

To configure and use the Learning feature

The learning feature is a repetitive pattern filter that observes activity on a web site or application protected by the application firewall, to determine what constitutes normal activity on that web site or application. It then generates a list of relaxations for supported security checks.. Users normally find it easier to configure relaxations by using the learning feature than by entering relaxations manually.

1. Click the **Learning** tab. At the top of the **Learning** tab is list of the security checks that are available in the current profile and that support the learning feature.

2. To configure the learning thresholds, select a security check, and then type the appropriate values in the following text boxes:

   Minimum number threshold. Depending on which security check's learning settings you are configuring, the minimum number threshold might refer to the minimum number of total user sessions that must be observed, the minimum number of requests that must be observed, or the minimum number of times a specific form field must be observed, before a learned relaxation is generated. Default: 1

   Percentage of times threshold. Depending on which security check's learning settings you are configuring, the percentage of times threshold might refer to the percentage of total observed user sessions that violated the security check, the percentage of requests, or the percentage of times a form field matched a particular field type, before a learned relaxation is generated. Default: 0
3. To remove all learned data and reset the learning feature, so that it must start its observations again from the beginning, click **Remove All Learned Data**.

   Note: This button removes only learned recommendations that have not been reviewed and either approved or skipped. It does not remove learned relaxations that have been accepted and deployed.

4. To review learned relaxations for a security check, select that security check, then click **Manage Rules**.

5. In the **Manage Learned Rules** dialog box, choose how you want to review the learned rules.

   - To review the actual learned patterns as displayed in the window, do nothing and proceed to the next step.

   - To review the learned data hierarchically as a branching tree, allowing you to choose general patterns that match many of the learned patterns, click **Visualizer**.
6. If you have chosen to review actual learned patterns, perform the following steps.

   a. Select the first learned relaxation, and choose how to handle it.

      To modify and then accept the relaxation, click **Edit & Deploy**, edit the relaxation regular expression, and then click **OK**.

      To accept the relaxation without modifications, click **Deploy**.

      To remove the relaxation from the list without deploying it, click **Skip**.
   b. Repeat the previous step to review each additional learned relaxation.
7. If you have chosen to use the Learning Visualizer, perform the following steps.

   a. In the branching heirarchical display, select a node that contains a learned pattern, and choose how to handle it.

      The screen area beneath the tree structure, under **Regex of Selected Node**, displays a generalized expression that matches all of the patterns in that node. If you want to display an expression that matches just one of the branches or just one of the leaves, select that branch or leaf.

      -

To modify and then accept the learned relaxation, click **Edit & Deploy**, edit the relaxation regular expression, and then click **OK**.

- To accept the relaxation without modifications, click **Deploy**.
- To remove the modification from the list without deploying it, click **Skip**.

b. Repeat the previous step to review other portions of the display.

c. Click **Close** to return to the **Manage Learned Rules** dialog box.

8. Click **Close** to return to the **Configure Application Firewall Profile** dialog box, **Learning** tab.

To create and configure a policy

1. In the navigation pane, expand **Application Firewall**, then expand **Policies**, and then select **Firewall**.
2. In the details pane, click **Add**.
3. In the **Create Application Firewall Policy** dialog box, **Policy Name** text box, type a name for your new policy. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 128 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.
4. Select the profile that you want to associate with this policy from the **Profile** drop-down list. You can create a new profile to associate with your policy by clicking **New**, and you can modify an existing profile by clicking **Modify**.
5. In the **Expression** text area, create a rule for your policy.
   - You can type a rule directly into the text area.
   - You can click **Prefix** to select the first term for your rule, and follow the prompts. See To Create an Application Firewall Rule (Expression) for a complete description of this process.
   - You can click **Add** to open the **Add Expression** dialog box, and use it to construct the rule. See The Add Expression Dialog Box for a complete description of this process.
6. Click **Create**, and then click **Close**.

To bind an Application Firewall policy

1. In the navigation pane, expand **Application Firewall**, select the policy that you created, and then click **Global Bindings**.

2. In the **Bind/Unbind Firewall Policy(s) to Global** dialog box, click **Insert**. A record is inserted into the list of bindings, and in the **Policy Name** column a drop-down list of available policies appears.

3. Select your policy, or click **New Policy** to create a new policy.

4. Click **OK**.

Manual Configuration By Using the NetScaler Command Line

You can configure many application firewall features from the NetScaler command line. There are important exceptions, however. You cannot enable signatures from the command line. There are over 1,000 default signatures in seven categories; the task is simply too complex for the command line interface. You can configure the check actions and parameters for security checks from the command line, but cannot enter manual relaxations. While you can configure the adaptive learning feature and enable learning from the command line, you cannot review learned relaxations or learned rules and approve or skip them. The command line interface is intended for advanced users who are thoroughly familiar with the NetScaler appliance and the application firewall feature.

To manually configure the Application Firewall by using the NetScaler command line, use a telnet or secure shell client of your choice to log on to the NetScaler command line.

To create a profile by using the NetScaler command line

At the command prompt, type the following commands:

- add appfw profile <name> [**-defaults** (**basic** | **advanced**)]
- set appfw profile <name> **-type** (**HTML** | **XML** | **HTML XML**)
- save ns config

Example

The following example adds a profile named `pr-basic`, with basic defaults, and assigns a profile type of `HTML`. This is the appropriate initial configuration for a profile to protect an HTML Web site.

```
add appfw profile pr-basic -defaults basic
set appfw profile pr-basic -type HTML
save ns config
```

Parameters for Creating a Profile

name (Profile Name)

A name for the profile. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) symbols.

defaults (Defaults)

You can choose one of two default configurations when you create a profile: Basic or Advanced. A profile created with basic defaults should protect most Web sites while requiring little additional configuration. A profile created with advanced defaults is intended to protect more complex Web sites requiring additional configuration. You can modify either type of default configuration.

type (Profile Type)

The type of content that the profile will protect. There are three types of profile: **HTML** (HTML), **XML** (XML), or **Web 2.0** (HTML XML). If you are unsure what types of content your profile will protect, you can specify Web 2.0 to make the full range of Application Firewall security checks available to protect your Web site.

To configure a profile by using the NetScaler command line

At the command prompt, type the following commands:

- set appfw profile <name> <arg1> [<arg2> ...] where <arg1> represents a parameter and <arg2> represents either another parameter or the value to assign to the parameter represented by <arg1>. For descriptions of the parameters to use when configuring specific security checks, see Advanced Protections and its subtopics. For descriptions of the other parameters, see "Parameters for Creating a Profile."
- save ns config

Example

The following example shows how to configure an HTML profile created with basic defaults to begin protecting a simple HTML-based Web site. This example turns on logging and maintenance of statistics for most security checks, but enables blocking only for those checks that have extremely low false positive rates and require no special configuration. It also turns on transformation of unsafe HTML and unsafe SQL, which prevents attacks but does not block requests to your Web sites. With logging and statistics enabled, you can later review the logs to determine whether to enable blocking for a specific security check.

```
set appfw profile -startURLAction log stats
set appfw profile -denyURLAction block log stats
set appfw profile -cookieConsistencyAction log stats
set appfw profile -crossSiteScriptingAction log stats
set appfw profile -crossSiteScriptingTransformUnsafeHTML ON
set appfw profile -fieldConsistencyAction log stats
set appfw profile -SQLInjectionAction log stats
```

```
set appfw profile -SQLInjectionTransformSpecialChars ON
set appfw profile -SQLInjectionOnlyCheckFieldsWithSQLChars ON
set appfw profile -SQLInjectionParseComments checkall
set appfw profile -fieldFormatAction log stats
set appfw profile -bufferOverflowAction block log stats
set appfw profile -CSRFtagAction log stats
save ns config
```

To create and configure a policy

At the NetScaler command prompt, type the following commands:

- add appfw policy <name> <rule> <profile>
- save ns config

Example

The following example adds a policy named `pl-blog`, with a rule that intercepts all traffic to or from the host `blog.example.com`, and associates that policy with the profile `pr-blog`. This is an appropriate policy to protect a blog hosted on a specific hostname.

```
add appfw policy pl-blog "HTTP.REQ.HOSTNAME.DOMAIN.EQ("blog.example.com")" pr-blog
```

Parameters for creating and configuring a policy

name

A name for your policy. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 128 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.

rule

A policy rule, or expression, in NetScaler expressions language. For a short description and some useful examples of Application Firewall rules, see . For a complete description of the NetScaler expressions language, see the *Citrix NetScaler Policy Configuration and Reference Guide*

profile

The name of the profile that you previously created.

To bind an Application Firewall policy

At the NetScaler command prompt, type the following commands:

- bind appfw global <policy> <priority>
- save ns config

Example

The following example binds the policy named `pl-blog` and assigns it a priority of `10`.

```
bind appfw global pl-blog 10
save ns config
```

PCRE Character Encoding Format

The NetScaler operating system supports direct entry of characters in the printable ASCII character set only—characters with hexadecimal codes between HEX 20 (ASCII 32) and HEX 7E (ASCII 127). To include a character with a code outside that range in your application firewall configuration, you must enter its UTF-8 hexadecimal code as a PCRE regular expression.

A number of character types require encoding using a PCRE regular expression if you include them in your application firewall configuration as a URL, form field name, or Safe Object expression. They include:

Upper-ASCII characters. Characters with encodings from HEX 7F (ASCII 128) to HEX FF (ASCII 255). Depending on the character map used, these encodings can refer to control codes, ASCII characters with accents or other modifications, non-Latin alphabet characters, and symbols not included in the basic ASCII set. These characters can appear in URLs, form field names, and safe object expressions.

Double-Byte characters. Characters with encodings that use two 8-byte words. Double-byte characters are used primarily for representing Chinese, Japanese, and Korean text in electronic format. These characters can appear in URLs, form field names, and safe object expressions.

ASCII control characters. Non-printable characters used to send commands to a printer. All ASCII characters with hexadecimal codes less than HEX 20 (ASCII 32) fall into this category. These characters should never appear in a URL or form field name, however, and would rarely if ever appear in a safe object expression.

The NetScaler appliance does not support the entire UTF-8 character set, but only the characters found in the following eight charsets:

- **English US (ISO-8859-1).** Although the label reads, “English US,” the application firewall supports all characters in the ISO-8859-1 character set, also called the Latin-1 character set. This character set fully represents most modern western European languages and represents all but a few uncommon characters in the rest.
- **Chinese Traditional (Big5).** The application firewall supports all characters in the BIG5 character set, which includes all of the Traditional Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in Hong Kong, Macau, Taiwan, and by many people of Chinese ethnic heritage who live outside of mainland China.
- **Chinese Simplified (GB2312).** The application firewall supports all characters in the GB2312 character set, which includes all of the Simplified Chinese characters (ideographs) commonly used in modern Chinese as spoken and written in mainland China.
-

Japanese (SJIS). The application firewall supports all characters in the Shift-JIS (SJIS) character set, which includes most characters (ideographs) commonly used in modern Japanese.

- **Japanese (EUC-JP).** The application firewall supports all characters in the EUC-JP character set, which includes all characters (ideographs) commonly used in modern Japanese.

- **Korean (EUC-KR).** The application firewall supports all characters in the EUC-KR character set, which includes all characters (ideographs) commonly used in modern Korean.

- **Turkish (ISO-8859-9).** The application firewall supports all characters in the ISO-8859-9 character set, which includes all letters used in modern Turkish.

- **Unicode (UTF-8).** The application firewall supports certain additional characters in the UTF-8 character set, including those used in modern Russian.

When configuring the application firewall, you enter all non-ASCII characters as PCRE-format regular expressions using the hexadecimal code assigned to that character in the UTF-8 specification. Symbols and characters within the normal ASCII character set, which are assigned single, two-digit codes in that character set, are assigned the same codes in the UTF-8 character set. For example, the exclamation point (!), which is assigned hex code 21 in the ASCII character set, is also hex 21 in the UTF-8 character set. Symbols and characters from another supported character set have a paired set of hexadecimal codes assigned to them in the UTF-8 character set. For example, the letter a with an acute accent (á) is assigned UTF-8 code C3 A1.

The syntax you use to represent these UTF-8 codes in the application firewall configuration is “\xNN” for ASCII characters; “\xNN\xNN” for non-ASCII characters used in English, Russian, and Turkish; and “\xNN\xNN\xNN” for characters used in Chinese, Japanese, and Korean. For example, if you want to represent a ! in an application firewall regular expression as a UTF-8 character, you would type \x21. If you want to include an á, you would type \xC3\xA1.

Note: Normally you do not need to represent ASCII characters in UTF-8 format, but when those characters might confuse a web browser or an underlying operating system, you can use the character’s UTF-8 representation to avoid this confusion. For example, if a URL contains a space, you might want to encode the space as \x20 to avoid confusing certain browsers and web server software.

Below are examples of URLs, form field names, and safe object expressions that contain non-ASCII characters that must be entered as PCRE-format regular expressions to be included in the application firewall configuration. Each example shows the actual URL, field name, or expression string first, followed by a PCRE-format regular expression for it.

- A URL containing extended ASCII characters.

  Actual URL: `http://www.josénuñez.com`

  Encoded URL: `^http://www[.]jos\xC3\xA9nu\xC3\xB1ez[.]com$`

- Another URL containing extended ASCII characters.

  Actual URL: `http://www.example.de/trömso.html`

  Encoded URL: `^http://www[.]example[.]de/tr\xC3\xB6mso[.]html$`

- A form field name containing extended ASCII characters.

  Actual Name: `nome_do_usuário`

  Encoded Name: `^nome_do_usu\xC3\xA1rio$`

- A safe object expression containing extended ASCII characters.

  Unencoded Expression `[A-Z]{3,6}¥[1-9][0-9]{6,6}`

  Encoded Expression: `[A-Z]{3,6}\xC2\xA5[1-9][0-9]{6,6}`

You can find a number of tables that include the entire Unicode character set and matching UTF-8 encodings on the Internet. A useful web site that contains this information is located at the following URL:

http://www.utf8-chartable.de/unicode-utf8-table.pl

For the characters in the table on this web site to display correctly, you must have an appropriate Unicode font installed on your computer. If you do not, the visual display of the character may be in error. Even if you do not have an appropriate font installed to display a character, however, the description and the UTF-8 and UTF-16 codes on this set of web pages will be correct.

Signatures

The application firewall signatures function provides specific, configurable rules that protect your web sites against known attacks. A signature represents a pattern that is a component of a known attack on an operating system, a web server, a web site, an XML-based web service, or any other server that is connected to a web site or web service. A signature can consist of a literal string or a PCRE-compliant regular expression.

To specify how the application firewall is to use signatures, you configure a signatures object, which specifies the signatures to apply to your traffic and the actions to be taken when the signatures match the traffic. A signatures object also contains the SQL injection and cross-site scripting patterns, and may also contain XPath injection patterns. These patterns are not actually signatures but are used by some of the advanced protection checks. The SQL Injection and Cross-Site Scripting patterns contain the SQL special symbols and keywords, the cross-site scripting allowed tags and attributes, and the denied patterns for the HTML and XML SQL Injection and Cross-Site Scripting checks. The XPath injection patterns contain the XPath (*XML Path Language*) denied patterns.

Note: If you use the wizard to configure signatures, the signatures object is created automatically.

The application firewall examines requests to your protected web sites and web services to determine whether a request matches a signature. Matching requests are handled as you specify when configuring the Signatures actions. By default, matching requests are logged so that you can examine them later. If you enabled blocking, the application firewall displays an error page or error object. If you enabled statistics, the application firewall also includes the request in the statistics that it maintains about requests that match an application firewall signature or security check.

If you want to configure signatures manually, you must create a signatures object from a template. There are two default templates that you can use: the ***Default Signatures** template and the ***Xpath Injection** template. The ***Default Signatures** template contains 1,209 signatures, in addition to the complete list of SQL injection and cross-site scripting allowed and denied patterns. The ***Xpath Injection** template contains all of those, and in addition contains 57 Xpath keywords and special strings.

Once you have created a signatures object, you can configure all parts of it, including the signatures rules, the XML SQL Injection and Cross-Site Scripting rules, and the Xpath injection rules. You can also import signatures from a supported vulnerability scanner such as Cenzic, and you can manually create and modify your own custom signatures in the signatures editor. You can also add new SQL injection, cross-site scripting, and XPath injection patterns, modify existing patterns, and remove patterns.

Important: Regardless of whether you use the wizard for initial configuration or configure your signatures object manually, you should regularly apply the Citrix updates to keep your signatures current.

Manually Configuring the Signatures Feature

To use signatures to protect your web sites, you must review the rules, and enable and configure the ones that you want to apply. The rules are disabled by default. Citrix recommends that you enable all rules that are applicable to the type of content that your web site uses.

To manually configure the signatures feature, use a browser to connect to the configuration utility. Then, create a signatures object from a template or an existing signatures object and configure the new object.

Note: The following procedures do not address adding user-defined signatures to a signatures object. To create your own signatures, see The Signatures Editor.

To Create a Signatures Object from a Template

1. In the navigation pane, expand **Application Firewall**, and then select **Signatures**.
2. In the details pane, select the signatures object that you want to use as a template.

   Your choices are:

   - *** Default Signatures.** Contains the signatures rules, the SQL injection rules, and the cross-site scripting rules.
   - *** XPath Injection.** Contains everything that is in the *** Default Signatures** template, and also contains the XPath injection rules.
3. Click **Add**.
4. In the **Add Signatures Object** dialog box, type a name for your new signatures object, and then click **OK**. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), and underscore (_) symbols.
5. Proceed with configuring the new signatures object, or click **Close**. To proceed with configuring the new object, see steps 3 and following of the procedure described in "To Configure a Signatures Object." The contents of your **Add Signatures Object** dialog box are the same as those of the **Modify Signatures Object** dialog box.

To Configure a Signatures Object

1. In the navigation pane, expand **Application Firewall**, and then select **Signatures**.
2. In the details pane, select the signatures object that you want to configure, and then click **Open**.
3. In the **Modify Signatures Object** dialog box, set the **Display Filter Criteria** options at the left to display the filter items that you want to configure.

   As you modify these options, the results that you requested are displayed in the Filtered Results window at the right.

   - To display only selected categories of signatures, check or clear the appropriate signature-category check boxes. The signature categories are:

Name	Type of Attack that this Signature Protects Against
cgi	CGI scripts. Includes Perl and UNIX shell scripts.
client	Browsers and other clients.
coldfusion	Web sites that use the Adobe Systems ColdFusion application server.
frontpage	Web sites that use Microsoft's FrontPage server.
iis	Web sites that use the Microsoft Internet Information Server (IIS).
misc	Miscellaneous attacks.
php	Web sites that use PHP

   - To display only signatures that have specific check actions enabled, select the **ON** check box for each of those actions, clear the **ON** check boxes for the other actions, and clear all of the **OFF** check boxes. To display only signatures that have a specific check action disabled, select their respective **OFF** check boxes and clear all of the **ON** check boxes. To display signatures regardless of whether they have a check action enabled or disabled, select or clear both the **ON** and the **OFF** check boxes for that action. The check actions are:

Criterion	Description
Enabled	The signature is enabled. The application firewall checks only for signatures that are enabled when it processes traffic.
Block	Connections that match this signature are blocked.
Log	A log entry is produced for any connection that matches this signature.
Stats	The application firewall includes any connection that matches this signature in the statistics that it generates for that check.

   - To display only signatures that contain a specific string, type the string into the text box under the filter criteria, and then click **Search**.
   - To reset all display filter criteria to the default settings and display all signatures, click **Show All**.

4. For information about a specific signature, select the signature, and then click the blue double arrow to the left of the **Category** field. The **Signature Rule Vulnerability Detail** message box appears. It contains information about the purpose of the signature and provides links to external web-based information about the vulnerability or vulnerabilities that this signature addresses. To access an external link, click the blue double arrow to the left of the description of that link.

5. Configure the settings for a signature by selecting the appropriate check boxes.

6. If you want to add a local signature rule to the signatures object, or modify an existing local signature rule, see The Signatures Editor.

7. If you have no need for SQL injection, cross-site scripting, or Xpath injection patterns, click **OK**, and then click **Close**. Otherwise, in the lower left-hand corne of the details pane, click **Manage SQL/XSS Patterns**.

8. In the **Manage SQL/XSS Patterns** dialog box, **Filtered Results** window, navigate to the pattern category and pattern that you want to configure. For information about the SQL injection patterns, see HTML SQL Injection Check. For information about the cross-site scripting patterns, see HTML Cross-Site Scripting Check.

9. To add a new pattern:

    a. Select the branch to which you want to add the new pattern.

    b. Click the **Add** button directly below the lower section of the **Filtered Results** window.

    c. In the **Create Signature Item** dialog box, fill in the **Element** text box with the pattern that you want to add. If you are adding a transformation pattern to the transformrules branch, under **Elements**, fill in the **From** text box with the pattern that you want to change and the **To** text box with the pattern to which you want to change the previous pattern.

    d. Click **OK**.

10. To modify an existing pattern:

    a. In the **Filtered Results** window, select the branch that contains the pattern that you want to modify.

    b. In the detail window beneath the **Filtered Results** window, select the pattern that you want to modify.

    c. Click **Modify**.

    d. In the **Modify Signature Item** dialog box, **Element** text box, modify the pattern. If you are modifying a transformation pattern, you can modify either or both patterns under **Elements**, in the **From** and the **To** text boxes.

    e. Click **OK**.

11. To remove a pattern, select the pattern that you want to remove, then click the **Remove** button below the details pane beneath the **Filtered Results** window. When prompted, confirm your choice by clicking **Close**.

12. To add the patterns category to the XSS branch:

a. Select the branch to which you want to add the patterns category.

b. Click the **Add** button directly below the **Filtered Results** window.

Note: Currently you can add only one category, named patterns, to the XSS branch, so after you click **Add**, you must accept the default choice, which is `patterns`.

c. Click **OK**.

13. To remove a branch, select that branch, and then click the **Remove** button directly below the **Filtered Results** window. When prompted, confirm your choice by clicking **OK**.

Note: If you remove a default branch, you remove all of the patterns in that branch. Doing so can disable the security checks that use that information.

14. When you are finished modifying the SQL injection, cross-site scripting, and XPath injection patterns, click **OK**, and then click **Close** to return to the **Modify Signatures Object** dialog box.

15. Click **OK** at any point to save your changes, and when you are finished configuring the signatures object, click **Close**.

Updating a Signatures Object

Citrix regularly updates the signatures for the Application Firewall. You should regularly update the signatures on your Application Firewall to ensure that your Application Firewall is using the most current list. Ask your Citrix representative or Citrix reseller for the URL to access the updates.

To Update a Signatures Object

1. In the navigation pane, expand **Application Firewall**, and then select **Signatures**.
2. In the details pane, select the signatures object that you want to update, and then click **Update**.
3. In the **Update Signatures Object** dialog box, choose one of the following options.
   - **Import from URL.** Choose this option if you download signature updates from a web URL.
   - **Import from Local File.** Choose this option if you import signature updates from a file on your local hard drive, network hard drive, or other storage device.
4. In the text area, type the URL, or type or browse to the local file.
5. Click **Update**. The update file is imported, and the **Update Signatures** dialog box changes to a format nearly identical to that of the **Modify Signatures Object** dialog box, which is described in To Configure a Signatures Object. The **Update Signatures Object** dialog box displays all branches with new or modified signature rules, SQL injection or cross-site scripting patterns, and XPath injection patterns if there are any.
6. Review and configure the new and modified signatures.
7. When you are finished, click **OK**, and then click **Close**.

Updating a Signatures Object from a Supported Vulnerability Scanning Tool

You can add and update signatures generated by a supported vulnerability scanning tool, such as Cenzic, to the signatures in a signatures object. Before you update signatures, you must export them from the vulnerability scanning tool to a file.

To Import and Update Signatures from a Vulnerability Scanning Tool

1. In the navigation pane, expand **Application Firewall**, and then click **Signatures**.
2. In the details pane, select the signatures object that you want to update, and then click **Update**.
3. In the **Update Signatures Object** dialog box, on the **External Format** tab, choose one of the following options.
   - **Import from URL.** Choose this option if you download signature updates from a Web URL.
   - **Import from Local File.** Choose this option if you import signature updates from a file on your local or a network hard drive or other storage device.
4. In the text area, type the URL, or browse or type the path to the local file.
5. Click **Update**. The update file is imported, and the **Update Signatures** dialog box changes to a format nearly identical to that of the **Modify Signatures Object** dialog box, which is described in To Configure a Signatures Object. The **Update Signatures Object** dialog box displays all branches with new or modified signature rules, SQL injection or cross-site scripting patterns, and XPath injection patterns if there are any.
6. Review and configure the new and modified signatures.
7. When you are finished, click **OK**, and then click **Close**.

The Signatures Editor

You can use the signatures editor, which is available in the configuration utility, to add a new user-defined (*local*) signature rule to an existing signatures object, or to modify a previously configured local signature rule. Except that it is defined by the user (you), a local signature rule has the same attributes as a default signature rule from Citrix, and it functions in the same way. You enable or disable it, and configure the signature actions for it, just as you do for a default signature.

Add a local rule if you need to protect your web sites and services from a known attack that the existing signatures do not match. For example, you might discover a new type of attack and determine its characteristics by examining the logs on your web server, or you might obtain third-party information about a new type of attack.

At the heart of a signature rule are the rule *patterns*, which collectively describe the characteristics of the attack that the rule is designed to match. Each pattern can consist of a simple string, a PCRE-format regular expression, or the built-in SQL injection or cross-site scripting patterns.

You might want to modify a signature rule by adding a new pattern or modifying an existing pattern to match an attack. For example, you might find out about changes to an attack, or you might determine a better pattern by examining the logs on your web server, or from third-party information.

Parameters for the Signature Editor

Actions

The **Enabled**, **Block**, **Log**, and **Stats** check boxes. Select or clear the check boxes as appropriate to configure what the Application Firewall does when the signature rule is matched.

- To enable the signature rule, select **Enabled**.
- To enable blocking for the signature rule, select **Block**.
- To enable logging for the signature rule, select **Log**.
- To enable maintaining of statistics for the signature rule, select **Stats**.

Category

The category in which the signature rule is included. Assigning a signature to a category enables you to configure it and other signatures in that category as a group, which can significantly speed up the configuration process when you want to configure many signature rules in the same way.

LogString

A brief string (a few words or a short sentence) that describes the attack that this signature rule matches. This string is used when logging a match to the NetScaler log.

Comment

A longer description of the attack and the signature rule, with information that another user who is configuring this signature object would need to know. Optional.

Patterns

The patterns that describe the characteristics of the attack that this signature rule should match. Patterns can be fixed strings, PCRE-format regular expressions, or the built-in SQL injection or cross-site scripting patterns. See Signature Rule Patterns for more information.

Note: If a signature rule has more then one pattern, a match does not occur unless all of the patterns match the data to which the rule is compared. If either of two patterns can define an attack, but both would not necessarily be present, you should create two signature rules.

To add a signature by using the Signatures Editor

1. In the navigation pane, expand **Application Firewall**, and then select **Signatures**.
2. In the details pane, select the signatures object that you want to edit, and then click **Open**.
3. In the **Modify Signatures Object** dialog box, in the middle of the screen beneath the **Filtered Results window**, click **Add**.
4. In the **Add Local Signature Rule** dialog box, configure the actions for a signature by selecting the appropriate check boxes.
5. Choose a category for the new signature rule from the **Category** drop-down list.

   You can also create a new category by clicking the icon to the right of the list and using the **Add Signature Rule Category dialog** box to add a new category to the list, The rule you are modifying is automatically added to the new category. For instructions, see To add a signature rule category.
6. In the **LogString** text box, type a brief description of the signature rule to be used in the logs.
7. In the **Comment** text box, type a comment. (Optional)
8. In the **Patterns** list, click **Add**, and in the **Create New Signature Rule Pattern** dialog box add one or more patterns for your signature rule. For instructions, see Signature Rule Patterns.
9. Click **OK**.

To modify a signature by using the Signatures Editor

1. In the navigation pane, expand **Application Firewall**, and then select **Signatures**.
2. In the details pane, select the signatures object that you want to configure, and then click **Open**.
3. In the **Modify Signatures Object** dialog box, in the middle of the screen beneath the **Filtered Results window**, select that signature that you want to configure, and then click **Open**.
4. In the **Modify Local Signature Rule** dialog box, configure the actions for a signature by selecting the appropriate check boxes.
5. Choose a category for the new signature rule from the **Category** drop-down list.

   You can also create a new category by clicking the icon to the right of the list, and using the **Add Signature Rule Category dialog** box to add a new category to the list. The rule you are modifying is automatically added to the new category. To add a signature rule category.
6. In the **LogString** text box, modify the description of the signature rule to be used in the logs.
7. In the **Comment** text box, type a comment. (Optional)
8. In the **Patterns** list, add or edit a pattern.

   - To add a pattern, click **Add**. In the **Create New Signature Rule Pattern** dialog box, add one or more patterns for your signature rule, and then click **OK**.
   - To edit a pattern, select the pattern, and then click **Open**. In the **Edit Signature Rule Pattern** dialog box, modify the pattern, and then click **OK**.

   For more information about adding or editing patterns, see Signature Rule Patterns.
9. Click **OK**.

To add a signature rule category

Putting signature rules into a category enables you to configure the actions for a group of signatures instead of for each individual signature. You might want to do so for the following reasons:

- **Ease of selection.** For example, assume that all of signature rules in a particular group protect against attacks on a specific type of web server software or technology. If your protected web sites use that software or technology, you want to enable them all. If they do not, you do not want to enable any of them.
- **Ease of initial configuration.** It is easiest to set defaults for a group of signatures as a category, instead of one-by-one. You can then make any changes to individual signatures as needed.
- **Ease of ongoing configuration.** It is easier to configure signatures if you can display only those that meet specific criteria, such as belonging to a specific category.

1. In the navigation pane, expand **Application Firewall**, and then select **Signatures**.
2. In the details pane, select that signatures object that you want to configure, and then click **Open**.
3. In the **Modify Signatures Object** dialog box, in the middle of the screen, beneath the Filtered Results window, click **Add**.
4. In the **Add Local Signature Rule** dialog box, click the icon to the right of the **Category** drop-down list.
5. In the **Add Signature Rule Category** dialog box, **New Category** text box, type a name for your new signature category. The name can consist of from one to 64 characters and must start with an alphanumeric character.
6. Click **OK**.

Signature Rule Patterns

You can add a new pattern to a signature rule or modify an existing pattern of a signature rule to specify a string or expression that characterizes an aspect of the attack that the signature matches. To determine which patterns an attack exhibits, you can examine the logs on your web server, use a tool to observe connection data in real time, or obtain the string or expression from a third-party report about the attack.

Caution: Any new pattern that you add to a signature rule is in an AND relationship with the existing patterns. Do not add a new pattern to an existing signature rule if you do not want a potential attack to have to match all of the patterns in order to match the signature.

Each pattern can consist of a simple string, a PCRE-format regular expression, or the built-in SQL injection or cross-site scripting pattern. Before you attempt to add a pattern that is based on a regular expression, you should make sure that you understand PCRE-format regular expressions. PCRE expressions are complex and powerful; if you do not understand how they work, you can unintentionally create a pattern that matches something that you did not want (a *false positive*) or that fails to match something that you did want (a *false negative*).

If you are not already familiar with PCRE-format regular expressions, you can use the following resources to learn the basics, or for help with some specific issue:

- *"Mastering Regular Expressions"*, Third Edition. Copyright (c) 2006 by Jeffrey Friedl. O'Reilly Media, ISBN: 9780596528126
- *"Regular Expressions Cookbook"*. Copyright (c) 2009 by Jan Goyvaerts and Steven Levithan. O'Reilly Media, ISBN: 9780596520687
- **PCRE Man page/Specification** (text/official): http://www.pcre.org/pcre.txt
- **PCRE Man Page/Specification** (html/gammon.edu.au): http://www.gammon.com.au/pcre/index.html
- **Wikipedia PCRE entry**: http://en.wikipedia.org/wiki/PCRE
- **PCRE Mailing List** (run by exim.org): http://lists.exim.org/mailman/listinfo/pcre-dev

If you need to encode non-ASCII characters in a PCRE-format regular expression, the NetScaler platform supports encoding of hexadecimal UTF-8 codes. For more information, see PCRE Character Encoding Format.

To configure a signature rule pattern

1. In the navigation pane, expand **Application Firewall**, and then select **Signatures**.

2. In the details pane, select that signatures object that you want to configure, and then click **Open**.

3. In the **Modify Signatures Object** dialog box, in the middle of the screen beneath the **Filtered Results** window, either click **Add** to create a signature rule, or select an existing signature rule and click **Open.**

   Note: You can modify only signature rules that you added. You cannot modify the default signature rules.

   Depending on your action, either the **Add Local Signature Rule** or the **Modify Local Signature Rule** dialog box appears. Both dialog boxes have the same contents.

4. Under the **Patterns** window in the dialog box that you opened, either click **Add** to add a new pattern, or select an existing pattern from the list beneath the **Add** button and click **Open**. Depending on your action, either the **Create New Signature Rule Pattern** or the **Edit Signature Rule Pattern** dialog box appears. Both dialog boxes have the same contents.

5. In the **Location** area, define the elements to examine with this pattern,. The **Location** area describes what elements of the HTTP request or response to examine for this pattern. As you choose a value from the **Area** drop-down list, the remaining parts of the **Location** area change interactively. Following are all configuration items that might appear in this section.

   Area

   Drop-down list of elements that describe a particular portion of the HTTP connection. The choices are as follows:

   - **HTTP_ANY**. All parts of the HTTP connection.
   - **HTTP_COOKIE**. Cookies in the HTTP headers.
   - **HTTP_FORM_FIELD**. Form fields and their contents.
   - **HTTP_HEADER**. The contents of the HTTP header.
   - **HTTP_RAW_HEADER**. The entire HTTP header.
   - **HTTP_METHOD**. The HTTP method.
   - **HTTP_POST_BODY**. HTTP post bodies containing web form data.
   - **HTTP_STATUS_CODE**. The HTTP status code.
   - **HTTP_STATUS_MESSAGE**. The HTTP status message.
   - **HTTP_URL**. The contents of a URL in the HTTP headers or body.
   - **HTTP_RAW_URL**. An entire URL in the HTTP headers or body.

URL

Examines any URLs found in the elements specified by the **Area** setting.

- To enable, select the **Enabled** check box.
- To search for a literal string in a URL, type the string in the text area.
- To search for a pattern defined by a regular expression, select the **Is Regular Expression** check box, and then type the regular expression in the text area. Use the **Regex Tokens** to insert common regular expression elements at the cursor, or the **Regex Editor** for more assistance in constructing the regular expression that you want.

Field Name

Examines any form field names found in the elements specified by the **Area** selection.

- To enable, select the **Enabled** check box.
- To search for a literal string in a form field, type the string in the text area.
- To search for a pattern defined by a regular expression, select the **Is Regular Expression** check box, and then type the regular expression in the text area. Use the **Regex Tokens** to insert common regular expression elements at the cursor, or the **Regex Editor** for more assistance in constructing the regular expression that you want.

6. In the **Pattern** area, define the pattern. A pattern is a literal string or PCRE-format regular expression that defines the pattern that you want to match. The **Pattern** area contains the following elements:

Match

A drop-down list of four elements that describes the type of pattern you are using.

- **Literal**. A literal string.
- **PCRE**. A PCRE-format regular expression.

  NOTE: When you choose PCRE, the regular expression tools beneath the Pattern window are enabled. These tools are not useful for other types of patterns.

- **Injection**. Directs the application firewall to look for injected SQL in the specified location. The **Pattern** window disappears, because the application firewall already has the patterns for SQL injection.

  NOTE: If you choose **Injection**, a warning appears, telling you that the **Area** will be reset to **HTTP_FORM_FIELD**. Click **Yes** to accept this change, or **No** to reject it and retain your current **Area** setting.

- **CrossSiteScripting**. Directs the application firewall to look for cross-site scripts in the specified location. The **Pattern** window disappears, because the application firewall already has the patterns for cross-site scripts.

Pattern Window (unlabeled)

In this window, type the pattern that you want to match.

- **Literal.** Simply type the string you want to search for.
- **PCRE.** Type the regular expression in the text area. Use the **Regex Tokens** to insert common regular expression elements at the cursor, or the **Regex Editor** for more assistance in constructing the regular expression that you want.
- **Offset (under *More*>>).** The number of characters to skip over before starting to match on this pattern. You use this field to start examining a string at some point other than the first character.
- **Depth (under *More*>>).** How many characters from the starting point to examine for matches. You use this field to limit searches of a large string to a specific number of characters.
- **Min-Length (under *More*>>).** The minimum match length. Any match that contains fewer than the specified number of characters is not considered to be a valid match.
- **Max-Length (under *More*>>).** The maximum match length. Any match that contains more than the specified number of characters is not considered to be a valid match.
- **Pattern Type (under *More*>>).** A list box with one choice, **fastmatch**. You can use fastmatch only for a literal pattern, to improve performance.

7. Click **OK**.
8. Repeat the previous four steps to add or modify additional patterns.
9. When finished adding or modifying patterns, click **OK** to save your changes and return to the **Signatures** pane.

Caution: Until you click **OK** in the **Add Local Signature Rule** or **Modify Local Signature Rule** dialog box, your changes are not saved. Do not close either of these dialog boxes without clicking **OK** unless you want to discard your changes.

Advanced Protections

The application firewall advanced protections (*security checks*) are a set of filters designed to catch complex or unknown attacks on your protected web sites and web services. The security checks use heuristics, positive security, and other techniques to detect attacks that may not be detected by signatures alone. You configure the security checks by creating and configuring an application firewall *profile*, which is a collection of user-defined settings that tell the application firewall which security checks to use and how to handle a request or response that fails a security check. A profile is associated with a *signatures object* and with a *policy* to create a security configuration.

The application firewall provides twenty security checks, which differ widely in the types of attacks that they target and how complex they are to configure. The security checks are organized into the following categories:

- **Common security checks.** Checks that apply to any aspect of web security that either does not involve content or is equally applicable to all types of content.
- **HTML security checks.** Checks that examine HTML requests and responses. These checks apply to HTML-based web sites and to the HTML portions of Web 2.0 sites, which contain mixed HTML and XML content.
- **XML security checks.** Checks that examine XML requests and responses. These checks apply to XML-based web services and to the XML portions of Web 2.0 sites.

The security checks protect against a wide range of types of attack, including attacks on operation system and web server software vulnerabilities, SQL database vulnerabilities, errors in the design and coding of web sites and web services, and failures to secure sites that host or can access sensitive information.

All security checks have a set of configuration options, the check actions, which control how the application firewall handles a connection that matches a check. Three check actions are available for all security checks. They are:

- **Block.** Block connections that match the signature. Disabled by default.
- **Log.** Log connections that match the signature, for later analysis. Enabled by default.
- **Stats.** Maintain statistics, for each signature, that show how many connections it matched and provide certain other information about the types of connections that were blocked. Disabled by default.

A fourth check action, **Learn**, is available for more than half of the check actions. It observes traffic to a protected Web site or web service and uses connections that repeatedly violate the security check to generate recommended exceptions (*relaxations*) to the check, or new rules for the check. In addition to the check actions, certain security checks have parameters that control the rules that the check uses to determine which connections violate that check, or that configure the application firewall's response to connections that violate the check. These parameters are different for each check, and they are described in the documentation for each check.

To configure security checks, you can use the application firewall wizard, as described in The Application Firewall Wizard, or you can configure the security checks manually, as described in Manual Configuration By Using the Configuration Utility and Manual Configuration By Using the Configuration Utility. Some tasks, such as manually entering relaxations or rules or reviewing learned data, can be done only by using the configuration utility, not the command line. Using the wizard is usually best configuration method, but in some cases manual configuration might be easier if you are thoroughly familiar with it and simply want to adjust the configuration for a single security check.

Regardless of which method you use to configure the security checks, each security check requires that certain tasks be performed. Many checks require that you specify exceptions (*relaxations*) to prevent blocking of legitimate traffic before you enable blocking for that security check. You can do this manually, by observing the log entries after a certain amount of traffic has been filtered and then creating the necessary exceptions. However, it is usually much easier to enable the learning feature and let it observe the traffic and recommend the necessary exceptions.

Top-Level Advanced Protections

Four of the advanced protections are especially effective against common types of Web attacks, and are therefore more commonly used than any of the others. They are:

HTML Cross-Site Scripting. Examines requests and responses for scripts that attempt to access or modify content on a different Web site than the one on which the script is located. When this check finds such a script, it either renders the script harmless before forwarding the request or response to its destination, or it blocks the connection.

HTML SQL Injection. Examines requests that contain form field data for attempts to inject SQL commands into an SQL database. When this check detects injected SQL code, it either blocks the request or renders the injected SQL code harmless before forwarding the request to the Web server.

Note: If both of the following conditions apply to your configuration, you should make certain that your Application Firewall is correctly configured:

- If you enable the HTML Cross-Site Scripting check or the HTML SQL Injection check (or both), and
- Your protected Web sites accept file uploads or contain Web forms that can contain large POST body data.

For more information about configuring the Application Firewall to handle this case, see Configuring the Application Firewall

- **Buffer Overflow.** Examines requests to detect attempts to cause a buffer overflow on the Web server.
- **Cookie Consistency.** Examines cookies returned with user requests to verify that they match the cookies your Web server set for that user. If a modified cookie is found, it is stripped from the request before the request is forwarded to the Web server.

The Buffer Overflow check is simple; you can usually enable blocking for it immediately. The other three top-level checks are considerably more complex and require configuration before you can safely use them to block traffic. Citrix strongly recommends that, rather than attempting to configure these checks manually, you enable the learning feature and allow it to generate the necessary exceptions.

HTML Cross-Site Scripting Check

The HTML Cross-Site Scripting check examines both the headers and the POST bodies of user requests for possible cross-site scripting attacks. If it finds a cross-site script, it either modifies (*transforms*) the request to render the attack harmless, or blocks the request.

To prevent misuse of the scripts on your protected web sites to breach security on your web sites, the HTML Cross-Site Scripting check blocks scripts that violate the *same origin rule*, which states that scripts should not access or modify content on any server but the server on which they are located. Any script that violates the same origin rule is called a cross-site script, and the practice of using scripts to access or modify content on another server is called cross-site scripting. The reason cross-site scripting is a security issue is that a web server that allows cross-site scripting can be attacked with a script that is not on that web server, but on a different web server, such as one owned and controlled by the attacker.

Unfortunately, many companies have a large installed base of Javascript-enhanced web content that violates the same origin rule. If you enable the HTML Cross-Site Scripting check on such a site, you have to generate the appropriate exceptions so that the check does not block legitimate activity.

If you use the wizard or the configuration utility, in the **Modify HTML Cross-Site Scripting Check** dialog box, on the **General** tab you can enable or disable the **Block**, **Log**, **Learn**, and **Statistics** actions, and in addition the following parameters:

Transform. If enabled, the application firewall makes the following changes to requests that match the HTML Cross-Site Scripting check:

- Left angle bracket (<) to HTML character entity equivalent (<)
- Right angle bracket (>) to HTML character entity equivalent (>)

This ensures that browsers do not interpret unsafe html tags, such as `<script>`, and thereby execute malicious code. If you enable both request-header checking and transformation, any special characters found in request headers are also modified as described above. If scripts on your protected web site contain cross-site scripting features, but your web site does not rely upon those scripts to operate correctly, you can safely disable blocking and enable transformation. This configuration ensures that no legitimate web traffic is blocked, while stopping any potential cross-site scripting attacks.

Check complete URLs. If checking of complete URLs is enabled, the application firewall examines entire URLs for HTML cross-site scripting attacks instead of checking just the query portions of URLs.

Check Request headers. If Request header checking is enabled, the application firewall examines the headers of requests for HTML cross-site scripting attacks, instead of just URLs.

If you use the command-line interface, you can enter the following commands to configure the HTML Cross-Site Scripting Check:

- set appfw profile <profileName> **-crossSiteScriptingAction** [**block**] [**learn**] [**log**] [**stats**] [**none**]
- set appfw profile <profileName> **-crossSiteScriptingTransformUnsafeHTML** ([**ON**] | [**OFF**])
- set appfw profile <profileName> **-crossSiteScriptingCheckCompleteURLs** ([**ON**] | [**OFF**])

To specify relaxations for the HTML Cross-Site Scripting check, you must use the configuration utility. On the **Checks** tab of the **Modify HTML Cross-Site Scripting Check** dialog box, click **Add** to open the **Add HTML Cross-Site Scripting Check Relaxation** dialog box, or select an existing relaxation and click **Open** to open the **Modify HTML Cross-Site Scripting Check Relaxation**dialog box. Either dialog box provides the same options for configuring a relaxation, as described in Manual Configuration By Using the Configuration Utility.

Following are examples of HTML Cross-Site Scripting check relaxations:

Web Form Field Expressions

Logon Fields. The following expression exempts all fields beginning with the string `logon_` followed by a string of upper- and lower-case letters or numbers that is at least two characters long and no more than fifteen characters long:

```
^logon_[0-9A-Za-z]{2,15}$
```

Name Fields. The following expression exempts form fields with names beginning with `Name_` followed by a string beginning with a letter or number and consisting of from one to twenty letters, numbers, or the apostrophe or hyphen symbol:

```
^Name_[0-9A-Za-z][0-9A-Za-z'-]{0,20}$
```

Name Fields (Special Characters). If your web site has Turkish-speaking customers whose first names may contain special characters, you might have a form field that begins with the string Türkçe-Name_ on their logon page. In addition, the customers may use the same special characters in their names. The special characters in both of these strings must be represented as encoded UTF-8 strings. The following expression exempts form fields beginning with Türkçe-Name_ and containing Turkish special characters:

```
^T\xC3\xBCrk\xC3\xA7e-Name_([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])+$
```

Note: See PCRE Character Encoding Format for a complete description of supported special characters and how to encode them properly.

Session-ID Fields. The following expression exempts all fields beginning with the string `sessionid-` followed by a ten-digit number:

```
^sessionid-[0-9]{10,10}$
```

URL Expressions

- **URLs using Javascript.** You can use a single expression to exempt all URLs that end with a filename that follows a specified pattern. The following expression exempts all URLs that end with the string `query_` followed by a string of upper- and lower-case

letters or numbers that is at least two characters long and no more than forty characters long, and ending with the string `.js`:

```
query_[0-9A-Za-z]{2,40}[.]js$
```

- **URLs containing a Specified String.** You can use an expression to exempt all URLs that contain a specific string. The following expression exempts all URLs that contain the string `prodinfo`:

  ```
  ^https?://(([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f]+[.])+[a-z]{2,6}/[^<>?]*\?prodinfo[^<>?]*$
  ```

  In the above expression , each character class has been grouped with the string `\\x[0-9A-Fa-f][0-9A-Fa-f]`, which matches all properly constructed character encoding strings but does not allow stray backslash characters that are not associated with a UTF-8 character encoding string. The double backslash (\\) is an escaped backslash, which tells the application firewall to interpret it as a literal backslash. If you included only one backslash, the application firewall would interpret the following left square bracket ([) as a literal character instead of as the opening of a character class, which would break the expression.

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (`.*`) metacharacter/wildcard combination, can have results you do not want or expect, such as blocking access to web content that you did not intend to block or allowing an attack that the HTML Cross-Site Scripting check would otherwise have blocked.

HTML SQL Injection Check

The HTML SQL Injection check provides special defenses against injection of unauthorized SQL code that might break security. It examines both the headers and the POST bodies of requests for injected SQL code. If the application firewall detects unauthorized SQL code in a user request, it either transforms the request, to render the SQL code inactive, or blocks the request.

Many web applications have web forms that use SQL to communicate with relational database servers. Often, the scripts that pass web form information to the database do not validate the information provided by the user before sending it to the database. Malicious code or a hacker can use the insecure web form to send SQL commands to the web server.

Note: To prevent blocking of legitimate requests, this check ignores cookies that were set by the server, even if they contain elements that the Cookie Consistency Check would otherwise block.

If you use the wizard or the configuration utility, in the **Modify Cookie Consistency Check** dialog box, on the **General** tab you can enable or disable the Block, Log, Statistics, and Learn actions, and the following actions:

- **Transform.** Make the following changes to requests that match the HTML SQL Injection check:
  - Single straight quote (') to double straight quote (")
  - Backslash (\) to double backslash (\\).
  - Semicolon (;) is dropped completely.

  These three characters (*special strings*) are necessary to issue commands to an SQL server. Unless an SQL command is prefaced with a special string, most SQL servers ignore that command. For this reason, the changes that the application firewall performs when transformation is enabled prevent an attacker from injecting active SQL. After these changes are made, it is safe to forward the request to your protected web site. When web forms on your protected web site may legitimately contain SQL special strings, but the web form does not rely upon the special strings to operate correctly, you can disable blocking and enable transformation to prevent blocking of legitimate web form data without reducing the protection that the application firewall provides to your protected web sites.

  Note: You normally enable either transformation or blocking, but not both. If you have blocking enabled, enabling transformation is redundant because the application firewall already blocks access to requests that contain injected SQL.

- **Restrict checks to fields containing SQL special characters.** If you configure the application firewall to check only fields that contain SQL special strings, the application firewall skips web form fields that do not contain special characters. Since most SQL servers do not process SQL commands that are not preceded by a special character, enabling this parameter can significantly reduce the load on the application firewall and speed up processing without placing your protected web sites at risk.

- **SQL comments handling.** By default, the application firewall checks all SQL comments for injected SQL commands. Many SQL servers ignore anything in a comment, however, even if it is preceded by an SQL special character. For faster processing, if your SQL server ignores comments, you can configure the application firewall to skip comments when examining requests for injected SQL. The SQL comments handling options are:
  - **ANSI.** Skip ANSI-format SQL comments, which are normally used by UNIX-based SQL databases.
  - **Nested.** Skip nested SQL comments, which are normally used by Microsoft SQL Server.
  - **ANSI/Nested.** Skip comments that adhere to both the ANSI and nested SQL comment standards. Comments that match only the ANSI standard, or only the nested standard, are still checked for injected SQL.

    Caution: In most cases, you should not choose the Nested or the ANSI/Nested option unless your back-end database runs on Microsoft SQL Server. Most other types of SQL server software do not recognize nested comments. If nested comments appear in a request directed to another type of SQL server, they may indicate an attempt to breach security on that server.
  - **Check all Comments.** Check the entire request for injected SQL, without skipping anything. The default setting.
- **Check Request headers.** Examine the headers of requests for HTML SQL Injection attacks, instead of just URLs.

  Caution: If you enable both request header checking and transformation, any SQL special characters found in headers are also transformed. The Accept, Accept-Charset, Accept-Encoding, Accept-Language, Expect, and User-Agent headers normally contain semicolons (;), so enabling both Request header checking and transformation simultaneously may cause errors.

If you use the command-line interface, you can enter the following commands to configure the HTML SQL Injection Check:

- set appfw profile <profileName> **-SQLInjectionAction** [**block**] [**learn**] [**log**] [**stats**] [**none**]
- set appfw profile <profileName> **-SQLInjectionTransformSpecialChars** ([**ON**] | [**OFF**])
- set appfw profile <profileName> **-SQLInjectionOnlyCheckFieldsWithSQLChars** ([**ON**]|[**OFF**])
- set appfw profile <profileName> **-SQLInjectionParseComments** ([**checkall**] | [**ansi**|**nested**] | [**ansinested**])

To specify relaxations for the HTML SQL Injection check, you must use the configuration utility. On the **Checks** tab of the **Modify HTML SQL Injection Check** dialog box, click **Add** to open the **Add HTML SQL Injection Check Relaxation** dialog box, or select an existing relaxation and click **Open** to open the **Modify HTML SQL Injection Check Relaxation** dialog box. Either dialog box provides the same options for configuring a relaxation, as described in Manual Configuration By Using the Configuration Utility.

Following are examples of HTML SQL Injection check relaxations:

Web Form Field Name Expressions

Logon Fields. The following expression exempts all fields beginning with the string `logon_` followed by a string of letters or numbers that is at least two characters long and no more than fifteen characters long:

```
^logon_[0-9A-Za-z]{2,15}$
```

Name Fields. The following expression exempts form fields with names beginning with `Name_` followed by a string beginning with a letter or number and consisting of from one to twenty letters, numbers, or the apostrophe or hyphen symbol:

```
^Name_[0-9A-Za-z][0-9A-Za-z'-]{0,20}$
```

Name Fields (Special Characters). If your web site has Turkish-speaking customers whose first names may contain special characters, you might have a form field that begins with the string Türkçe-Name_ on their logon page. In addition, the customers may use the same special characters in their names. The special characters in both of these strings must be represented as encoded UTF-8 strings. The following expression exempts form fields beginning with Türkçe-Name_ and containing Turkish special characters:

```
^T\xC3\xBCrk\xC3\xA7e-Name_([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])+$
```

Note: See PCRE Character Encoding Format for a complete description of supported special characters and how to encode them properly.

Session-ID Fields. The following expression exempts all fields beginning with the string `sessionid-` followed by a ten-digit number:

```
^sessionid-[0-9]{10,10}$
```

Action URL Expressions

URLs using Javascript. You can use a single expression to exempt all URLs that end with a filename that follows a specified pattern. The following expression exempts all URLs that end with the string `query_` followed by a string of upper- and lower-case letters or numbers that is at least two characters long and no more than forty characters long, and that end with the string `.js`:

```
query_[0-9A-Za-z]{2,40}[.]js$
```

URLs containing a Specified String. You can use an expression to exempt all URLs that contain a specific string. The following expression exempts all URLs that contain the string `prodinfo`:

```
^https?://(([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])(([0-9A-Za-z_-]|\\x[0-9A-Fa-f]
[0-9A-Fa-f]+[.])+[a-z]{2,6}/[^<>?]*\?prodinfo[^<>?]*$
```

In the expression above, each character class has been grouped with the string `\\x[0-9A-Fa-f][0-9A-Fa-f]`, which matches all properly constructed character encoding strings but does not allow stray backslash characters that are not associated with a UTF-8 character encoding string. The double backslash (\\) is an escaped backslash, which tells the application firewall to interpret it as a literal backslash. If you included only one backslash, the application firewall would interpret the following left square bracket ([) as a literal character instead of as the opening of a character class, which would break the expression.

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (`.*`) metacharacter/wildcard combination, can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the HTML SQL Injection check would otherwise have blocked.

Buffer Overflow Check

The Buffer Overflow check detects attempts to cause a buffer overflow on the web server. If the application firewall detects a URL, cookie or header longer than the specified maximum length in a request, it blocks that request because it might be an attempt to cause a buffer overflow.

The Buffer Overflow check prevents attacks against insecure operating-system or web-server software that can crash or behave unpredictably when it receives a data string that is larger than it can handle. Proper programming techniques prevent buffer overflows by checking incoming data and either rejecting or truncating overlong strings. Many programs, however, do not check all incoming data and are therefore vulnerable to buffer overflows. This issue especially affects older versions of web-server software and operating systems, many of which are still in use.

If you use the wizard or the configuration utility, in the **Modify Buffer Overflow Check** dialog box, on the **General** tab you can enable or disable the Block, Log, and Statistics actions. On the **Checks** tab, you can set the following parameters:

- **Maximum URL Length.** The maximum length the application firewall allows in a requested URL. Requests with longer URLs are blocked. Possible Values: 0-65536. Default: 1024
- **Maximum Cookie Length.** The maximum length the application firewall allows for an individual cookie in a request. Longer cookies are stripped from requests before those requests are forwarded to your protected web server. Possible Values: 0-65536. Default: 4096
- **Maximum Header Length.** The maximum length the application firewall allows for HTTP headers. Requests with longer headers are blocked. Possible Values: 0-65536. Default: 4096

If you use the command-line interface, you can add the following Buffer Overflow Check arguments to the set appfwl profile <profileName> command:

- **-bufferOverflowAction [block] [log| [stats]**
- **-bufferOverflowMaxURLLength** <positiveInteger>
- **-bufferOverflowMaxCookieLength** <positiveInteger>
- **-bufferOverflowMaxHeaderLength** <positiveInteger>

Cookie Consistency Check

The Cookie Consistency check examines cookies returned by users, to verify that they match the cookies that your web site set for that user. If a modified cookie is found, it is stripped from the request before the request is forwarded to the web server. You can also configure the Cookie Consistency check to transform all of the server cookies that it processes, by encrypting the cookies, proxying the cookies, or adding flags to the cookies. This check applies to requests and responses.

An attacker would normally modify a cookie to gain access to sensitive private information by posing as a previously authenticated user, or to cause a buffer overflow. The Buffer Overflow check protects against attempts to cause a buffer overflow by using a very long cookie. The Cookie Consistency check focuses on the first scenario.

If you use the wizard or the configuration utility, in the **Modify Cookie Consistency Check** dialog box, on the **General** tab you can enable or disable the following actions:

- Block
- Log
- Learn
- Statistics
- Transform. If enabled, the Transform action modifies all cookies as specified in the following settings:
    - **Encrypt Server Cookies.** Encrypt cookies set by your web server, except for any listed in the Cookie Consistency check relaxation list, before forwarding the response to the client. Encrypted cookies are decrypted when the client sends a subsequent request, and the decrypted cookies are reinserted into the request before it is forwarded to the protected web server. Specify one of the following types of encryption:
        - **None.** Do not encrypt or decrypt cookies. The default.
        - **Decrypt only.** Decrypt encrypted cookies only. Do not encrypt cookies.
        - **Encrypt session only.** Encrypt session cookies only. Do not encrypt persistent cookies. Decrypt any encrypted cookies.
        - **Encrypt all.** Encrypt both session and persistent cookies. Decrypt any encrypted cookies.

          Note: When encrypting cookies, the application firewall adds the **HttpOnly** flag to the cookie. This flag prevents scripts from accessing and parsing the cookie. The flag therefore prevents a script-based virus or trojan from accessing a decrypted cookie and using that information to breach security. This is done regardless of the **Flags to Add in Cookies** parameter settings, which are handled independently of the **Encrypt Server Cookies** parameter

settings.

- **Proxy Server Cookies.** Proxy all non-persistent (*session*) cookies set by your web server, except for any listed in the Cookie Consistency check relaxation list. Cookies are proxied by using the existing application firewall session cookie. The application firewall strips session cookies set by the protected web server and saves them locally before forwarding the response to the client. When the client sends a subsequent request, the application firewall reinserts the session cookies into the request before forwarding it to the protected web server. Specify one of the following settings

  - **None.** Do not proxy cookies. The default.

  - **Session only.** Proxy session cookies only. Do not proxy persistent cookies.

    Note: If you disable cookie proxying after having enabled it (set this value to **None** after it was set to **Session only**), cookie proxying is maintained for sessions that were established before you disabled it. You can therefore safely disable this feature while the application firewall is processing user sessions.
- **Flags to Add in Cookies**. Add flags to cookies during transformation. Specify one of the following settings:

  - **None.** Do not add flags to cookies. The default.

  - **HTTP only.** Add the HttpOnly flag to all cookies. Browsers that support the HttpOnly flag do not allow scripts to access cookies that have this flag set.

  - **Secure**. Add the Secure flag to cookies that are to be sent only over an SSL connection. Browsers that support the Secure flag do not send the flagged cookies over an insecure connection.

  - **All.** Add the HttpOnly flag to all cookies, and the Secure flag to cookies that are to be sent only over an SSL connection.

If you use the command-line interface, you can enter the following commands to configure the Cookie Consistency Check:

- set appfw profile <profileName> **-cookieConsistencyAction** [**block**] [**learn**] [**log**] [**stats**] [**none**]

- set appfw profile <profileName> **-cookieTransforms** ([**ON**] | [**OFF**])

- set appfw profile <profileName> **-cookieEncryption** ([**none**] | [**decryptOnly**] | [**encryptSession**] | [**encryptAll**])

- set appfw profile <profileName> **-cookieProxying** ([**none**] | [**sessionOnly**])

- set appfw profile <profileName> **-addCookieFlags** ([**none**] | [**httpOnly**] | [**secure**] | [**all**])

To specify relaxations for the Cookie Consistency check, you must use the configuration utility. On the **Checks** tab of the **Modify Cookie Consistency Check** dialog box, click **Add** to open the **Add Cookie Consistency Check Relaxation** dialog box, or select an existing relaxation and click **Open** to open the **Modify Cookie Consistency Check Relaxation**dialog box. Either dialog box provides the same options for configuring a relaxation, as described in Manual Configuration By Using the Configuration Utility.

Following are examples of Cookie Consistency check relaxations:

- **Logon Fields.** The following expression exempts all form fields beginning with the string `logon_` followed by a string of letters or numbers that is at least two characters long and no more than fifteen characters long:

  ```
  ^logon_[0-9A-Za-z]{2,15}$
  ```

- **Logon Fields (special characters).** The following expression exempts all form fields beginning with the string `türkçe-logon_` followed by a string of letters or numbers that is at least two characters long and no more than fifteen characters long:

  ```
  ^t\xC3\xBCrk\xC3\xA7e-logon_[0-9A-Za-z]{2,15}$
  ```

  Note: The special characters in that string must be represented as encoded UTF-8 strings. See PCRE Character Encoding Format for a complete description of supported special characters and how to encode them properly.

- **Arbitrary strings.** Allow cookies that contain the string `sc-item_`, followed by the ID of an item that the user has added to his shopping cart ([0-9A-Za-z]+), a second underscore (_), and finally the number of these items he wants ([1-9][0-9]?), to be user-modifiable:

  ```
  ^sc-item_[0-9A-Za-z]+_[1-9][0-9]?$
  ```

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (`.*`) metacharacter/wildcard combination, can have results you do not want or expect, such as blocking access to web content that you did not intend to block or allowing an attack that the Cookie Consistency check would otherwise have blocked.

Data Leak Prevention Checks

The data-leak-prevention checks filter responses to prevent leaks of sensitive information, such as credit card numbers and social security numbers, to unauthorized recipients.

Credit Card Check

The Credit Card check provides special handling for credit card numbers. A web application does not usually send a credit card number in a response to a user request, even when the user supplies a credit card number in the request. The application firewall examines web server responses, including headers, for credit card numbers. If it finds a credit card number in the response, and the administrator has not configured it to allow credit card numbers to be sent, it responds in one of two ways:

- It blocks the response.
- It replaces all but the final group of digits in the credit card with x's. For example, a credit card number of 9876-5432-1234-5678 would be rendered xxxx-xxxx-xxxx-5678.

The Credit Card check prevents attackers from exploiting a security flaw in your web server software or on your web site to obtain credit card numbers of your customers. If your web sites do not have access to credit card information, you do not need to configure this check. If you have a shopping cart or other application that can access credit card numbers, or your web sites have access to database servers that contain credit card numbers, you should configure protection for each type of credit card that you accept.

Note: A web site that does not access an SQL database usually does not have access to sensitive private information such as credit card numbers.

If you use the wizard or the configuration utility, in the **Credit Card Check** dialog box, on the **General** tab you can enable or disable the **Block**, **Log**, and **Statistics** actions, and the following actions:

- **X-Out.** Mask any credit card number detected in a response by replacing each digit, except the digits in the final group, with the letter "X."
- **Maximum credit cards allowed per page.** Allow up to the specified number of credit card numbers per page in responses without masking the credit card numbers or blocking the response. The Maximum is set to zero (0) by default. Web pages do not usually contain unmasked credit card numbers, but occasionally a web page might legitimately contain a credit card number or even a list of credit card numbers. To allow one or more credit card numbers to appear in a web page before masking the numbers or blocking the response, change the value in the "Maximum credit cards allowed per page" text box to the number of credit cards that you want to allow.

To configure the types of credit cards to be protected, in the **Modify Credit Card Check** dialog box, select each credit card type that you want to protect, and then click **Protect**. If you want to cancel protection for a credit card type, select that credit card type and then click **Unprotect**. You can hold down your Shift or Ctrl key while choosing credit card types, and then enable or disable several credit card types at once by clicking the **Protect** or **Unprotect** button while multiple credit card types are selected.

If you use the command-line interface, you can enter the following commands to configure the Credit Card Check:

- set appfw profile <profileName> **-creditCardAction** [**block**] [**log**] [**stats**] [**none**]

- set appfw profile <profileName> **-creditCard** (**VISA** | **MASTERCARD** | **DISCOVER** | **AMEX** | **JCB** | **DINERSCLUB**)
- set appfw profile <profileName> **-creditCardMaxAllowed** <integer>
- set appfw profile <profileName> **-creditCardXOut** ([**ON**] | [**OFF**])

Safe Object Check

The Safe Object check provides user-configurable protection for sensitive business information, such as customer numbers, order numbers, and country-specific or region-specific telephone numbers or postal codes. A user-defined regular expression or custom plug-in tells the application firewall the format of this information and defines the rules to be used to protect it. If a string in a user request matches a safe object definition, the application firewall either blocks the response, masks the protected information, or removes the protected information from the response before sending it to the user, depending on how you configured that particular safe object rule.

The Safe Object check prevents attackers from exploiting a security flaw in your web server software or on your web site to obtain sensitive private information, such as company credit card numbers or social security numbers. If your web sites do not have access to these types of information, you do not need to configure this check. If you have a shopping cart or other application that can access such information, or your web sites have access to database servers that contain such information, you should configure protection for each type of sensitive private information that you handle and store.

Note: A web site that does not access an SQL database usually does not have access to sensitive private information.

The **Safe Object Check** dialog box is unlike that for any other check. Each safe object expression that you create is the equivalent of a separate security check, similar to the **Credit Card** check, for that type of information. If you use the wizard or the configuration utility, you add a new expression by clicking **Add** and configuring the expression in the **Add Safe Object** dialog box. You modify an existing expression by selecting it, then clicking **Open**, and then configuring the expression in the **Modify Safe Object** dialog box.

In the **Safe Object** dialog box for each safe object expression, you can configure the following:

- **Safe Object Name.** A name for your new safe object. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 255 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.
- **Actions.** Enable or disable the **Block**, **Log**, and **Statistics** actions, and the following actions:
  - **X-Out.** Mask any information that matches the safe object expression, by replacing each character with the letter “X”.
  - **Remove.** Remove any information that matches the safe object expression.
- **Regular Expression.** Enter a PCRE-compatible regular expression that defines the safe object. You can create the regular expression in one of three ways: by typing the regular expression directly into the text box, by using the **Regex Tokens** menu to enter regular expression elements and symbols directly into the text box, or by opening the **Regular Expressions Editor** and using it to construct the expression. The regular expression must consist of ASCII characters only. Do not cut and paste characters that are not part of the basic 128-character ASCII set. If you want to include non-ASCII

characters, you must manually type those characters in PCRE hexadecimal character encoding format.

Note: Do not use start anchors (^) at the beginning of Safe Object expressions, or end anchors ($) at the end of Safe Object expressions. These PCRE entities are not supported in Safe Object expressions, and if used, will cause your expression not to match what it was intended to match.

- **Maximum Match Length.** Enter a positive integer that represents the maximum length of the string that you want to match. For example, if you want to match U.S. social security numbers, enter the number eleven (11) in this field. That allows your regular expression to match a string with nine numerals and two hyphens. If you want to match California driver's license numbers, enter the number eight (8).

  Caution: If you do not enter a maximum match length in this field, the application firewall uses a default value of one (1) when filtering for strings that match your safe object expressions. As a result, most safe object expressions fail to match their target strings.

You cannot use the command-line interface to configure the Safe Object check. You must configure it by using either the application firewall wizard or the configuration utility.

Following are examples of Safe Object check regular expressions:

- Look for strings that appear to be U.S. social security numbers, which consist of three numerals (the first of which must not be zero), followed by a hyphen, followed by two more numerals, followed by a second hyphen, and ending with a string of four more numerals:

  [1-9][0-9]{2,2}-[0-9]{2,2}-[0-9]{4,4}

- Look for strings that appear to be California driver's license IDs, which start with a letter and are followed by a string of exactly seven numerals:

  [A-Za-z][0-9]{7,7}

- Look for strings that appear to be Example Manufacturing customer IDs which, consist of a string of five hexadecimal characters (all the numerals and the letters A through F), followed by a hyphen, followed by a three-letter code, followed by a second hyphen, and ending with a string of ten numerals:

  [0-9A-Fa-f]{5,5}-[A-Za-z]{3,3}-[0-9]{10,10}

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write to ensure that they define exactly the type of string you want to add as a safe object definition, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results you did not want or expect, such as blocking access to web content that you did not intend to block.

Advanced Form Protection Checks

The advanced Form Protection checks examine web form data to prevent attackers from compromising your system by modifying the web forms on your web sites or sending unexpected types and quantities of data to your web site in a form.

Field Formats Check

The Field Formats check verifies the data that users send to your web sites in a web form. It examines both the length and type of data to ensure that it is appropriate for the form field in which it appears. If the application firewall detects inappropriate web form data in a user request, it blocks the request. This check applies to HTML requests only. It does not apply to XML requests.

By preventing an attacker from sending inappropriate web form data to your web site, the Field Formats check prevents certain types of attacks on your web site and database servers. For example, if a particular field expects the user to enter a phone number, the Field Formats check examines the user's response to ensure that the data matches the format for a phone number. If a particular field expects a first name, the Field Formats check ensures that the data in that field is of a type and length appropriate for a first name. It does the same thing for each form field that you configure it to protect.

The Field Formats check provides a different type of protection than does the Form Field Consistency check. The Form Field Consistency check verifies that the structure of the web forms returned by users is intact, that data format restrictions configured in the HTML are respected, and that data in hidden fields has not been modified. It can do this without any specific knowledge about your web forms other than what it derives from the web form itself. The Field Formats check verifies that the data in each form field matches the specific formatting restrictions that you configured manually, or that the learning feature generated and you approved. In other words, the Form Field Consistency check enforces general web form security, while the Field Formats check enforces the specific rules that you set for your web forms.

Before it can protect your web forms, the Field Formats check requires that you configure the application firewall to recognize the type and length of data expected in each form field on each web form that you want to protect.

If you use the wizard or the configuration utility, in the **Modify Field Formats Check** dialog box, on the **General** tab you can enable or disable the Block, Log, Learn, and Statistics actions and the following parameters:

- **Field Type.** Assign a default field type to form fields in web forms that do not have a field type. This parameter is not set by default. You can assign any field type that is defined on your application firewall as the default field type.

  Caution: If you set a restrictive default field type and do not disable blocking until you are certain that the field types assigned to your form fields are correct, users may be unable to use your web forms.

- **Minimum Length.** The default minimum data length assigned to form fields in web forms that do not have an explicit setting. This parameter is set to 0 by default, which allows the user to leave the field blank. Any higher setting forces users to fill in the field.

- **Maximum Length.** The default maximum data length assigned to form fields in web forms that do not have an explicit setting. This parameter is set to 65535 by default.

If you use the command-line interface, you can enter the following commands to configure the Field Formats Check:

- set appfw profile <profileName> **-fieldFormatAction** [**block**] [**learn**] [**log**] [**stats**] [**none**]
- set appfw profile <profileName> **-defaultFieldFormatType** <string>
- set appfw profile <profileName> **-defaultFieldFormatMinLength** <integer>
- set appfw profile <profileName> **-defaultFieldFormatMaxLength** <integer>

To specify relaxations for the Field Formats check, you must use the configuration utility. On the **Checks** tab of the **Modify Field Formats Check** dialog box, click **Add** to open the **Add Field Formats Check Relaxation** dialog box, or select an existing relaxation and click **Open** to open the **Modify Field Formats Check Relaxation**dialog box. Either dialog box provides the same options for configuring a relaxation, as described in Manual Configuration By Using the Configuration Utility.

Following are examples of Field Formats check relaxations:

Choose form fields with the name FirstName:

^FirstName$

Choose form fields with names that begin with Name_ and are followed by a string beginning with a letter or number and consisting of from one to twenty letters, numbers, or the apostrophe or hyphen symbol:

^Name_[0-9A-Za-z][0-9A-Za-z'-]{0,20}$

Choose form fields with names that begin with Türkçe-FirstName_ and are otherwise the same as the previous expression, except that they can contain Turkish special characters throughout:

^T\xC3\xBCrk\xC3\xA7e-FirstName_([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])+$

Note: See PCRE Character Encoding Format for a complete description of supported special characters and how to encode them properly.

Choose form field names that begin with a letter or number, consist of a combination of letters and/or numbers only, and that contain the string Num anywhere in the string:

^[0-9A-Za-z]*Num[0-9A-Za-z]*$

Form Field Consistency Check

The Form Field Consistency check examines the web forms returned by users of your web site, and verifies that the web form was not modified inappropriately by the client. This check applies only to HTML requests that contain a web form, with or without data. It does not apply to XML requests.

The Form Field Consistency check prevents clients from making unauthorized changes to the structure of the web forms on your web site when they are filling out a web form and submitting data by using that form. It also ensures that the data a user submits meets the HTML restrictions for length and type, and that data in hidden fields is not modified. This prevents an attacker from tampering with a web form and using the modified form to gain unauthorized access to web site, redirect the output of a contact form that uses an insecure script and thereby send unsolicited bulk email, or exploit a vulnerability in your web server software to gain control of the web server or the underlying operating system. Web forms are a weak link on many web sites and attract a wide range of attacks.

The Form Field Consistency check verifies all of the following:

- If a field is sent to the user, the check ensures that it is returned by the user.
- The check enforces HTML field lengths and types.

  Note: The Form Field Consistency check enforces HTML restrictions on data type and length but does not otherwise validate the data in web forms. You can use the Field Formats check to set up rules that validate data returned in specific form fields on your web forms
- If your web server does not send a field to the user, the check does not allow the user to add that field and return data in it.
- If a field is a read-only or hidden field, the check verifies that the data has not changed.
- If a field is a list box or radio button field, the check verifies that the data in the response corresponds to one of the values in that field.

If a web form returned by a user violates one or more of the Form Field consistency checks, and you have not configured the application firewall to allow that web form to violate the Form Field Consistency checks, the request is blocked.

If you use the wizard or the configuration utility, in the **Modify Form Field Consistency Check** dialog box, on the **General** tab you can enable or disable the **Block**, **Log**, **Learn**, and **Statistics** actions.

If you use the command-line interface, you can enter the following command to configure the Form Field Consistency Check:

- set appfw profile <profileName> **-fieldConsistencyAction** [**block**] [**learn**] [**log**] [**stats**] [**none**]

To specify relaxations for the Form Field Consistency check, you must use the configuration utility. On the **Checks** tab of the **Modify Form Field Consistency Check** dialog box, click **Add** to open the **Add Form Field Consistency Check Relaxation** dialog box, or select an existing relaxation and click **Open** to open the **Modify Form Field Consistency Check Relaxation**dialog box. Either dialog box provides the same options for configuring a relaxation, as described in Manual Configuration By Using the Configuration Utility.

Following are examples of Form Field Consistency check relaxations:

Form Field Names

Choose form fields with the name UserType:

^UserType$

Choose form fields with names that begin with UserType_ and are followed by a string that begins with a letter or number and consists of from one to twenty-one letters, numbers, or the apostrophe or hyphen symbol:

^UserType_[0-9A-Za-z][0-9A-Za-z'-]{0,20}$

Choose form fields with names that begin with Türkçe-UserType_ and are otherwise the same as the previous expression, except that they can contain Turkish special characters throughout:

^T\xC3\xBCrk\xC3\xA7e-UserType_([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])+$

Note: See [PCRE Character Encoding Format] ... for a complete description of supported special characters and how to encode them properly.

Choose form field names that begin with a letter or number, consist of a combination of letters and/or numbers only, and that contain the string Num anywhere in the string:

^[0-9A-Za-z]*Num[0-9A-Za-z]*$

Form Field Action URLs

- Choose URLs beginning with http://www.example.com/search.pl? and containing any string after the query except for a new query:

  ^http://www[.]example[.]com/search[.]pl\?[^?]*$

- Choose URLs that begin with http://www.example-español.com and have paths and filenames that consist of upper-case and lower-case letters, numbers, non-ASCII special characters, and selected symbols in the path. The ñ character and any other special characters are represented as encoded UTF-8 strings containing the hexadecimal code assigned to each special character in the UTF-8 charset:

  ^http://www[.]example-espa\xC3\xB1ol[.]com/(([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*/)*([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*[.](asp|htp|php|s?html?)$

Note: See PCRE Character Encoding Format for a complete description of supported special characters and how to encode them properly.

- Choose all URLs that contain the string /search.cgi?:

  ^[^?<>]*/search[.]cgi\?[^?<>]*$

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (.*) metacharacter/wildcard combination, can have results you do not want or expect, such as blocking access to web content that you did not intend to block or allowing an attack that the Cookie Consistency check would otherwise have blocked.

CSRF Form Tagging Check

The CSRF Form Tagging check tags each web form sent by a protected web site to users with a unique and unpredictable FormID, and then examines the web forms returned by users to ensure that the supplied FormID is correct. This check protects against Cross Site Request Forgery (CSRF) attacks. This check applies only to HTML requests that contain a web form, with or without data. It does not apply to XML requests.

The CSRF Form Tagging check prevents attackers from using their own web forms to send high volume form responses with data to your protected web sites. This check requires relatively little CPU processing capacity compared to certain other security checks that analyze web forms in depth. It is therefore able to handle high volume attacks without seriously degrading the performance of the protected web site or the application firewall itself.

Before you enable the CSRF Form Tagging check, you should be aware of the following:

- You need to enable form tagging. The CSRF check depends on form tagging and does not work without it.
- You should disable the Citrix NetScaler Integrated Caching feature for all web pages containing forms that are protected by that profile. The Integrated Caching feature and CSRF form tagging are not compatible.
- You should consider enabling Referer checking. Referer checking is part of the Start URL check, but it prevents cross-site request forgeries, not Start URL violations. Referer checking also puts less load on the CPU than does the CSRF Form Tagging check. If a request violates Referer checking, it is immediately blocked, so the CSRF Form Tagging check is not invoked.
- The CSRF Form Tagging check does not work with web forms that use different domains in the form-origin URL and form-action URL. For example, CSRF Form Tagging cannot protect a web form with a form-origin URL of http://www.example.com/ and a form action URL of http://www.example.org/form.pl, because example.com and example.org are different domains.

If you use the wizard or the configuration utility, in the **Modify CSRF Form Tagging Check** dialog box, on the **General** tab you can enable or disable the **Block**, **Log**, and **Statistics** actions.

If you use the command-line interface, you can enter the following command to configure the CSRF Form Tagging Check:

- set appfw profile <profileName> **-fieldConsistencyAction** [**block**] [**log**] [**stats**] [**none**]

To specify relaxations for the CSRF Form Tagging check, you must use the configuration utility. On the **Checks** tab of the **Modify CSRF Form Tagging Check** dialog box, click **Add** to open the **Add CSRF Form Tagging Check Relaxation** dialog box, or select an existing relaxation and click **Open** to open the **Modify CSRF Form Tagging Check Relaxation** dialog box. Either dialog box provides the same options for configuring a relaxation, as described in Manual Configuration By Using the Configuration Utility.

Following are examples of CSRF Form Tagging check relaxations:

Note: The following expressions are URL expressions that can be used in both the Form Origin URL and Form Action URL roles.

Choose URLs beginning with http://www.example.com/search.pl? and containing any string after the query, except for a new query:

```
^http://www[.]example[.]com/search[.]pl\?[^?]*$
```

Choose URLs that begin with http://www.example-español.com and have paths and filenames that consist of upper-case and lower-case letters, numbers, non-ASCII special characters, and selected symbols in the path. The ñ character and any other special characters are represented as encoded UTF-8 strings containing the hexadecimal code assigned to each special character in the UTF-8 charset:

```
^http://www[.]example-espa\xC3\xB1ol[.]com/(([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])
([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*/)*([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])
([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*[.](asp|htp|php|s?html?)$
```

Note: See PCRE Character Encoding Format for a complete description of supported special characters and how to encode them properly.

Choose all URLs that contain the string /search.cgi?:

```
^[^?<>]*/search[.]cgi\?[^?<>]*$
```

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (`.*`) metacharacter/wildcard combination, can have results you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the check would otherwise have blocked.

Deny URL Check

The Deny URL check examines and blocks connections to URLs that are commonly accessed by hackers and malicious code. This check contains a list of URLs that are common targets of hackers or malicious code and that rarely if ever appear in legitimate requests. You can also add URLs or URL patterns to the list. The Deny URL check prevents attacks against various security weaknesses known to exist in web server software or on many web sites.

The Deny URL check takes priority over the Start URL check, and thus denies malicious connection attempts even when a Start URL relaxation would normally allow a request to proceed.

If you use the wizard or the configuration utility, in the **Modify Deny URL Check** dialog box, on the **General** tab you can enable or disable the **Block**, **Log**, and **Statistics** actions.

If you use the command-line interface, you can enter the following command to configure the Deny URL Check:

- set appfw profile <profileName> **-denyURLAction** [**block**] [**log**] [**stats**] [**none**]

To create and configure your own deny URLs, you must use the configuration utility. On the **Checks** tab of the **Modify Deny URL Check** dialog box, click **Add** to open the **Add Deny URL** dialog box, or select an existing user-defined deny URL and click **Open** to open the **Modify Deny URL**dialog box. Either dialog box provides the same options for creating and configuring a deny URL, as described in Manual Configuration By Using the Configuration Utility.

Following are examples of Deny URL expressions:

Do not allow users to access the image server at `images.example.com` directly:

^http://images[.]example[.]com$

Do not allow users to access CGI (`.cgi`) or PERL (`.pl`) scripts directly:

^http://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-]*/)*
[0-9A-Za-z][0-9A-Za-z_.-]*[.](cgi|pl)$

Here is the same deny URL, modified to support non-ASCII characters:

^http://www[.]example[.]com/(([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])
([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*/)*([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])
([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*[.](cgi|pl)$

Note: See PCRE Character Encoding Format for a complete description of supported special characters and how to encode them properly.

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL or pattern that you want to block, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (`.*`) metacharacter/wildcard combination, can have results that you do not want, such as

blocking access to web content that you did not intend to block.

URL Protection Checks

The URL Protection checks examine request URLs to prevent attackers from aggressively attempting to access multiple URLs (*forceful browsing*) or using a URL to trigger a known security vulnerability in web server software or web site scripts.

Start URL Check

The Start URL check examines the URLs in incoming requests and blocks the connection attempt if the URL does not meet the specified criteria. To meet the criteria, the URL must match an entry in the Start URL list, unless the Enforce URL Closure parameter is enabled. If you enable this parameter, a user who clicks a link on your Web site is connected to the target of that link.

The primary purpose of the Start URL check is to prevent repeated attempts to access random URLs on a Web site, (*forceful browsing*). Forceful browsing can be used to trigger a buffer overflow, find content that users were not intended to access directly, or find a back door into secure areas of your Web server.

If you use the wizard or the configuration utility, in the **Modify Start URL Check** dialog box, on the **General** tab you can enable or disable **Block**, **Log**, **Statistics**, and **Learn** actions, and the following parameters:

- **Enforce URL Closure.** Allow users to access any web page on your web site by clicking a hyperlink on any other page on your web site. Users can navigate to any page on your web site that can be reached from the home page or any designated start page by clicking hyperlinks.

  Note: The URL closure feature allows any query string to be appended to and sent with the action URL of a web form submitted by using the HTTP GET method. If your protected web sites use forms to access an SQL database, make sure that you have the SQL injection check enabled and properly configured.

- **Validate Referer Header.** Verify that the Referer header in a request that contains web form data from your protected web site instead of another web site. This action verifies that your web site, not an outside attacker, is the source of the web form. Doing so protects against cross-site request forgeries (CSRF) without requiring form tagging, which is more CPU-intensive than header checks. The application firewall can handle the HTTP Referer header in one of the following three ways, depending on which option you select in the drop-down list:

  - **Off.** Do not validate the Referer header.

  - **If-Present.** Validate the Referer header if a Referer header exists. If an invalid Referer header is found, the request generates a referer-header violation. If no Referer header exists, the request does not generate a referer-header violation. This option enables the application firewall to perform Referer header validation on requests that contain a Referer header, but not block requests from users whose browsers do not set the Referer header or who use web proxies or filters that remove that header.

  - **Always.** Always validate the Referer header. If there is no Referer header, or if the Referer header is invalid, the request generates a referer-header violation.

  Note: Although the referer header check and Start URL security check share the same action settings, it is possible to violate the referer header check without violating the Start URL check. The difference is visible in the logs, which log referer header check violations separately from Start URL check violations.

One Start URL setting, **Exempt Closure URLs from Security Checks**, is not configured in the **Modify Start URL Check** dialog box, but in the **Settings** tab of the **Configure Application Firewall Profile** dialog box. If enabled, this setting directs the application firewall not to run further security checks on URLs that meet the URL Closure criteria.

If you use the command-line interface, you can enter the following commands to configure the Start URL Check:

- set appfw profile <profileName> **-startURLAction** [**block**] [**learn**] [**log**] [**stats**] [**none**]
- set appfw profile <profileName> **-startURLClosure** ([**ON**] | [**OFF**])
- set appfw profile <profileName> **-exemptClosureURLsFromSecurityChecks** ([**ON**] | [**OFF**])
- set appfw profile <profileName> **-RefererHeaderCheck** ([**none**] | [**if-present**] | [**always**])

To specify relaxations for the Start URL check, you must use the configuration utility. On the **Checks** tab of the **Modify Start URL Check** dialog box, click **Add** to open the **Add Start URL Check Relaxation** dialog box, or select an existing relaxation and click **Open** to open the **Modify Start URL Check Relaxation**dialog box. Either dialog box provides the same options for configuring a relaxation, as described in Manual Configuration By Using the Configuration Utility.

Following are examples of Start URL check relaxations:

- Allow users to access the home page at `www.example.com`:

  ^http://www[.]example[.]com$

- Allow users to access all static HTML (`.htm` and `.html`), server-parsed HTML (`.htp` and `.shtml`), PHP (`.php`), and Microsoft ASP (`.asp`) format web pages at `www.example.com`:

  ^http://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-]*/)*
  [0-9A-Za-z][0-9A-Za-z_.-]*[.](asp|htp|php|s?html?)$

- Allow users to access web pages with pathnames or file names that contain non-ASCII characters at `www.example-español.com`:

  ^http://www[.]example-espa\xC3\xB1ol[.]com/(([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])([0-9A-Za-z_-]|\\x
  ([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*[.](asp|htp|php|s?html?)

  Note: In the above expression, each character class has been grouped with the string `\\x[0-9A-Fa-f][0-9A-Fa-f]`, which matches all properly-constructed character encoding strings but does not allow stray backslash characters that are not associated with a UTF-8 character encoding string. The double backslash (\\) is an escaped backslash, which tells the application firewall to interpret it as a literal backslash. If

you included only one backslash, the application firewall would instead interpret the following left square bracket ([) as a literal character instead of the opening of a character class, which would break the expression. See PCRE Character Encoding Format for a complete description of supported special characters and how to encode them properly.

- Allow users to access all GIF (`.gif`), JPEG (`.jpg` and `.jpeg`), and PNG (`.png`) format graphics at `www.example.com`:

  ^http://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-]*/)*
  [0-9A-Za-z][0-9A-Za-z_.-]*[.](gif|jpe?g|png)$

- Allow users to access CGI (`.cgi`) and PERL (`.pl`) scripts, but only in the CGI-BIN directory:

  ^http://www[.]example[.]com/CGI-BIN/[0-9A-Za-z][0-9A-Za-z_.-]*[.](cgi|pl)$

- Allow users to access Microsoft Office and other document files in the `docsarchive` directory:

  ^http://www[.]example[.]com/docsarchive/[0-9A-Za-z][0-9A-Za-z_-.]*[.](doc|xls|pdf|ppt)$

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions that you write. Make sure that they define exactly the URL you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (`.*`) metacharacter/wildcard combination, can have results you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the Start URL check would otherwise have blocked.

Deny URL Check

The Deny URL check examines and blocks connections to URLs that are commonly accessed by hackers and malicious code. This check contains a list of URLs that are common targets of hackers or malicious code and that rarely if ever appear in legitimate requests. You can also add URLs or URL patterns to the list. The Deny URL check prevents attacks against various security weaknesses known to exist in web server software or on many web sites.

The Deny URL check takes priority over the Start URL check, and thus denies malicious connection attempts even when a Start URL relaxation would normally allow a request to proceed.

If you use the wizard or the configuration utility, in the **Modify Deny URL Check** dialog box, on the **General** tab you can enable or disable the **Block**, **Log**, and **Statistics** actions.

If you use the command-line interface, you can enter the following command to configure the Deny URL Check:

- set appfw profile <profileName> **-denyURLAction** [**block**] [**log**] [**stats**] [**none**]

To create and configure your own deny URLs, you must use the configuration utility. On the **Checks** tab of the **Modify Deny URL Check** dialog box, click **Add** to open the **Add Deny URL** dialog box, or select an existing user-defined deny URL and click **Open** to open the **Modify Deny URL**dialog box. Either dialog box provides the same options for creating and configuring a deny URL, as described in Manual Configuration By Using the Configuration Utility.

Following are examples of Deny URL expressions:

Do not allow users to access the image server at `images.example.com` directly:

^http://images[.]example[.]com$

Do not allow users to access CGI (`.cgi`) or PERL (`.pl`) scripts directly:

^http://www[.]example[.]com/([0-9A-Za-z][0-9A-Za-z_-]*/)*
[0-9A-Za-z][0-9A-Za-z_.-]*[.](cgi|pl)$

Here is the same deny URL, modified to support non-ASCII characters:

^http://www[.]example[.]com/(([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])
([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*/)*([0-9A-Za-z]|\\x[0-9A-Fa-f][0-9A-Fa-f])
([0-9A-Za-z_-]|\\x[0-9A-Fa-f][0-9A-Fa-f])*[.](cgi|pl)$

Note: See PCRE Character Encoding Format for a complete description of supported special characters and how to encode them properly.

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL or pattern that you want to block, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (`.*`) metacharacter/wildcard combination, can have results that you do not want, such as

blocking access to web content that you did not intend to block.

XML Protection Checks

The XML Protection checks examine requests for XML-based attacks of all types.

Caution: The XML security checks apply only to content that is sent with an HTTP content-type header of text/xml. If the content-type header is missing, or is set to a different value, all XML security checks are bypassed. If you plan to protect XML or Web 2.0 web applications, the webmasters of each web server that hosts those applications should ensure that the proper HTTP content-type header is sent.

XML Format Check

The XML Format check examines the XML format of incoming requests and blocks those requests that are not well formed or that do not meet the criteria in the XML specification for properly-formed XML documents. Some of those criteria are:

- An XML document must contain only properly-encoded Unicode characters that match the Unicode specification.
- No special XML syntax characters—such as < , > and &—can be included in the document except when used in XML markup.
- All begin, end, and empty-element tags must be correctly nested, with none missing or overlapping.
- XML element tags are case-sensitive. All beginning and end tags must match exactly.
- A single root element must contain all the other elements in the XML document.

A document that does not meet the criteria for well-formed XML does not meet the definition of an XML document. Strictly speaking, it is not XML. However, not all XML applications and web services enforce the XML well-formed standard, and not all handle poorly-formed or invalid XML correctly. Inappropriate handling of a poorly-formed XML document can cause security breaches. The purpose of the XML Format check is to prevent a malicious user from using a poorly-formed XML request to breach security on your XML application or web service.

If you use the wizard or the configuration utility, in the **Modify XML Format Check** dialog box, on the **General** tab you can enable or disable the **Block**, **Log**, and **Statistics** actions.

If you use the command-line interface, you can enter the following command to configure the XML Format Check:

- set appfw profile <profileName> **-xmlFormatAction** [**block**] [**log**] [**stats**] [**none**]

You cannot configure exceptions to the XML Format check. You can only enable or disable it.

XML Denial-of-Service Check

The XML Denial of Service (*XML DoS* or *XDoS*) check examines incoming XML requests to determine whether they match the characteristics of a denial-of-service (DoS) attack, and blocks those requests that do. The purpose of the XML DoS check is to prevent an attacker from using XML requests to launch a denial-of-service attack on your web server or web site.

If you use the wizard or the configuration utility, in the **Modify XML Denial-of-Service Check** dialog box, on the **General** tab you can enable or disable the **Block**, **Log**, **Statistics**, and **Learn** actions:

If you use the command-line interface, you can enter the following command to configure the XML Denial-of-Service check:

- set appfw profile <profileName> **-xmlDoSAction** [**block**] [**log**] [**learn**] [**stats**] [**none**]

To configure individual XML Denial-of-Service rules, you must use the configuration utility. On the **Checks** tab of the **Modify XML Denial-of-Service Check** dialog box, select a rule and click **Open** to open the **Modify XML Denial-of-Service** dialog box for that rule. The individual dialog boxes differ for the different rules but are extremely simple. Some only allow you to enable or disable the rule; others allow you to modify a number by typing a new value in a text box.

The individual XML Denial-of-Service rules are:

Maximum Element Depth

Restrict the maximum number of nested levels in each individual element to 256. If this rule is enabled, and the application firewall detects an XML request with an element that has more than the maximum number of allowed levels, it blocks the request. You can modify the maximum number of levels to any value from one (1) to 65,535.

Maximum Element Name Length

Restrict the maximum length of each element name to 128 characters. This includes the name within the expanded namespace, which includes the XML path and element name in the following format:

{http://prefix.example.com/path/}target_page.xml

The user can modify the maximum name length to any value between one (1) character and 65,535.

Maximum # Elements

Restrict the maximum number of any one type of element per XML document to 65,535. You can modify the maximum number of elements to any value between one (1) and 65,535.

Maximum # Element Children

Restrict the maximum number of children (including other elements, character information, and comments) each individual element is allowed to have to 65,535. You can modify the maximum number of element children to any value between one (1) and 65,535.

Maximum # Attributes

Restrict the maximum number of attributes each individual element is allowed to have to 256. You can modify the maximum number of attributes to any value between one (1) and 256.

Maximum Attribute Name Length

Restrict the maximum length of each attribute name to 128 characters. You can modify the maximum attribute name length to any value between one (1) and 2,048.

Maximum Attribute Value Length

Restrict the maximum length of each attribute value to 2048 characters. You can modify the maximum attribute name length to any value between one (1) and 2,048.

Maximum Character Data Length

Restrict the maximum character data length for each element to 65,535. You can modify the length to any value between one (1) and 65,535.

Maximum File Size

Restrict the size of each file to 20 MB. You can modify the maximum file size to any value.

Minimum File Size

Require that each file be at least 9 bytes in length. You can modify the minimum file size to any positive integer representing a number of bytes.

Maximum # Entity Expansions

Limit the number of entity expansions allowed to the specified number. Default: 1024.

Maximum Entity Expansion Depth

Restrict the maximum number of nested entity expansions to no more than the specified number. Default: 32

Maximum # Namespaces

Limit the number of namespace declarations in an XML document to no more than the specified number. Default: 16

Maximum Namespace URI Length

Limit the URL length of each namespace declaration to no more than the specified number of characters. Default: 256

Block Processing Instructions

Block any special processing instructions included in the request. This rule has no user-modifiable values.

Block DTD

Block any document type definitions (*DTD*) included with the request. This rule has no user-modifiable values.

Block External Entities

Block all references to external entities in the request. This rule has no user-modifiable values.

SOAP Array Check

Enable or disable the following SOAP array checks:

- **Maximum SOAP Array Size.** The maximum total size of all SOAP arrays in an XML request before the connection is blocked. You can modify this value. Default: 20000000
- **Maximum SOAP Array Rank.** The maximum rank or dimensions of any single SOAP array in an XML request before the connection is blocked. You can modify this value. Default: 16

XML Cross-Site Scripting Check

The XML Cross-Site Scripting check examines both the headers and the bodies of user requests for possible cross-site scripting attacks. If it finds a possible cross-site scripting attack, it blocks the request.

To prevent misuse of the scripts on your protected web services to breach security on your web services, the XML Cross-Site Scripting check blocks scripts that violate the *same origin rule*, which states that scripts should not access or modify content on any server but the server on which they are located. Any script that violates the same origin rule is called a cross-site script, and the practice of using scripts to access or modify content on another server is called cross-site scripting. The reason cross-site scripting is a security issue is that a web server that allows cross-site scripting can be attacked with a script that is not on that web server, but on a different web server, such as one owned and controlled by the attacker.

Unfortunately, many companies have a large installed base of Javascript-enhanced web content that violates the same origin rule. If you enable the XML Cross-Site Scripting check on such a site, you have to generate the appropriate exceptions so that the check does not block legitimate activity. In addition, to prevent blocking of legitimate requests, this check ignores cookies that were set by the server, even if they contain elements that the Cookie Consistency check would otherwise block. You should keep that in mind when configuring this check.

If you use the wizard or the configuration utility, in the **Modify Cookie Consistency Check** dialog box, on the **General** tab you can enable or disable the **Block**, **Log**, and **Statistics** actions, and the following parameters:

- **Transform.** Make the following changes to requests that match the XML Cross-Site Scripting check:

  - Left angle bracket (<) to HTML character entity equivalent (<)

  - Right angle bracket (>) to HTML character entity equivalent (>)

  These changes prevent browsers from interpreting unsafe html tags, such as `<script>`, and thereby executing malicious code. If you enable both request-header checking and transformation, any special characters found in request headers are also modified as described above. If scripts on your protected web site contain cross-site scripting features, but your web site does not rely upon those scripts to operate correctly, you can safely disable blocking and enable transformation. This configuration ensures that no legitimate web traffic is blocked, while stopping any potential cross-site scripting attacks.

  Check complete URLs. If checking of complete URLs is enabled, the application firewall examines entire URLs for XML Cross-Site Scripting attacks instead of checking just the query portions of URLs.

  Check Request headers. If Request header checking is enabled, the application firewall examines request headers for XML Cross-Site Scripting attacks, instead of examining just URLs.

If you use the command-line interface, you can enter the following commands to configure the XML Cross-Site Scripting Check:

- set appfw profile <profileName> **-crossSiteScriptingAction** [**block**] [**learn**] [**log**] [**stats**] [**none**]
- set appfw profile <profileName> **-crossSiteScriptingTransformUnsafeHTML** ([**ON**] | [**OFF**])
- set appfw profile <profileName> **-crossSiteScriptingCheckCompleteURLs** ([**ON**] | [**OFF**])

To specify relaxations for the XML Cross-Site Scripting check, you must use the configuration utility. On the **Checks** tab of the **Modify XML Cross-Site Scripting Check** dialog box, click **Add** to open the **Add XML Cross-Site Scripting Check Relaxation** dialog box, or select an existing relaxation and click **Open** to open the **Modify XML Cross-Site Scripting Check Relaxation**dialog box. Either dialog box provides the same options for configuring a relaxation, as described in Manual Configuration By Using the Configuration Utility.

Following are examples of XML Cross-Site Scripting check relaxations:

Name element or attribute. The following expression exempts all elements beginning with the string `name_` followed by a string of upper- and lower-case letters or numbers that is at least two characters long and no more than fifteen characters long:

```
^name_[0-9A-Za-z]{2,15}$
```

URL element or attribute. The following expression exempts URLs with hostnames of `web.example.com`, with a path up to four levels deep followed by an optional filename and extension, but no HTML or query symbols :

```
^https?://web[.]example[.]com(/[^<>?]{1,30}){0,4}(/[^<>?]{1,30})*$
```

URL element or attribute (special characters). The following expression exempts URLs with hostnames of `web.türkçe-example.com`, with the same path and file restrictions as above:

```
^https?://web[.]t\xC3\xBCrk\xC3\xA7e-example[.]com(/[^<>?]{1,30}){0,4}(/[^<>?]{1,30})*$
```

Note: See PCRE Character Encoding Format for a complete description of supported special characters and how to encode them properly.

Caution: Regular expressions are powerful. Especially if you are not thoroughly familiar with PCRE-format regular expressions, double-check any regular expressions you write. Make sure that they define exactly the URL that you want to add as an exception, and nothing else. Careless use of wildcards, and especially of the dot-asterisk (`.*`) metacharacter/wildcard combination, can have results that you do not want, such as blocking access to web content that you did not intend to block or allowing an attack that the XML Cross-Site Scripting check would otherwise have blocked.

XML SQL Injection Check

The XML SQL Injection check examines both the headers and the bodies of user requests for possible XML SQL Injection attacks. If it finds injected SQL, it blocks the request.

To prevent misusing the scripts on your protected web services to breach security on your web services, the XML SQL Injection check blocks scripts that violate the *same origin rule*, which states that scripts should not access or modify content on any server but the server on which they are located. Any script that violates the same origin rule is called a cross-site script, and the practice of using scripts to access or modify content on another server is called XML SQL Injection. The reason XML SQL Injection is a security issue is that a web server that allows XML SQL Injection can be attacked with a script that is not on that web server, but on a different web server, such as one owned and controlled by the attacker.

Unfortunately, many companies have a large installed base of Javascript-enhanced web content that violates the same origin rule. If you enable the XML SQL Injection check on such a site, you have to generate the appropriate exceptions so that the check does not block legitimate activity. In addition, to prevent blocking of legitimate requests, this check ignores cookies that were set by the server, even if they contain elements that the Cookie Consistency check would otherwise block. You should keep this in mind when configuring this check.

Note: To prevent blocking of legitimate requests, this check ignores cookies that were set by the server, even if they contain elements that the Cookie Consistency check would otherwise block.

If you use the wizard or the configuration utility, in the **Modify XML SQL Injection Check** dialog box, on the **General** tab you can enable or disable **Block**, **Log**, and **Statistics** actions, and the following parameters:

- **Restrict checks to fields containing SQL special characters.** If you configure the application firewall to check only fields that contain SQL special strings, the application firewall skips web form fields that do not contain special characters. Since most SQL servers do not process SQL commands that are not preceded by a special character, enabling this parameter can significantly reduce the load on the application firewall and speed up processing without placing your protected web sites at risk.

- **SQL comments handling.** By default, the application firewall checks all SQL comments for injected SQL commands. Many SQL servers ignore anything in a comment, however, even if it is preceded by an SQL special character. For faster processing, if your SQL server ignores comments, you can configure the application firewall to skip comments when examining requests for injected SQL. The SQL comments handling options are:

  - **ANSI.** Skip ANSI-format SQL comments, which are normally used by UNIX-based SQL databases.

  - **Nested.** Skip nested SQL comments, which are normally used by Microsoft SQL Server.

  - **ANSI/Nested.** Skip comments that adhere to both the ANSI and nested SQL comment standards. Comments that match only the ANSI standard, or only the nested

standard, are checked for injected SQL.

Caution: In most cases, you should not choose the Nested or the ANSI/Nested option unless your database runs on Microsoft SQL Server. Most other types of SQL server software do not recognize nested comments. If nested comments appear in a request directed to another type of SQL server, they may indicate an attempt to breach security on that server.

- **Check all Comments.** Check the entire request for injected SQL, without skipping anything. The default setting.

- **Check Request headers.** If Request header checking is enabled, the application firewall examines the headers of requests for XML SQL Injection attacks, instead of just URLs.

  Caution: If you enable both request header checking and transformation, any SQL special characters found in headers are also transformed. The Accept, Accept-Charset, Accept-Encoding, Accept-Language, Expect, and User-Agent headers normally contain semicolons (;), so enabling both Request header checking and transformation simultaneously may cause errors.

If you use the command-line interface, you can enter the following commands to configure the XML SQL Injection Check:

- set appfw profile <profileName> **-SQLInjectionAction** [**block**] [**learn**] [**log**] [**stats**] [**none**]
- set appfw profile <profileName> **-SQLInjectionTransformSpecialChars** ([**ON**] | [**OFF**])
- set appfw profile <profileName> **-SQLInjectionOnlyCheckFieldsWithSQLChars** ([**ON**] | [**OFF**])
- set appfw profile <profileName> **-SQLInjectionParseComments** ([**checkall**] | [**ansi** | **nested**] | [**ansinested**])

You configure the exceptions to the XML SQL Injection check by opening the **Modify XML SQL Injection Check** dialog box, **Checks** tab. An exception can consist of either a literal string or a PCRE-format regular expression. For information about adding, modifying, removing, enabling, or disabling exceptions, see Manual Configuration By Using the Configuration Utility.

Following are examples of XML SQL Injection check relaxations:

- **Name element or attribute.** The following expression exempts all elements beginning with the string `name_` followed by a string of upper- and lower-case letters or numbers that is at least two characters long and no more than fifteen characters long:

  ```
  ^name_[0-9A-Za-z]{2,15}$
  ```

- **URL element or attribute.** The following expression exempts URLs with hostnames of `web.example.com`, with a path up to four levels deep followed by an optional file name and extension, but no HTML or query symbols :

^https?://web[.]example[.]com(/[^<>?]{1,30}){0,4}(/[^<>?]{1,30})*$

- **URL element or attribute (special characters).** The following expression exempts URLs with hostnames of `web.türkçe-example.com`, with the same path and file restrictions as above:

  ^https?://web[.]t\xC3\xBCrk\xC3\xA7e-example[.]com(/[^<>?]{1,30}){0,4}(/[^<>?]{1,30})*$

  Note: See PCRE Character Encoding Format for a complete description of supported special characters and how to encode them properly.

XML Attachment Check

The XML Attachment check examines incoming requests for malicious attachments, and it blocks those requests that contain attachments that might breach applications security. The purpose of the XML Attachment check is to prevent an attacker from using an XML attachment to breach security on your server.

If you use the wizard or the configuration utility, in the **Modify XML Attachment Check** dialog box, on the **General** tab you can enable or disable the **Block**, **Log**, **Statistics**, and **Learn** actions:

If you use the command-line interface, you can enter the following command to configure the XML Attachment Check:

- set appfw profile <profileName> **-xmlAttachmentAction [block] [log] [stats] [none]**

You must configure the other XML Attachment check settings in the configuration utility. In the **Modify XML Attachment Check** dialog box, on the **Checks** tab, you can configure the following settings:

- **Maximum Attachment Size.** Allow attachments that are no larger than the maximum attachment size you specify. To enable this option, first select the **Enabled** check box, and then type the maximum attachment size in bytes in the **Size** text box.
- **Attachment Content Type.** Allow attachments of the specified content type. To enable this option, first select the **Enabled** check box, and then enter a regular expression that matches the Content-Type attribute of the attachments that you want to allow.
    - You can type the URL expression directly in the text window. If you do so, you can use the **Regex Tokens** menu to enter a number of useful regular expressions at the cursor instead of typing them manually.
    - You can click **Regex Editor** to open the **Add Regular Expression** dialog box and use it to construct the URL expression.

Web Services Interoperability Check

The Web Services Interoperability (WS-I) check examines both requests and responses for adherence to the WS-I standard, and blocks those requests and responses that do not adhere to this standard. The purpose of the WS-I check is to block requests that might not interact with other XML appropriately. An attacker can use inconsistencies in interoperability to launch an attack on your XML application.

If you use the wizard or the configuration utility, in the **Modify Web Services Interoperability Check** dialog box, on the **General** tab you can enable or disable the **Block**, **Log**, **Statistics**, and **Learn** actions.

If you use the command-line interface, you can enter the following command to configure the Web Services Interoperability check:

- set appfw profile <profileName> **-xmlWSIAction** [**block**] [**log**] [**learn**] [**stats**] [**none**]

To configure individual Web Services Interoperability rules, you must use the configuration utility. On the **Checks** tab of the **Modify Web Services Interoperability Check** dialog box, select a rule and click **Enable** or **Disable** to enable or disable the rule. You can also click **Open** to open the **Web Services Interoperability Detail** message box for that rule. The message box displays read-only information about the rule. You cannot modify or make other configuration changes to any of these rules.

XML Message Validation Check

The XML Message Validation check examines requests that contain XML messages to ensure that they are valid. If a request contains an invalid XML message, the application firewall blocks the request. The purpose of the XML Validation check is to prevent an attacker from using specially constructed invalid XML messages to breach the security of your application.

If you use the wizard or the configuration utility, in the **Modify XML Message Validation Check** dialog box, on the **General** tab you can enable or disable the **Block**, **Log**, and **Statistics** actions.

If you use the command-line interface, you can enter the following command to configure the XML Message Validation Check:

- set appfw profile <profileName> **-xmlValidationAction [block] [log] [stats] [none]**

You must use the configuration utility to configure the other XML Validation check settings. In the **Modify XML Message Validation Check** dialog box, on the **Checks** tab, you can configure the following settings:

- **XML Message Validation.** Use one of the following options to validate the XML message:
    - **SOAP Envelope.** Validate only the SOAP envelope of XML messages.
    - **WSDL.** Validate XML messages by using an XML SOAP WSDL. If you choose WSDL validation, in the **WSDL Object** drop-down list you must choose a WSDL. If you want to validate against a WSDL that has not already been imported to the application firewall, you can click the **Import** button to open the **Manage WSDL Imports** dialog box and import your WSDL. See WSDL for more information.
        - If you want to validate the entire URL, leave the **Absolute** radio button in the **End Point Check** button array selected. If you want to validate only the portion of the URL after the host, select the **Relative** radio button.
        - If you want the application firewall to enforce the WSDL strictly, and not allow any additional XML headers not defined in the WSDL, you must clear the **Allow additional headers not defined in the WSDL** check box.

          Caution: If you uncheck the **Allow Additional Headers not defined in the WSDL** check box, and your WSDL does not define all XML headers that your protected XML application or Web 2.0 application expects or that a client sends, you may block legitimate access to your protected service.
    - **XML Schema.** Validate XML messages by using an XML schema. If you choose XML schema validation, in the **XML Schema Object** drop-down list you must choose an XML schema. If you want to validate against an XML schema that has not already been imported to the application firewall, you can click the **Import** button to open the **Manage XML Schema Imports** dialog box and import your WSDL. See WSDL for more information.
- **Response Validation.** By default, the application firewall does not attempt to validate responses. If you want to validate responses from your protected application or Web 2.0 site, select the **Validate Response** check box. When you do, the **Reuse the XML**

Schema specified in request validation check box and the **XML Schema Object** drop-down list are activated.

- Check the **Reuse XML Schema** check box to use the schema you specified for request validation to do response validation as well.

  Note: If you check this check box, the **XML Schema Object** drop-down list is grayed out.

- If you want to use a different XML schema for response validation, use the **XML Schema Object** drop-down list to select or upload that XML schema .

XML SOAP Fault Filtering Check

The XML SOAP Fault Filtering check examines responses from your protected web services and filters out XML SOAP faults. This prevents leaking of sensitive information to attackers.

If you use the wizard or the configuration utility, in the **Modify XML SOAP Fault Filtering Check** dialog box, on the **General** tab you can enable or disable the **Block**, **Log**, and **Statistics** actions, and the **Remove** action, which removes SOAP faults before forwarding the response to the user.

If you use the command-line interface, you can enter the following command to configure the XML SOAP Fault Filtering Check:

set appfw profile <profileName> **-XMLSOAPFaultAction** [**block**] [**log**] [**stats**] [**none**]

You cannot configure exceptions to the XML SOAP Fault Filtering check. You can only enable or disable it.

Policies

The application firewall uses two types of policies: firewall policies and auditing policies. Firewall policies control which traffic is sent to the application firewall. Auditing policies control the log server to which application firewall logs are sent.

Firewall policies can be complex because the policy rule can consist of multiple expressions in the NetScaler expressions language, which is a full-fledged object oriented programming language capable of defining with extreme precision exactly which connections to filter. Because firewall policies operate within the context of the application firewall, they must meet certain criteria that are connected to how the application firewall functions and what traffic is appropriately filtered by it. As long as you keep these criteria in mind, however, firewall policies are similar to policies for other NetScaler features. The instructions here do not attempt to cover all aspects of writing firewall policies, but only provide an introduction to policies and cover those criteria that are unique to the application firewall.

Auditing policies are simple because the policy rule is always `ns_true`. You need only specify the log server that you want to send logs to, the logging levels that you want to use, and a few other criteria that are explained in detail.

Firewall Policies

A firewall policy is a rule associated with a profile. The rule is an expression or group of expressions that defines the types of request/response pairs that the application firewall is to filter by applying the profile. Firewall policy expressions are written in the NetScaler expressions language, an object-oriented programming language with special features to support specific NetScaler functions. The profile is the set of actions that the application firewall is to use to filter request/response pairs that match the rule.

Firewall policies enable you to assign different filtering rules to different types of web content. Not all web content is alike. A simple web site that uses no complex scripting and accesses and handles no private data might require only the level of protection provided by a profile created with basic defaults. Web content that contains Javascript-enhanced web forms or accesses an SQL database probably requires more tailored protection. You can create a different profile to filter that content, and create a separate firewall policy that can determine which requests are attempting to access that content. You then associate the policy expression with a profile you created and globally bind the policy to put it into effect.

The application firewall processes only HTTP connections, and therefore uses a subset of the overall NetScaler expressions language. The information here is limited to topics and examples that are likely to be useful when configuring the application firewall. For a procedure that explains how to create and configure a policy by using the configuration utility, see To create and configure a policy. For a procedure to do so by using the NetScaler command line, see To create and configure a policy. For detailed information about the NetScaler expressions language, see the *Citrix NetScaler Policy Configuration and Reference Guide*.

To create an Application Firewall rule (expression) by using the configuration utility

Like other NetScaler policy rules, application firewall rules use NetScaler expressions syntax. This syntax is powerful, flexible, and extensible. It is too complex to describe completely in this set of instructions. You can use the following procedure to create a simple policy, or you can read it as an overview of the policy creation process.

1. If you have not already done so, navigate to the appropriate location in the Application Firewall wizard or the NetScaler configuration utility to create your policy rule:

    - If you are configuring a policy in the Application Firewall wizard, in the navigation pane, click **Application Firewall**, then in the details pane click **Application Firewall Wizard**, and then navigate to the **Specify Rule** screen.

    - If you are configuring a policy manually, in the navigation pane, expand **Application Firewall**, then **Policies**, and then **Firewall**. In the details pane, to create a new policy, click **Add**. To modify an existing policy, select the policy, and then click **Open**.

2. On the **Specify Rule** screen, the **Create Application Firewall Profile** dialog box, or the **Configure Application Firewall Profile** dialog box, click **Prefix**, and then choose the prefix for your expression from the drop-down list. Your choices are:

   - **HTTP.** The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
   - **SYS.** The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
   - **CLIENT.** The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
   - **SERVER.** The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.

   After you choose a prefix, the application firewall displays a two-part prompt window that displays the possible next choices at the top, and a brief explanation of what the selected choice means at the bottom.

3. Choose your next term.

   If you chose HTTP as your prefix, your only choice is REQ, which specifies the Request/Response pair. (The application firewall operates on the request and response as a unit instead of on each separately.) If you chose another prefix, your choices are more varied. For help on a specific choice, click that choice once to display information about it in the lower prompt window.

   When you have decided which term you want, double-click it to insert it into the **Expression** window.

4. Type a period after the term you just chose. You are then prompted to choose your next term, as described in the previous step. When a term requires that you type a value, fill in the appropriate value. For example, if you choose `HTTP.REQ.HEADER("")`, type the header name between the quotation marks.

5. Continue choosing terms from the prompts and filling in any values that are needed, until your expression is finished.

   Following are some examples of expressions for specific purposes.

   - **Specific web host.** To match traffic from a particular web host:

     HTTP.REQ.HEADER("Host").EQ("shopping.example.com")

     For `shopping.example.com`, substitute the name of the web host that you want to match.

   - **Specific web folder or directory.** To match traffic from a particular folder or directory on a Web host:

     HTTP.REQ.URL.STARTSWITH("https//www.example.com/folder")

For `www.example.com`, substitute the name of the web host. For `folder`, substitute the folder or path to the content that you want to match. For example, if your shopping cart is in a folder called `/solutions/orders`, you substitute that string for folder.

- **Specific type of content: GIF images.** To match GIF format images:

  HTTP.REQ.URL.ENDSWITH(".gif")

  To match other format images, substitute another string in place of `.gif`.

- **Specific type of content: scripts.** To match all CGI scripts located in the `CGI-BIN` directory:

  HTTP.REQ.URL.STARTSWITH("https//www.example.com/CGI-BIN")

  To match all JavaScripts with `.js` extensions:

  HTTP.REQ.URL.ENDSWITH(".js")

  For more information about creating policy expressions, see the *Citrix NetScaler Policy Configuration and Reference Guide*.

The Add Expression Dialog Box

The **Add Expression** dialog box (also referred to as the *Expression Editor*) helps users who are not familiar with the NetScaler expressions language to construct a policy that matches the traffic that they want to filter.

1. If you have not already done so, navigate to the appropriate location in the Application Firewall wizard or the NetScaler configuration utility:
   - If you are configuring a policy in the Application Firewall wizard, in the navigation pane, click **Application Firewall**, then in the details pane click **Application Firewall Wizard**, and then navigate to the **Specify Rule** screen.
   - If you are configuring a policy manually, in the navigation pane, expand **Application Firewall**, then **Policies**, and then **Firewall**. In the details pane, to create a new policy, click **Add**. To modify an existing policy, select the policy, and then click **Open**.
2. On the **Specify Rule** screen, in the **Create Application Firewall Profile** dialog box, or in the **Configure Application Firewall Profile** dialog box, click **Add**.
3. In the **Add Expression** dialog box, in the **Construct Expression** area, in the first list box, choose one of the following prefixes:
   - **HTTP.** The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol. The default choice.

- **SYS.** The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.

- **CLIENT.** The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.

- **SERVER.** The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.

4. In the second list box, choose your next term. The available terms differ depending on the choice you made in the previous step, because the dialog box automatically adjusts the list to contain only those terms that are valid for the context. For example, if you selected HTTP in the previous list box, the only choice is REQ, for requests. Because the application firewall treats requests and associated responses as a single unit and filters both, you do not need to specific responses separately. After you choose your second term, a third list box appears to the right of the second. The **Help** window displays a description of the second term, and the **Preview Expression** window displays your expression.

5. In the third list box, choose the next term. A new list box appears to the right, and the **Help** window changes to display a description of the new term. The **Preview Expression** window updates to display the expression as you have specified it to that point.

6. Continue choosing terms, and when prompted filling in arguments, until your expression is complete. If you make a mistake or want to change your expression after you have already selected a term, you can simply choose another term. The expression is modified, and any arguments or additional terms that you added after the term that you modified are cleared.

7. When you have finished constructing your expression, click **OK** to close the **Add Expression** dialog box. Your expression is inserted into the **Expression** text area.

Auditing Policies

Auditing policies determine the messages that are generated and logged during an Application Firewall session. These messages are logged in SYSLOG format to the local NSLOG server or to an external logging server. Different types of messages are logged on the basis of the level of logging selected.

To create an auditing policy, you must first create either an NSLOG server or a SYSLOG server. After specifying the server, you create the policy and specify the type of log and the server to which logs are sent.

To create an auditing server by using the NetScaler command line

You can create two different types of auditing server: an NSLOG server or a SYSLOG server. The command names are different, but the parameters for the commands are the same.

To create an auditing server, at the NetScaler command prompt, type the following commands:

- add audit <type> <name> <serverIP> [**-serverPort** <port>] **-logLevel** <logLevel> ... [**-dateFormat** (**MMDDYYYY** | **DDMMYYYY**)] [**-logFacility** <logFacility>] [**-tcp** (**NONE** | **ALL**)] [**-acl** (**ENABLED** | **DISABLED**)] [**-timeZone** (**GMT_TIME** | **LOCAL_TIME**)] [**-userDefinedAuditlog** (**YES** | **NO**)] [**-appflowExport** (**ENABLED** | **DISABLED**)]

- save ns config

Example

The following example creates a syslog server named syslog1 at IP 10.124.67.91, with loglevels of emergency, critical, and warning, log facility set to LOCAL1, that logs all TCP connections:

```
add audit syslogAction syslog1 10.124.67.91 -logLevel emergency critical warning -logFacility LOCAL1 -tcp ALL
save ns config
```

To modify or remove an auditing server by using the NetScaler command line

- To modify an auditing server, type the set audit <type> command, the name of the auditing server, and the parameters to be changed, with their new values.
- To remove an auditing server, type the rm audit <type> command and the name of the auditing server.

Example

The following example modifies the syslog server named syslog1 to add errors and alerts to the log level:

```
set audit syslogAction syslog1 10.124.67.91 -logLevel emergency critical warning alert error
-logFacility LOCAL1 -tcp ALL
save ns config
```

Parameters for configuring an auditing server

type (Auditing Type)

The type of logging server you are configuring. Possible values: nslogAction (NSLOG), syslogAction (SYSLOG).

name (Name)

A name for the syslog server. The name can consist of from one to 31 upper-case and lower-case letters, numbers, and the period (.), underscore (_) and hyphen (-) symbols.

serverIP (IP Address)

The IP address of the server, in IPV4 or IPV6 format.

serverPort (Port)

The port number on which the server listens for connections.

logLevel (Log Levels)

The types of information to be logged to the server. The choices are:

- ALERT
- CRITICAL
- DEBUG

- EMERGENCY
- ERROR
- INFORMATIONAL
- NOTICE
- WARNING

dateFormat (Date format)

The format used for dates in the logs. The choices are MMDDYYYY (U.S. style) or DDMMYYYY (International style).

logFacility (Log Facility)

The log facility on the NetScaler appliance or VPX virtual appliance. Possible values: LOCAL0, LOCAL1, LOCAL2.

tcp (TCP Logging)

Enable logging of TCP connections. Possible values: NONE, ALL.

acl (ACL Logging)

Enable logging of ACL connections. Possible values: ENABLED, DISABLED.

timeZone (Time Zone)

The Unix time zone to use in the logs.

userDefinedAuditLog (User Configurable Log Messages)

Enable user configurable log messages. Possible values: YES, NO.

appflowExport (AppFlow Logging)

Enable export of logs to the NetScaler AppFlow feature. Possible values: ENABLED, DISABLED.

Example

The following example creates a syslog server named syslog1 at IP 10.124.67.91, with loglevels of emergency, critical, and warning, log facility set to LOCAL1, that logs all TCP connections:

```
add audit syslogAction syslog1 10.124.67.91 -logLevel emergency critical warning
-logFacility LOCAL1 -tcp ALL
save ns config
```

To create or configure an auditing server by using the configuration utility

1. In the navigation pane, expand **Application Firewall**, then **Policies**, and then **Auditing**.
2. In the details pane, click the **Server** tab.
3. Do one of the following:
   - To add a new auditing server, click **Add**.
   - To modify an existing auditing server, select the server, and then click **Open**.
4. In the **Create Auditing Server** or **Configure Auditing Server** dialog box, set the following parameters:
   - Name
   - Auditing Type
   - IP Address
   - Port
   - Log Levels
   - Log Facility
   - TCP Logging
   - ACL Logging
   - User-Configurable Log Messages
   - AppFlow Logging
   - Date Format
   - Time Zone
5. Click **Create** or **OK**.

To create an auditing policy by using the NetScaler command line

You can create an NSLOG policy or a SYSLOG policy. The type of policy must match the type of server. The command names for the two types of policy are different, but the parameters for the commands are the same.

At the NetScaler command prompt, type the following commands:

- add audit <type> <name> [**-rule** <expression>] [**-action** <string>]

- save ns config

Example

The following example creates a policy named syslogP1 that logs application firewall traffic to a syslog server named syslog1.

```
add audit syslogPolicy syslogP1 -rule "ns_true" -action syslog1
save ns config
```

To configure an auditing policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands:

- set audit <type> <name> [**-rule** <expression>] [**-action** <string>]
- save ns config

Example

The following example modifies the policy named syslogP1 to log application firewall traffic to a syslog server named syslog2.

```
set audit syslogPolicy syslogP1 -rule "ns_true" -action syslog2
save ns config
```

Parameters for an auditing policy

type (Auditing Type)

The type of syslog server that you are using. The choices are nslogPolicy (NSLOG) and syslogPolicy (SYSLOG).

name (Name)

A name for the syslog server. The name can consist of from one to 31 upper-case and lower-case letters, numbers, and the period (.), underscore (_) and hyphen (-) symbols.

rule (no configuration utility equivalent)

The rule that defines the policy. Always `ns_true` for application firewall policies. Must be included when configuring an auditing policy at the NetScaler command line. Is included automatically when configuring by using the configuration utility.

action (Server)

The name of the auditing server.

To configure an auditing policy by using the configuration utility

1. In the navigation pane, expand **Application Firewall**, then **Policies**, and then **Auditing**.
2. In the details pane, do one of the following:
   - To add a new policy, click **Add**.
   - To modify an existing policy, select the policy, and then click **Open**.
3. In the **Create Auditing Policy** or **Configure Auditing Policy** dialog box, set the following parameters:
   - Name
   - Auditing Type
   - Server
4. Click **Create** or **OK**.

Imports

Several application firewall features make use of external files that you upload to the application firewall when configuring it. Using the configuration utility, you manage those files in the **Imports** pane, which has four tabs corresponding to the four types of files you can import: HTML error objects, XML error objects, XML schemas, and Web Services Description Language (WSDL) files. Using the NetScaler command line, you can import these types of files, but you cannot export them.

HTML Error Object

When a user's connection to an HTML or Web 2.0 page is blocked, or a user asks for a non-existent HTML or Web 2.0 page, the application firewall sends an HTML-based error response to the user's browser. When configuring which error response the application firewall should use, you have two choices:

- You can configure a *redirect URL*, which can be hosted on any Web server to which users also have access. For example, if you have a custom error page on your Web server, `404.html`, you can configure the application firewall to redirect users to that page when a connection is blocked.

- You can configure an *HTML error object*, which is an HTML-based Web page that is hosted on the application firewall itself. If you choose this option, you must upload the HTML error object to the application firewall. You do that in the Imports pane, on the **HTML Error Object** tab.

The error object must be a standard HTML file that contains no non-HTML syntax except for application firewall error object customization variables. It cannot contain any CGI scripts, server-parsed code, or PHP code. The customization variables enable you to embed troubleshooting information in the error object that the user receives when a request is blocked. While most requests that the application firewall blocks are illegitimate, even a properly configured application firewall can occasionally block legitimate requests, especially when you first deploy it or after you make significant changes to your protected Web sites. By embedding information in the error page, you provide the user with the information that he or she needs to give to the technical support person so that any issues can be fixed.

The application firewall error page customization variables are:

- `${NS_TRANSACTION_ID}`. The transaction ID that the application firewall assigned to this transaction.

- `${NS_APPFW_SESSION_ID}`. The application firewall session ID.

- `${NS_APPFW_VIOLATION_CATEGORY}`. The specific application firewall security check or rule that was violated.

- `${NS_APPFW_VIOLATION_LOG}`. The detailed error message associated with the violation.

- `${COOKIE("<CookieName>")}`. The contents of the specified cookie. For <CookieName>, substitute the name of the specific cookie that you want to display on the error page. If you have multiple cookies whose contents you want to display for troubleshooting, you can use multiple instances of this customization variable, each with the appropriate cookie name.

  Note: If you have blocking enabled for the Cookie Consistency Check, any blocked cookies are not displayed on the error page because the application firewall blocks them.

To use these variables, you embed them in the HTML or XML of the error page object as if they were an ordinary text string. When the error object is displayed to the user, for each customization variable the application firewall substitutes the information to which the variable refers. An example HTML error page that uses custom variables is shown below.

```
<!doctype html public "-//w3c//dtd html 4.0//en">
<html>
<head>
<title>Page Not Accessible</title>
</head>
<body>
<h1>Page Not Accessible</h1>
<p>The page that you accessed is not available. You can:</p>
<ul>
<li>return to the <b><a href="[homePage]">home page</a></b>, re-establish your session, and try again, or,
<li>report this incident to the help desk via <b><a href="mailto:[helpDeskEmailAddress]">email</a></b> or b
</ul>
<p>If you contact the help desk, please provide the following information:</p>
<table cellpadding=8 width=80%>
<tr><th align="right" width=30%>Transaction ID:</th><td align="left" valign="top" width=70%>${NS_TRANSACT
<tr><th align="right" width=30%>Session ID:</th><td align="left" valign="top" width=70%>${NS_APPFW_SESSIO
<tr><th align="right" width=30%>Violation Category:</th><td align="left" valign="top" width=70%>${NS_APPFW
<tr><th align="right" width=30%>Violation Log:</th><td align="left" valign="top" width=70%>${NS_APPFW_VIO
